E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

DATA USABILITY SUMMARY REPORT
GOWANUS FORMER SITE

Client: Brown and Caldwell, Albany, New York
SDGs: 23H0841
Laboratory: Aqua Pro-tech Laboratories, Fairfield, New Jersey
Site: Gowanus, NY
Date: March 15, 2024

Client Sample ID	Laboratory Sample ID	Date Collected	Matrix
MR-304-6.0-8.0-20230811	23H0841-01	8/11/2023	Soil
MR-304-27.0-29.0-20230811	23H0841-02	8/11/2023	Soil

Data validation was performed on the analytical data for two (2) sample collected August 11, 2023, by Yu and associates at the Gowanus Site in New York. The samples were analyzed under the Environmental Protection Agency (USEPA) "Test Methods for Evaluating Solid Waste Physical/Chemical SW-846 Method" described below.

Specific method references are as follows:

Analysis	Method References
Volatile Organic Compounds (VOCs)	USEPA SW-846 8260D; 1311/8260D
Semivolatile Organic Compounds (SVOCs)	USEPA SW-846 8270E; 1311/8270E
Pesticides	USEPA SW-846 8081B; 1311/8081B
Herbicides	USEPA SW-846 8151A; 1311/8151A
PCBs	USEPA SW-846 8082A
Metals	USEPA SW846 6020B; 1311/6020B
Mercury	USEPA 7473; 1311/7470A
Total Cyanide	USEPA SW846 9010C+9014
Reactive Cyanide	USEPA SW846 9010C+9014
Reactive Sulfide	USEPA SW846 9030B
Ignitability	USEPA SW846 1010A
Corrosivity-pH	USEPA SW846 9045D

Data were reviewed in accordance with the USEPA National Functional Guidelines (NFGs) listed below and appropriate method specific USEPA Region II Data Validation Standard Operating Procedures (SOPs). The USEPA NFGs were developed for the Contract Laboratory Program (CLP) methods and may not be applicable to the analytical methods and procedures utilized by the laboratory for this data set. Results were also qualified using analytical method criteria and the reviewer's professional judgement where specific guidance was not applicable.

The following items/criteria were reviewed for this report:

- Data Completeness
- Chain of Custody
- Holding times and sample preservation
- Field Duplicate Accuracy
- Internal Standard Area and RT
- Surrogates
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike and Matrix Spike Duplicate Samples
- Method and field blank contamination
- Laboratory Duplicate Samples
- Serial Dilution
- Initial and continuing calibration summaries
- Compound Quantitation
- Reporting Limits
- Sample comments and Quality Control Summaries

Overall Usability Issues:

- Overall, the data is acceptable for the intended purposes. Minor analytical issues were found with the following data quality indicators resulting in qualified results: continuing calibrations, method blanks, and laboratory control samples.

Chain of Custody:

- No issues noted with the Chain of custody.

Volatile Organic Compounds (VOCs)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
VOCs by SW-846 8260D and	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.
TCLP VOCs by 1311/8260D	Soil	14 Days from collection to leachate and analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established control limits (CL).

- LCS and or LCSD analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8260D-TCLP	MR-304-6.0-8.0-20230811 MR-304-27.0-29.0-20230811	2-Butanone	10% < %R < CL	J (detects) UJ (non-detects)	6L

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- A MS/MSD analysis was not performed on a sample within this SDG.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- ICVs and CCVs were within the specified control limits except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8260D	MR-304-6.0-8.0-20230811 MR-304-27.0-29.0-20230811	Chloroethane	CCV %D > 20% (decrease in response)	UJ (NDs) J (Detects)	SL

Compound Quantitation and Identification

GC/MS analysis utilizes retention time and mass spectra criteria to identify detected results.

- All identified compounds met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.

- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Mass Spectrometer tuning criteria was within control limits.
- Overall system performance was acceptable.

Semivolatile Organic Compounds (SVOCs)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
SVOCs by SW-846 8270E	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
TCLP SVOCs by 1311/8270E	Soil	14 Days from collection to leachate and 7 days from leachate to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination with the following exception: The method blank associated with soil samples had TIC detections of Hexadecanoic acid, butyl ester, Octadecanoic acid, butyl ester and 4-hydroxy-4-methyl-2-Pentanone,. Sample detections less than five times the method blank detection are qualified as rejected, reason code 2.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries for all samples.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS and or LCSD analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8270E	MR-304-6.0-8.0-20230811 MR-304-27.0-29.0-20230811	2,4-Dinitrophenol	%R > CL	J (Detects) No action (NDs)	6H

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD

percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- A MS/MSD analysis was not performed on a sample within this SDG.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% RPD is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- ICVs and CCVs were within the specified control limits except for analytes presented in the following table.
-

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8270E	MR-304-6.0-8.0-20230811 MR-304-27.0-29.0-20230811	2,4-Dinitrophenol 2,4-Dinitrotoluene 2-Nitrophenol 3-Nitroaniline 4,6-Dinitro-2-methylphenol Benzo(g,h,i)perylene Dibenz(a,h)anthracene Indeno(1,2,3-cd)pyrene	CCV %D > 20% (increase in response)	J (detects) No action (NDs)	SH

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
		Hexachlorocyclopentadiene	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL
8270E-TCLP	MR-304-6.0-8.0-20230811 MR-304-27.0-29.0-20230811	Hexachlorobenzene Pentachlorophenol	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL
		2,4-Dinitrotoluene Hexachloroethane	CCV %D > 20% (increase in response)	J (detects) No action (NDs)	SH

Reporting Limits and Compound Quantitation

GC/MS analysis utilizes retention time and mass spectra criteria to identify detected results.

- All identified compounds met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T. Some samples were diluted due to elevated SVOC concentrations and elevated reporting limits are provided.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Mass Spectrometer tuning criteria was within control limits.
- Overall system performance was acceptable.

GC Methods (PCBs, Pesticides, Herbicides)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8081B (Pesticides), 8082A (PCBs) and 8151A (Herbicides)	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
TCLP Herbicides by 1311/8151A	Soil	14 Days from collection to leachate and 7 days from leachate to analysis	Cool to <6 °C.
TCLP Pesticides by 1311/8081B	Soil	14 Days from collection to leachate and 7 days from leachate to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. GC analyses requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries except for analytes presented in the following table:

Method	Sample	Surrogate	Exceedance	Qualification	Reason Code
8081B	MR-304-6.0-8.0-20230811	Decachlorobiphenyl	> CL	J (Detects) No action (NDs)	3H

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- The pesticide LCS exhibited recoveries an order of magnitude above the control limits for all compounds, most likely due to a spiking error. Since all sample results were non-detect, no qualification was required.

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits. Spike recovery requirement is not applicable when the sample concentration exceeds the spike concentration by a factor of four or more.

- A MS/MSD analysis was not performed on a sample within this SDG.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed.

- CCVs exhibited compounds above control limits; however, associated samples results were non-detect, and qualification was not warranted.
- The original lab report had issues affecting how pesticide and PCB calibration factors were reported in the CCV summaries. That information was later corrected and provided as an addendum to the data package.

Reporting Limits and Compound Quantitation

GC methods utilize retention time and dual column analysis to identify detected results. When dual column analysis is performed the percent difference (%D) of detected sample results must be less than 25%.

- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.
- Dual column comparison was not provided as part of the data package.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Overall system performance was acceptable.

Metals and General Chemistry

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
Metals by SW-846 601D	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to <6 °C.
TCLP Metals by 1311/6010D	Soil	180 days from collection to Leachate and 180 days to analysis	Cool to <6 °C.
Mercury by SW-846 7473	Soil	28 days from collection to analysis	Cool to <6 °C.
TCLP Mercury by 1311/7473	Soil	28 days from collection to analysis	Cool to <6 °C.
Reactive Cyanide by SW-846 9014	Soil	14 days from collection to analysis	Cool to <6 °C.
Reactive Sulfide by SW-846 9030B	Soil	7 days from collection to analysis	Cool to <6 °C.
Ignitability by SW-846 1010A	Soil	14 days from collection to analysis	Cool to <6 °C.
Corrosivity by SW-846 9045	Soil	7 days from collection to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks - Method, Trip, Field, ICBs and CCBs

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS analysis exhibited acceptable recoveries.

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits. Spike recovery requirement not applicable when the sample concentration exceeds the spike concentration by a factor of four or more.

- A MS/MSD analysis was not performed on a sample within this SDG.

Laboratory Duplicate

Laboratory duplicate analysis measures precision of the analytical method. The relative percent difference (RPD) is measured between parent and duplicate sample results. The Laboratory duplicate RPDs must be within laboratory-established acceptance limits.

- A laboratory duplicate analysis was not performed on a sample within this SDG.

Serial Dilution

The serial dilution analysis indicates the presence matrix interferences. Sample results greater than 50 times the MDL are evaluated, and percent difference (%D) is measured between undiluted and diluted sample results. A control limit of 20% is applied.

- The serial dilution analysis was not performed on a sample within this SDG.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for samples in this report.

Initial Calibration and Continuing Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. Continuing calibration standards are used to assess calibration drift.

- ICVs and CCVs were within the specified control limits.

Reporting Limits and Analyte Quantitation

- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Overall system performance was acceptable.

Data Qualifiers

J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

UJ = The analyte was not detected above the sample reporting limit; and the reporting limit is approximate.

U = The analyte was analyzed for but was not detected above the method detection limit.

R = The sample results is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

Reason Codes

1	Holding time violation
2	Method blank contamination
3	Surrogate recovery
4	MS/MSD recovery
5	MS/MSD precision outside limits
6	LCS recovery
7	Field blank contamination
8	Field duplicate precision outside limits
9	Other deficiencies (including cooler temperature)
A	Absence of supporting QC
S	ICV, CCV or column performance check problem
Y	Initial and continuing calibration blank problem
M	Interference check samples problem
O	Post digestion spike outside of 85-115%
F	MSA correlation coefficient <0.995, or MSA not done
G	Serial dilution problem
K	DFTPP or BFB tuning problem
Q	Initial calibration problem
X	Internal standard recovery problem
V	Second source standard calibration verification problem
L	Low bias
Z	Retention time problem
N	Counting time error (radionuclide chemistry)
W	Detector instability (radionuclide chemistry)
C	Co-elution of compounds
E	Value exceeds linear calibration range
I	Interferences present during analysis
T	Trace level compound, poor quantitation
P	1C/2C precision outside limits
B	LCS/LCSD precision outside limits
D	Lab Dup/Rep precision outside limits
H	High bias

Person Contacted: Date/Time: 8/11/23 16:50

Comments/Resolution:

Extractable Petroleum Hydrocarbons:

Gas Chromatography/Flame Ionization Detector

New Jersey Department of Environmental Protection Site Remediation Program Extractable Petroleum Hydrocarbons Methodology (Version 3.0).
USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8015D or NJDEP Office of Quality Assurance Quantitation of Semi-Volatile Petroleum Products in Water, Soil and Sediment OQA-QAM-025, Revision 6.

Metals:

Inductively-Coupled Plasma Atomic Emission Spectrometry or Inductively-Coupled Plasma Mass Spectroscopy

Wastewater and Groundwater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 200.7, Method 200.8.
Soil Samples: USEPA Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 6010D.

Mercury:

Cold Vapor Atomic Absorption Spectrometry

Wastewater and Groundwater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 245.1.
Soil Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 7471B.

Volatile Organic Compounds:

Purge and Trap Gas Chromatography/Mass Spectroscopy

Drinking Water Samples: USEPA Methods for the Determination of Organic Compounds in Drinking Water, Method 524.2.
Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 624.1.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update VI, Method 8260D.

Semi-Volatile Organic Compounds:

Gas Chromatography/Mass Spectroscopy

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 625.1.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update VI, Method 8270E.

PFAS Compounds:

Liquid Chromatography/Tandem Mass Spectroscopy

Drinking Water Samples: USEPA Methods for the Determination of Selected Perfluorinated Alkyl Acids in Drinking Water by Solid Phase Extraction and Liquid Chromatography/Tandem Mass Spectrometry (LC/MS/MS), Method 537 (v1.1).

Pesticides:

Gas Chromatography/Electron Capture Detector

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 608.3.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8081B.

Polychlorinated Biphenyls (PCBs):

Gas Chromatography/Electron Capture Detector

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 608.3.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8082A.

General Chemistry Methods:

Various general chemistry methods are taken from "Standard Methods for the Examination of Water and Wastewater, 22nd Edition", .

Specific method citations can be found on the Analytical Results Summary page of this report listed under 'Method'.

** A complete list of Pace Fairfield's certified Methods are on the Standards And Docs page of the Results Retrieval System

Method Detection Limit (MDL):

The MDL is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. The value is calculated following the guidelines defined in:
"**Definition and Procedure for the Determination of the Method Detection Limit, Revision 2**"
EPA 821-R-16-006, published December 2016.

Reporting Limit (RL):

The RL is the Concentration of the lowest calibration standard that was included in the initial calibration of the instrument. On analytical reports this value is corrected for percent moisture and any concentration or dilution factors.

Concentration (Conc.) / Result:

If the compound is detected, the measured concentration is reported. If this column is "ND", or contains a 'less than' (<) symbol, the compound was not detected.

Tentatively Identified Compound (TIC):

A TIC is a non-targeted compound, not included in the calibration, identified by a mass spectral library search OR requested to be identified and reported by the client.

Abbreviations:

ND	Non-Detect
TNTC	Too Numerous To Count

Qualifiers:

U	Indicates the compound was analyzed for but was not detected.
J	Indicates an estimated value. All tentatively identified compounds (TICs) and results below the RL receive this qualifier.
E	Indicates that the concentration of the compound exceeds the calibration range of the instrument. In most cases the results of a diluted analysis will be reported instead and contain a "**D"** qualifier.
D	Indicates result is based on a dilution. This can occur when an initial analysis was **E** flagged, if historical data indicates a dilution may be appropriate on an initial run, OR if the consistency of the sample is such that the instrument may not perform properly if left undiluted.
H	Indicates a Hold Time violation.
B	Indicates the Analyte was found in the method blank as well as the sample.
N	Used when reporting a specific tentatively identified compound.
P	Greater than 25% diff. between 2 GC columns for a Dual Column Analysis.

QUALITY CONTROL
Conformance/Non-Conformance Summary

ANALYSIS: INORGANICS [6010D / 1311/6010D / 7473 / 1311/7470A / 1010A / 9045D / 9014 / 9030B]

Method 6010D:
The percent recoveries for some metals were outside of the QC limits for the matrix spike and matrix spike duplicate (low). The blank spike met all QC criteria.

Method 1311/6010D:
The percent recoveries for Arsenic, Chromium and Lead were outside of the QC limits for the matrix spike and matrix spike duplicate (low). The blank spike met all QC criteria.

Methods 1311/7470A / 7473 / 1010A / 9045D:
All samples met the QC criteria.

Method 9014:
The percent recovery for Reactive Cyanide was outside of the QC limits for the matrix spike and matrix spike duplicate (low). The blank spike met all QC criteria.

Method 9030B:
The percent recovery for Reactive Sulfide was outside of the QC limits for the matrix spike (low). The blank spike met all QC criteria.

ANALYSIS: Herbicides [8151A]

Sample 23H0841-01 has one surrogate (Decachlorobiphenyl) outside of the QC limits (high), due to matrix interference.

ANALYSIS: PCBs [8082A]

All samples met the QC criteria.

ANALYSIS: PESTICIDES [8081B]

Sample 23H0841-01 has one surrogate (Decachlorobiphenyl) outside of the QC limits (high), due to matrix interference.

ANALYSIS: SEMI-VOLATILES BY GC/MS [8270E]

The continuing calibrations were outside of the QC limits for some compounds (low and high).

The percent recoveries for 2,4-Dinitrophenol, 4,6-Dinitro-2-methylphenol and Hexachlorocyclopentadiene were outside of the QC limits for the matrix spike and matrix spike duplicate (low).

ANALYSIS: VOLATILES BY GC/MS [8260D]

The continuing calibration (SAH0504-CCV1) was outside of the QC limits for Chloroethane (low).

The percent recoveries for some compounds were outside of the QC limits for the matrix spike and matrix spike duplicate (low).
The blank spike met all QC criteria.
The percent recoveries for some compounds were outside of the QC limits for the tclp blank spike (low).

ND, U - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

ND, U - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

DATA USABILITY SUMMARY REPORT
GOWANUS FORMER SITE

Client: Brown and Caldwell, Albany, New York
SDGs: 23H0975
Laboratory: Aqua Pro-tech Laboratories, Fairfield, New Jersey
Site: Gowanus, NY
Date: May 14, 2024

Client Sample ID	Laboratory Sample ID	Date Collected	Matrix
MR-304-65.0-67.0-20230814	23H0975-01	8/14/2023	Soil

Data validation was performed on the analytical data for one (1) sample collected August 11, 2023, by Yu and Associates at the Gowanus Site in New York. The samples were analyzed under the Environmental Protection Agency (USEPA) "Test Methods for Evaluating Solid Waste Physical/Chemical SW-846 Method" described below.

Specific method references are as follows:

Analysis	Method References
Volatile Organic Compounds (VOCs)	USEPA SW-846 8260D; 1311/8260D
Semivolatile Organic Compounds (SVOCs)	USEPA SW-846 8270E; 1311/8270E
Pesticides	USEPA SW-846 8081B; 1311/8081B
Herbicides	USEPA SW-846 8151A; 1311/8151A
PCBs	USEPA SW-846 8082A
Metals	USEPA SW846 6020B; 1311/6020B
Mercury	USEPA 7473; 1311/7470A
Total Cyanide	USEPA SW846 9010C+9014
Reactive Cyanide	USEPA SW846 9010C+9014
Reactive Sulfide	USEPA SW846 9030B

Data were reviewed in accordance with the USEPA National Functional Guidelines (NFGs) listed below and appropriate method specific USEPA Region II Data Validation Standard Operating Procedures (SOPs). The USEPA NFGs were developed for the Contract Laboratory Program (CLP) methods and may not be applicable to the analytical methods and procedures utilized by the laboratory for this data set. Results were also qualified using analytical method criteria and the reviewer's professional judgement where specific guidance was not applicable.

- USEPA. National Functional Guidelines for Superfund Organics Methods Data Review. OLEM 9240.0-51, EPA 540-R-20-005, November 2020
- USEPA. National Functional Guidelines for Superfund Inorganics Methods Data Review. OLEM 9240.0-51, EPA 542-R-20-006, November 2020
- USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review. OSWER 9240.1-05A-A-P EPA540/R-99/008. October 1999

- USEPA Contract Laboratory Program Region II Data Validation SOPs (HW-2, HW-22, HW-24, HW-44, HW-45)

The following items/criteria were reviewed for this report:

- Data Completeness
- Chain of Custody
- Holding times and sample preservation
- Field Duplicate Accuracy
- Internal Standard Area and RT
- Surrogates
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike and Matrix Spike Duplicate Samples
- Method and field blank contamination
- Laboratory Duplicate Samples
- Serial Dilution
- Initial and continuing calibration summaries
- Compound Quantitation
- Reporting Limits
- Sample comments and Quality Control Summaries

Overall Usability Issues:

- Overall, the data is acceptable for the intended purposes. Minor analytical issues were found with the following data quality indicators resulting in qualified results: continuing calibrations, surrogates, and laboratory control samples.

Chain of Custody:

- No issues noted with the Chain of custody.

Volatile Organic Compounds (VOCs)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
VOCs by SW-846 8260D and	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.
TCLP VOCs by 1311/8260D	Soil	14 Days from collection to leachate and analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries except for analytes presented in the following table:

Method	Sample	Surrogate	Exceedance	Qualification	Reason Code
8260D-TCLP	MR-304-65.0-67.0-20230814	Dibromofluoromethane	> CL	J (Detects) No action (NDs)	3H

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established control limits (CL).

- LCS and or LCSD analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8260D-TCLP	MR-304-65.0-67.0-20230814	2-Butanone	10% < %R < CL	J (detects) UJ (non-detects)	6L

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- A MS/MSD analysis was not performed on a sample within this SDG.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- ICVs and CCVs were within the specified control limits except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8260D	MR-304-65.0-67.0-20230814	1,1,2,2-Tetrachloroethane	CCV %D > 20% (decrease in response)	UJ (NDs) J (Detects)	SL
		1,2-Dichloropropane			

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
		Bromoform	CCV %D > 20% (increase in response)	J (detects) No action (NDs)	SH

Compound Quantitation and Identification

GC/MS analysis utilizes retention time and mass spectra criteria to identify detected results.

- All identified compounds met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Mass Spectrometer tuning criteria was within control limits.
- Overall system performance was acceptable.

Semivolatile Organic Compounds (SVOCs)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
SVOCs by SW-846 8270E	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
TCLP SVOCs by 1311/8270E	Soil	14 Days from collection to leachate and 7 days from leachate to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination with the following exception: The method blank associated with soil samples had TIC detection for Hexadecanoic acid, butyl ester. Sample detections were greater than than five times the method blank detection and no qualification was required.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries for all samples.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS and or LCSD analysis exhibited acceptable recoveries.

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- A MS/MSD analysis was not performed on a sample within this SDG.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% RPD is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- ICVs and CCVs were within the specified control limits except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8270E	MR-304-65.0-67.0-20230814	Benzaldehyde	CCV %D > 20% (increase in response)	J (detects) No action (NDs)	SH
		2,4-Dinitrophenol Hexachlorocyclopentadiene Pentachlorophenol	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL
8270E-TCLP		Hexachlorobenzene Pentachlorophenol	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL
		2,4-Dinitrotoluene	CCV %D > 20% (increase in	J (detects) No action (NDs)	SH

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
			response)		

Reporting Limits and Compound Quantitation

GC/MS analysis utilizes retention time and mass spectra criteria to identify detected results.

- All identified compounds met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T. Some samples were diluted due to elevated SVOC concentrations and elevated reporting limits are provided.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Mass Spectrometer tuning criteria was within control limits.
- Overall system performance was acceptable.

GC Methods (PCBs, Pesticides, Herbicides)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8081B (Pesticides), 8082A (PCBs) and 8151A (Herbicides)	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
TCLP Herbicides by 1311/8151A	Soil	14 Days from collection to leachate and 7 days from leachate to analysis	Cool to <6 °C.
TCLP Pesticides by 1311/8081B	Soil	14 Days from collection to leachate and 7 days from leachate to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. GC analyses requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS and or LCSD analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8081B	MR-304-65.0-67.0-20230814	4,4'-DDD	10% < %R < CL	J (detects) UJ (non-detects)	6L
		4,4'-DDE			
		alpha-BHC			
		beta-BHC			
		Endosulfan II			

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
		Endrin			

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits. Spike recovery requirement is not applicable when the sample concentration exceeds the spike concentration by a factor of four or more.

- A MS/MSD analysis was not performed on a sample within this SDG.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed.

- Herbicide (8151A) CCVs exhibited compounds above control limits; however, associated samples results were non-detect, and qualification was not warranted.
- The original lab report had issues affecting how pesticide and PCB calibration factors were reported in the CCV summaries. That information was later corrected and provided as an addendum to the data package.

Reporting Limits and Compound Quantitation

GC methods utilize retention time and dual column analysis to identify detected results. When dual column analysis is performed the percent difference (%D) of detected sample results must be less than 25%.

- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.
- Dual column comparison was not provided as part of the data package.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Overall system performance was acceptable.

Metals and General Chemistry

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
Metals by SW-846 601D	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to <6 °C.
TCLP Metals by 1311/6010D	Soil	180 days from collection to Leachate and 180 days to analysis	Cool to <6 °C.
Mercury by SW-846 7473	Soil	28 days from collection to analysis	Cool to <6 °C.
TCLP Mercury by 1311/7473	Soil	28 days from collection to Leachate and 28 days to analysis	Cool to <6 °C.
Reactive Cyanide by SW-846 9014	Soil	14 days from collection to analysis	Cool to <6 °C.
Reactive Sulfide by SW-846 9030B	Soil	7 days from collection to analysis	Cool to <6 °C.
Ignitability by SW-846 1010A	Soil	14 days from collection to analysis	Cool to <6 °C.
Corrosivity by SW-846 9045	Soil	7 days from collection to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks - Method, Trip, Field, ICBs and CCBs

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS analysis exhibited acceptable recoveries.

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits. Spike recovery requirement not applicable when the sample concentration exceeds the spike concentration by a factor of four or more.

- A MS/MSD analysis was not performed on a sample within this SDG.

Laboratory Duplicate

Laboratory duplicate analysis measures precision of the analytical method. The relative percent difference (RPD) is measured between parent and duplicate sample results. The Laboratory duplicate RPDs must be within laboratory-established acceptance limits.

- A laboratory duplicate analysis was not performed on a sample within this SDG.

Serial Dilution

The serial dilution analysis indicates the presence matrix interferences. Sample results greater than 50 times the MDL are evaluated, and percent difference (%D) is measured between undiluted and diluted sample results. A control limit of 20% is applied.

- The serial dilution analysis was not performed on a sample within this SDG.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for samples in this report.

Initial Calibration and Continuing Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. Continuing calibration standards are used to assess calibration drift.

- ICVs and CCVs were within the specified control limits.

Reporting Limits and Analyte Quantitation

- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Overall system performance was acceptable.

Please contact the undersigned if you have any questions or need further information.

Data Qualifiers

J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

UJ = The analyte was not detected above the sample reporting limit; and the reporting limit is approximate.

U = The analyte was analyzed for but was not detected above the method detection limit.

R = The sample results is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

Reason Codes

1	Holding time violation
2	Method blank contamination
3	Surrogate recovery
4	MS/MSD recovery
5	MS/MSD precision outside limits
6	LCS recovery
7	Field blank contamination
8	Field duplicate precision outside limits
9	Other deficiencies (including cooler temperature)
A	Absence of supporting QC
S	ICV, CCV or column performance check problem
Y	Initial and continuing calibration blank problem
M	Interference check samples problem
O	Post digestion spike outside of 85-115%
F	MSA correlation coefficient <0.995, or MSA not done
G	Serial dilution problem
K	DFTPP or BFB tuning problem
Q	Initial calibration problem
X	Internal standard recovery problem
V	Second source standard calibration verification problem
L	Low bias
Z	Retention time problem
N	Counting time error (radionuclide chemistry)
W	Detector instability (radionuclide chemistry)
C	Co-elution of compounds
E	Value exceeds linear calibration range
I	Interferences present during analysis
T	Trace level compound, poor quantitation
P	1C/2C precision outside limits
B	LCS/LCSD precision outside limits
D	Lab Dup/Rep precision outside limits
H	High bias

Extractable Petroleum Hydrocarbons:

Gas Chromatography/Flame Ionization Detector

New Jersey Department of Environmental Protection Site Remediation Program Extractable Petroleum Hydrocarbons Methodology (Version 3.0).
USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8015D or NJDEP Office of Quality Assurance Quantitation of Semi-Volatile Petroleum Products in Water, Soil and Sediment OQA-QAM-025, Revision 6.

Metals:

Inductively-Coupled Plasma Atomic Emission Spectrometry or Inductively-Coupled Plasma Mass Spectroscopy

Wastewater and Groundwater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 200.7, Method 200.8.
Soil Samples: USEPA Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 6010D.

Mercury:

Cold Vapor Atomic Absorption Spectrometry

Wastewater and Groundwater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 245.1.
Soil Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 7471B.

Volatile Organic Compounds:

Purge and Trap Gas Chromatography/Mass Spectroscopy

Drinking Water Samples: USEPA Methods for the Determination of Organic Compounds in Drinking Water, Method 524.2.
Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 624.1.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update VI, Method 8260D.

Semi-Volatile Organic Compounds:

Gas Chromatography/Mass Spectroscopy

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 625.1.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update VI, Method 8270E.

PFAS Compounds:

Liquid Chromatography/Tandem Mass Spectroscopy

Drinking Water Samples: USEPA Methods for the Determination of Selected Perfluorinated Alkyl Acids in Drinking Water by Solid Phase Extraction and Liquid Chromatography/Tandem Mass Spectrometry (LC/MS/MS), Method 537 (v1.1).

Pesticides:

Gas Chromatography/Electron Capture Detector

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 608.3.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8081B.

Polychlorinated Biphenyls (PCBs):

Gas Chromatography/Electron Capture Detector

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 608.3.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8082A.

General Chemistry Methods:

Various general chemistry methods are taken from "Standard Methods for the Examination of Water and Wastewater, 22nd Edition", .

Specific method citations can be found on the Analytical Results Summary page of this report listed under 'Method'.

** A complete list of Pace Fairfield's certified Methods are on the Standards And Docs page of the Results Retrieval System

Method Detection Limit (MDL):

The MDL is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. The value is calculated following the guidelines defined in:
"**Definition and Procedure for the Determination of the Method Detection Limit, Revision 2**"
EPA 821-R-16-006, published December 2016.

Reporting Limit (RL):

The RL is the Concentration of the lowest calibration standard that was included in the initial calibration of the instrument. On analytical reports this value is corrected for percent moisture and any concentration or dilution factors.

Concentration (Conc.) / Result:

If the compound is detected, the measured concentration is reported. If this column is "ND", or contains a 'less than' (<) symbol, the compound was not detected.

Tentatively Identified Compound (TIC):

A TIC is a non-targeted compound, not included in the calibration, identified by a mass spectral library search OR requested to be identified and reported by the client.

Abbreviations:

ND	Non-Detect
TNTC	Too Numerous To Count

Qualifiers:

U	Indicates the compound was analyzed for but was not detected.
J	Indicates an estimated value. All tentatively identified compounds (TICs) and results below the RL receive this qualifier.
E	Indicates that the concentration of the compound exceeds the calibration range of the instrument. In most cases the results of a diluted analysis will be reported instead and contain a "**D"** qualifier.
D	Indicates result is based on a dilution. This can occur when an initial analysis was **E** flagged, if historical data indicates a dilution may be appropriate on an initial run, OR if the consistency of the sample is such that the instrument may not perform properly if left undiluted.
H	Indicates a Hold Time violation.
B	Indicates the Analyte was found in the method blank as well as the sample.
N	Used when reporting a specific tentatively identified compound.
P	Greater than 25% diff. between 2 GC columns for a Dual Column Analysis.

QUALITY CONTROL
Conformance/Non-Conformance Summary

ANALYSIS: INORGANICS [6010D / 1311/6010D / 7473 / 1311/7470A / 1010A / 9045D / 9014 / 9030B]

Method 6010D:
The percent recoveries for some metals were outside of the QC limits for the matrix spikes and matrix spike duplicates (low). The blank spikes met all QC criteria.

Method 1311/6010D:
The percent recoveries for Arsenic, Chromium and Lead were outside of the QC limits for the matrix spike and matrix spike duplicate (low). The blank spike met all QC criteria.

Methods 1311/7470A / 7473 / 1010A / 9045D:
All samples met the QC criteria.

Method 9014:
The percent recovery for Reactive Cyanide was outside of the QC limits for the matrix spike and matrix spike duplicate (low). The blank spike met all QC criteria.

Method 9030B:
The percent recovery for Reactive Sulfide was outside of the QC limits for the matrix spike and matrix spike duplicate (low). The blank spike met all QC criteria.

ANALYSIS: Herbicides [8151A]

Sample 23H0975-01 met all QC criteria.

ANALYSIS: PCBs [8082A]

Sample 23H0975-01 met all QC criteria.

ANALYSIS: PESTICIDES [8081B]

The percent recoveries for some compounds were outside of the QC limits for the blank spike (low).

ANALYSIS: SEMI-VOLATILES BY GC/MS [8270E]

The continuing calibrations were outside of the QC limits for some compounds (low and high).

ANALYSIS: VOLATILES BY GC/MS [8260D]

The continuing calibration (SAH0507-CCV1) was outside of the QC limits for Chloroethane (low).

DATA USABILITY SUMMARY REPORT
GOWANUS FORMER SITE

Client: Brown and Caldwell, Albany, New York
SDGs: 23H1159
Laboratory: Aqua Pro-tech Laboratories, Fairfield, New Jersey
Site: Gowanus, NY
Date: May 16, 2024

Client Sample ID	Laboratory Sample ID	Date Collected	Matrix
SCPT-109-3.0-4.5-20230817	23H1159-01	8/17/2023	Soil
SCPT-101-4.0-5.0-20230817	23H1159-02	8/17/2023	Soil

Data validation was performed on the analytical data for two (2) samples collected August 17, 2023, by Yu and associates at the Gowanus Site in New York. The samples were analyzed under the Environmental Protection Agency (USEPA) "Test Methods for Evaluating Solid Waste Physical/Chemical SW-846 Method" described below.

Specific method references are as follows:

Analysis	Method References
Volatile Organic Compounds (VOCs)	USEPA SW-846 8260D; 1311/8260D
Semivolatile Organic Compounds (SVOCs)	USEPA SW-846 8270E; 1311/8270E
Pesticides	USEPA SW-846 8081B; 1311/8081B
Herbicides	USEPA SW-846 8151A; 1311/8151A

Corrosivity-pH	USEPA SW846 9045D

Data were reviewed in accordance with the USEPA National Functional Guidelines (NFGs) listed below and appropriate method specific USEPA Region II Data Validation Standard Operating Procedures (SOPs). The USEPA NFGs were developed for the Contract Laboratory Program (CLP) methods and may not be applicable to the analytical methods and procedures utilized by the laboratory for this data set. Results were also qualified using analytical method criteria and the reviewer's professional judgement where specific guidance was not applicable.

- USEPA Contract Laboratory Program Region II Data Validation SOPs (HW-2, HW-22, HW-24, HW-44, HW-45)

The following items/criteria were reviewed for this report:

- Data Completeness
- Chain of Custody
- Holding times and sample preservation
- Field Duplicate Accuracy
- Internal Standard Area and RT
- Surrogates
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike and Matrix Spike Duplicate Samples
- Method and field blank contamination
- Laboratory Duplicate Samples
- Serial Dilution
- Initial and continuing calibration summaries
- Compound Quantitation
- Reporting Limits
- Sample comments and Quality Control Summaries

Overall Usability Issues:

- Overall, the data is acceptable for the intended purposes. Minor analytical issues were found with the following data quality indicators resulting in qualified results: continuing calibrations, surrogates, serial dilutions, matrix spike samples and laboratory control samples.

Chain of Custody:

- No issues noted with the Chain of custody.

Volatile Organic Compounds (VOCs)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
VOCs by SW-846 8260D and	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.
TCLP VOCs by 1311/8260D	Soil	14 Days from collection to leachate and analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established control limits (CL).

- LCS and or LCSD analysis exhibited acceptable recoveries.

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- A MS/MSD analysis was not performed on a sample within this SDG.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30%

relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- ICVs and CCVs were within the specified control limits except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8260D	SCPT-101-4.0-5.0-20230817 SCPT-109-3.0-4.5-20230817	2-Butanone Acetone	CCV %D > 20% (increase in response)	J (detects) No action (NDs)	SH
		Chloroethane	CCV %D > 20% (decrease in response)	UJ (NDs) J (Detects)	SL

Compound Quantitation and Identification

GC/MS analysis utilizes retention time and mass spectra criteria to identify detected results.

- All identified compounds met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Mass Spectrometer tuning criteria was within control limits.
- Overall system performance was acceptable.

Semivolatile Organic Compounds (SVOCs)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
SVOCs by SW-846 8270E	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
TCLP SVOCs by 1311/8270E	Soil	14 Days from collection to leachate and 7 days from leachate to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries except for analytes presented in the following table:

Method	Sample	Surrogate	Exceedance	Qualification	Reason Code
8270E	SCPT-101-4.0-5.0-20230817 SCPT-109-3.0-4.5-20230817	Phenol-d6%	> CL	J (Detects) No action (NDs)	3H

- Since only one acid surrogate was outside control limits, no qualification was required.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS and or LCSD analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8270E-TCLP	SCPT-109-3.0-4.5-20230817 SCPT-101-4.0-5.0-20230817	2,4,6-Trichlorophenol	10% < %R < CL	J (detects) UJ (non-detects)	6L
		2,4-Dinitrotoluene			

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
		Hexachlorobenzene	10% > %R < CL	J (detects) R (non-detects)	6L
8270E	SCPT-109-3.0-4.5-20230817 SCPT-101-4.0-5.0-20230817	Acetophenone	> CL	J (Detects) No action (NDs)	6H
		3-Nitroaniline			
		3+4-Methylphenol			
		Phenol			

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- A MS/MSD analysis was not performed on a sample within this SDG.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% RPD is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- ICVs and CCVs were within the specified control limits except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8270E-TCLP	SCPT-109-3.0-4.5-20230817 SCPT-101-4.0-5.0-20230817	2,4-Dinitrotoluene	CCV %D > 20% (increase in response)	J (detects) No action (NDs)	SH
		Hexachlorobenzene Pentachlorophenol	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL
8270E	SCPT-109-3.0-4.5-20230817 SCPT-101-4.0-5.0-20230817	1,4-Dioxane 2,4-Dimethylphenol 2-Methylphenol 3+4-Methylphenol Acetophenone Benzaldehyde bis(2-chloroethoxy)methane bis(2-chloroethyl)ether Isophorone Nitrobenzene n-Nitroso-di-n-propylamine Phenol	CCV %D > 20% (increase in response)	J (detects) No action (NDs)	SH
		2,4-Dinitrophenol Caprolactam Hexachlorocyclopentadiene Pentachlorophenol	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL

Reporting Limits and Compound Quantitation

GC/MS analysis utilizes retention time and mass spectra criteria to identify detected results.

- All identified compounds met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T. Some samples were diluted due to elevated SVOC concentrations and elevated reporting limits are provided.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Mass Spectrometer tuning criteria was within control limits.
- Overall system performance was acceptable.

GC Methods (PCBs, Pesticides, Herbicides)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8081B (Pesticides), 8082A (PCBs) and 8151A (Herbicides)	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
TCLP Herbicides by 1311/8151A	Soil	14 Days from collection to leachate and 7 days from leachate to analysis	Cool to <6 °C.
TCLP Pesticides by 1311/8081B	Soil	14 Days from collection to leachate and 7 days from leachate to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. GC analyses requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries except for analytes presented in the following table:

Method	Sample	Surrogate	Exceedance	Qualification	Reason Code
8082A	SCPT-109-3.0-4.5-20230817	DCB TCMX	10% < %R < CL	J (detects) UJ (non-detects)	3L
8151A	SCPT-101-4.0-5.0-20230817	DCAA	> CL	J (Detects) No action (NDs)	3H
8081B-TCLP	SCPT-101-4.0-5.0-20230817	DCB TCMX	> CL	J (Detects) No action (NDs)	3H

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS and or LCSD analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8081B	SCPT-109-3.0-4.5-20230817 SCPT-101-4.0-5.0-20230817	4,4'-DDD	> CL	J (Detects) No action (NDs)	6H
		4,4'-DDT			
		Andrin			
		alpha-Chlordane			
		Chlordane			
		Endosulfan I			
		Endosulfan II			
		Endosulfan Sulfate			
		Endrin aldehyde			
		Endrin ketone			
		gamma-chlordane			
		Heptachlor epoxide			
		Methoxychlor			

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits. Spike recovery requirement is not applicable when the sample concentration exceeds the spike concentration by a factor of four or more.

- A MS/MSD analysis was not performed on a sample within this SDG.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report had issues affecting how pesticide and PCB calibration factors were reported in the CCV summaries. That information was later corrected and provided as an addendum to the data package.

Reporting Limits and Compound Quantitation

GC methods utilize retention time and dual column analysis to identify detected results. When dual column analysis is performed the percent difference (%D) of detected sample results must be less than 25%.

- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.
- Dual column comparison was not provided as part of the data package.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Overall system performance was acceptable.

Metals and General Chemistry

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
Metals by SW-846 601D	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to <6 °C.
TCLP Metals by 1311/6010D	Soil	180 days from collection to Leachate and 180 days to analysis	Cool to <6 °C.
Mercury by SW-846 7473	Soil	28 days from collection to analysis	Cool to <6 °C.
TCLP Mercury by 1311/7473	Soil	28 days from collection to Leachate and 28 days to analysis	Cool to <6 °C.
Reactive Cyanide by SW-846 9014	Soil	14 days from collection to analysis	Cool to <6 °C.
Reactive Sulfide by SW-846 9030B	Soil	7 days from collection to analysis	Cool to <6 °C.
Ignitability by SW-846 1010A	Soil	14 days from collection to analysis	Cool to <6 °C.
Corrosivity by SW-846 9045	Soil	7 days from collection to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks - Method, Trip, Field, ICBs and CCBs

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS and or LCSD analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
6010D	SCPT-109-3.0-4.5-20230817 SCPT-101-4.0-5.0-20230817	Selenium	30% < %R < CL	J (detects) UJ (non-detects)	6L

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established

acceptance limits. Spike recovery requirement not applicable when the sample concentration exceeds the spike concentration by a factor of four or more.

- MS/MSD analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
6010D	SCPT-109-3.0-4.5-20230817	Aluminum	30% < %R < CL	J (detects) UJ (non-detects)	4L
		Antimony			
		Beryllium			
		Cadmium			
		Cobalt			
		Magnesium			
		Selenium			
		Silver			
		Thallium			
		Vanadium	> CL	J (Detects) No action (NDs)	4H
		Zinc			
	SCPT-101-4.0-5.0-20230817	Aluminum	30% < %R < CL	J (detects) UJ (non-detects)	4L
		Antimony			
		Arsenic			
		Beryllium			
		Cadmium			
		Cobalt			
		Iron			
		Magnesium			
		Nickel			
		Selenium			
		Sodium			
		Silver			
		Thallium			
		Vanadium			

- The MS/MSD analysis performed on a sample SCPT-109-3.0-4.5-20230817 exhibited recoveries outside control limit for other analytes (Barium, Calcium, Lead, Manganese). However, since the sample concentration was greater than four times the spike amount, no qualification was required.
- The MS/MSD analysis performed on a sample SCPT-101-4.0-5.0-20230817 exhibited recoveries outside control limit for other analytes (Barium, Calcium, Lead, Chromium and Copper). However, since the sample concentration was greater than four times the spike amount, no qualification was required.

Laboratory Duplicate

Laboratory duplicate analysis measures precision of the analytical method. The relative percent difference (RPD) is measured between parent and duplicate sample results. The Laboratory duplicate RPDs must be within laboratory-established acceptance limits.

- A laboratory duplicate analysis was not performed on a sample within this SDG.

Serial Dilution

The serial dilution analysis indicates the presence matrix interferences. Sample results greater than 50 times the MDL are evaluated, and percent difference (%D) is measured between undiluted and diluted sample results. A control limit of 20% is applied.

- The serial dilution analysis was performed on a sample SCPT-109-3.0-4.5-20230817 exhibited RPDs outside control limits for Aluminum, Barium Calcium, Chromium, Cobalt, Copper, Iron Lead, Magnesium, Manganese, Nickel, Vanadium and Zinc. Results are qualified as estimated, J, reason code, AA.
- The serial dilution analysis was performed on a sample SCPT-101-4.0-5.0-20230817 exhibited RPDs outside control limits for Potassium and Sodium. Results are qualified as estimated, J, reason code, AA.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for samples in this report.

Initial Calibration and Continuing Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. Continuing calibration standards are used to assess calibration drift.

- ICVs and CCVs were within the specified control limits.

Reporting Limits and Analyte Quantitation

- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Overall system performance was acceptable.

Data Qualifiers

J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

UJ = The analyte was not detected above the sample reporting limit; and the reporting limit is approximate.

U = The analyte was analyzed for but was not detected above the method detection limit.

R = The sample results is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

Reason Codes

1	Holding time violation
2	Method blank contamination
3	Surrogate recovery
4	MS/MSD recovery
5	MS/MSD precision outside limits
6	LCS recovery
7	Field blank contamination
8	Field duplicate precision outside limits
9	Other deficiencies (including cooler temperature)
A	Absence of supporting QC
S	ICV, CCV or column performance check problem
Y	Initial and continuing calibration blank problem
M	Interference check samples problem
O	Post digestion spike outside of 85-115%
F	MSA correlation coefficient <0.995, or MSA not done
G	Radiochem Minimum Detectable Concentration (MDC)
K	DFTPP or BFB tuning problem
Q	Initial calibration problem
X	Internal standard recovery problem
V	Second source standard calibration verification problem
L	Low bias
Z	Retention time problem
N	Counting time error (radionuclide chemistry)
W	Detector instability (radionuclide chemistry)
C	Co-elution of compounds
E	Value exceeds linear calibration range
I	Interferences present during analysis
T	Trace level compound, poor quantitation
P	1C/2C precision outside limits
B	LCS/LCSD precision outside limits
D	Lab Dup/Rep precision outside limits
H	High bias
AA	Serial Dilution

Inductively-Coupled Plasma Atomic Emission Spectrometry or Inductively-Coupled Plasma Mass Spectroscopy

Wastewater and Groundwater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 200.7, Method 200.8.
Soil Samples: USEPA Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 6010D.

Mercury:

Cold Vapor Atomic Absorption Spectrometry

Wastewater and Groundwater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 245.1.
Soil Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 7471B.

Volatile Organic Compounds:

Purge and Trap Gas Chromatography/Mass Spectroscopy

Drinking Water Samples: USEPA Methods for the Determination of Organic Compounds in Drinking Water, Method 524.2.
Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 624.1.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update VI, Method 8260D.

Semi-Volatile Organic Compounds:

Gas Chromatography/Mass Spectroscopy

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 625.1.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update VI, Method 8270E.

PFAS Compounds:

Liquid Chromatography/Tandem Mass Spectroscopy

Drinking Water Samples: USEPA Methods for the Determination of Selected Perfluorinated Alkyl Acids in Drinking Water by Solid Phase Extraction and Liquid Chromatography/Tandem Mass Spectrometry (LC/MS/MS), Method 537 (v1.1).

Pesticides:

Gas Chromatography/Electron Capture Detector

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 608.3.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8081B.

Polychlorinated Biphenyls (PCBs):

Gas Chromatography/Electron Capture Detector

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 608.3.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8082A.

General Chemistry Methods:

Various general chemistry methods are taken from "Standard Methods for the Examination of Water and Wastewater, 22nd Edition", .

Specific method citations can be found on the Analytical Results Summary page of this report listed under 'Method'.

** A complete list of Pace Fairfield's certified Methods are on the Standards And Docs page of the Results Retrieval System

Method Detection Limit (MDL):

The MDL is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. The value is calculated following the guidelines defined in:
"**Definition and Procedure for the Determination of the Method Detection Limit, Revision 2**"
EPA 821-R-16-006, published December 2016.

Reporting Limit (RL):

The RL is the Concentration of the lowest calibration standard that was included in the initial calibration of the instrument. On analytical reports this value is corrected for percent moisture and any concentration or dilution factors.

Concentration (Conc.) / Result:

If the compound is detected, the measured concentration is reported. If this column is "ND", or contains a 'less than' (<) symbol, the compound was not detected.

Tentatively Identified Compound (TIC):

A TIC is a non-targeted compound, not included in the calibration, identified by a mass spectral library search OR requested to be identified and reported by the client.

Abbreviations:

ND	Non-Detect
TNTC	Too Numerous To Count

Qualifiers:

U	Indicates the compound was analyzed for but was not detected.
J	Indicates an estimated value. All tentatively identified compounds (TICs) and results below the RL receive this qualifier.
E	Indicates that the concentration of the compound exceeds the calibration range of the instrument. In most cases the results of a diluted analysis will be reported instead and contain a "**D"** qualifier.
D	Indicates result is based on a dilution. This can occur when an initial analysis was **E** flagged, if historical data indicates a dilution may be appropriate on an initial run, OR if the consistency of the sample is such that the instrument may not perform properly if left undiluted.
H	Indicates a Hold Time violation.
B	Indicates the Analyte was found in the method blank as well as the sample.
N	Used when reporting a specific tentatively identified compound.
P	Greater than 25% diff. between 2 GC columns for a Dual Column Analysis.

QUALITY CONTROL
Conformance/Non-Conformance Summary

ANALYSIS: INORGANICS [6010D / 1311/6010D / 7473 / 1311/7470A / 1010A / 9045D / 9014 / 9030B]

Method 6010D:
The percent recovery for Selenium was outside of the QC limits for the blank spike (slightly low).
The percent recoveries for several metals were outside of the QC limits for the matrix spikes and matrix spike duplicates (low).
Method 1311/6010D:
The percent recoveries for Arsenic, Chromium and Lead were outside of the QC limits for the matrix spike and matrix spike duplicate (low). The blank spike met all QC criteria.
Method 9014:
The percent recovery for Reactive Cyanide was outside of the QC limits for the matrix spike and matrix spike duplicate (low). The blank spike met all QC criteria.
Method 9030B:
The percent recovery for Reactive Sulfide was outside of the QC limits for the matrix spike and matrix spike duplicate (low). The blank spike met all QC criteria.
Methods 7473 / 1311/7470A / 1010A / 9045D:
All samples met the QC criteria.

ANALYSIS: Herbicides [8151A]

Sample 23H1159-02 has surrogates outside of the QC limits (high), due to matrix interference.

ANALYSIS: PCBs [8082A]

Samples 23H1159-01 and -02 have surrogates outside of the QC limits (low and high), due to matrix interferences.

ANALYSIS: PESTICIDES [8081B]

Sample 23H1159-02 has surrogates outside of the QC limits (high), due to matrix interference.

The percent recoveries for some compounds were outside of the QC limits for the blank spike, matrix spike and matrix spike duplicate (low and high).

ANALYSIS: SEMI-VOLATILES BY GC/MS [8270E]

The continuing calibrations were outside of the QC limits for some compounds (low and high).

The percent recoveries for some compounds were outside of the QC limits for the blank spikes, matrix spike and matrix spike duplicate (low and high).

Samples 23H1159-01 and -02 have one surrogate (Phenol-d6) outside of the QC limits (high), due to matrix interferences.

ANALYSIS: VOLATILES BY GC/MS [8260D]

The continuing calibration (SAH0583-CCV1) was outside of the QC limits for 2-Butanone (high), Acetone (high) and Chloroethane (low).

The percent recoveries for some compounds were outside of the QC limits for the matrix spike and matrix spike duplicate (low).
The blank spike met all QC criteria.

DATA USABILITY SUMMARY REPORT
GOWANUS FORMER SITE

Client: Brown and Caldwell, Albany, New York
SDGs: 23H1250
Laboratory: Aqua Pro-tech Laboratories, Fairfield, New Jersey
Site: Gowanus, NY
Date: May 17, 2024

Client Sample ID	Laboratory Sample ID	Date Collected	Matrix
SCPT-102-4.0-5.0-20230818	23H1250-01	8/18/2023	Soil
SCPT-108-5.0-6.0-20230818	23H1250-02	8/18/2023	Soil

Data validation was performed on the analytical data for two (2) samples collected August 18, 2023, by Yu and associates at the Gowanus Site in New York. The samples were analyzed under the Environmental Protection Agency (USEPA) "Test Methods for Evaluating Solid Waste Physical/Chemical SW-846 Method" described below.

Specific method references are as follows:

Analysis	Method References
Volatile Organic Compounds (VOCs)	USEPA SW-846 8260D; 1311/8260D
Semivolatile Organic Compounds (SVOCs)	USEPA SW-846 8270E; 1311/8270E
Pesticides	USEPA SW-846 8081B; 1311/8081B
Herbicides	USEPA SW-846 8151A; 1311/8151A

Reactive Sulfide	USEPA SW846 9030B
Ignitability	USEPA SW846 1010A
Corrosivity-pH	USEPA SW846 9045D

Data were reviewed in accordance with the USEPA National Functional Guidelines (NFGs) listed below and appropriate method specific USEPA Region II Data Validation Standard Operating Procedures (SOPs). The USEPA NFGs were developed for the Contract Laboratory Program (CLP) methods and may not be applicable to the analytical methods and procedures utilized by the laboratory for this data set. Results were also qualified using analytical method criteria and the reviewer's professional judgement where specific guidance was not applicable.

- USEPA Contract Laboratory Program Region II Data Validation SOPs (HW-2, HW-22, HW-24, HW-44, HW-45)

The following items/criteria were reviewed for this report:

- Data Completeness
- Chain of Custody
- Holding times and sample preservation
- Field Duplicate Accuracy
- Internal Standard Area and RT
- Surrogates
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike and Matrix Spike Duplicate Samples
- Method and field blank contamination
- Laboratory Duplicate Samples
- Serial Dilution
- Initial and continuing calibration summaries
- Compound Quantitation
- Reporting Limits
- Sample comments and Quality Control Summaries

Overall Usability Issues:

- Overall, the data is acceptable for the intended purposes. SVOC Hexachlorobenzene associated with TCLP analysis was rejected due to low recovery of the laboratory control samples. Minor analytical issues were found with the following data quality indicators resulting in qualified results: continuing calibrations, and laboratory control samples.

Chain of Custody:

- No issues noted with the Chain of custody.

Volatile Organic Compounds (VOCs)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
VOCs by SW-846 8260D and	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.
TCLP VOCs by 1311/8260D	Soil	14 Days from collection to leachate and analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established control limits (CL).

- LCS and or LCSD analysis exhibited acceptable recoveries.

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- A MS/MSD analysis was not performed on a sample within this SDG.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30%

relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- ICVs and CCVs were within the specified control limits except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8260D	SCPT-102-4.0-5.0-20230818 SCPT-108-5.0-6.0-20230818	2-Butanone 2-Hexanene Acetone	CCV %D > 20% (increase in response)	J (detects) No action (NDs)	SH
		Chloroethane	CCV %D > 20% (decrease in response)	UJ (NDs) J (Detects)	SL

Compound Quantitation and Identification

GC/MS analysis utilizes retention time and mass spectra criteria to identify detected results.

- All identified compounds met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Mass Spectrometer tuning criteria was within control limits.
- Overall system performance was acceptable.

Semivolatile Organic Compounds (SVOCs)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
SVOCs by SW-846 8270E	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
TCLP SVOCs by 1311/8270E	Soil	14 Days from collection to leachate and 7 days from leachate to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries except for analytes presented in the following table:

Method	Sample	Surrogate	Exceedance	Qualification	Reason Code
8270E	SCPT-102-4.0-5.0-20230818	2,4,6-TBP	> CL	J (Detects) No action (NDs)	3H

- Since only one acid surrogate was outside control limits, no qualification was required.
- Dilution analyses exhibited surrogates outside control limits; since surrogates were diluted outside the calibration range, no qualification was required.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS and or LCSD analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8270E-TCLP	SCPT-102-4.0-5.0-20230818 SCPT-108-5.0-6.0-20230818	2,4,6-Trichlorophenol	10% < %R < CL	J (detects) UJ (non-	6L

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
		2,4-Dinitrotoluene		detects)	
		Hexachlorobenzene	10% > %R < CL	J (detects) R (non-detects)	6L
8270E	SCPT-102-4.0-5.0-20230818 SCPT-108-5.0-6.0-20230818	Acetophenone	> CL	J (Detects) No action (NDs)	6H
		3-Nitroaniline			
		3+4-Methylphenol			
		Phenol			

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- A MS/MSD analysis was not performed on a sample within this SDG.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% RPD is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- All recoveries and/or correlation coefficient criteria.

- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- ICVs and CCVs were within the specified control limits except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8270E-TCLP	SCPT-102-4.0-5.0-20230818 SCPT-108-5.0-6.0-20230818	2,4-Dinitrotoluene	CCV %D > 20% (increase in response)	J (detects) No action (NDs)	SH
		Hexachlorobenzene Pentachlorophenol	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL
8270E	SCPT-102-4.0-5.0-20230818 SCPT-108-5.0-6.0-20230818	2,4-Dinitrophenol 4,6-Dinitro-2-methylphenol Hexachlorocyclopentadiene Pentachlorophenol	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL
		Acetophenone Benzaldehyde bis(2-chloroethyl)ether Isophorone Nitrobenzene n-Nitroso-di-n-propylamine Phenol	CCV %D > 20% (increase in response)	J (detects) No action (NDs)	SH

Reporting Limits and Compound Quantitation

GC/MS analysis utilizes retention time and mass spectra criteria to identify detected results.

- All identified compounds met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T. Some samples were diluted due to elevated SVOC concentrations and elevated reporting limits are provided.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Mass Spectrometer tuning criteria was within control limits.
- Overall system performance was acceptable.

GC Methods (PCBs, Pesticides, Herbicides)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8081B (Pesticides), 8082A (PCBs) and 8151A (Herbicides)	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
TCLP Herbicides by 1311/8151A	Soil	14 Days from collection to leachate and 7 days from leachate to analysis	Cool to <6 °C.
TCLP Pesticides by 1311/8081B	Soil	14 Days from collection to leachate and 7 days from leachate to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. GC analyses requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries except for analytes presented in the following table:

Method	Sample	Surrogate	Exceedance	Qualification	Reason Code
8082A	SCPT-102-4.0-5.0-20230818	DCB	> CL	J (Detects) No action (NDs)	3H
	SCPT-108-5.0-6.0-20230818	TCMX	> CL	J (Detects) No action (NDs)	3H
8151A	SCPT-108-5.0-6.0-20230818	DCAA	> CL	J (Detects) No action (NDs)	3H
8081B	SCPT-102-4.0-5.0-20230818	DCB	> CL	J (Detects) No action (NDs)	3H

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS and or LCSD analysis exhibited acceptable recoveries.

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits. Spike recovery requirement is not applicable when the sample concentration exceeds the spike concentration by a factor of four or more.

- A MS/MSD analysis was not performed on a sample within this SDG.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report had issues affecting how pesticide and PCB calibration factors were reported in the CCV summaries. That information was later corrected and provided as an addendum to the data package.

Reporting Limits and Compound Quantitation

GC methods utilize retention time and dual column analysis to identify detected results. When dual column analysis is performed the percent difference (%D) of detected sample results must be less than 25%.

- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.
- Dual column comparison was not provided as part of the data package.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Overall system performance was acceptable.

Metals and General Chemistry

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
Metals by SW-846 601D	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to <6 °C.
TCLP Metals by 1311/6010D	Soil	180 days from collection to Leachate and 180 days to analysis	Cool to <6 °C.
Mercury by SW-846 7473	Soil	28 days from collection to analysis	Cool to <6 °C.
TCLP Mercury by 1311/7473	Soil	28 days from collection to Leachate and 28 days to analysis	Cool to <6 °C.
Reactive Cyanide by SW-846 9014	Soil	14 days from collection to analysis	Cool to <6 °C.
Reactive Sulfide by SW-846 9030B	Soil	7 days from collection to analysis	Cool to <6 °C.
Ignitability by SW-846 1010A	Soil	14 days from collection to analysis	Cool to <6 °C.
Corrosivity by SW-846 9045	Soil	7 days from collection to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks - Method, Trip, Field, ICBs and CCBs

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS and or LCSD analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
6010D	SCPT-102-4.0-5.0-20230818 SCPT-108-5.0-6.0-20230818	Selenium	30% < %R < CL	J (detects) UJ (non-detects)	6L

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established

acceptance limits. Spike recovery requirement not applicable when the sample concentration exceeds the spike concentration by a factor of four or more.

- A MS/MSD analysis was not performed on a sample within this SDG.

Laboratory Duplicate

Laboratory duplicate analysis measures precision of the analytical method. The relative percent difference (RPD) is measured between parent and duplicate sample results. The Laboratory duplicate RPDs must be within laboratory-established acceptance limits.

- A laboratory duplicate analysis was not performed on a sample within this SDG.

Serial Dilution

The serial dilution analysis indicates the presence matrix interferences. Sample results greater than 50 times the MDL are evaluated, and percent difference (%D) is measured between undiluted and diluted sample results. A control limit of 20% is applied.

- The serial dilution analysis was not performed on a sample within this SDG.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for samples in this report.

Initial Calibration and Continuing Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. Continuing calibration standards are used to assess calibration drift.

- ICVs and CCVs were within the specified control limits.

Reporting Limits and Analyte Quantitation

- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Overall system performance was acceptable.

Data Qualifiers

J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

UJ = The analyte was not detected above the sample reporting limit; and the reporting limit is approximate.

U = The analyte was analyzed for but was not detected above the method detection limit.

R = The sample results is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

Reason Codes

1	Holding time violation
2	Method blank contamination
3	Surrogate recovery
4	MS/MSD recovery
5	MS/MSD precision outside limits
6	LCS recovery
7	Field blank contamination
8	Field duplicate precision outside limits
9	Other deficiencies (including cooler temperature)
A	Absence of supporting QC
S	ICV, CCV or column performance check problem
Y	Initial and continuing calibration blank problem
M	Interference check samples problem
O	Post digestion spike outside of 85-115%
F	MSA correlation coefficient <0.995, or MSA not done
G	Radiochem Minimum Detectable Concentration (MDC)
K	DFTPP or BFB tuning problem
Q	Initial calibration problem
X	Internal standard recovery problem
V	Second source standard calibration verification problem
L	Low bias
Z	Retention time problem
N	Counting time error (radionuclide chemistry)
W	Detector instability (radionuclide chemistry)
C	Co-elution of compounds
E	Value exceeds linear calibration range
I	Interferences present during analysis
T	Trace level compound, poor quantitation
P	1C/2C precision outside limits
B	LCS/LCSD precision outside limits
D	Lab Dup/Rep precision outside limits
H	High bias
AA	Serial Dilution

Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update VI, Method 8260D.

Semi-Volatile Organic Compounds:

Gas Chromatography/Mass Spectroscopy

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 625.1.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update VI, Method 8270E.

PFAS Compounds:

Liquid Chromatography/Tandem Mass Spectroscopy

Drinking Water Samples: USEPA Methods for the Determination of Selected Perfluorinated Alkyl Acids in Drinking Water by Solid Phase Extraction and Liquid Chromatography/Tandem Mass Spectrometry (LC/MS/MS), Method 537 (v1.1).

Pesticides:

Gas Chromatography/Electron Capture Detector

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 608.3.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8081B.

Polychlorinated Biphenyls (PCBs):

Gas Chromatography/Electron Capture Detector

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 608.3.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8082A.

General Chemistry Methods:

Various general chemistry methods are taken from "Standard Methods for the Examination of Water and Wastewater, 22nd Edition", .

Specific method citations can be found on the Analytical Results Summary page of this report listed under 'Method'.

** A complete list of Pace Fairfield's certified Methods are on the Standards And Docs page of the Results Retrieval System

Method Detection Limit (MDL):

The MDL is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. The value is calculated following the guidelines defined in:
"**Definition and Procedure for the Determination of the Method Detection Limit, Revision 2**"
EPA 821-R-16-006, published December 2016.

Reporting Limit (RL):

The RL is the Concentration of the lowest calibration standard that was included in the initial calibration of the instrument. On analytical reports this value is corrected for percent moisture and any concentration or dilution factors.

Concentration (Conc.) / Result:

If the compound is detected, the measured concentration is reported. If this column is "ND", or contains a 'less than' (<) symbol, the compound was not detected.

Tentatively Identified Compound (TIC):

A TIC is a non-targeted compound, not included in the calibration, identified by a mass spectral library search OR requested to be identified and reported by the client.

Abbreviations:

ND	Non-Detect
TNTC	Too Numerous To Count

Qualifiers:

U	Indicates the compound was analyzed for but was not detected.
J	Indicates an estimated value. All tentatively identified compounds (TICs) and results below the RL receive this qualifier.
E	Indicates that the concentration of the compound exceeds the calibration range of the instrument. In most cases the results of a diluted analysis will be reported instead and contain a "**D"** qualifier.
D	Indicates result is based on a dilution. This can occur when an initial analysis was **E** flagged, if historical data indicates a dilution may be appropriate on an initial run, OR if the consistency of the sample is such that the instrument may not perform properly if left undiluted.
H	Indicates a Hold Time violation.
B	Indicates the Analyte was found in the method blank as well as the sample.
N	Used when reporting a specific tentatively identified compound.
P	Greater than 25% diff. between 2 GC columns for a Dual Column Analysis.

QUALITY CONTROL
Conformance/Non-Conformance Summary

ANALYSIS: INORGANICS [6010D / 1311/6010D / 7471B / 1311/7470A / 1010A / 9045D / 9014 / 9030B]

Method 6010D:
The percent recovery for Selenium was outside of the QC limits for the blank spike (slightly low).
The percent recoveries for several metals were outside of the QC limits for the matrix spikes and matrix spike duplicates (low).
Method 1311/6010D:
The percent recoveries for Arsenic, Chromium and Lead were outside of the QC limits for the matrix spike and matrix spike duplicate (low). The blank spike met all QC criteria.
Method 9014:
The percent recovery for Reactive Cyanide was outside of the QC limits for the matrix spike and matrix spike duplicate (low). The blank spike met all QC criteria.
Method 9030B:
The percent recovery for Reactive Sulfide was outside of the QC limits for the matrix spike and matrix spike duplicate (low). The blank spike met all QC criteria.
Methods 1311/7470A / 7471B / 1010A / 9045D:
All samples met the QC criteria.

ANALYSIS: Herbicides [8151A]

Sample 23H1250-02 has surrogates outside of the QC limits (low and high), due to matrix interference.

ANALYSIS: PCBs [8082A]

Samples 23H1250-01 and -02 have surrogates outside of the QC limits (high), due to matrix interferences.

ANALYSIS: PESTICIDES [8081B]

The percent recovery for 4,4'-DDT was outside of the QC limits for the matrix spike (low).

Sample 23H1250-01 has surrogates outside of the QC limits (high), due to matrix interference.

ANALYSIS: SEMI-VOLATILES BY GC/MS [8270E]

The continuing calibrations were outside of the QC limits for some compounds (low and high).

The percent recoveries for some compounds were outside of the QC limits for the blank spikes, matrix spike and matrix spike duplicate (low and high).

Samples 23H1250-01, -01RE2 and -02RE1 have surrogates outside of the QC limits (low and high), due to matrix interferences.

ANALYSIS: VOLATILES BY GC/MS [8260D]

The continuing calibrations were outside of the QC limits for some compounds (low and high).

The percent recoveries for some compounds were outside of the QC limits for the matrix spike and matrix spike duplicate (low).

Sample 23H1250-02 has one internal standard (1,4-Dichlorobenzene-d4) outside of the QC limits (low), due to matrix interference.

ND - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

ND, U - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

Site: Gowanus, NY
Date: June 10, 2024

Client Sample ID	Laboratory Sample ID	Date Collected	Matrix
SCPT-111-4.0-5.0-20230821	23H1331-01	8/21/2023	Soil
SCPT-110-4.0-5.0-20230821	23H1331-02	8/21/2023	Soil

Data validation was performed on the analytical data for two (2) samples collected August 21, 2023, by Yu and Associates at the Gowanus Site in New York. The samples were analyzed under the Environmental Protection Agency (USEPA) "Test Methods for Evaluating Solid Waste Physical/Chemical SW-846 Method" described below.

Specific method references are as follows:

Analysis	Method References
Volatile Organic Compounds (VOCs)	USEPA SW-846 8260D; 1311/8260D
Semivolatile Organic Compounds (SVOCs)	USEPA SW-846 8270E; 1311/8270E
Pesticides	USEPA SW-846 8081B; 1311/8081B

Reactive Sulfide	USEPA SW846 9030B
Ignitability	USEPA SW846 1010A
Corrosivity-pH	USEPA SW846 9045D

Data were reviewed in accordance with the USEPA National Functional Guidelines (NFGs) listed below and appropriate method specific USEPA Region II Data Validation Standard Operating Procedures (SOPs). The USEPA NFGs were developed for the Contract Laboratory Program (CLP) methods and may not be applicable to the analytical methods and procedures utilized by the laboratory for this data set. Results were also qualified using analytical method criteria and the reviewer's professional judgement where specific guidance was not applicable.

- USEPA Contract Laboratory Program Region II Data Validation SOPs (HW-2, HW-22, HW-24, HW-44, HW-45)

The following items/criteria were reviewed for this report:

- Data Completeness
- Chain of Custody
- Holding times and sample preservation
- Field Duplicate Accuracy
- Internal Standard Area and RT
- Surrogates
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike and Matrix Spike Duplicate Samples
- Method and field blank contamination
- Laboratory Duplicate Samples
- Serial Dilution
- Initial and continuing calibration summaries
- Compound Quantitation
- Reporting Limits
- Sample comments and Quality Control Summaries

Overall Usability Issues:

- Overall, the data is acceptable for the intended purposes. SVOC Hexachlorobenzene associated with TCLP analysis was rejected due to low recovery of the laboratory control samples. Minor analytical issues were found with the following data quality indicators resulting in qualified results: continuing calibrations, surrogates, and laboratory control samples.

Chain of Custody:

- No issues noted with the Chain of custody.

Volatile Organic Compounds (VOCs)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
VOCs by SW-846 8260D and	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.
TCLP VOCs by 1311/8260D	Soil	14 Days from collection to leachate and analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries except for analytes presented in the following table:

Method	Sample	Surrogate	Exceedance	Qualification	Reason Code
8260D-TCLP	SCPT-111-4.0-5.0-20230821 SCPT-110-4.0-5.0-20230821	4-Bromobenzene	10% < %R < CL	J (detects) UJ (non-detects)	3L

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established control limits (CL).

- LCS and or LCSD analysis exhibited acceptable recoveries.

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- A MS/MSD analysis was not performed on a sample within this SDG.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- ICVs and CCVs were within the specified control limits except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8260D	SCPT-111-4.0-5.0-20230821 SCPT-110-4.0-5.0-20230821	Chloroethane	CCV %D > 20% (decrease in response)	UJ (NDs) J (Detects)	SL

Compound Quantitation and Identification

GC/MS analysis utilizes retention time and mass spectra criteria to identify detected results.

- All identified compounds met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.

- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Mass Spectrometer tuning criteria was within control limits.
- Overall system performance was acceptable.

Semivolatile Organic Compounds (SVOCs)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
SVOCs by SW-846 8270E	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
TCLP SVOCs by 1311/8270E	Soil	14 Days from collection to leachate and 7 days from leachate to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries except for analytes presented in the following table:

Method	Sample	Surrogate	Exceedance	Qualification	Reason Code
8270E	SCPT-111-4.0-5.0-20230821 SCPT-110-4.0-5.0-20230821	Phenol-d6	> CL	J (Detects) No action (NDs)	3H

- Since only one acid surrogate was outside control limits, no qualification was required.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS and or LCSD analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8270E-TCLP	SCPT-111-4.0-5.0-20230821 SCPT-110-4.0-5.0-20230821	2,4,6-Trichlorophenol	10% < %R < CL	J (detects) UJ (non-detects)	6L
		2,4-Dinitrotoluene			
		Hexachlorobenzene	10% > %R < CL	J (detects) R (non-detects)	6L
8270E	SCPT-111-4.0-5.0-20230821 SCPT-110-4.0-5.0-20230821	Acetophenone	> CL	J (Detects) No action (NDs)	6H
		3-Nitroaniline			
		3+4-Methylphenol			
		Phenol			

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- A MS/MSD analysis was not performed on a sample within this SDG.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% RPD is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- All recoveries and/or correlation coefficient criteria.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- ICVs and CCVs were within the specified control limits except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8270E-TCLP	SCPT-111-4.0-5.0-20230821 SCPT-110-4.0-5.0-20230821	2,4-Dinitrotoluene	CCV %D > 20% (increase in response)	J (detects) No action (NDs)	SH
		Hexachlorobenzene Pentachlorophenol	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL
8270E	SCPT-111-4.0-5.0-20230821 SCPT-110-4.0-5.0-20230821	2,4-Dinitrophenol 4,6-Dinitro-2-methylphenol Hexachlorocyclopentadiene Pentachlorophenol	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL
		Acetophenone Benzaldehyde bis(2-chloroethyl)ether Isophorone Nitrobenzene n-Nitroso-di-n-propylamine Phenol	CCV %D > 20% (increase in response)	J (detects) No action (NDs)	SH

Reporting Limits and Compound Quantitation

GC/MS analysis utilizes retention time and mass spectra criteria to identify detected results.

- All identified compounds met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T. Some samples were diluted due to elevated SVOC concentrations and elevated reporting limits are provided.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Mass Spectrometer tuning criteria was within control limits.
- Overall system performance was acceptable.

GC Methods (PCBs, Pesticides, Herbicides)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8081B (Pesticides), 8082A (PCBs) and 8151A (Herbicides)	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
TCLP Herbicides by 1311/8151A	Soil	14 Days from collection to leachate and 7 days from leachate to analysis	Cool to <6 °C.
TCLP Pesticides by 1311/8081B	Soil	14 Days from collection to leachate and 7 days from leachate to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. GC analyses requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries except for analytes presented in the following table:

Method	Sample	Surrogate	Exceedance	Qualification	Reason Code
8082A	SCPT-110-4.0-5.0-20230821	DCB	10% < %R < CL	J (detects) UJ (non-detects)	3L
8081B	SCPT-111-4.0-5.0-20230821	DCB	10% < %R < CL	J (detects) UJ (non-detects)	3L

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS and or LCSD analysis exhibited acceptable recoveries.

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD

percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits. Spike recovery requirement is not applicable when the sample concentration exceeds the spike concentration by a factor of four or more.

- The MS/MSD analysis performed on sample SCPT-111-4.0-5.0-20230821 for herbicides exhibited acceptable recoveries.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed.

- ICVs and CCVs were within the specified control limits except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8151A-TCLP	SCPT-111-4.0-5.0-20230821 SCPT-110-4.0-5.0-20230821	2,4-D 2,4-TP (Silvex)	CCV %D > 20% (increase in response)	J (detects) No action (NDs)	SH

- The original lab report had issues affecting how pesticide and PCB calibration factors were reported in the CCV summaries. That information was later corrected and provided as an addendum to the data package.

Reporting Limits and Compound Quantitation

GC methods utilize retention time and dual column analysis to identify detected results. When dual column analysis is performed the percent difference (%D) of detected sample results must be less than 25%.

- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.

- Dual column comparison was not provided as part of the data package.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Overall system performance was acceptable.

Metals and General Chemistry

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
Metals by SW-846 601D	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to <6 °C.
TCLP Metals by 1311/6010D	Soil	180 days from collection to Leachate and 180 days to analysis	Cool to <6 °C.
Mercury by SW-846 7473	Soil	28 days from collection to analysis	Cool to <6 °C.
TCLP Mercury by 1311/7473	Soil	28 days from collection to Leachate and 28 days to analysis	Cool to <6 °C.
Reactive Cyanide by SW-846 9014	Soil	14 days from collection to analysis	Cool to <6 °C.
Reactive Sulfide by SW-846 9030B	Soil	7 days from collection to analysis	Cool to <6 °C.
Ignitability by SW-846 1010A	Soil	14 days from collection to analysis	Cool to <6 °C.
Corrosivity by SW-846 9045	Soil	7 days from collection to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks - Method, Trip, Field, ICBs and CCBs

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS and/or LCSD analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
6010D	SCPT-111-4.0-5.0-20230821 SCPT-110-4.0-5.0-20230821	Selenium	30% < %R < CL	J (detects) UJ (non-detects)	6L

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits. Spike recovery requirement not applicable when the sample concentration exceeds the spike concentration by a factor of four or more.

- A MS/MSD analysis was not performed on a sample within this SDG.

Laboratory Duplicate

Laboratory duplicate analysis measures precision of the analytical method. The relative percent difference (RPD) is measured between parent and duplicate sample results. The Laboratory duplicate RPDs must be within laboratory-established acceptance limits.

- A laboratory duplicate analysis was not performed on a sample within this SDG.

Serial Dilution

The serial dilution analysis indicates the presence matrix interferences. Sample results greater than 50 times the MDL are evaluated, and percent difference (%D) is measured between undiluted and diluted sample results. A control limit of 20% is applied.

- The serial dilution analysis was not performed on a sample within this SDG.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for samples in this report.

Initial Calibration and Continuing Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. Continuing calibration standards are used to assess calibration drift.

- ICVs and CCVs were within the specified control limits.

Reporting Limits and Analyte Quantitation

- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Overall system performance was acceptable.

Please contact the undersigned if you have any questions or need further information.

Data Qualifiers

J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

UJ = The analyte was not detected above the sample reporting limit; and the reporting limit is approximate.

U = The analyte was analyzed for but was not detected above the method detection limit.

R = The sample results is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

Reason Codes

1	Holding time violation
2	Method blank contamination
3	Surrogate recovery
4	MS/MSD recovery
5	MS/MSD precision outside limits
6	LCS recovery
7	Field blank contamination
8	Field duplicate precision outside limits
9	Other deficiencies (including cooler temperature)
A	Absence of supporting QC
S	ICV, CCV or column performance check problem
Y	Initial and continuing calibration blank problem
M	Interference check samples problem
O	Post digestion spike outside of 85-115%
F	MSA correlation coefficient <0.995, or MSA not done
G	Radiochem Minimum Detectable Concentration (MDC)
K	DFTPP or BFB tuning problem
Q	Initial calibration problem
X	Internal standard recovery problem
V	Second source standard calibration verification problem
L	Low bias
Z	Retention time problem
N	Counting time error (radionuclide chemistry)
W	Detector instability (radionuclide chemistry)
C	Co-elution of compounds
E	Value exceeds linear calibration range
I	Interferences present during analysis
T	Trace level compound, poor quantitation
P	1C/2C precision outside limits
B	LCS/LCSD precision outside limits
D	Lab Dup/Rep precision outside limits
H	High bias
AA	Serial Dilution

COMMENTS/SPECIAL INSTRUCTIONS

Cooler Temp. upon receipt at lab 4.1

CERTIFICATIONS: NELAP (National Environmental Laboratory Accredation Program) NJDEP #07010 PADEP #68-02903 NYDOH #11634 CTPH #0233 US ARMY

By signing this Chain of Custody Agreement, customer expressly agrees to pay APL for all charges, reasonably incurred in connection with analysis and reporting for these samples

Extractable Petroleum Hydrocarbons:

Gas Chromatography/Flame Ionization Detector

New Jersey Department of Environmental Protection Site Remediation Program Extractable Petroleum Hydrocarbons Methodology (Version 3.0).
USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8015D or NJDEP Office of Quality Assurance Quantitation of Semi-Volatile Petroleum Products in Water, Soil and Sediment OQA-QAM-025, Revision 6.

Metals:

Inductively-Coupled Plasma Atomic Emission Spectrometry or Inductively-Coupled Plasma Mass Spectroscopy

Wastewater and Groundwater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 200.7, Method 200.8.
Soil Samples: USEPA Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 6010D.

Mercury:

Cold Vapor Atomic Absorption Spectrometry

Wastewater and Groundwater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 245.1.
Soil Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 7471B.

Volatile Organic Compounds:

Purge and Trap Gas Chromatography/Mass Spectroscopy

Drinking Water Samples: USEPA Methods for the Determination of Organic Compounds in Drinking Water, Method 524.2.
Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 624.1.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update VI, Method 8260D.

Semi-Volatile Organic Compounds:

Gas Chromatography/Mass Spectroscopy

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 625.1.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update VI, Method 8270E.

PFAS Compounds:

Liquid Chromatography/Tandem Mass Spectroscopy

Drinking Water Samples: USEPA Methods for the Determination of Selected Perfluorinated Alkyl Acids in Drinking Water by Solid Phase Extraction and Liquid Chromatography/Tandem Mass Spectrometry (LC/MS/MS), Method 537 (v1.1).

Pesticides:

Gas Chromatography/Electron Capture Detector

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 608.3.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8081B.

Polychlorinated Biphenyls (PCBs):

Gas Chromatography/Electron Capture Detector

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 608.3.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8082A.

General Chemistry Methods:

Various general chemistry methods are taken from "Standard Methods for the Examination of Water and Wastewater, 22nd Edition", .

Specific method citations can be found on the Analytical Results Summary page of this report listed under 'Method'.

** A complete list of Pace Fairfield's certified Methods are on the Standards And Docs page of the Results Retrieval System

Method Detection Limit (MDL):

The MDL is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. The value is calculated following the guidelines defined in:
"**Definition and Procedure for the Determination of the Method Detection Limit, Revision 2**"
EPA 821-R-16-006, published December 2016.

Reporting Limit (RL):

The RL is the Concentration of the lowest calibration standard that was included in the initial calibration of the instrument. On analytical reports this value is corrected for percent moisture and any concentration or dilution factors.

Concentration (Conc.) / Result:

If the compound is detected, the measured concentration is reported. If this column is "ND", or contains a 'less than' (<) symbol, the compound was not detected.

Tentatively Identified Compound (TIC):

A TIC is a non-targeted compound, not included in the calibration, identified by a mass spectral library search OR requested to be identified and reported by the client.

Abbreviations:

ND	Non-Detect
TNTC	Too Numerous To Count

Qualifiers:

U	Indicates the compound was analyzed for but was not detected.
J	Indicates an estimated value. All tentatively identified compounds (TICs) and results below the RL receive this qualifier.
E	Indicates that the concentration of the compound exceeds the calibration range of the instrument. In most cases the results of a diluted analysis will be reported instead and contain a "**D"** qualifier.
D	Indicates result is based on a dilution. This can occur when an initial analysis was **E** flagged, if historical data indicates a dilution may be appropriate on an initial run, OR if the consistency of the sample is such that the instrument may not perform properly if left undiluted.
H	Indicates a Hold Time violation.
B	Indicates the Analyte was found in the method blank as well as the sample.
N	Used when reporting a specific tentatively identified compound.
P	Greater than 25% diff. between 2 GC columns for a Dual Column Analysis.

QUALITY CONTROL
Conformance/Non-Conformance Summary

ANALYSIS: INORGANICS [6010D / 1311/6010D / 7471B / 1311/7470A / 1010A / 9045D / 9014 / 9030B]

Method 6010D:
The percent recovery for Selenium was outside of the QC limits for the blank spike (slightly low).
The percent recoveries for some metals were outside of the QC limits for the matrix spikes and matrix spike duplicates (low).
Method 7471B:
The percent recovery for Mercury was outside of the QC limits for the matrix spike duplicate (low). The blank spike met all QC criteria.
Methods 1311/7470A / 1311/6010D / 1010A / 9014 / 9045D:
All samples met the QC criteria.
Method 9030B:
The percent recovery for Reactive Sulfide was outside of the QC limits for the matrix spike and matrix spike duplicate (low). The blank spike met all QC criteria.

ANALYSIS: Herbicides [8151A]

Sample 23H1331-02 has one surrogate (DCAA-2) outside of the QC limits (low), due to matrix interference.

ANALYSIS: PCBs [8082A]

Sample 23H1331-01 has one surrogate (Decachlorobiphenyl [2C]) outside of the QC limits (high), due to matrix interference.
Sample 23H1331-02 has one surrogate (Decachlorobiphenyl) outside of the QC limits (low), due to matrix interference.

ANALYSIS: PESTICIDES [8081B]

Sample 23H1331-01 has two surrogates (Decachlorobiphenyl, Decachlorobiphenyl [2C]) outside of the QC limits (low and high), due to matrix interference.

ANALYSIS: SEMI-VOLATILES BY GC/MS [8270E]

The continuing calibrations were outside of the QC limits for some compounds (low and high).

The percent recoveries for 2,4-Dinitrophenol and 4,6-Dinitro-2-methylphenol were outside of the QC limits for the matrix spike (low).
The percent recoveries for 2,4-Dinitrophenol, 4,6-Dinitro-2-methylphenol and Hexachlorocyclopentadience were outside of the QC limits for the matrix spike duplicate (low). The blank spike met all QC criteria.

Samples 23H1331-01 and -02 have one surrogate (Phenol-d6) outside of the QC limits (high), due to matrix interferences.

ANALYSIS: VOLATILES BY GC/MS [8260D]

The continuing calibration (SAI0014-CCV1) was outside of the QC limits for Chloroethane (low).

The percent recoveries for several compounds were outside of the QC limits for the matrix spike and matrix spike duplicate (low).
The blank spike met all QC criteria.
The percent recoveries for some compounds were outside of the QC limits for the tclp blank spike (low).

Samples 23H1331-01 and -02 have one surrogate (4-Bromofluorobenzene) outside of the QC limits (low), due to matrix interference.

ND - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

ND, U - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

ND, U - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

Analyte	Result	Qual	MDL	RL	Units	Dilution	Analyzed
Corrosivity-pH	**8.20**				**pH Units**	**1**	**8/22/23 12:00**

ND, U - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

DATA USABILITY SUMMARY REPORT
GOWANUS FORMER SITE

Client: Brown and Caldwell, Albany, New York
SDGs: 23H1612
Laboratory: Aqua Pro-tech Laboratories, Fairfield, New Jersey
Site: Gowanus, NY
Date: June 12, 2024

Client Sample ID	Laboratory Sample ID	Date Collected	Matrix
MR-302-6.0-8.0-20230823	23H1612-01	8/23/2023	Soil
MR-302-25.0-27.0-20230823	23H1612-02	8/23/2023	Soil
MR-302-65.0-67.0-20230823	23H1612-03	8/23/2023	Soil

Data validation was performed on the analytical data for three (3) samples collected August 23, 2023, by Yu and Associates at the Gowanus Site in New York. The samples were analyzed under the Environmental Protection Agency (USEPA) "Test Methods for Evaluating Solid Waste Physical/Chemical SW-846 Method" described below.

Specific method references are as follows:

Analysis	Method References
Volatile Organic Compounds (VOCs)	USEPA SW-846 8260D; 1311/8260D
Semivolatile Organic Compounds (SVOCs)	USEPA SW-846 8270E; 1311/8270E

Data were reviewed in accordance with the USEPA National Functional Guidelines (NFGs) listed below and appropriate method specific USEPA Region II Data Validation Standard Operating Procedures (SOPs). The USEPA NFGs were developed for the Contract Laboratory Program (CLP) methods and may not be applicable to the analytical methods and procedures utilized by the laboratory for this data set. Results were also qualified using analytical method criteria and the reviewer's professional judgement where specific guidance was not applicable.

- USEPA Contract Laboratory Program Region II Data Validation SOPs (HW-2, HW-22, HW-24, HW-44, HW-45)

The following items/criteria were reviewed for this report:

- Data Completeness
- Chain of Custody
- Holding times and sample preservation
- Field Duplicate Accuracy
- Internal Standard Area and RT
- Surrogates
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike and Matrix Spike Duplicate Samples
- Method and field blank contamination
- Laboratory Duplicate Samples
- Serial Dilution
- Initial and continuing calibration summaries
- Compound Quantitation
- Reporting Limits
- Sample comments and Quality Control Summaries

Overall Usability Issues:

- Overall, the data is acceptable for the intended purposes. Minor analytical issues were found with the following data quality indicators resulting in qualified results: continuing calibrations, surrogates, and laboratory control samples.

Chain of Custody:

- No issues noted with the Chain of custody.

Volatile Organic Compounds (VOCs)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
VOCs by SW-846 8260D and	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.
TCLP VOCs by 1311/8260D	Soil	14 Days from collection to leachate and analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries except for analytes presented in the following table:

Method	Sample	Surrogate	Exceedance	Qualification	Reason Code
8260D-TCLP	MR-302-6.0-8.0-20230823 MR-302-25.0-27.0-20230823 MR-302-65.0-67.0-20230823	4-Bromobenzene	10% < %R < CL	J (detects) UJ (non-detects)	3L

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established control limits (CL).

- LCS and or LCSD analysis exhibited acceptable recoveries.

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- A MS/MSD analysis was not performed on a sample within this SDG.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- ICVs and CCVs were within the specified control limits except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8260D	MR-302-25.0-27.0-20230823 MR-302-65.0-67.0-20230823	Chloroethane	CCV %D > 20% (decrease in response)	UJ (NDs) J (Detects)	SL
	MR-302-6.0-8.0-20230823	Bromomethane Chloroethane Chloromethane Dichlorodifluoromethane	CCV %D > 20% (decrease in response)	UJ (NDs) J (Detects)	SL

Compound Quantitation and Identification

GC/MS analysis utilizes retention time and mass spectra criteria to identify detected results.

- All identified compounds met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Mass Spectrometer tuning criteria was within control limits.
- Overall system performance was acceptable.

Semivolatile Organic Compounds (SVOCs)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
SVOCs by SW-846 8270E	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
TCLP SVOCs by 1311/8270E	Soil	14 Days from collection to leachate and 7 days from leachate to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination with the following exception: The method blank associated with soil samples exhibited TIC detections for Hexadecanoic acid, butyl ester and Octadecanoic acid, butyl ester. Associated sample detections less than five times the method blank detection are qualified as rejected, reason code 2.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries except for analytes presented in the following table:

Method	Sample	Surrogate	Exceedance	Qualification	Reason Code
8270E	MR-302-25.0-27.0-20230823 MR-302-65.0-67.0-20230823	Phenol-d6	> CL	J (Detects) No action (NDs)	3H

- Since only one acid surrogate was outside control limits, no qualification was required.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS and or LCSD analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8270E-TCLP	MR-302-6.0-8.0-20230823 MR-302-25.0-27.0-20230823 MR-302-65.0-67.0-20230823	All target compounds	> CL	J (Detects) No action (NDs)	6H
8270E	MR-302-6.0-8.0-20230823 MR-302-25.0-27.0-20230823 MR-302-65.0-67.0-20230823	Acetophenone	> CL	J (Detects) No action (NDs)	6H
		3-Nitroaniline			
		3+4-Methylphenol			
		Phenol			
		2_Methylphenol			

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- MS and/or MSD analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8270E-TCLP	MR-302-6.0-8.0-20230823	All target compounds	> CL	J (Detects) No action (NDs)	6H

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% RPD is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a

correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- All recoveries and/or correlation coefficient criteria.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- ICVs and CCVs were within the specified control limits except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8270E-TCLP	MR-302-6.0-8.0-20230823 MR-302-25.0-27.0-20230823 MR-302-65.0-67.0-20230823	2,4-Dinitrotoluene Hexachlorobutadiene Hexachloroethane Nitrobenzene	CCV %D > 20% (increase in response)	J (detects) No action (NDs)	SH
8270E	MR-302-25.0-27.0-20230823 MR-302-65.0-67.0-20230823	2,4-Dinitrophenol 4,6-Dinitro-2-methylphenol Hexachlorocyclopentadiene Pentachlorophenol	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL
		Acetophenone Benzaldehyde bis(2-chloroethyl)ether Isophorone Nitrobenzene n-Nitroso-di-n-propylamine Phenol	CCV %D > 20% (increase in response)	J (detects) No action (NDs)	SH
	MR-302-6.0-8.0-20230823	2,4-Dinitrophenol 4,6-Dinitro-2-methylphenol Hexachlorocyclopentadiene Pentachlorophenol	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
		2-Methylphenol 3+4-Methylphenol Acetophenone Benzaldehyde Hexachlorobutadiene Nitrobenzene n-Nitroso-di-n-propylamine Phenol	CCV %D > 20% (increase in response)	J (detects) No action (NDs)	SH

Reporting Limits and Compound Quantitation

GC/MS analysis utilizes retention time and mass spectra criteria to identify detected results.

- All identified compounds met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T. Some samples were diluted due to elevated SVOC concentrations and elevated reporting limits are provided.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Mass Spectrometer tuning criteria was within control limits.
- Overall system performance was acceptable.

GC Methods (PCBs, Pesticides, Herbicides)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8081B (Pesticides), 8082A (PCBs) and 8151A (Herbicides)	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
TCLP Herbicides by 1311/8151A	Soil	14 Days from collection to leachate and 7 days from leachate to analysis	Cool to <6 °C.
TCLP Pesticides by 1311/8081B	Soil	14 Days from collection to leachate and 7 days from leachate to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. GC analyses requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS and or LCSD analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8151A	MR-302-6.0-8.0-20230823 MR-302-25.0-27.0-20230823 MR-302-65.0-67.0-20230823	2,4-TP (Silvex)	10% < %R < CL	J (detects) UJ (non-detects)	6L
8181B-TCLP	MR-302-6.0-8.0-20230823 MR-302-25.0-27.0-20230823 MR-302-65.0-67.0-20230823	4,4'-DDD 4,4'-DDT Aldrin alpha-Chlordane Chlordane Endosulfan I Endosulfan sulfate Endrin	10% < %R < CL	J (detects) UJ (non-detects)	6L

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
		gamma-BHC gamma-Chlordane Heptachlor			

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits. Spike recovery requirement is not applicable when the sample concentration exceeds the spike concentration by a factor of four or more.

- A MS/MSD analysis was not performed on a sample within this SDG.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed.

- ICVs and CCVs were within the specified control limits.
- The original lab report had issues affecting how pesticide and PCB calibration factors were reported in the CCV summaries. That information was later corrected and provided as an addendum to the data package.

Reporting Limits and Compound Quantitation

GC methods utilize retention time and dual column analysis to identify detected results. When dual column analysis is performed the percent difference (%D) of detected sample results must be less than 25%.

- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.
- Dual column comparison was not provided as part of the data package.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Overall system performance was acceptable.

Metals and General Chemistry

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
Metals by SW-846 601D	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to <6 °C.
TCLP Metals by 1311/6010D	Soil	180 days from collection to Leachate and 180 days to analysis	Cool to <6 °C.
Mercury by SW-846 7473	Soil	28 days from collection to analysis	Cool to <6 °C.
TCLP Mercury by 1311/7473	Soil	28 days from collection to Leachate and 28 days to analysis	Cool to <6 °C.
Reactive Cyanide by SW-846 9014	Soil	14 days from collection to analysis	Cool to <6 °C.
Reactive Sulfide by SW-846 9030B	Soil	7 days from collection to analysis	Cool to <6 °C.
Ignitability by SW-846 1010A	Soil	14 days from collection to analysis	Cool to <6 °C.
Corrosivity by SW-846 9045	Soil	7 days from collection to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks - Method, Trip, Field, ICBs and CCBs

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- The method blank had a detection of Zinc. Associated sample results were all grater than five times the blank detection and therefore no qualification weas required.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS and/or LCSD analysis exhibited acceptable recoveries.

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits. Spike recovery requirement not applicable when the sample concentration exceeds the spike concentration by a factor of four or more.

- The MS/MSD analysis performed on sample MR-302-6.0-8.0-20230823 exhibited acceptable recoveries and RPD.

Laboratory Duplicate

Laboratory duplicate analysis measures precision of the analytical method. The relative percent difference (RPD) is measured between parent and duplicate sample results. The Laboratory duplicate RPDs must be within laboratory-established acceptance limits.

- A laboratory duplicate analysis was not performed on a sample within this SDG.

Serial Dilution

The serial dilution analysis indicates the presence matrix interferences. Sample results greater than 50 times the MDL are evaluated, and percent difference (%D) is measured between undiluted and diluted sample results. A control limit of 20% is applied.

- The serial dilution analysis was not performed on a sample within this SDG.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for samples in this report.

Initial Calibration and Continuing Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. Continuing calibration standards are used to assess calibration drift.

- ICVs and CCVs were within the specified control limits.

Reporting Limits and Analyte Quantitation

- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Overall system performance was acceptable.

Please contact the undersigned if you have any questions or need further information.

Data Qualifiers

J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

UJ = The analyte was not detected above the sample reporting limit; and the reporting limit is approximate.

U = The analyte was analyzed for but was not detected above the method detection limit.

R = The sample results is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

Reason Codes

1	Holding time violation
2	Method blank contamination
3	Surrogate recovery
4	MS/MSD recovery
5	MS/MSD precision outside limits
6	LCS recovery
7	Field blank contamination
8	Field duplicate precision outside limits
9	Other deficiencies (including cooler temperature)
A	Absence of supporting QC
S	ICV, CCV or column performance check problem
Y	Initial and continuing calibration blank problem
M	Interference check samples problem
O	Post digestion spike outside of 85-115%
F	MSA correlation coefficient <0.995, or MSA not done
G	Radiochem Minimum Detectable Concentration (MDC)
K	DFTPP or BFB tuning problem
Q	Initial calibration problem
X	Internal standard recovery problem
V	Second source standard calibration verification problem
L	Low bias
Z	Retention time problem
N	Counting time error (radionuclide chemistry)
W	Detector instability (radionuclide chemistry)
C	Co-elution of compounds
E	Value exceeds linear calibration range
I	Interferences present during analysis
T	Trace level compound, poor quantitation
P	1C/2C precision outside limits
B	LCS/LCSD precision outside limits
D	Lab Dup/Rep precision outside limits
H	High bias
AA	Serial Dilution

Comments/Resolution:

Extractable Petroleum Hydrocarbons:

Gas Chromatography/Flame Ionization Detector

New Jersey Department of Environmental Protection Site Remediation Program Extractable Petroleum Hydrocarbons Methodology (Version 3.0).
USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8015D or NJDEP Office of Quality Assurance Quantitation of Semi-Volatile Petroleum Products in Water, Soil and Sediment OQA-QAM-025, Revision 6.

Metals:

Inductively-Coupled Plasma Atomic Emission Spectrometry or Inductively-Coupled Plasma Mass Spectroscopy

Wastewater and Groundwater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 200.7, Method 200.8.
Soil Samples: USEPA Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 6010D.

Mercury:

Cold Vapor Atomic Absorption Spectrometry

Wastewater and Groundwater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 245.1.
Soil Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 7471B.

Volatile Organic Compounds:

Purge and Trap Gas Chromatography/Mass Spectroscopy

Drinking Water Samples: USEPA Methods for the Determination of Organic Compounds in Drinking Water, Method 524.2.
Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 624.1.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update VI, Method 8260D.

Semi-Volatile Organic Compounds:

Gas Chromatography/Mass Spectroscopy

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 625.1.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update VI, Method 8270E.

PFAS Compounds:

Liquid Chromatography/Tandem Mass Spectroscopy

Drinking Water Samples: USEPA Methods for the Determination of Selected Perfluorinated Alkyl Acids in Drinking Water by Solid Phase Extraction and Liquid Chromatography/Tandem Mass Spectrometry (LC/MS/MS), Method 537 (v1.1).

Pesticides:

Gas Chromatography/Electron Capture Detector

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 608.3.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8081B.

Polychlorinated Biphenyls (PCBs):

Gas Chromatography/Electron Capture Detector

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 608.3.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8082A.

General Chemistry Methods:

Various general chemistry methods are taken from "Standard Methods for the Examination of Water and Wastewater, 22nd Edition", .

Specific method citations can be found on the Analytical Results Summary page of this report listed under 'Method'.

** A complete list of Pace Fairfield's certified Methods are on the Standards And Docs page of the Results Retrieval System

Method Detection Limit (MDL):

The MDL is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results. The value is calculated following the guidelines defined in:
"**Definition and Procedure for the Determination of the Method Detection Limit, Revision 2**"
EPA 821-R-16-006, published December 2016.

Reporting Limit (RL):

The RL is the Concentration of the lowest calibration standard that was included in the initial calibration of the instrument. On analytical reports this value is corrected for percent moisture and any concentration or dilution factors.

Concentration (Conc.) / Result:

If the compound is detected, the measured concentration is reported. If this column is "ND", or contains a 'less than' (<) symbol, the compound was not detected.

Tentatively Identified Compound (TIC):

A TIC is a non-targeted compound, not included in the calibration, identified by a mass spectral library search OR requested to be identified and reported by the client.

Abbreviations:

ND	Non-Detect
TNTC	Too Numerous To Count

Qualifiers:

U	Indicates the compound was analyzed for but was not detected.
J	Indicates an estimated value. All tentatively identified compounds (TICs) and results below the RL receive this qualifier.
E	Indicates that the concentration of the compound exceeds the calibration range of the instrument. In most cases the results of a diluted analysis will be reported instead and contain a "**D"** qualifier.
D	Indicates result is based on a dilution. This can occur when an initial analysis was **E** flagged, if historical data indicates a dilution may be appropriate on an initial run, OR if the consistency of the sample is such that the instrument may not perform properly if left undiluted.
H	Indicates a Hold Time violation.
B	Indicates the Analyte was found in the method blank as well as the sample.
N	Used when reporting a specific tentatively identified compound.
P	Greater than 25% diff. between 2 GC columns for a Dual Column Analysis.

QUALITY CONTROL
Conformance/Non-Conformance Summary

ANALYSIS: INORGANICS [6010D / 1311/6010D / 7471B / 1311/7470A / 1010A / 9045D / 9014 / 9030B]

Method 6010D:
The percent recoveries for some metals were outside of the QC limits for the matrix spikes and matrix spike duplicates (low).

Method 1311/7470A:
The percent recovery for Mercury was outside of the QC limits for the matrix spike and matrix spike duplicate (low). The blank spike met all QC criteria.

Method 7471B:
The percent recovery for Mercury was outside of the QC limits for the matrix spike (low). The blank spike met all QC criteria.

Methods 1311/6010D / 1010A / 9045D / 9014:
All samples met the QC criteria.

Method 9030B:
The percent recovery for Reactive Sulfide was outside of the QC limits for the matrix spike and matrix spike duplicate (low). The blank spike met all QC criteria.

ANALYSIS: Herbicides [8151A]

The percent recovery for 2,4,5-TP (Silvex) was outside of the QC limits for the blank spike (low).

ANALYSIS: PCBs [8082A]

All samples met the QC criteria.

ANALYSIS: PESTICIDES [8081B]

The percent recoveries for some compounds were outside of the QC limits for the tclp blank spike (low).

ANALYSIS: SEMI-VOLATILES BY GC/MS [8270E]

The continuing calibrations were outside of the QC limits for some compounds (low and high).

The percent recoveries for some compounds were outside of the QC limits for the matrix spike and matrix spike duplicate (low).

Samples 23H1612-02 and -03 have one surrogate (Phenol-d6) outside of the QC limits (high), due to matrix interferences.

ANALYSIS: VOLATILES BY GC/MS [8260D]

The continuing calibrations were outside of the QC limits for some compounds (low).

The percent recoveries for several compounds were outside of the QC limits for the matrix spikes and matrix spike duplicates (low). The blank spikes met all QC criteria.

B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

Section 1
Introduction

1.1 Overview

This report presents the results of the Phase II Environmental Investigation (Phase II Investigation) conducted at four contiguous parcels of land acquired by the New York City Department of Environmental Protection (DEP) to facilitate the construction of a 4-million-gallon combined sewer overflow (CSO) retention facility for CSO outfall Owls Head OH-007.

The location of the four parcels of land, herein referred to as the Site, as well as the parcel owned by the New York City Department of Sanitation (DSNY), are shown on Figure 1. The construction activities related to the CSO project will encompass all five properties within an approximately 4-acre triangular shaped property bounded by the Gowanus Canal to the north, 2nd Avenue to the southeast, and the 6th Street Turning Basin to the southwest.

The western portion of the Site is located across the canal from the former Citizens Municipal Works Manufactured Gas Plant (Citizens manufactured gas plant [MGP]) site which continues to be investigated and remediated by National Grid (NG) pursuant to a Voluntary Cleanup Agreement with the New York State Department of Environmental Conservation (DEC). In 2024, DEP implemented investigation activities on the former DSNY property and areas south of 5th Street to evaluate impacts related to the Citizens MGP site.

1.2 Phase II Investigation Purpose and Objectives

The purpose of the Phase II Investigation was to evaluate the presence or absence of hazardous substances or petroleum products in the subsurface environmental media at the Site, including soil, groundwater and soil vapor related to areas of potential environmental concerns identified in the Phase I Environmental Site Assessment (ESA) conducted by Hazen and Sawyer/Brown and Caldwell, a Joint Venture (HSBC) in 2022. Details on the areas of potential environmental concern are summarized in Section 2.0 below. The scope of the Phase II activities included sampling and analysis of soil and groundwater to investigate the lateral and vertical extent of contamination at each of the areas of potential environmental concern (shown on Figure 2).

The objectives of this Phase II Investigation Report are to:

- Document soil contamination conditions relevant to the remedial design aspects for soil excavation, handling, treatment, and disposal options for soil removed during facility construction.
- Document groundwater contamination conditions relevant to the remedial design and dewatering, treatment and disposal of groundwater encountered during excavation of soil as part of facility construction.

Use of contents on this sheet is subject to the limitations specified at the end of this document.
CSO-GC-SFS-DES-R-PHASE II INVESTIGATION-20250220.DOCX

Section 2
Site Background

The Phase I ESA of the Site (HSBC, 2022) identified several historical and present-day industrial uses that potentially released hazardous substances or petroleum products into soils and groundwater beneath the Site. The locations of potential environmental concerns were identified by reviewing sources provided by Environmental Data Resources, Inc. (EDR), including historical Sanborn fire insurance maps, historical aerial photography, historical city directories, and numerous regulatory databases maintained by various federal and state government agencies. Other sources reviewed during the ESA included regulatory files obtained from DEC, and findings from a pre-design investigation (PDI) conducted by HSBC on the DSNY property (HSBC, 2018). The identified locations of environmental concerns and their associated contaminants of concern (COCs) are listed below. Figure 2 shows the approximate locations of environmental concerns.

2.1 Creosoting Works

An 1886 Sanborn fire insurance map indicates the Eppinger & Russell Creosoting Works was located on the western-most parcel of the Site. The Sanborn map shows four horizontal wood treating cylinders (retort cylinders) and an oil tank that were likely used in the creosoting operations. Creosoting operations involved pressure-treating wood with creosote, a liquid made from coal tar obtained from MGPs. It is not uncommon to find creosoting operations located in the vicinity of MGPs, such as the former Citizens Gas Light Company that was present on the opposite side of the Gowanus Canal. Coal tar, a waste product from MGPs, is usually a dense non- aqueous phase liquid (DNAPL) containing numerous hazardous substances including benzene, toluene, ethylbenzene, xylenes (BTEX), naphthalene and various polycyclic aromatic hydrocarbon (PAH) compounds. In the process of manufacturing creosote, some of the more volatile fractions of the coal tar were boiled off to further increase the density of the liquid. Coal tar and other residuals of the former creosoting operation may be present in soils and groundwater as DNAPL and /or dissolved and sorbed phases. COCs associated with creosote include:

- BTEX
- Naphthalene
- PAHs

2.2 Paint Pigment Manufacturing

The 1886 Sanborn map indicates the J.W. Masury Dry Color Works was located in a structure situated in the central portion of the Site. The Masury company manufactured paint, and it follows that the dry color works produced pigments used in their products. Late 19th Century pigments were manufactured from heavy metals including arsenic, cadmium, chromium, cobalt, lead and mercury, as well from synthetic organic chemicals derived from coal tar and petrochemicals. Early publications list several synthetic dye businesses in the Gowanus area. COCs associated with paint pigments include:

- Arsenic
- Cadmium
- Chromium

Use of contents on this sheet is subject to the limitations specified at the end of this document.
CSO-GC-SFS-DES-R-PHASE II INVESTIGATION-20250220.DOCX

- Cobalt
- Lead
- Mercury
- Synthetic organic pigments (possibly reported as tentatively identified compounds (TICs) in SW-846 analytical methods)

2.3 Vehicle and Scrap Metal Salvage

Historical city directories list several scrap metal and vehicle salvage operations at addresses associated with the western portions of the Site. The exact location has not been determined. A 1980 Sanborn fire insurance map labels the currently open area (i.e., Block 990 Lot 21) as "Scrap Metal Storage." Historical aerial photographs dated 1961, 1971 and 1974 appear to show piles of scrap and possible vehicles in this area. The 1974 photograph may show the building on Block 990 Lot 21 in the process of being demolished, with debris, scrap or other material piled in its place. Vehicle salvage operations are typically associated with the release of petroleum products and various hazardous substances including lead from batteries and wiring, elemental mercury from mercury switches, asbestos from brakes, antifreeze, and various petroleum-based lubricants and fluids. Some metal salvaging sites are known to have been contaminated by polychlorinated biphenyls (PCBs) derived from improper draining of transformers when salvaging the copper in their cores. COCs associated with vehicle salvage and scrap yards include:

- Petroleum constituents (BTEX, naphthalene, PAHs)
- PCBs
- Asbestos
- Antifreeze
- Elemental mercury
- Lead

2.4 Asbestos Storage

A 1994 city directory provided by EDR lists Phoenix Asbestos Disposal at 110 Fifth Street (Lot 21). The New York State (NYS) Solid Waste Facilities database lists Spartan Dismantling at 110 Fifth Street from 1995-2004. A 1950 Sanborn map identifies asbestos storage on Block 990 Lot 21. Block 990 Lots 1 and 16 were occupied by David E Kennedy, Inc., an apparent predecessor company of Kentile Floors, which manufactured asbestos-containing floor tiles. Asbestos storage would not have been regulated in the 1950s, and United States Environmental Protection Agency (EPA) did not ban asbestos for use in fireproofing and insulation until the mid-1970s. Asbestos is a hazardous substance and, depending on its form, may have been released during unregulated storage or manufacturing operations and potentially incorporated as particulate matter in shallow on-site soils.

2.5 Leaking UST and Free Phase Petroleum Product

The owner of the portion of the Site consisting of Block 990 Lots 1 and 16 entered the two parcels in the DEC's Brownfield Cleanup Program (BCP) in 2015. The BCP application describes a subsurface investigation conducted by the applicant to investigate potential impacts associated with an underground storage tank (UST) on one of the parcels. The investigation included a geophysical survey to locate the UST, and soil borings to evaluate soil quality in the vicinity of the tank. The geophysical survey identified an anomaly consistent with a UST, which was located adjacent to a fill port with a "fuel oil" cap and a vent pipe on the sidewalk in front of the building along 2nd Avenue. Free phase

Use of contents on this sheet is subject to the limitations specified at the end of this document.
CSO-GC-SFS-DES-R-PHASE II INVESTIGATION-20250220.DOCX

petroleum product, a light non-aqueous phase liquid or LNAPL, was observed in two soil borings. The BCP application also states that five petroleum spills were reported on the Site between 1994 and 2015. One spill, reporting gross soil contamination and free-phase petroleum-like material in soils, is currently open. COCs associated with leaking UST and petroleum include:

- BTEX
- Naphthalene
- PAHs

2.6 Present-Day Industrial Usages

The Site and buildings were visited during ESA and pre-demolition survey (PDS) activities. Based on observations during these visits, current uses include bus and vehicle storage, document shredding, wood working, steel fabrication, fire and mold remediation services, industrial and municipal utility contracting, and wholesale baked goods warehousing and distribution. Inspection of the buildings and interviews with tenants and owners were conducted to assess the potential for current operations and waste handling practices to impact Site soils and groundwater.

2.7 Manufactured Gas Plant

The former Citizens MGP is located directly across the Gowanus Canal from the Site. It operated for approximately 100 years from the 1860s through the early 1960s. The 2017 PDI conducted on the DSNY property documented the presence of MGP DNAPL at several boring locations across the property. This DNAPL likely migrated within deeper strata (below the Gowanus Canal) from the Citizens MGP to locations on the DSNY property. In addition, MGP DNAPL migrated into one of the newly installed monitoring wells and accumulated in the 2-foot sump of the monitoring well two weeks after installation. The mobility of the DNAPL indicates a potential for impacts beyond the DSNY property, including areas to the south (i.e., the Site). COCs associated with MGP DNAPLs include:

- BTEX
- Naphthalene
- PAHs

2.8 Marine Fuel Terminal

Historical aerial photographs and Sanborn fire insurance maps indicate a large marine fuel terminal operated on the south shore of the 6th Street Turning basin from at least 1961 to 1991. The 1969 Sanborn map indicates the combined capacity of the terminal's above ground and underground storage tanks was in excess of 845,000 gallons. The current regulatory programs for permitting, spill control, and spill reporting that govern a major oil storage facility (MOSF) did not exist in the 1960s. Therefore, it is not uncommon for older marine terminals to have large volumes of residual and mobile product remaining in the zone of water table fluctuation. Although product spills from storage tanks and barge unloading operations might have been partially isolated from the Site by the intervening turning basin, substantial releases to the basin could have permeated the Site's bulkheads and impacted the soils beneath the existing buildings and parking area. Product may also have migrated on the water table directly to the Site near 2nd Avenue. COCs associated with fuel oils and older gasolines include:

- BTEX
- Methyl tert-butyl ether (MTBE)
- Lead

Use of contents on this sheet is subject to the limitations specified at the end of this document.
CSO-GC-SFS-DES-R-PHASE II INVESTIGATION-20250220.DOCX

- Naphthalene
- PAHs

2.9 Upgradient Database Listings

The EDR search identified 531 listings within the ASTM minimum search distances from the Site (0.25 to 1 mile). In the Phase I ESA, a total of 23 upgradient listings were judged to be close enough to potentially impact Site soil and groundwater. One listing had a spill of No. 2 Fuel oil in 2004 with no record of a cleanup. A second site had a spill of waste oil in 2004 when the New York City Fire Department (FDNY) responded to a fire. Waste oil may contain solvents, PCBs and heavy metals in addition to ordinary petroleum constituents. No details of a purported cleanup were provided. COCs associated with these spills include:

- BTEX
- Naphthalene
- PAHs
- Solvents
- PCBs
- Heavy metals

Use of contents on this sheet is subject to the limitations specified at the end of this document.
CSO-GC-SFS-DES-R-PHASE II INVESTIGATION-20250220.DOCX

Section 3

Phase II Investigation Scope of Work

The Phase II investigation scope of work was implemented to evaluate the presence or absence of hazardous substances or petroleum products in the subsurface environmental media of the Site, including soil, groundwater and soil vapor.

The scope of work for conducting the Phase II investigation field activities is described in the following workplan:

- "Phase II Environmental Investigation Workplan CSO-GC-SFS-DES OH Construction of CSO Facility at Gowanus Canal Outfall OH-007" (Phase II Workplan) prepared by the HSBC (March 2023). The Phase II Workplan included a Field Sampling Plan (FSP) and a Quality Assurance Project Plan (QAPP).

Phase II activities were also conducted in accordance with the following document:

- "Health and Safety Plan for Gowanus Canal Tank Siting and Superfund Support, CSO-GC-SFS-DEC, Brooklyn, New York" prepared by the HSBC (March 2023).

3.1 Scope of Work – Implemented

Table 1 provides a summary of the soil borings drilled, monitoring wells installed, and soil vapor points sampled during the Phase II field activities and includes specifics on depth of drilling and sampling, well screen intervals, and other details for each location. Figure 3 depicts the locations of the soil borings, monitoring wells, and soil vapor points installed during the Phase II activities.

The scope of field activities conducted during the Phase II Investigation included the following:

- Drilled and collected soil samples from 37 of the 64 planned soil borings and four monitoring well locations as shown on Figure 3.
- Drilled and installed four monitoring well clusters (OH-MW-04S/I/D, OH-MW-05S/I/D, OH-MW-06S/I/D) and OH-MW-07S/I/D). Each cluster consisted of three wells; one shallow, one intermediate, and one deep well.
- Installed and sampled two soil vapor points (OH-SV-06 and OH-SV-07) in two of the onsite buildings.
- Conducted groundwater sampling, water level measurements, and NAPL thickness gauging at all newly installed wells.

The methods and procedures for the field investigation activities are described below.

3.2 Utility Clearance

Prior to each phase of intrusive activities, soil boring, soil vapor sampling and monitoring well locations were cleared for subsurface utilities using hand tools. Each investigation location was hand cleared down to 6 ft. below ground surface (bgs) or the water table encountered at that location. Hand clearing activities were conducted by the drilling contractor, Aquifer Drilling and Testing (ADT), A Cascade Company. Also, Dig Safely New York was contacted by ADT and provided clearance (one-call mark out) for subsurface utilities.

Use of contents on this sheet is subject to the limitations specified at the end of this document.
CSO-GC-SFS-DES-R-PHASE II INVESTIGATION-20250220.DOCX

3.3 Soil Investigation

Drilling services during the field activities were provided by ADT. The field team recorded observations, prepared logs, and collected soil samples for laboratory analyses during the drilling and sampling of all borings. Samples were collected from the borings in accordance with the details outlined in the OH-007 Phase II Work Plan. A total of 43 soil borings, including four monitoring well locations and two step-out borings (OH-SB-12A and OH-SB-16A) were drilled and sampled at the Site. A direct-push drill rig, specifically a Geoprobe ® 6600 was used for these activities. The drill rig was equipped with a Macrocore ® sampling tool to collect 5-foot-long sampling cores. The Macrocore ® sampling tool contains a removable acetate liner into which the soil core is collected during downward advancement of the tool. A new clean liner was used for each interval. At each location, soil cores were collected continuously from ground surface to the total depth of each boring (see Table 1). The sampling equipment was decontaminated after use and between sample locations.

Soils extracted from these borings were visually examined, characterized and logged, and screened in the field for organic vapors using a photoionization detector (PID). The soils were described for physical properties such as color, sorting, layering, etc. The grain size distribution of soils was visually characterized in the field and logged in accordance with the Burmister Soil Classification System (1958). The Burmister classification was then converted to the Unified Soil Classification System (USCS) for preparation of the final boring logs (see Appendix A).

Soil sampling was biased to the interval with the greatest observed impacts within each stratigraphic unit or 1-foot interval directly above the base of a stratigraphic unit, if no impacts were observed. At a minimum, a sample was collected in the upper 1-foot interval in the fill at each location. A second sample was collected from the 1-foot interval within the zone of water table fluctuation (smear zone). For deeper borings, additional samples were collected based on observations and field screening in the underlying glacial sands. Each soil sample collected was analyzed for the following parameters:

- Volatile organic compounds (VOCs) by EPA Method 8260B including MTBE
- Semi-volatile organic compounds (SVOCs) by EPA Method 8270C including tentatively identified compounds (TICs) and alkylated PAHs by GC/MS SIM
- PCBs by EPA Method 8082A
- Pesticides by EPA Method 8081
- Herbicides by EPA Method 8151A
- TAL metals by EPA Method 6010D
- Total cyanide by EPA Method 9014
- Asbestos by ASTM Method D7521

Soil samples were collected, handled and analyzed in accordance with the Phase II Workplan. Soil samples were provided to Aqua Pro-Tech Laboratories (DOH #11634) during the Phase II activities. Aqua Pro-Tech laboratories is certified to conduct the analyses listed above, under the New York State Department of Health (DOH) Environmental Laboratory Approval Program (ELAP). Validation of the laboratory data was conducted in accordance with the QAPP and are provided in Appendix B.

Details on the total depths drilled, sample intervals and analysis at each soil boring are provided in Table 1. Boring logs are provided in Appendix A. Soil investigation locations are shown on Figure 3.

3.4 Groundwater Investigation

The Phase II groundwater investigation included the installation of four new monitoring well clusters. Each well cluster included three wells; a shallow well screened within the fill material, straddling the

Use of contents on this sheet is subject to the limitations specified at the end of this document.
CSO-GC-SFS-DES-R-PHASE II INVESTIGATION-20250220.DOCX

water table; an intermediate depth well screened in the glacial deposits immediately below the meadow mat/alluvial deposits; and a deep well screened deeper within the glacial deposits.

The wells were installed to provide information on groundwater levels and groundwater quality in the areas of potential environmental concern, identified in the Phase I ESA.

Further details on the groundwater investigation are provided in the sections below. The following subsections describe the installation and development of monitoring wells, water level measurements, NAPL gauging, and groundwater sampling and analysis.

3.4.1 Monitoring Well Installation

Monitoring wells were installed by hollow stem drilling techniques using the Geoprobe ® 6600 rig. The well construction details for the monitoring well clusters were selected based on the observations made during the drilling and sampling of the associated soil borings (MW-04D for the OH-MW-04S/I/D well cluster, MW-05D for the OH-MW-05S/I/D cluster, MW-06 for the OH-MW-06S/I/D cluster) and MW-07 for the OH-MW-07S/I/D cluster. Monitoring wells designated with an "S" were installed to straddle the water table at each well cluster location. Monitoring wells designated with an "I" were of intermediate depth and were designed and installed to monitor the upper zone of the Glacial Outwash Deposits (directly below the meadow mat), and those wells designated with a "D" were designed to monitor the deeper portion of the Glacial Outwash Deposits. Each monitoring well was constructed with two-inch inside diameter schedule 40 polyvinyl chloride (PVC) risers and screens in accordance with procedures and specification in the FSP and Standard Operating Procedure (SOP) BCNNJ-SOP_MWD2-0916 in Appendix A of the FSP. A two-foot sump was added to the bottom of the well screen at OH-MW-05I, OH-MW-05D, OH-MW-06I, OH-MW-06D, OH-MW-07I and OH-MW-07D in anticipation of accumulating and collecting dense NAPL, if present.

Well construction logs are provided in Appendix A. Details of the monitoring well construction are provided in Table 1. The monitoring well cluster locations are shown on Figure 3.

3.4.2 Monitoring Well Development

Each of the newly installed monitoring wells was developed following installation and after a minimum period of 24 hours had passed to allow the cement/bentonite grout to set. Each of the newly installed wells was developed in accordance with the procedures outlined in the FSP and SOP - BCNNJ-SOP_MWD2-0916 in Appendix A of the FSP. The development water and sediment removed from the wells was containerized in New York State Department of Transportation (DOT) approved 55-gallon drums and managed as Investigation-Derived Waste (IDW) (see Section 3.8).

3.4.3 Water Level Measurements and NAPL Gauging

On August 7, 2023, water level measurements and NAPL gauging were conducted on the newly installed monitoring wells (Figure 3). Groundwater levels were measured to the nearest 0.01 ft using an oil-water interface probe. NAPL thickness, if any, was measured using either an oil-water interface probe or a threaded rod. The depth to the bottom of the well was also measured. Measured total depths were compared to previously recorded total depths, where available, to determine if silt had accumulated at the bottom of the well. Water levels were measured from a surveyed elevation reference mark on the well casing and recorded in the field book. The NAPL measurements were made prior to the placement of any equipment in the well for sampling. When detected with the interface probe, the presence of NAPL was confirmed by withdrawing a sample with a clear, bottom-fill Teflon® or polyethylene bailer, and/or lowering a clean threaded steel rod to the liquid level in the well (NAPL will often adhere to grooves in threaded section of rod). The threaded rod was then cleaned and lowered to the bottom of each well to determine if any NAPL had accumulated at the base. Water

Use of contents on this sheet is subject to the limitations specified at the end of this document.
CSO-GC-SFS-DES-R-PHASE II INVESTIGATION-20250220.DOCX

level measurements, results and notes from NAPL gauging, and calculated groundwater elevations for each well are provided in Table 2.

3.4.4 Groundwater Sampling and Analysis

Groundwater samples were collected from the newly installed wells except OH-MW-06I and OH-MW-07I which had NAPL accumulation in the well sump (Figure 3). Groundwater samples were collected using low-flow purging and sampling procedures in accordance with EPA, Region II, Groundwater Sampling Procedure; Low Stress (Low Flow) Purging and Sampling (EPA SOP-GW-001, 2010). Groundwater samples collected from each well were analyzed for the following parameters:

- VOCs by EPA Method 8260D including MTBE and TICs
- SVOCs by EPA Method 8270E including TICs
- PCBs by EPA Method 8082A
- Pesticides by EPA Method 8081B
- Herbicides by EPA Method 8151
- TAL metals by EPA Method 6010D
- Total Cyanide by EPA Method 9014

3.5 Soil Vapor Investigation

The soil vapor investigation included the installation and sampling of two soil vapor points, OH-SV-6 and OH-SV-7 on the Site. Soil vapor points were installed in accordance with the procedures described in Appendix A of the FSP and the DOH guidance for evaluating vapor intrusion. Due to the shallow water table at the Site, the soil vapor probes were placed in the pre-cleared borehole instead of backfilling and installing the points via direct push methods.

A leak test was conducted at each soil vapor location to confirm there was no short-circuiting of ambient air into the sample line and apparatus. Once the leak test confirmed an effective seal, a sample was collected with a summa canister at each soil vapor location. Each soil vapor sample was collected over a 2-hour period and analyzed for VOCs by EPA Method TO-15.

3.6 Community Air Monitoring

During implementation of the Phase II intrusive activities, a Community Air Monitoring Plan (CAMP) was implemented which included a combination of real-time (continuous) perimeter monitoring and work zone monitoring of VOCs, cyanide and particulates (i.e., dust). The CAMP was implemented in accordance with the guidelines presented by the New York State Department of Health (DOH) in Appendix 1A of the DEC Division of Environmental Remediation's Technical Guidance for Site Investigation and Remediation (DER-10). CAMP monitoring was conducted during periods of intrusive site work.

The specific requirements and protocols for CAMP monitoring at the Site were detailed in the CAMP included in Appendix C of the OH-007 Phase II Work Plan. The CAMP was implemented by YU & Associates during the Phase II activities.

3.7 Investigation Derived Waste Management

Waste generated during the field investigation activities (i.e., IDW) included soil cuttings, groundwater from purging during sampling, well development water, equipment decontamination water, disposable sampling equipment, and personal protective equipment (PPE). IDW was

Use of contents on this sheet is subject to the limitations specified at the end of this document.
CSO-GC-SFS-DES-R-PHASE II INVESTIGATION-20250220.DOCX

managed, characterized and disposed of at permitted off-site facilities in accordance with the specifications of EPA Guide to Management of investigation-Derived Wastes (OSWER Publication 9345.3-03FS, January 1992). IDW was segregated and containerized in DOT-approved 55-gallon steel drums with secure lids, properly labelled to identify their contents and temporarily staged at the Site. Samples from both solid and liquid waste were collected and submitted for waste characterization analysis. Waste manifests were signed by an authorized DEP representative prior to transporting to off-site disposal facility.

3.8 Deviations in the Scope of Work

The following deviations in the scope of work occurred during the implementation of the field activities for the Phase II investigation:

- Soil boring location OH-SB-16 encountered an obstruction and was offset and renamed OH-SB-16-A to the southeast to complete the required depth.
- Soil boring OH-SB-26 was not drilled and sampled due to its close proximity to the MW-07D sampling location.
- Soil borings OH-SB-32, OH-SB-35, OH-SB-36, OH-SB-37, OH-SB-38, OH-SB-43, OH-SB-44, OH-SB-47, OH-SB-48, OH-SB-49, OH-SB-54, OH-SB-55, OH-SB-57, OH-SB-59, OH-SB-63, OH-SB-64, OH- and SB-65 were not completed due to access issues with the tenants.
- Soil borings OH-SB-33, OH-34, OH-SB-39 through OH-SB-42, OH-SB-45, OH-SB-46, OH-SB-50 through OH-SB-53, OH-SB-56, OH-SB-58 and OH-SB-60 were not completed to the target depths since these borings were not cleared of potential subsurface utilities. Hand clearing down to 6 ft. bgs was not completed at these locations due to subsurface obstructions, which included multiple concrete slabs.
- Borings OH-SB-67 and OH-SB-68 were not drilled and sampled since these locations were along 5th Street and there wasn't enough space to safely installed the boring and the should of the roadway was completely occupied by out of service vehicles.
- Soil vapor sampling points OH-SV-08 and OH-SV-09 were not installed and sampled due to access issues with tenants and/or onsite tenant activities during the Phase II Investigation.

Use of contents on this sheet is subject to the limitations specified at the end of this document.
CSO-GC-SFS-DES-R-PHASE II INVESTIGATION-20250220.DOCX

Section 4
Phase II Investigation Findings

This section of the Phase II Investigation Report presents information on the identified COCs in Site soils, groundwater, and soil vapor, and the presence of MGP residuals as it pertains to excavation; soil handling, treatment and disposal; dewatering; and groundwater treatment.

4.1 Physical and Geologic Setting

The following subsurface characterization is based on information generated during the Phase II Investigation activities as well as relevant information from the previous investigations to present a more complete picture of the subsurface conditions likely to be encountered during construction of the Gowanus CSO Facility.

4.1.1 Site-Specific Stratigraphy

The area within the Site has been leveled with urban fill and is generally flat. The stratigraphic units encountered during the Phase II investigation activities included: fill, meadow mat/alluvial deposit, glacial outwash deposits (see cross sections on Figures 4 and 5). Below these units are the Jameco Gravel, decomposed rock (saprolite) and Fordham Gneiss which have been encountered at deeper boring installed as part of the geotechnical investigation and previous PDI activities. Since the objective of the Phase II Investigation was to evaluate shallow soils for potential impacts and releases, the site-specific discussions also include data from the geotechnical investigation (to support CSO facility design) and PDI activities conducted in and around the area of OH-007 to get a complete picture of the underlying stratigraphy. These stratigraphic units are furthered described below.

Fill. The fill is composed of various materials including sand, silt, gravel, fragments of coal, wood, brick and debris, and covers the entire area encompassing the Site and DSNY property. This unit overlies the meadow mat/alluvial deposits throughout the Site. The fill varies in thickness across the Site, typically ranging between 5 ft and 16 ft and generally thickens moving from east to west.

Meadow Mat/Alluvial Deposits. Beneath the fill is a layer of meadow mat/alluvial deposits which are likely floodplain sediments associated with the former Gowanus Creek. These deposits are variable in composition and consist of a fine-grained alluvial sand (silty sand) and an organic marsh deposit (meadow mat) containing layered organics/peat, silt, clay and fine sand. The marsh/alluvial deposits were observed in all of the Phase II borings drilled on OH-007. However, not all borings were advanced past the meadow mat/alluvial deposits into the underlying glacial sands. The thickness of the meadow mat/alluvial deposits ranges from 15 ft to 27 ft.

Glacial Outwash Deposits. Underlying the meadow mat/alluvial deposits and the fill are the glacial outwash deposits which were deposited during the Pleistocene Epoch. The glacial outwash deposits extend to the top of what may be the Jameco Gravel, which can be as deep as 168 ft bgs as observed at previous borings OH-SB-01 installed during the 2017 PDI program. The glacial outwash is typically composed of a loose, fine to coarse grained sand with varying amounts of silt and gravel, although isolated, interbedded finer-grained lenses have been observed. These finer-grained deposits were encountered in the geotechnical borings that extended to greater depths (beyond the scope of the Phase II borings).

Use of contents on this sheet is subject to the limitations specified at the end of this document.
CSO-GC-SFS-DES-R-PHASE II INVESTIGATION-20250220.DOCX

The Phase II Investigation activities did not extend beyond the glacial sand deposits. However, based upon previous activities conducted on the adjacent DSNY property, the following stratigraphic units are below the Glacial deposits.

Gravel/Cobble/Boulder Zone. A coarse-grained gravel/cobble/boulder zone consisting of a poorly sorted, loose, medium to coarse sand and gravel with cobbles and boulders was encountered beneath the glacial outwash and directly above the decomposed bedrock (saprolite). This boulder zone may represent the Jameco Gravel, or it may represent a more local, high energy depositional environment in proximity to the leading edge or terminal moraine of the Pleistocene glaciers. In either case, this coarse boulder zone is a significant feature when contemplating any construction that might extend to bedrock.

This coarse-grained outwash deposit was encountered at depths ranging between 162 ft bgs (geotechnical boring MR-05) and 168 ft bgs at PDI boring OH-SB-01. The thickness of this gravel/cobble/boulder zone ranges between approximately 10.5 ft and 23.5 ft.

Decomposed Bedrock (Saprolite). Saprolite is bedrock that has weathered so significantly that it assumes soil-like properties. The saprolite was observed at two of the five borings that were drilled to the top of bedrock. These two borings (OH-SB-01 and MR-01) encountered the saprolite at depths ranging between 178.5 and 180 ft bgs. The saprolite has been observed to be a greenish-blue-white silty clay with varying amounts of decomposed gneiss and medium to fine grained quartz. The saprolite ranges in thickness from 29.5 to 40.6 ft and was only encountered in the northeastern portion of the OH-007 Site.

Fordham Gneiss. The Fordham Gneiss was encountered in two PDI borings (OH-SB-01 and OH-SB-07) and three geotechnical borings (MR-01, MR-03 and MR-05). Weathered bedrock was encountered at all five borings at depths ranging from 185 ft bgs to 220 ft bgs. Competent bedrock was observed at four of the five borings drilled at depths ranging from 190 ft bgs to 225 ft bgs. PDI boring OH-SB-01 was terminated in weathered bedrock at a depth of 190 ft bgs. Overall, the top of bedrock is an undulating surface and appears to be deeper (+/- 35 ft.) in the eastern portion of the Site. The Fordham Gneiss is the oldest bedrock in Brooklyn and Manhattan and is predominantly a metamorphosed, layered medium to coarse-grained rock that is composed of quartz, feldspar, hornblende, biotite and amphibolite.

4.2 Hydrostratigraphy and Groundwater Flow

Groundwater level data from the newly installed monitoring well clusters were included in the evaluation of hydrostratigraphy and groundwater flow. The following sections describe groundwater flow at the Site including: position of the water table, hydrogeologic properties of the aquifers, and the likely direction of groundwater movement based on the newly installed wells.

4.2.1 Water-Bearing Zone Identification and Groundwater Flow

The water table at the Site is shallow and occurs within fill and/or the upper part of the meadow mat/alluvial deposits. Groundwater elevations from the monitoring wells are presented in Table 2 and groundwater elevations are presented on Figure 6.

The groundwater elevations in monitoring wells screened within the shallow groundwater zone ranges from 1.03 to 3.08 ft NAVD with higher groundwater elevations observed further inland from the canal. In tidally influenced areas, the hydraulic gradient can change in response to the tides. Groundwater in such areas will travel at constantly changing rates and possibly undergo temporary changes in flow direction due to the fluctuating gradients. Because the water levels posted on Figure 6 were collected over a period of time and not at neap tide, when the difference between high and low tide levels in

Use of contents on this sheet is subject to the limitations specified at the end of this document.
CSO-GC-SFS-DES-R-PHASE II INVESTIGATION-20250220.DOCX

tidal waters tend to be the least, the groundwater flow is best understood by considering the average flow direction gradient. The water level data indicate that groundwater at the Site flows generally from the southeast to the west-northwest. Note that there are three monitoring well clusters on the DSNY property, but these were not accessible during the monitoring event.

Below the meadow mat/alluvial deposits and within the upper portions of the Glacial Outwash Deposits, there appears to be an intermediate groundwater flow zone. Groundwater elevations from monitoring wells screened within this zone ranges from 2.06 to 2.93 ft NAVD with the higher elevation observed further inland from the canal at MW-04I. The groundwater elevations of the wells screened in the intermediate zone indicate a general flow direction to the west-northwest. Based on the groundwater elevation data collected on August 7, 2023, this intermediate groundwater zone is lower in elevation than the water table in the OH-MW-04 and OH-MW-05 well clusters, and higher in elevation than the water table wells in the OH-MW-06 and OH-MW-07 well cluster. This difference in hydraulic head indicates both a downward and upward gradient between the shallow and intermediate groundwater zones. To confirm this, continuous water level monitoring utilizing data loggers would need to be conducted in wells screened in the intermediate and shallow groundwater zones.

Monitoring wells were also installed to evaluate groundwater conditions slightly deeper in the glacial outwash deposits to a depth of approximately 60-70 ft bgs. The groundwater elevations from these deeper wells (MW-4D, MW-5D, MW-6D and MW-7D) ranged from 2.68 to 3.46 ft NAVD with the higher groundwater elevation observed further inland at MW-4D. In general, the groundwater elevations at the wells screened deeper in the glacial outwash deposits were higher than the intermediate and shallow groundwater zone wells, possibly indicating an upward hydraulic gradient. The difference in groundwater elevations in wells screened in the intermediate zone and deeper glacial outwash deposits ranged from 0.3 to 0.95 ft, indicating that the 60 to 70 ft. depths and the upper portions of the Glacial Outwash Deposits (intermediate groundwater zone) are not hydraulically continuous and could potentially be different groundwater flow zones. This difference in groundwater elevations between wells screened in the upper and lower portion of the glacial outwash deposits was not observed in well clusters installed on the DSNY property.

Based on the groundwater elevations in the shallow water bearing zone (Figure 6) it appears that the lateral groundwater flow is from southeast to northwest across the Site. However, as mentioned above Influences such as tidal cycles affecting the water table, surface runoff and other external factors (pumping, preferential pathways from utilities, etc.) would need to be evaluated over time (continuous water level monitoring in wells and the Gowanus Canal) to provide confirmation of the groundwater flow direction, and/or changes in direction due to those external influences. An evaluation of those influences was not included as part of the objective of the Phase II Investigation and was not conducted during the field activities.

Similar to the shallow zone, groundwater flow direction in the intermediate and deep zones could not be approximated because of insufficient measuring points. However, groundwater elevation data also suggest flow to the northwest towards the canal based on the hydraulic gradients from the available wells. To confirm the groundwater flow direction in these two zones, similar hydraulic evaluations would also need to be conducted in the intermediate and deep groundwater wells.

4.3 NAPL Nature and Extent

During the Phase II activities, soil borings were drilled and sampled at 43 locations to characterize the site-specific stratigraphy and to collect samples for laboratory analysis.

Soils from each boring, in addition to being classified for soil type, were screened for indications of impact via visual and olfactory examination and measurement of organic vapor concentrations using

Use of contents on this sheet is subject to the limitations specified at the end of this document.
CSO-GC-SFS-DES-R-PHASE II INVESTIGATION-20250220.DOCX

a PID. Visible NAPL, if encountered, was described with regard to color, odor, viscosity, consistency, distribution in the sample, and degree of saturation. This information was used to evaluate NAPL in the subsurface laterally, and to a limited extent vertically to meet the investigation objectives. Recall, the investigation and sampling program was developed to evaluate shallow impacts related to potential areas of environmental concern. Accordingly, most of the sampling was conducted in the fill material at the Site and a limited number of borings were extended into the underlying meadow mat and glacial deposits.

Table 3 of this Phase II report provides a summary of locations and depth intervals where NAPL was observed in borings on the Site along with descriptions of the NAPL. These observations along with analytical data are included on the geologic cross-sections (Figures 4 and 5) which provide a visual depiction of the distribution of the NAPL and indicate potential migration pathways it has followed. In addition, the boring logs (Appendix A) include detailed descriptions of the visual observation. Figures 7 through 9 further illustrate the lateral and vertical distribution of NAPL/coal tar in plan view based on findings of this Phase II investigation. Figure 7 shows the NAPL observations in the fill, Figure 8 shows NAPL observations in the meadow mat/alluvial deposit and Figure 9 shows NAPL observations in the glacial outwash deposit.

4.3.1 General Findings

The following summary of NAPL observations is based on data described above and detailed in Table 3 and shown on Figures 4, 5 and 7 through 9. This information will assist in the development of soil management plans for excavation of soil for facility construction. Soil handling, treatment and disposal or reuse methods can depend upon the soil characteristics or the presence and concentration of NAPL (coal tar) and other contaminants. Figures 4 and 5 show the extent of NAPL observed at different depth intervals (cross sectional view) and Figures 7 through 9 show the vertical and lateral distribution of NAPL across the Site. The following NAPL observations/evaluation will need to be considered in managing excavated soils.

- Fill – Visual NAPL impacts were observed in the fill at locations OH-SB-16A, OH-SB-20, OH-SB-22 and OH-SB-27 (Figure 7). NAPL was observed at depths in the groundwater fluctuation zone or just below the depth of the water table encountered during drilling and the greatest depth of NAPL impact encountered in the fill was 15 to 15.3 ft bgs at boring OH-SB-22. In addition, there were a few locations where other indications of impacts including staining, sheen and weak odors were observed in the water table fluctuation zone in the fill.
- Meadow Mat/Alluvial Deposits - Visual NAPL impacts were observed in the upper 2-feet of the meadow mat/alluvial deposits at a single location, OH-SB-17 (Figure 8). Staining, sheen and weak odors were also observed in this unit at several locations (Table 3). The tidal fluctuation at the Site is within both the fill and the upper portion of the meadow mat/alluvial deposits. Therefore, it likely that the visual NAPL and other indications of impacts such as odors, sheen, staining etc. in the meadow mat is due to the movement of impacts within the tidal fluctuation zone.
- Glacial Outwash Deposits – Visual NAPL impacts were observed in five (MW-05, MW-06, MW-07, OH-SB-16A and OH-SB-24) of the six boring locations that were drilled and sampled to depths that encountered the glacial sands during the Phase II investigation (Figure 9). These borings are all in the tip of the peninsula (western portion of the Site), across from the Former Citizens MGP Site and bounded by the main channel of the Gowanus Canal on one side and the 6th Street Basin on the other. NAPL impacts were observed directly below the meadow mat/alluvial deposits to depths ranging between 38.5 and 56.1 ft. bgs. The deepest boring installed during the Phase II Investigation was terminated at a depth of 75 ft. bgs. Previous work done during the PDI, and geotechnical drilling have encountered NAPL at deeper depths. However, vertical delineation of

Use of contents on this sheet is subject to the limitations specified at the end of this document.
CSO-GC-SFS-DES-R-PHASE II INVESTIGATION-20250220.DOCX

NAPL was not an objective of this investigation. The NAPL impacts are not continuous over the entire interval drilled but instead appear to be present within and migrating through the coarser grained materials of the glacial outwash deposits. At depth intervals where there are finer grained materials with varying amounts of silt and clay, the NAPL is not present or was only observed in trace amounts (blebs). NAPL impacts in the glacial outwash at the Site have elevated concentrations of PAHs and BTEX compounds, which are the major components of coal tar and likely migrated beneath the Gowanus Canal from the Former Citizens MGP site.

- The greatest NAPL impacts were observed at boring MW-06D. Visual impacts at this boring extended from 33.2 ft bgs (just below the base of meadow mat/alluvial deposits) to 47.7 ft bgs but were not continuous over this interval.
- The deepest NAPL impacts were observed at boring MW-07D at a depth interval of 56.1 ft bgs.

In addition to NAPL being observed in soil, it has migrated into two of the newly installed monitoring wells. Two feet of NAPL accumulated in the sump at OH-MW-06I and one-half inch accumulated in the sump at OH-MW-07I within two weeks after these wells were installed. The mobility of NAPL could be a potential concern during future construction activities at the Site.

4.4 Soil Analytical Data

During the course of the Phase II activities, a minimum of one sample per stratum was collected from each boring and submitted for laboratory analysis. The samples were analyzed for the list of constituents included in the OH-007 Phase II Work Plan and QAPP as presented in Section 3.4. A total of 97 soil samples were collected from 43 borings (not including quality assurance/quality control [QA/QC] samples) and submitted for laboratory analyses. For the purpose of providing a conservative assessment of soil conditions, constituent concentrations detected in the soil samples were compared to 6 NYCRR Subpart 375 Soil Cleanup Objectives (SCOs) for Restricted Residential Use (RR-SCO), Commercial Use (RUC-SCO) and Unrestricted Use criteria (UU-SCO). Note that for the purpose of this report, the UU-SCO will only be discussed to a limited extent since this soil cleanup objective is not considered a remedial goal for the Site. Instead, the UU-SCO is included to evaluate the soil for unrestricted use or beneficial use under NYCRR Part 360.13. Tables 4A through 4E provide a summary of the soil quality data and a comparison to the RUC-SCOs, RUC-SCO and UU-SCOs. Soil quality data including exceedances are presented on Figures 10 through 23. In addition, total BTEX, total PAHs, naphthalene and lead concentrations are included on the geologic cross sections (Figure 4 and 5). The complete laboratory data packages from the analytical laboratories engaged in this Project, along with the Data Usability Summary Reports (DUSR) and data validation results are included in Appendix B.

4.4.1 VOCs in Soil

VOCs including BTEX were detected in the subsurface at concentrations greater than the UU-SCO and RR-SCO at several boring locations as depicted on Figures 10 through 12. Below are details of VOC detections in the subsurface and analytical results are presented in Table 4A.

Benzene was detected at concentrations above the UU-SCO in samples collected in the fill at locations OH-SB-20 (0.114 mg/kg) and OH-SB-25 (0.144 mg/kg) at depths with observed NAPL or indications of NAPL such as naphthalene odor (mothball-like odor). Acetone was detected at concentrations above the UU-SCO in samples collected in the fill at locations OH-SB-18, OH-SB-56, OH-SB-61, OH-SB-62 and OH-SB-66. Methylene chloride was detected above the UU-SCO at OH-SB-27 (0.102 mg/kg). No VOCs were detected in the fill at concentrations above the RR-SCO and RUC-SCO. Figure 10 shows the locations in the fill with BTEX concentrations exceeding the respective SCOs.

DRAFT for review purposes only. Use of contents on this sheet is subject to the limitations specified at the end of this document.
CSO-GC-SFS-DES-R-PHASE II INVESTIGATION-20250218_VERA

One or more BTEX compounds was detected at concentrations above the UU-SCO in samples collected in the meadow mat/alluvial deposits at locations OH-SB-13, OH-SB-17 and OH-SB-23 at depths with observed NAPL or indications of NAPL such as naphthalene odor (mothball-like odor). In addition, these samples were collected in the tidal fluctuation zones at these locations. At location OH-SB-14 and OH-SB-17, acetone and 2-butanone (MEK) were detected at concentrations above the UU-SCO. No VOCs were detected in the meadow mat/alluvial deposits at concentrations above the RR-SCO and RUC-SCO. Figure 11 shows the locations in the meadow mat/alluvial deposits with BTEX concentrations exceeding the respective SCOs.

Several VOCs including 1,2,4 Trimethylbenzene and BTEX compounds were detected above the RR-SCO and RUC-SCO at location MW-05, MW-06, MW-07, OH-SB-16A, OH-SB-22 and OH-SB-24. At each of the six locations, the sample was collected from the glacial sand at a depth which corresponds to an interval where NAPL, specifically coal tar was observed. These borings are located in the northwestern portion of the Site, directly across from the former Citizens MGP site. These borings are also the only borings in this portion of the Site that were advanced below the meadow mat into the glacial outwash deposits. Borings that were advanced into this stratigraphic unit during previous PDI activities were also impacted by BTEX compounds related to NAPL. Based on the spatial distribution of NAPL in the glacial outwash deposits from the Phase II and PDI investigations, it is likely that other boring locations in the northwestern part of the Site would encounter NAPL and BTEX impacts if they were advanced into the glacial outwash deposits. Figure 12 shows the locations in the glacial outwash deposits with BTEX concentrations exceeding the respective SCOs.

4.4.2 SVOCs in Soil

Several SVOCs, specifically PAHs were detected at concentrations above their respective SCOs (see Table 4B for analytical results). Figure 13 depicts the locations where one or more of the detected SVOCs is greater than the RR-SCO. The PAHs detected can generally be separated into two groups based on molecular weight: low molecular weight (LMW) PAHs, which include PAHs with 2 to 3 aromatic rings in their molecular structure; and high molecular weight (HMW) PAHs, which include PAHs with more than 3 aromatic rings in their molecular structure. Furthermore, exceedances of the SCOs for these two groups of PAHs are tied to the occurrence of NAPL in the sample interval. The PAH exceedances of the RR-SCO can be subdivided into exceedances of LMW PAHs and HMW PAHs, as follows:

- LMW PAHs: Naphthalene, acenaphthene, acenaphthylene, fluorene, anthracene, and phenanthrene were detected at concentrations greater than the RR-SCO and RUC-SCO in samples collected from locations in the northwestern part of the Site and are spatially associated with the presence of NAPL (i.e. exceedance of LMW PAHs were only observed sampled intervals where NAPL was observed), LMW PAHs exceeded the RR-SCO and RUC-SCO in the fill at locations OH-SB-20, OH-SB-22 and OH-SB-27; in the meadow mat/alluvial deposits at OH-SB-17 and in the glacial outwash deposits at locations MW-05, MW-06, MW-07, OH-SB-16A and OH-SB-24. Coal tar can contain various compounds of which naphthalene is typically the most dominant. Therefore, the spatial distribution of naphthalene concentrations in the fill, meadow mat/alluvial deposits and glacial outwash deposits were plotted on Figures 14 through 16. Note that LMW were also detected at location OH-SB-16 above the RR-SCO and RUC-SCO, but all the detections are qualified as estimated due to dilution on the sample and low recoveries on the surrogate (see note in DUSR). Noteworthy, there were no visual impacts or PID readings above background from these samples and no VOCs detected. If future construction activities are being considered in the area of OH-SB-16, then confirmation sampling should be conducted.

Use of contents on this sheet is subject to the limitations specified at the end of this document.
CSO-GC-SFS-DES-R-PHASE II INVESTIGATION-20250220.DOCX

- HMW PAHs: Of the HMW PAHs analyzed, the following were detected at concentrations above the RR-SCO at several locations: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene, benzo(g,h,i)perylene, fluoranthene, and pyrene. Eight of these HMW PAHs have relatively low (3.9 ppm or less) RR-SCOs and there were exceedances of the RR-SCOs in samples collected from the fill in 39 of the 43 boring locations. Typically, HMW PAH exceedances in the fill occur in samples from or near intervals where soil sample descriptions indicate materials such as cinders, brick, asphalt, coal fragments or other construction debris. HMW PAHs exceedances were also observed in the fill at intervals with NAPL impacts and these concentrations were typically an order of magnitude higher than sample intervals without NAPL impacts. Four of the five samples collected in the meadow mat had exceedances of one or more of the eight HMW PAHs. Samples collected in the meadow mat that exceeded the RR-SCOs were either collected at an interval close to the fill/meadow mat transition or with indications of impacts such as odors and sheen. The other two HMW PAHs (fluoranthene and pyrene) have a higher RR-SCO of 100 ppm and only had exceedances at samples where NAPL was observed. HMW PAHs were only observed in the glacial sands at locations where NAPL was observed in the sample interval.

In summary, LMW PAHs in soil at concentrations above the RR-SCO (i.e., naphthalene) are associated with NAPL, whereas the HMW PAHs in soil at concentrations slightly above the RR-SCO are associated with materials such as coal fragments, cinders, ash and other debris in the historic fill at the Site and at higher concentrations (order of magnitude) when detected in sample intervals with NAPL impacts.

4.4.3 PCBs in Soil

Total PCBs were detected above the UU-SCO in soil samples collected in the fill at 13 of the 43 soil boring locations (Figure 17). Most of the detections were from 1-2 ft bgs. Nine samples were above the RR-SCO of 1 mg/kg with the highest concentration of total PCBs (18.1 mg/kg) detected at location OH-SB-22 in the 2.0 to 3.0 ft sample interval. PCBs were also detected in a sample collected in the glacial outwash (14.3 mg/kg) at this location and the sample was collected from an interval where NAPL was observed. The source of this deeper impact in unknown at this time. See Table 4C for analytical results.

4.4.4 Metals in Soil

Metals including arsenic, barium, cadmium, copper, lead, mercury, nickel, selenium, silver and/or zinc were detected at concentrations above the UU-SCO and the RR-SCOs in several borings across the Site and all exceedances occurred in samples collected in the fill. Lead and mercury were by far the most frequently detected metals in the fill. The spatial distribution of these two compounds are shown on Figures 18 through 23. See Table 4D for analytical results. There were no exceedances of SCOs in samples collected in the meadow mat or glacial sands.

Free cyanide was not detected in any of the samples submitted for analysis. This compound can be associated with purifier waste from MGP operations.

The exceedances of the UU-SCOs, specifically the Protection of Groundwater may disqualify the material for unrestricted use or beneficial use as Fill Type F2 under 6 NYCRR Part 360.13.

4.4.5 Pesticides and Herbicides in Soil

There were no detections of pesticides or herbicides above the RR-SCO or RUC-SCO. One or more pesticides including 4,4'-DDD, 4-4'-DDE, 4,4'-DDT and/or Aldrin were detected above the UU-SCO at 23 boring locations. See Table 4E for analytical results.

Use of contents on this sheet is subject to the limitations specified at the end of this document.
CSO-GC-SFS-DES-R-PHASE II INVESTIGATION-20250220.DOCX

4.4.6 Asbestos in Surficial Soil

Due to the historic storage of asbestos and asbestos containing material identified in the EDR report, surficial soil samples (0-3 ft bgs) were analyzed for asbestos by ASTM Method D7521. A total of 78 soil samples were analyzed from 40 soil boring locations. A DEP Certified Asbestos Investigator from Environmental Planning & Management (EPM) Inc. was contracted to conduct the sampling and evaluate of the data. At each location a shallow sample was collected from the upper 3 ft and a second sample was collected down to a depth of 6 ft., except for locations where obstructions prevented the borehole from advancing to 6 ft. bgs. Asbestos materials and/or asbestos fibers were detected in soil samples at 13 soil boring locations. An evaluation of the data and is presented in the Asbestos in Soil Survey Report (EPM Inc., August 17, 2023) in Appendix C.

4.5 Groundwater Quality

This section presents the results of the groundwater analyses conducted during the Phase II Investigation activities. Groundwater samples were collected from all the newly installed monitoring wells except MW-6I and MW-7I where NAPL was observed in the sump and/or well screen interval.

Groundwater quality data from the August 2023 sampling event are provided in Tables 5A through 5E and the exceedances of VOCs, SVOCs and metals are presented on Figures 24 through 26. The analytical results were compared to the New York State Class GA Groundwater Quality Criteria (i.e., the 6 NYCRR Part 703 Standards and guidance values from the Division of Water Technical and Operational Guidance Series [TOGS] 1.1.1) to provide a conservative point of reference. Compounds detected at concentrations exceeding Class GA Groundwater Quality Criteria during the August 2023 event were as follows:

- 1,2,4-Trimethylbenzene
- Benzene
- Ethylbenzene
- Isopropylbenzene (Cumene)
- Styrene
- Toluene
- Total Xylenes
- 2,4-Dimethylphenol
- 3/4-Methylphenol
- Acenaphthene
- Biphenyl (Diphenyl)
- Naphthalene
- Chrysene
- Fluorene
- Phenanthrene
- Arsenic
- Iron
- Magnesium
- Manganese
- Sodium

Benzene, toluene, ethylbenzene, xylenes, naphthalene, fluorene, phenanthrene and/or chrysene were detected at concentrations greater than the Class GA Groundwater Quality Criteria at wells screened in the intermediate and deep hydrostratigraphic zones at locations MW-5I, MW-5D, MW-6D and MW-7D in the western portion of the Site (see Figures 24 and 25). The source of these compounds is the NAPL (coal tar) that likely has migrated from the Former Citizens MGP site directly across the Gowanus Canal from the Site. As previously stated, MW-6I and MW-7I were not sampled due to the presence of NAPL in these monitoring wells. There were also exceedances of the Class GA Groundwater Quality Criteria in shallow water table monitoring wells including: ethylbenzene and isopropylbenzene at MW-05S; benzene, total xylenes and naphthalene at MW-06S and naphthalene at MW-7S. These monitoring wells are screened within the tidal fluctuation zone in the water table and these dissolved phase impacts are likely due to residuals in the smear zone or tidal fluctuation zone at these wells.

Use of contents on this sheet is subject to the limitations specified at the end of this document.
CSO-GC-SFS-DES-R-PHASE II INVESTIGATION-20250220.DOCX

The MW-04 well cluster is the farthest inland from the Gowanus Canal or the 6th Street Basin. Benzene was detected at MW-04I (screened in the intermediate hydrostratigraphic zone) above the Class GA Groundwater Quality Criteria. There were other low-level detections of ethylbenzene, toluene, total xylenes and naphthalene at this location. These compounds are likely related to the dissolved phase plume associated with the NAPL (coal tar) impacts observed in the intermediate hydrostratigraphic zone in the upper glacial sands just below the meadow mat. There were no detections of VOCs or SVOCs in the shallow, water table well, MW-04S.

One or more metals including arsenic, iron, magnesium, manganese and/or sodium exceeded the Class GA Groundwater Quality Criteria at each of the monitoring well sampled in August 2023. Figure 26 shows the concentration of metals in the water table and groundwater flow zones in the glacial outwash deposits investigated during the Phase II activities.

It should be noted that groundwater quality criteria are not directly applicable to evaluating treatment requirements for meeting discharge limits that are established for groundwater managed during excavation and dewatering operations.

4.6 Soil Vapor

Soil vapor samples were collected at two (OH-SV-06 and OH-SV-07) of the four planned sampling locations at the Site. The locations where a sample was not collected were inaccessible due to tenant activities.

The samples were submitted for laboratory analysis and the results are presented in Table 6. Currently, DEC has not established criteria or background levels for evaluating concentrations of compounds in soil vapor. The list below presents the compounds found in the soil vapor samples at concentrations above the laboratory detection limits.

The compounds detected include:

- Benzene
- Toluene
- Ethylbenzene
- Xylenes
- Ethanol
- tert-Butyl alcohol (TBA)
- Tetrachloroethene (PCE)
- Tetrahydrofuran
- Trichloroethene (TCE)
- Acetone
- N-Hexane
- Isopropanol
- N-heptane
- Carbon disulfide
- Carbon tetrachloride
- Cyclohexane
- Dichlorodifluoromethane (Freon 12)
- Trichlorofluoromethane (Freon 11)
- 1,3,5 – Trimethylbenzene
- 1,3 – Butadiene
- 1,3-Dichlorobenzene
- 1,2,4 - Trimethylbenzene
- 2,2,4 - Trimethylpentane
- 2-Butanone (MEK)
- Ethyl acetate
- 4-Ethyltoluene
- 4-Methyl-2-pentanone (MIBK)
- Chloroform
- Chloromethane
- Chloroethane

It may be appropriate to conduct a vapor intrusion study if indoor air quality is a concern for planned uses of the property.

Use of contents on this sheet is subject to the limitations specified at the end of this document.

Limitations

This document was prepared solely for New York City Department of Environmental Protection in accordance with professional standards at the time the services were performed and in accordance with the contract between New York City Department of Environmental Protection and HSBC dated April 29, 2021. This document is governed by the specific scope of work authorized by New York City Department of Environmental Protection; it is not intended to be relied upon by any other party except for regulatory authorities contemplated by the scope of work. We have relied on information or instructions provided by New York City Department of Environmental Protection and other parties and, unless otherwise expressly indicated, have made no independent investigation as to the validity, completeness, or accuracy of such information.

This document sets forth the results of certain services performed by HSBC with respect to the property or facilities described therein (the Property). New York City Department of Environmental Protection recognizes and acknowledges that these services were designed and performed within various limitations, including budget and time constraints. These services were not designed or intended to determine the existence and nature of all possible environmental risks (which term shall include the presence or suspected or potential presence of any hazardous waste or hazardous substance, as defined under any applicable law or regulation, or any other actual or potential environmental problems or liabilities) affecting the Property. The nature of environmental risks is such that no amount of additional inspection and testing could determine as a matter of certainty that all environmental risks affecting the Property had been identified. Accordingly, THIS DOCUMENT DOES NOT PURPORT TO DESCRIBE ALL ENVIRONMENTAL RISKS AFFECTING THE PROPERTY, NOR WILL ANY ADDITIONAL TESTING OR INSPECTION RECOMMENDED OR OTHERWISE REFERRED TO IN THIS DOCUMENT NECESSARILY IDENTIFY ALL ENVIRONMENTAL RISKS AFFECTING THE PROPERTY.

Further, HSBC makes no warranties, express or implied, with respect to this document, except for those, if any, contained in the agreement pursuant to which the document was prepared. All data, drawings, documents, or information contained this report have been prepared exclusively for the person or entity to whom it was addressed and may not be relied upon by any other person or entity without the prior written consent of HSBC unless otherwise provided by the Agreement pursuant to which these services were provided.

Use of contents on this sheet is subject to the limitations specified at the end of this document.

Notes
(1) - Soil was only retrieved from the upper 4 ft. at boring due to subsurface obstruction during hand clearing.
BGS - Below Ground Surface
ft. - Feet
NAPL - Non-Aqueous Phase Liquid
NAVD - North American Vertical Datum
(--) - Not Meaured

Notes:
Concentrations above NYSPART375UU are shaded gray
Concentrations above NYSPART375RR are boldfaced
Concentrations above NYSPART375C are italicized
< = method detection limit
mg/kg = milligram per kilogram
N = Normal sample
FD = Field Duplicate
ft = feet
J = The result is qualified as an estimated concentration or amount.
U = The result is not detected above the associated detection limit.
UJ = The result is not detected. The detection limit is estimated.
UR = The sample non-detection results is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

Notes:
Concentrations above NYSPART375UU are shaded gray
Concentrations above NYSPART375RR are boldfaced
Concentrations above NYSPART375C are italicized
< = method detection limit
mg/kg = milligram per kilogram
N = Normal sample
FD = Field Duplicate
ft = feet
J = The result is qualified as an estimated concentration or amount.
U = The result is not detected above the associated detection limit.
UJ = The result is not detected. The detection limit is estimated.
UR = The sample non-detection results is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

Notes:
Concentrations above NYSPART375UU are shaded gray
Concentrations above NYSPART375RR are boldfaced
Concentrations above NYSPART375C are italicized
< = method detection limit
mg/kg = milligram per kilogram
N = Normal sample
FD = Field Duplicate
ft = feet
J = The result is qualified as an estimated concentration or amount.
U = The result is not detected above the associated detection limit.
UJ = The result is not detected. The detection limit is estimated.
UR = The sample non-detection results is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

Notes:
Concentrations above NYSPART375UU are shaded gray
Concentrations above NYSPART375RR are boldfaced
Concentrations above NYSPART375C are italicized
< = method detection limit
mg/kg = milligram per kilogram
N = Normal sample
FD = Field Duplicate
ft = feet
J = The result is qualified as an estimated concentration or amount.
U = The result is not detected above the associated detection limit.
UJ = The result is not detected. The detection limit is estimated.
UR = The sample non-detection results is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

Notes:
Concentrations above NYSPART375UU are shaded gray
Concentrations above NYSPART375RR are boldfaced
Concentrations above NYSPART375C are italicized
< = method detection limit
mg/kg = milligram per kilogram
N = Normal sample
FD = Field Duplicate
ft = feet
J = The result is qualified as an estimated concentration or amount.
U = The result is not detected above the associated detection limit.
UJ = The result is not detected. The detection limit is estimated.
UR = The sample non-detection results is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

Notes:
Concentrations above NYSPART375UU are shaded gray
Concentrations above NYSPART375RR are boldfaced
Concentrations above NYSPART375C are italicized
< = method detection limit
mg/kg = milligram per kilogram
N = Normal sample
FD = Field Duplicate
ft = feet
J = The result is qualified as an estimated concentration or amount.
U = The result is not detected above the associated detection limit.
UJ = The result is not detected. The detection limit is estimated.
UR = The sample non-detection results is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

Notes:
ug/L = microgram per liter
J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
U - The analyte was analyzed for, but was not detected above the sample method detection limit.
UJ - The analyte was not detected above the sample method detection limit; and the method detection limit is approximate.
Concentrations above NYS703 are shaded gray
Concentrations above NYSTOGS are boldfaced

Notes:
ug/L = microgram per liter
J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
U - The analyte was analyzed for, but was not detected above the sample method detection limit.
UJ - The analyte was not detected above the sample method detection limit; and the method detection limit is approximate.
UR - The sample non-detection results is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.
Concentrations above NYS703 are shaded gray
Concentrations above NYSTOGS are boldfaced

Xylenes, m & p	ug/m3	6.78	38.1
Xylenes, total	ug/m3	NA	54.7

Notes:

< = Method Detection Limit (MDL)

ug/m3 = micrograms per meter cubed

NA = not analyzed

U = The analyte was analyzed for, but was not detected above the sample method detection limit.

UJ = The analyte was not detected above the sample method detection limit; and the reporting limit is approximate.

J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

TB_20230503	23E0181-04	5/03/2023	Water

Data validation was performed on the analytical data for eight (8) samples collected between May 1 and May 3, 2023 by Yu and associates at the Gowanus Site in New York. The samples were analyzed under the Environmental Protection Agency (USEPA) "Test Methods for Evaluating Solid Waste Physical/Chemical SW-846 Method" described below.

Specific method references are as follows:

Analysis	Method References
Semivolatile Organic Compounds (SVOCs)	USEPA SW-846 8270E
Volatile Organic Compounds (VOCs)	USEPA SW-846 8260D
Semivolatiles - Alkylated PAHs	USEPA SW-846 8270D-SIM
Pesticides	USEPA SW-846 8081B
Herbicides	USEPA SW-846 8151A
PCBs	USEPA SW-846 8082A
Metals	USEPA SW846 6010D
Mercury	USEPA 7473/245.1
Cyanide	USEPA SW846 9014
Free Cyanide	SM 4500NC-E(M)

Data were reviewed in accordance with the USEPA National Functional Guidelines (NFGs) listed below and appropriate method specific USEPA Region II Data Validation Standard Operating Procedures (SOPs). The USEPA NFGs were developed for the Contract Laboratory Program (CLP) methods and may not be applicable to the analytical methods and procedures utilized by the laboratory for this data set. Results were also qualified using analytical method criteria and the reviewer's professional judgement where specific guidance was not applicable.

- USEPA. National Functional Guidelines for Superfund Organics Methods Data Review. OLEM 9240.0-51, EPA 540-R-20-005, November 2020

- USEPA. National Functional Guidelines for Superfund Inorganics Methods Data Review. OLEM 9240.0-51, EPA 542-R-20-006, November 2020
- USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review. OSWER 9240.1-05A-A-P EPA540/R-99/008. October 1999
- USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review. OSWER 9240.1-45 EPA540/R-04/004. October 2004
- USEPA Contract Laboratory Program Region II Data Validation SOPs (HW-2, HW-22, HW-24, HW-44, HW-45)

The following items/criteria were reviewed for this report:

- Data Completeness
- Chain of Custody
- Holding times and sample preservation
- Field Duplicate Accuracy
- Internal Standard Area and RT
- Surrogates
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike and Matrix Spike Duplicate Samples
- Method and field blank contamination
- Laboratory Duplicate Samples
- Serial Dilution
- Initial and continuing calibration summaries
- Compound Quantitation
- Reporting Limits
- Sample comments and Quality Control Summaries

Overall Usability Issues:

- Overall, the data is acceptable for the intended purposes. Certain poor responding SVOC results were rejected due to major recovery issues associated with matrix spike/matrix spike duplicates and laboratory control samples. Minor analytical issues were found with the following data quality indicators resulting in qualified results: initial calibration, continuing calibration, surrogates, matrix spike/matrix spike duplicates, laboratory control samples, serial dilutions, and laboratory duplicates.

Chain of Custody:

- Aqua Protech Labs (APL) subcontracted alkylated PAHs and Free Cyanide analyses to Alpha laboratories.
- Sample OH-SB-50-1.0-2.0-20230501 on the chain of custody was logged in as OH-SB-50-1.0-2.0-05012023.
- Samples FB-20230502 and FB_20230503 were listed for Alkylated PAH analysis; these samples were not analyzed for this parameter.

Volatile Organic Compounds (VOCs)

Holding Times and Preservation

Method	Matrix	Holding Time	Preservation
VOCs by SW-846 8260D	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries except for the following analytes.

Method	Sample	Surrogate	Exceedance	Qualification	Reason Code
8260D	TB-20230502	4-Bromofluorobenzene	%R < CL	UJ	3L
	TB_20230503	4-Bromofluorobenzene	%R < CL	UJ	3L

Laboratory Control Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS analysis exhibited acceptable recoveries except for the following analytes.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8260D	FB-20230502 FB_20230503 TB_20230503	Bromomethane	%R < CL	UJ	6L

- Compounds not listed were above control limits; where LCS/LCSD percent differences were above control limits and associated samples results were non-detect, qualification was not warranted.

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- MS/MSD analysis was not performed on samples evaluated in this report.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- All recoveries and/or correlation coefficient criteria were met.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- ICVs and CCVs were within the specified control limits with the following exceptions.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8260D	0H-SB-50-1.0-2.0-05012023	1,2-Dibromo-3-chloropropane	ICV %D > 20% (decrease in response)	UJ	SL
	FB-20230502	2-Butanone Bromomethane Chloromethane Dichlorodifluoromethane trans-1,3-Dichloropropene			
	TB-20230502	1,2,3-Trichlorobenzene 1,2,4-Trichlorobenzene			
	0H-SB-52-1.0-2.0-20230502	1,2-Dibromo-3-chloropropane 2-Butanone Acetone Dichlorodifluoromethane			
	0H-SB-51_1.0-2.0_20230503 0H-SB-60-1.0-2.0_20230503	Dichlorodifluoromethane			

- Compounds not listed were above control limits; where CCV percent differences were above control limits and associated samples results were non-detect, qualification was not warranted.

Reporting Limits and Compound Quantitation

GC/MS analysis utilizes retention time and mass spectra criteria to identify detected results.

- All identified compounds met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.

Semivolatile Organic Compounds (SVOCs)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
SVOCs by SW-846 8270E and 8270D-SIM	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

- All samples were received properly preserved and holding times were achieved for all analyses.

Method, Trip, and Field Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination with the following exception: The method blank associated with Sample OH-SB-52-1.0-2.0-20230502 had a TIC detection of Hexadecanoic acid, butyl ester. The sample detection was less than five times the method blank detection and qualified as rejected, reason code 2.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries for all samples.

Laboratory Control Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS analysis exhibited acceptable recoveries.

Method	Sample	Surrogate	Exceedance	Qualification	Reason Code
8270E	OH-SB-51_1.0-2.0_20230503 OH-SB-60-1.0-2.0_20230503	2,4-Dinitrophenol	%R < 10%	R (non-detects) J (detects)	6L

- Compounds associated with OH-SB-52-1.0-2.0-20230502 were above control limits; where LCS/LCSD percent differences were above control limits and associated samples results were non-detect, qualification was not warranted.

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- MS/MSD analysis exhibited acceptable recoveries except for the analytes presented in the following table.

Method	Sample	Analytes	Exceedance	Qualification	Reason Code
8270E	OH-SB-50-1.0-2.0-05012023	2,4-Dinitrophenol 3,3'-Dichlorobenzidine 4,6-Dinitro-2-methylphenol	%R < 10%	R (non-detects) J (detects)	4L
		Benzo(a)anthracene Benzo(a)pyrene Chrysene	%R < CL	UJ/J	4L
	OH-SB-51_1.0-2.0_20230503	2,4-Dinitrophenol 3,3'-Dichlorobenzidine 4,6-Dinitro-2-methylphenol Hexachlorocyclopentadiene	%R < 10%	R (non-detects) J (detects)	4L
		Phenanthrene Acenaphthene Anthracene Benzo(a)anthracene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(g,h,i)perylene Carbazole Chrysene Dibenzofuran Fluoranthene Fluorene Naphthalene Pyrene	%R > CL	J	4H

- Other analytes exhibited recoveries outside control limits; however, the sample concentration exceeds the spike concentration by a factor and therefore no qualification was required.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% RPD is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- All recoveries and/or correlation coefficient criteria were met with the following exceptions.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8270D-SIM	0H-SB-50-1.0-2.0-05012023 0H-SB-52-1.0-2.0-20230502 0H-SB-51_1.0-2.0_20230503 0H-SB-60-1.0-2.0_20230503	Benz[a]anthracene	%RSD >20%	UJ/J	Q
		Perylene			
		Indeno[1,2,3-cd]pyrene			
		Dibenz[ah] & [a,c]anthracene			
		Benzo[g,h,i]perylene			

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- ICVs and CCVs were within the specified control limits with the following exceptions.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8270E	0H-SB-50-1.0-2.0-05012023	1,4-Dioxane Benzaldehyde 4-Chloroaniline bis(2-chloroisopropyl)ether Hexachlorocyclopentadiene Pentachlorophenol	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL
	0H-SB-52-1.0-2.0-20230502	4-Nitrophenol Benzaldehyde Hexachlorocyclopentadiene Pentachlorophenol	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL
	FB-20230502	4-Nitrophenol Benzaldehyde Hexachlorocyclopentadiene			
	0H-SB-51_1.0-2.0_20230503 0H-SB-60-1.0-2.0_20230503	1,4-Dioxane 4-Chloroaniline Benzaldehyde bis(2-chloroisopropyl)ether Hexachlorocyclopentadiene bis(2-chloroethoxy)methane Phenol			
	FB_20230503	4-Nitrophenol Benzaldehyde Hexachlorocyclopentadiene			
8270D-SIM	0H-SB-50-1.0-2.0-05012023 0H-SB-52-1.0-2.0-20230502 0H-SB-51_1.0-2.0_20230503 0H-SB-60-1.0-2.0_20230503	Indeno[1,2,3-cd]pyrene			

- Other compounds not listed were above control limits; where CCV percent differences were above control limits and associated samples results were non-detect, qualification was not warranted.

Reporting Limits and Compound Quantitation

- Compounds detections met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T. Some samples were diluted due to elevated SVOC concentrations and elevated reporting limits are provided.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Mass Spectrometer tuning criteria was within control limits.
- Overall system performance was acceptable.

GC Methods (PCBs, Pesticides, Herbicides)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8081B (Pesticides), 8082A (PCBs) and 8151A (Herbicides)	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. GC analyses requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries except for the following analytes.

Method	Sample	Surrogate	Exceedance	Qualification	Reason Code
8082A	OH-SB-51_1.0-2.0_20230503 OH-SB-60-1.0-2.0_20230503	Decachlorobiphenyl	%R < CL	J (Detects) UJ (NDs)	3L
	OH-SB-51_1.0-2.0_20230503	Decachlorobiphenyl	%R > CL	J (Detects) No action (NDs)	3H
	OH-SB-52-1.0-2.0-20230502				
8081B	OH-SB-51_1.0-2.0_20230503 OH-SB-60-1.0-2.0_20230503	Decachlorobiphenyl	%R > CL	J (Detects) No action (NDs)	3H

Laboratory Control Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS analysis exhibited acceptable recoveries.

Method	Sample	Surrogate	Exceedance	Qualification	Reason Code
8081B	OH-SB-51_1.0-2.0_20230503 OH-SB-60-1.0-2.0_20230503	Endosulfan II	%R < CL	UJ	6L

- Other compounds not listed were above control limits; where LCS/LCSD percent differences were above control limits and associated samples results were non-detect, qualification was not warranted.

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- MS/MSD analysis was not performed on samples evaluated in this report.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99.

- All recoveries and/or correlation coefficient criteria were met.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed.

- ICVs and CCVs were within the specified control limits with the following exceptions.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8082A	0H-SB-50-1.0-2.0-05012023 0H-SB-52-1.0-2.0-20230502	Aroclor 1016	CCV %D > 20% (increase in response)	J (detects)	SH

- Other compounds not listed were above control limits; however, where CCV percent differences were above control limits and associated samples results were non-detect, qualification was not warranted.

Reporting Limits and Compound Quantitation

- Compounds detections met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.
- Dual column comparison was not provided as part of the data package.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Overall system performance was acceptable.

Metals and General Chemistry

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
Metals by SW-846 601D	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to <6 °C.
Mercury by SW-846 7473	Soil	28 days from collection to analysis	Cool to <6 °C.
Mercury by EPA 245.1	Water	28 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.
Cyanide by SW-846 9014	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
	Soil	14 days from collection to analysis	Cool to <6 °C.
Cyanide by SM 4500CN-E(M)	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
	Soil	14 days from collection to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks - Method, Trip, Field, ICBs and CCBs

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- Method 7473: CCBs had detections that were less than five times the associated sample concentration. No qualification was required.

Laboratory Control Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS analysis exhibited acceptable recoveries except for the following analytes.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
6010D	OH-SB-52-1.0-2.0-20230502	Thallium	%R < CL	UJ	6L
6010D	OH-SB-51_1.0-2.0_20230503 OH-SB-60-1.0-2.0_20230503	Silver	%R < CL	J/UJ	6L

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- MS/MSD analysis exhibited acceptable recoveries except for the analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
6010D	OH-SB-50-1.0-2.0-05012023	Aluminum	%R < CL	UJ/J	4L
		Antimony	%R < CL	UJ/J	4L
		Beryllium	%R < CL	UJ/J	4L
		Chromium	%R > CL	J (detects)	4H
		Iron	%R < CL	UJ/J	4L
		Magnesium	%R > CL	J (detects)	4H
		Nickel	%R < CL	UJ/J	4L
		Potassium	%R < CL	UJ/J	4L
		Selenium	%R < CL	UJ/J	4L
		Silver	%R < CL	UJ/J	4L
		Thallium	%R < CL	UJ/J	4L
		Vanadium	%R > CL	J (detects)	4H

- Other analytes exhibited recoveries outside control limits; however, the sample concentration exceeds the spike concentration by a factor and therefore no qualification was required.

Laboratory Duplicate

Laboratory duplicate analysis measures precision of the analytical method. The relative percent difference (RPD) is measured between parent and duplicate sample results. The Laboratory duplicate RPDs must be within laboratory-established acceptance limits.

- The laboratory duplicate analysis performed on OH-SB-50-1.0-2.0-05012023 exhibited recoveries outside control limits for chromium and magnesium. Associated sample detections are qualified as estimated, J, reason code D.

Serial Dilution

The serial dilution analysis indicates the presence matrix interferences. Sample results greater than 50 times the MDL are evaluated, and percent difference (%D) is measured between undiluted and diluted sample results. A control limit of 20% is applied.

- The serial dilution analysis performed on OH-SB-50-1.0-2.0-05012023 exhibited recoveries outside control limits for sodium. Associated sample detections are qualified as estimated, J, reason code AA.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Initial Calibration and Continuing Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. Continuing calibration standards are used to assess calibration drift.

- ICVs and CCVs were within the specified control limits.

Reporting Limits and Analyte Quantitation

- Analyte detections met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Overall system performance was acceptable.

Data Qualifiers

J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

UJ = The analyte was not detected above the sample reporting limit; and the reporting limit is approximate.

U = The analyte was analyzed for but was not detected above the method detection limit.

R = The sample results is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

Reason Codes

1	Holding time violation
2	Method blank contamination
3	Surrogate recovery
4	MS/MSD recovery
5	MS/MSD precision outside limits
6	LCS recovery
7	Field blank contamination
8	Field duplicate precision outside limits
9	Other deficiencies (including cooler temperature)
A	Absence of supporting QC
S	ICV, CCV or column performance check problem
Y	Initial and continuing calibration blank problem
M	Interference check samples problem
O	Post digestion spike outside of 85-115%
F	MSA correlation coefficient <0.995, or MSA not done
AA	Serial dilution problem
K	DFTPP or BFB tuning problem
Q	Initial calibration problem
X	Internal standard recovery problem
V	Second source standard calibration verification problem
L	Low bias
Z	Retention time problem
N	Counting time error (radionuclide chemistry)
W	Detector instability (radionuclide chemistry)
C	Co-elution of compounds
E	Value exceeds linear calibration range
I	Interferences present during analysis
T	Trace level compound, poor quantitation
P	1C/2C precision outside limits
B	LCS/LCSD precision outside limits
D	Lab Dup/Rep precision outside limits
H	High bias

Polychlorinated Biphenyls (PCBs):

Gas Chromatography/Electron Capture Detector

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 608.3, Method 8082A.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8082A.

General Chemistry Methods:

Various general chemistry methods are taken from "Standard Methods for the Examination of Water and Wastewater, 19th Edition".

Specific method citations can be found on the Analytical Results Summary page of this report listed under 'Method'.

** A complete list of APL's certified Methods are accessible on the Standards And Docs page of the Results Retrieval System

MDL:

Method Detection Limit. The minimum reportable concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. The value is calculated from the analysis of seven replicates of a spike sample. On analytical reports this value is corrected for percent moisture and any concentration or dilution factors.

RL:

Reporting Limit. The Concentration of the lowest calibration standard that was included in the initial calibration of the instrument. On analytical reports this value is corrected for percent moisture and any concentration or dilution factors.

Concentration (Conc) / Result:

If the compound is detected, the measured concentration is reported. If this column is left blank, or contains a 'less than' (<) symbol, the compound was not detected.

Tentatively Identified Compound (TIC):

A TIC is a non-targeted compound, not included in the calibration, identified by a mass spectral library search.

Qualifiers:

- **U:** Indicates the compound was analyzed for but was not detected.
- **J:** Indicates an estimated value. All tentatively identified compounds (TICs) and results below the RL receive this qualifier.
- **B:** Indicates the analyte was found in the method blank as well as the sample.
- **N:** Used when reporting a specific tentatively identified compound.
- **E:** Indicates that the concentration of the compound exceeds the calibration range of the instrument. The results of a diluted analysis will also be reported. The results of the dilution should be used for those compounds exceeding the calibration range in the undiluted analysis.

QUALITY CONTROL
Conformance/Non-Conformance Summary

ANALYSIS: INORGANICS [6010D / 7473 / 9014]

Method 6010D:
The percent recoveries for several metals were outside of the QC limits for the matrix spikes and matrix spike duplicates (low and high). The blank spikes met all QC criteria.

Methods 7473 / 9014:
Sample 23E0029-01 met all QC criteria.

ANALYSIS: Herbicides [8151A]

Sample 23E0029-01 met all QC criteria.

ANALYSIS: PCBs [8082A]

Sample 23E0029-01 met all QC criteria.

ANALYSIS: PESTICIDES [8081B]

Sample 23E0029-01 has one surrogate (Decachlorobiphenyl [2C]) outside of the QC limits (high), due to matrix interference.

ANALYSIS: VOLATILES BY GC/MS [8260D]

The continuing calibration (SAE0086-CCV1) was outside of the QC limits for some compounds (low and high).

The percent recoveries for some compounds were outside of the QC limits for the matrix spike and matrix spike duplicate (low). The blank spike met all QC criteria.

ANALYSIS: SEMI-VOLATILES BY GC/MS [8270E]

The continuing calibrations were outside of the QC limits for some compounds (low and high).

The percent recoveries for some compounds were outside of the QC limits for the matrix spike and matrix spike duplicate (low). The blank spike met all QC criteria.

ND, U - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

By signing this Chain of Custody Agreement, customer expressly agrees to pay APL for all charges, reasonably incurred in connection with analysis and reporting for these samples

Extractable Petroleum Hydrocarbons:

Gas Chromatography/Flame Ionization Detector

New Jersey Department of Environmental Protection Site Remediation Program Extractable Petroleum Hydrocarbons Methodology (Version 3.0).
USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8015B or NJDEP Office of Quality Assurance Quantitation of Semi-Volatile Petroleum Products in Water, Soil and Sediment OQA-QAM-025, Revision 6.

Metals:

Inductively-Coupled Plasma Atomic Emission Spectrometry or Inductively-Coupled Plasma Mass Spectroscopy

Wastewater and Groundwater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 200.7, Method 200.8.
Soil Samples: USEPA Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 6010D.

Mercury:

Cold Vapor Atomic Absorption Spectrometry

Wastewater and Groundwater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 245.1.
Soil Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 7471B.

Volatile Organic Compounds:

Purge and Trap Gas Chromatography/Mass Spectroscopy

Drinking Water Samples: USEPA Methods for the Determination of Organic Compounds in Drinking Water, Method 524.2.
Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 624.1, Method 8260C.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8260C.

Semi-Volatile Organic Compounds:

Gas Chromatography/Mass Spectroscopy

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 625.1, Method 8270D.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8270D.

PFAS Compounds:

Liquid Chromatography/Tandem Mass Spectroscopy

Drinking Water Samples: USEPA Methods for the Determination of Selected Perfluorinated Alkyl Acids in Drinking Water by Solid Phase Extraction and Liquid Chromatography/Tandem Mass Spectrometry (LC/MS/MS), Method 537.

Pesticides:

Gas Chromatography/Electron Capture Detector

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 608.3, Method 8081B.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8081B.

Polychlorinated Biphenyls (PCBs):

Gas Chromatography/Electron Capture Detector

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 608.3, Method 8082A.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8082A.

General Chemistry Methods:

Various general chemistry methods are taken from "Standard Methods for the Examination of Water and Wastewater, 19th Edition".

Specific method citations can be found on the Analytical Results Summary page of this report listed under 'Method'.

** A complete list of APL's certified Methods are accessible on the Standards And Docs page of the Results Retrieval System

MDL:

Method Detection Limit. The minimum reportable concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. The value is calculated from the analysis of seven replicates of a spike sample. On analytical reports this value is corrected for percent moisture and any concentration or dilution factors.

RL:

Reporting Limit. The Concentration of the lowest calibration standard that was included in the initial calibration of the instrument. On analytical reports this value is corrected for percent moisture and any concentration or dilution factors.

Concentration (Conc) / Result:

If the compound is detected, the measured concentration is reported. If this column is left blank, or contains a 'less than' (<) symbol, the compound was not detected.

Tentatively Identified Compound (TIC):

A TIC is a non-targeted compound, not included in the calibration, identified by a mass spectral library search.

Qualifiers:

- **U:** Indicates the compound was analyzed for but was not detected.
- **J:** Indicates an estimated value. All tentatively identified compounds (TICs) and results below the RL receive this qualifier.
- **B:** Indicates the analyte was found in the method blank as well as the sample.
- **N:** Used when reporting a specific tentatively identified compound.
- **E:** Indicates that the concentration of the compound exceeds the calibration range of the instrument. The results of a diluted analysis will also be reported. The results of the dilution should be used for those compounds exceeding the calibration range in the undiluted analysis.

QUALITY CONTROL
Conformance/Non-Conformance Summary

ANALYSIS: INORGANICS [6010D / 200.7 / 7473 / 245.1 / 9014 / SM 4500-CN C-16 plus E-16 / SM 4500-CN C-16 plus G-16]

Method 6010D:
The percent recovery for Thallium was outside of the QC limits for the blank spike (low).
The percent recoveries for several metals were outside of the QC limits for the matrix spikes and matrix spike duplicates (low and high).

Methods 200.7 / 7473 / 245.1 / 9014 / SM 4500-CN C-16 plus E-16 / SM 4500-CN C-16 plus G-16:
All samples met the QC criteria.

ANALYSIS: Herbicides [8151A]

All samples met the QC criteria.

ANALYSIS: PCBs [8082A]

Sample 23E0109-02 (FB) has one surrogate (Decachlorobiphenyl [2C]) outside of the QC limits (low).

ANALYSIS: PESTICIDES [8081B]

Sample 23E0109-01 has one surrogate (Decachlorobiphenyl) outside of the QC limits (high), due to matrix interference.

ANALYSIS: VOLATILES BY GC/MS [8260D]

The continuing calibrations were outside of the QC limits for some compounds (low and high).

The percent recovery for Bromomethane was outside of the QC limits for the blank spike duplicate (low).

Sample 23E0109-03 (TB) has one surrogate (4-Bromofluorobenzene) outside of the QC limits (slightly low).

ANALYSIS: SEMI-VOLATILES BY GC/MS [8270E]

The continuing calibrations were outside of the QC limits for some compounds (low and high).

ND, U - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

All Results Summary

Extractable Petroleum Hydrocarbons:

Gas Chromatography/Flame Ionization Detector

New Jersey Department of Environmental Protection Site Remediation Program Extractable Petroleum Hydrocarbons Methodology (Version 3.0).
USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8015B or NJDEP Office of Quality Assurance Quantitation of Semi-Volatile Petroleum Products in Water, Soil and Sediment OQA-QAM-025, Revision 6.

Metals:

Inductively-Coupled Plasma Atomic Emission Spectrometry or Inductively-Coupled Plasma Mass Spectroscopy

Wastewater and Groundwater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 200.7, Method 200.8.
Soil Samples: USEPA Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 6010D.

Mercury:

Cold Vapor Atomic Absorption Spectrometry

Wastewater and Groundwater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 245.1.
Soil Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 7471B.

Volatile Organic Compounds:

Purge and Trap Gas Chromatography/Mass Spectroscopy

Drinking Water Samples: USEPA Methods for the Determination of Organic Compounds in Drinking Water, Method 524.2.
Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 624.1, Method 8260C.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8260C.

Semi-Volatile Organic Compounds:

Gas Chromatography/Mass Spectroscopy

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 625.1, Method 8270D.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8270D.

PFAS Compounds:

Liquid Chromatography/Tandem Mass Spectroscopy

Drinking Water Samples: USEPA Methods for the Determination of Selected Perfluorinated Alkyl Acids in Drinking Water by Solid Phase Extraction and Liquid Chromatography/Tandem Mass Spectrometry (LC/MS/MS), Method 537.

Pesticides:

Gas Chromatography/Electron Capture Detector

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 608.3, Method 8081B.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8081B.

Polychlorinated Biphenyls (PCBs):

Gas Chromatography/Electron Capture Detector

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 608.3, Method 8082A.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8082A.

General Chemistry Methods:

Various general chemistry methods are taken from "Standard Methods for the Examination of Water and Wastewater, 19th Edition".

Specific method citations can be found on the Analytical Results Summary page of this report listed under 'Method'.

** A complete list of APL's certified Methods are accessible on the Standards And Docs page of the Results Retrieval System

MDL:

Method Detection Limit. The minimum reportable concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. The value is calculated from the analysis of seven replicates of a spike sample. On analytical reports this value is corrected for percent moisture and any concentration or dilution factors.

RL:

Reporting Limit. The Concentration of the lowest calibration standard that was included in the initial calibration of the instrument. On analytical reports this value is corrected for percent moisture and any concentration or dilution factors.

Concentration (Conc) / Result:

If the compound is detected, the measured concentration is reported. If this column is left blank, or contains a 'less than' (<) symbol, the compound was not detected.

Tentatively Identified Compound (TIC):

A TIC is a non-targeted compound, not included in the calibration, identified by a mass spectral library search.

Qualifiers:

- **U:** Indicates the compound was analyzed for but was not detected.
- **J:** Indicates an estimated value. All tentatively identified compounds (TICs) and results below the RL receive this qualifier.
- **B:** Indicates the analyte was found in the method blank as well as the sample.
- **N:** Used when reporting a specific tentatively identified compound.
- **E:** Indicates that the concentration of the compound exceeds the calibration range of the instrument. The results of a diluted analysis will also be reported. The results of the dilution should be used for those compounds exceeding the calibration range in the undiluted analysis.

QUALITY CONTROL
Conformance/Non-Conformance Summary

ANALYSIS: INORGANICS [6010D / 200.7 / 7473 / 245.1 / 9014 / SM 4500-CN C-16 plus E-16]

Method 6010D:
The percent recovery for Silver was outside of the QC limits for the blank spike (slightly low).
The percent recoveries for several metals were outside of the QC limits for the matrix spike and matrix spike duplicate (low and high).

Methods 200.7 / 7473 / 245.1 / 9014 / SM 4500-CN C-16 plus E-16:
All samples met the QC criteria.

ANALYSIS: Herbicides [8151A]

All samples met the QC criteria.

ANALYSIS: PCBs [8082A]

Samples 23E0181-01 and -02 have one surrogate (Decachlorobiphenyl) outside of the QC limits (low), due to matrix interferences.
Sample 23E0109-03 (FB) has one surrogate (Decachlorobiphenyl [2C]) outside of the QC limits (slightly low).

ANALYSIS: PESTICIDES [8081B]

The percent recoveries for several compounds were outside of the QC limits for the blank spike, matrix spike, and matrix spike duplicate (low and high).

Samples 23E0181-01 and -02 have one surrogate (Decachlorobiphenyl [2C]) outside of the QC limits (high), due to matrix interferences.

ANALYSIS: VOLATILES BY GC/MS [8260D]

The continuing calibration (SAE0235-CCV1) was outside of the QC limits for Dichlorodifluoromethane (low).

The percent recovery for Bromomethane was outside of the QC limits for the blank spike duplicate (low).

Sample 23E0819-04 (TB) has one surrogate (4-Bromofluorobenzene) outside of the QC limits (slightly low).

ANALYSIS: SEMI-VOLATILES BY GC/MS [8270E]

The continuing calibrations were outside of the QC limits for some compounds (low and high).

The percent recoveries for some compounds were outside of the QC limits for the blank spike, matrix spike, and matrix spike duplicate (low and high).

ND, U - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

ND, U - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard

D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

2,4-Dinitrotoluene	ND	U	0.108	2.00	ug/L	1	5/12/23 22:34	

ND, U - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

SW 846 8260D - Volatile Organics - GC/MS - VO+15 - TIC

Tentitively Identified Compound	Est Conc	RT	Qual	Units	Dilution	Analyzed
No TICs Found			U			

ND, U - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

DATA USABILITY SUMMARY REPORT
GOWANUS FORMER SITE

Client: Brown and Caldwell, Albany, New York
SDGs: L2325085 and 23E0281
Laboratory: Aqua Pro-tech Laboratories, Fairfield, New Jersey
Site: Gowanus, NY
Date: October 18, 2023

Client Sample ID	Laboratory Sample ID	Date Collected	Matrix
OH-SB-58_2.0-3.0-20230504	23E0281-01	05/04/2023	Soil
FB-20230504	23E0281-02	05/04/2023	Water
TB-20230504	23E0281-03	05/04/2023	Water
OH-SB-58_3.0-4.0-20230504	23E0281-04	05/04/2023	Soil
OH-SB-53_1.0-2.0-20230504	23E0281-05	05/04/2023	Soil
OH-SB-53_3.0-4.0-20230504	23E0281-06	05/04/2023	Soil

Data validation was performed on the analytical data for six (6) samples collected on May 4, 2023, by Yu and associates at the Gowanus Site in New York. The samples were analyzed under the Environmental Protection Agency (USEPA) "Test Methods for Evaluating Solid Waste Physical/Chemical SW-846 Method" described below.

Specific method references are as follows:

Analysis	Method References
Semivolatile Organic Compounds (SVOCs)	USEPA SW-846 8270E
Volatile Organic Compounds (VOCs)	USEPA SW-846 8260D
Semivolatiles - Alkylated PAHs	USEPA SW-846 8270D-SIM
Pesticides	USEPA SW-846 8081B
Herbicides	USEPA SW-846 8151A
PCBs	USEPA SW-846 8082A
Metals	USEPA SW846 6010D
Mercury	USEPA 7473/245.1
Cyanide	USEPA SW846 9014
Free Cyanide	SM 4500NC-E(M)

Data were reviewed in accordance with the USEPA National Functional Guidelines (NFGs) listed below and appropriate method specific USEPA Region II Data Validation Standard Operating Procedures (SOPs). The USEPA NFGs were developed for the Contract Laboratory Program (CLP) methods and may not be applicable to the analytical methods and procedures utilized by the laboratory for this data set. Results were also qualified using analytical method criteria and the reviewer's professional judgement where specific guidance was not applicable.

- USEPA Contract Laboratory Program Region II Data Validation SOPs (HW-2, HW-22, HW-24, HW-44, HW-45)

The following items/criteria were reviewed for this report:

- Data Completeness
- Chain of Custody
- Holding times and sample preservation
- Field Duplicate Accuracy
- Internal Standard Area and RT
- Surrogates
- Laboratory Control Sample (LCS) recoveries
- Matric Spike and Matrix Spike Duplicate Samples
- Method and field blank contamination
- Laboratory Duplicate Samples
- Serial Dilution
- Initial and continuing calibration summaries
- Compound Quantitation
- Reporting Limits
- Sample comments and Quality Control Summaries

Overall Usability Issues:

- Overall, the data is acceptable for the intended purposes. Minor analytical issues were found with the following data quality indicators resulting in qualified results: initial calibration, continuing calibration, surrogates, laboratory control samples, and method blank.

Chain of Custody:

- Aqua Protech Labs (APL) subcontracted alkylated PAHs and Free Cyanide analyses to Alpha laboratories.
- Sample FB-20230504 was listed for Alkylated PAH analysis; this sample was not analyzed for this parameter.

Volatile Organic Compounds (VOCs)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
VOCs by SW-846 8260D	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Surrogate	Exceedance	Qualification	Reason Code
8260D	FB-20230504 TB-20230504	4-Bromofluorobenzene	%R < CL	UJ	3L

Laboratory Control Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS/LCSD analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8260D	FB-20230504	1,2,4-Trichlorobenzene	%R < CL	UJ	6L
	TB-20230504	Bromomethane	%R < CL	UJ	6L

- Compounds not listed were above control limits; where LCS/LCSD percent differences were above control limits and associated samples results were non-detect, qualification was not warranted.

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- MS/MSD analysis was not performed on samples evaluated in this report.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- ICVs and CCVs were within the specified control limits except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8260D	FB-20230504	1,2,4-Trichlorobenzene	CCV %D > 20% (decrease in response)	UJ	SL
	OH-SB-58_2.0-3.0-20230504 OH-SB-58_3.0-4.0-20230504	Dichlorodifluoromethane			
	OH-SB-53_1.0-2.0-20230504 OH-SB-53_3.0-4.0-20230504	Acetone Dichlorodifluoromethane			

- Compounds not listed were above control limits; where CCV percent differences were above control limits and associated samples results were non-detect, qualification was not warranted.

Reporting Limits and Compound Quantitation

- Analyte detections met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Mass Spectrometer tuning criteria was within control limits.
- Overall system performance was acceptable.

Semivolatile Organic Compounds (SVOCs)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
SVOCs by SW-846 8270E and 8270D-SIM	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

- All QA/QC blanks were free of contamination with the following exception: The method blank associated with soil samples had TIC detections of Hexadecanoic acid, butyl ester and Octadecanoic acid, butyl ester. The sample detections were less than five times the method blank detection and qualified as rejected, reason code 2.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries for all samples.

Laboratory Control Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS analysis exhibited acceptable recoveries.

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- MS/MSD analysis was not performed on samples evaluated in this report.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% RPD is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample

results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- All recoveries and/or correlation coefficient criteria were met except for benzaldehyde which exhibited a correlation coefficient below the control limit. Associated non-detections were qualified as estimated, UJ, reason code Q.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8270D-SIM	OH-SB-58_2.0-3.0-20230504 OH-SB-58_3.0-4.0-20230504 OH-SB-53_1.0-2.0-20230504 OH-SB-53_3.0-4.0-20230504	Benz[a]anthracene	%RSD >20%	UJ/J	Q
		Perylene			
		Indeno[1,2,3-cd]pyrene			
		Dibenz[ah] & [a,c]anthracene			
		Benzo[g,h,i]perylene			

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- ICVs and CCVs were within the specified control limits except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8270D-SIM	0H-SB-58_2.0-3.0-20230504	Naphthalene	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL
8270E	0H-SB-58_2.0-3.0-20230504	1,4-Dioxane Benzaldehyde 4-Chloroaniline bis(2-chloroisopropyl)ether Hexachlorocyclopentadiene Pentachlorophenol	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL
	0H-SB-58_3.0-4.0-20230504 0H-SB-53_1.0-2.0-20230504 0H-SB-53_3.0-4.0-20230504	Benzaldehyde	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL
	FB-20230504	4-Nitrophenol Benzaldehyde Hexachlorocyclopentadiene	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL

- Other compounds not listed were above control limits; where CCV percent differences were above control limits and associated samples results were non-detect, qualification was not warranted.
- The SVOC Tune Summary and CCV summary were missing for Sequence SAE0273, which affects samples 23E0281-04, 23E0281-05 and 23E0281-06. This information was later provided by the laboratory and evaluated as a calibration addendum

Reporting Limits and Compound Quantitation

- Analyte detections met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T. Some samples were diluted due to elevated SVOC concentrations and elevated reporting limits are provided.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Mass Spectrometer tuning criteria was within control limits.
- Overall system performance was acceptable.

GC Methods (PCBs, Pesticides, Herbicides)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8081B (Pesticides), 8082A (PCBs) and 8151A (Herbicides)	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

- Method 8082: Surrogates exhibited acceptable recoveries except for the following: Decachlorobiphenyl associated with sample OH-SB-58_3.0-4.0-20230504 was below control limits on the primary column. Associated non-detect results are qualified as estimated, UJ, reason code 3L.
- Method 8081: Surrogates exhibited acceptable recoveries except for the following: Decachlorobiphenyl recoveries associated with all soil samples were above control limits on the secondary column. Associated samples results were non-detect, except one detection for 4,4'-DDE reported from the primary column.

Laboratory Control Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Surrogate	Exceedance	Qualification	Reason Code
8081B	OH-SB-58_2.0-3.0-20230504 OH-SB-58_3.0-4.0-20230504 OH-SB-53_1.0-2.0-20230504 OH-SB-53_3.0-4.0-20230504	Endosulfan II	%R < CL	UJ	6L

- Other compounds not listed were above control limits; where LCS/LCSD percent differences were above control limits and associated samples results were non-detect, qualification was not warranted.

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- MS/MSD analysis was not performed on samples evaluated in this report.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- CCVs exhibited compounds above control limits; however, associated samples results were non-detect, and qualification was not warranted.

- The original lab report had issues affecting how pesticide and PCB calibration factors were reported in the CCV summaries. That information was later corrected and provided as an addendum to the data package.

Reporting Limits and Compound Quantitation

GC methods utilizes retention time and dual column analysis to identify detected results. When dual column analysis is performed the percent difference (%D) of detected sample results must be less than 25%.

- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.
- Dual column comparison was not provided as part of the data package.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Overall system performance was acceptable.

Metals and General Chemistry

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
Metals by SW-846 601D	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to <6 °C.
Mercury by SW-846 7473	Soil	28 days from collection to analysis	Cool to <6 °C.
Mercury by EPA 245.1	Water	28 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.
Cyanide by SW-846 9014	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
	Soil	14 days from collection to analysis	Cool to <6 °C.
Cyanide by SM 4500CN-E(M)	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
	Soil	14 days from collection to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks - Method, Trip, Field, ICBs and CCBs

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination with the following exception: The method blank associated soil samples had detections for aluminum and iron. Sample detections are greater than five times the detections in the method blank. No qualification was required.
- The field blank was logged in for ICP analysis but was mistakenly analyzed by ICP-MS (EPA 200.8) for certain metals. The full analysis by ICP (EPA 200.7) was later provided by the laboratory and evaluated as an addendum to the report.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
6010D	OH-SB-58_2.0-3.0-20230504 OH-SB-58_3.0-4.0-20230504 OH-SB-53_1.0-2.0-20230504 OH-SB-53_3.0-4.0-20230504	Silver	%R < CL	UJ	6L

6010D	FB-20230504	Aluminum	%R > CL	ND (No Action)	NA
		Iron	%R > CL	ND (No Action)	NA

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- MS/MSD analysis was not performed on samples evaluated in this report.

Laboratory Duplicate

Laboratory duplicate analysis measures precision of the analytical method. The relative percent difference (RPD) is measured between parent and duplicate sample results. The Laboratory duplicate RPDs must be within laboratory-established acceptance limits.

- A laboratory duplicate analysis was not performed.

Serial Dilution

The serial dilution analysis indicates the presence matrix interferences. Sample results greater than 50 times the MDL are evaluated, and percent difference (%D) is measured between undiluted and diluted sample results. A control limit of 20% is applied.

- The serial dilution analysis was not performed on samples evaluated in this report.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Initial Calibration and Continuing Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. Continuing calibration standards are used to assess calibration drift.

- ICVs and CCVs were within the specified control limits.

Reporting Limits and Compound Quantitation

- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Overall system performance was acceptable.

Please contact the undersigned if you have any questions or need further information.

Data Qualifiers

J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

UJ = The analyte was not detected above the sample reporting limit; and the reporting limit is approximate.

U = The analyte was analyzed for but was not detected above the method detection limit.

R = The sample results is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

Reason Codes

1	Holding time violation
2	Method blank contamination
3	Surrogate recovery
4	MS/MSD recovery
5	MS/MSD precision outside limits
6	LCS recovery
7	Field blank contamination
8	Field duplicate precision outside limits
9	Other deficiencies (including cooler temperature)
A	Absence of supporting QC
S	ICV, CCV or column performance check problem
Y	Initial and continuing calibration blank problem
M	Interference check samples problem
O	Post digestion spike outside of 85-115%
F	MSA correlation coefficient <0.995, or MSA not done
G	Serial dilution problem
K	DFTPP or BFB tuning problem
Q	Initial calibration problem
X	Internal standard recovery problem
V	Second source standard calibration verification problem
L	Low bias
Z	Retention time problem
N	Counting time error (radionuclide chemistry)
W	Detector instability (radionuclide chemistry)
C	Co-elution of compounds
E	Value exceeds linear calibration range
I	Interferences present during analysis
T	Trace level compound, poor quantitation
P	1C/2C precision outside limits
B	LCS/LCSD precision outside limits
D	Lab Dup/Rep precision outside limits
H	High bias

NJDEP Office of Quality Assurance Quantitation of Semi-Volatile Petroleum Products in Water, Soil and Sediment OQA-QAM-025, Revision 6.

Metals:

Inductively-Coupled Plasma Atomic Emission Spectrometry or Inductively-Coupled Plasma Mass Spectroscopy

Wastewater and Groundwater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 200.7, Method 200.8.
Soil Samples: USEPA Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 6010D.

Mercury:

Cold Vapor Atomic Absorption Spectrometry

Wastewater and Groundwater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 245.1.
Soil Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 7471B.

Volatile Organic Compounds:

Purge and Trap Gas Chromatography/Mass Spectroscopy

Drinking Water Samples: USEPA Methods for the Determination of Organic Compounds in Drinking Water, Method 524.2.
Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 624.1, Method 8260C.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8260C.

Semi-Volatile Organic Compounds:

Gas Chromatography/Mass Spectroscopy

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 625.1, Method 8270D.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8270D.

PFAS Compounds:

Liquid Chromatography/Tandem Mass Spectroscopy

Drinking Water Samples: USEPA Methods for the Determination of Selected Perfluorinated Alkyl Acids in Drinking Water by Solid Phase Extraction and Liquid Chromatography/Tandem Mass Spectrometry (LC/MS/MS), Method 537.

Pesticides:

Gas Chromatography/Electron Capture Detector

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 608.3, Method 8081B.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8081B.

Polychlorinated Biphenyls (PCBs):

Gas Chromatography/Electron Capture Detector

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 608.3, Method 8082A.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8082A.

General Chemistry Methods:

Various general chemistry methods are taken from "Standard Methods for the Examination of Water and Wastewater, 19th Edition".

Specific method citations can be found on the Analytical Results Summary page of this report listed under 'Method'.

** A complete list of APL's certified Methods are accessible on the Standards And Docs page of the Results Retrieval System

QUALITY CONTROL
Conformance/Non-Conformance Summary

ANALYSIS: INORGANICS [6010D / 200.7 / 7473 / 245.1 / 9014 / SM 4500-CN C-16 plus E-16]

Method 6010D:
The percent recovery for Silver was outside of the QC limits for the blank spike (slightly low).
The percent recoveries for several metals were outside of the QC limits for the matrix spikes and matrix spike duplicates (low).

Methods 200.7 / 7473 / 245.1 / 9014 / SM 4500-CN C-16 plus E-16:
All samples met the QC criteria.

ANALYSIS: Herbicides [8151A]
All samples met the QC criteria.

ANALYSIS: PCBs [8082A]
Sample 23E0281-04 has surrogates outside of the QC limits (low and high), due to matrix interference.

ANALYSIS: PESTICIDES [8081B]
The percent recoveries for some compounds were outside of the QC limits for the blank spike, matrix spike, and matrix spike duplicate (low and high).

Samples 23E0281-01, -04, -05 and -06 have one surrogate (Decachlorobiphenyl [2C]) outside of the QC limits (high), due to matrix interferences.

ANALYSIS: VOLATILES BY GC/MS [8260D]
The continuing calibrations were outside of the QC limits for some compounds (low and high).

The percent recoveries for some compounds were outside of the QC limits for the blank spike duplicates, matrix spike, and matrix spike duplicate (low).

Samples 23E0281-02 (FB) and -03 (TB) have one surrogate (4-Bromofluorobenzene) outside of the QC limits (low).

ANALYSIS: SEMI-VOLATILES BY GC/MS [8270E]
The continuing calibrations were outside of the QC limits for some compounds (low and high).

The percent recoveries for 2,4-Dinitrophenol and 4,6-Dinitro-2-methylphenol were outside of the QC limits for the matrix spike and matrix spike duplicate (low). The blank spike met all QC criteria.

ND, U - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

ND, U - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

ND, U - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

ND, U - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

FootNotes

RL - Reporting limit
MDL - Minimum detection limit
ND, U - Indicates compound analyzed for but not detected
J - Indicates estimated velue

B - Indicates compound found in associeted blenk
E - Concentration exceeds highest calibration standerd
D - Indicates result is besed on e dilution
P - Greater than 25% diff. between 2 GC columns
H - Indicates a Hold Time violation
D1 - Sample was Decanted (Dissolved)

Data validation was performed on the analytical data for three (3) samples collected between May 4 and May 5, 2023, by Yu and Associates at the Gowanus Site in New York. The samples were analyzed under the Environmental Protection Agency (USEPA) "Test Methods for Evaluating Solid Waste Physical/Chemical SW-846 Method" described below.

Specific method references are as follows:

Analysis	Method References
Semivolatile Organic Compounds (SVOCs)	USEPA SW-846 8270E
Volatile Organic Compounds (VOCs)	USEPA SW-846 8260D
Semivolatiles - Alkylated PAHs	USEPA SW-846 8270D-SIM
Pesticides	USEPA SW-846 8081B
Herbicides	USEPA SW-846 8151A
PCBs	USEPA SW-846 8082A
Metals	USEPA SW846 6010D
Mercury	USEPA 7473/245.1
Cyanide	USEPA SW846 9014
Free Cyanide	SM 4500NC-E(M)

Data were reviewed in accordance with the USEPA National Functional Guidelines (NFGs) listed below and appropriate method specific USEPA Region II Data Validation Standard Operating Procedures (SOPs). The USEPA NFGs were developed for the Contract Laboratory Program (CLP) methods and may not be applicable to the analytical methods and procedures utilized by the laboratory for this data set. Results were also qualified using analytical method criteria and the reviewer's professional judgement where specific guidance was not applicable.

- USEPA. National Functional Guidelines for Superfund Organics Methods Data Review. OLEM 9240.0-51, EPA 540-R-20-005, November 2020
- USEPA. National Functional Guidelines for Superfund Inorganics Methods Data Review. OLEM 9240.0-51, EPA 542-R-20-006, November 2020
- USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review. OSWER 9240.1-05A-A-P EPA540/R-99/008. October 1999

- USEPA Contract Laboratory Program Region II Data Validation SOPs (HW-2, HW-22, HW-24, HW-44, HW-45)

The following items/criteria were reviewed for this report:

- Data Completeness
- Chain of Custody
- Holding times and sample preservation
- Field Duplicate Accuracy
- Internal Standard Area and RT
- Surrogates
- Laboratory Control Sample (LCS) recoveries
- Matric Spike and Matrix Spike Duplicate Samples
- Method and field blank contamination
- Laboratory Duplicate Samples
- Serial Dilution
- Initial and continuing calibration summaries
- Compound Quantitation
- Reporting Limits
- Sample comments and Quality Control Summaries

Overall Usability Issues:

- Overall, the data is acceptable for the intended purposes. Minor analytical issues were found with the following data quality indicators resulting in qualified results: continuing calibration, and surrogates.

Chain of Custody:

- Aqua Protech Labs (APL) subcontracted alkylated PAHs and Free Cyanide analyses to Alpha laboratories.

Volatile Organic Compounds (VOCs)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
VOCs by SW-846 8260D	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS analysis exhibited acceptable recoveries.

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- MS/MSD analysis was not performed on samples evaluated in this report.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When

parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- ICVs and CCVs were within the specified control limits except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8260D	TB_20230505	2-Hexanone	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL
		Bromomethane			
	0H-SB-56-1.0-2.0-20230504 0H-SB-56-3.0-4.0-20230504	Dichlorodifluoromethane			
		Tetrachloroethene			

Compound Quantitation and Identification

GC/MS analysis utilizes retention time and mass spectra criteria to identify detected results.

- All identified compounds met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Mass Spectrometer tuning criteria was within control limits.
- Overall system performance was acceptable.

Semivolatile Organic Compounds (SVOCs)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
SVOCs by SW-846 8270E and 8270D-SIM	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination with the following exception: The method blank associated soil samples had a detection of Naphthalene (8270E-SIM). Sample detections are greater than five times the detections in the method blank. No qualification was required.
- All QA/QC blanks were free of contamination with the following exception: The method blank associated with the soil samples had TIC detections of "lab contamination." Sample detections less than five times the method blank detection are qualified as rejected, reason code 2.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries for all samples.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS and/or LCSD analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte	Exceedance	Qualification	Reason Code
8270E	OH-SB-56-1.0-2.0-20230504 OH-SB-56-3.0-4.0-20230504	2-Nitrophenol	%R > CL	No action (NDs)	6H
		4-Chloro-3-methylphenol			
		Diethylphthalate			
		Dimethylphthalate			
		Di-n-butylphthalate			

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- MS/MSD analysis was not performed on samples evaluated in this report.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% RPD is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- ICVs and CCVs were within the specified control limits except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8270E	OH-SB-56-1.0-2.0-20230504 OH-SB-56-3.0-4.0-20230504	1,4-Dioxane 2,4-Dinitrophenol 2-Nitrophenol 4,6-Dinitro-2-methylphenol	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
		4-Chloroaniline Benzaldehyde bis(2-chloroisopropyl)ether Hexachlorocyclopentadiene			

Reporting Limits and Compound Quantitation

GC/MS analysis utilizes retention time and mass spectra criteria to identify detected results.

- All identified compounds met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T. Some samples were diluted due to elevated SVOC concentrations and elevated reporting limits are provided.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Mass Spectrometer tuning criteria was within control limits.
- Overall system performance was acceptable.

GC Methods (PCBs, Pesticides, Herbicides)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8081B (Pesticides), 8082A (PCBs) and 8151A (Herbicides)	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. GC analyses requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries except for the following analytes.

Method	Sample	Surrogate	Exceedance	Qualification	Reason Code
8082A	OH-SB-56-1.0-2.0-20230504 OH-SB-56-3.0-4.0-20230504	Decachlorobiphenyl	%R < CL	UJ	3L

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS analysis exhibited acceptable recoveries except for the following analytes.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8081B	OH-SB-56-1.0-2.0-20230504 OH-SB-56-3.0-4.0-20230504	alpha-Chlordane Chlordane Endrin aldehyde gamma-Chlordane	%R > CL	J (detects) Non-detects not qualified	6H

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD

percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- MS/MSD analysis was not performed on samples evaluated in this report.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed.

- CCVs exhibited compounds above control limits; however, associated samples results were non-detect, and qualification was not warranted.
- The original lab report had issues affecting how pesticide and PCB calibration factors were reported in the CCV summaries. That information was later corrected and provided as an addendum to the data package.

Reporting Limits and Compound Quantitation

GC methods utilizes retention time and dual column analysis to identify detected results. When dual column analysis is performed the percent difference (%D) of detected sample results must be less than 25%.

- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.
- Dual column comparison was not provided as part of the data package.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Overall system performance was acceptable.

Metals and General Chemistry

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
Metals by SW-846 601D	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to <6 °C.
Mercury by SW-846 7473	Soil	28 days from collection to analysis	Cool to <6 °C.
Mercury by EPA 245.1	Water	28 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.
Cyanide by SW-846 9014	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
	Soil	14 days from collection to analysis	Cool to <6 °C.
Cyanide by SM 4500CN-E(M)	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
	Soil	14 days from collection to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks - Method, Trip, Field, ICBs and CCBs

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination with the following exception: The method blank associated soil samples had detections of Aluminum and Iron. Sample detections are greater than five times the detections in the method blank. No qualification was required.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
6010D	OH-SB-56-1.0-2.0-20230504 OH-SB-56-3.0-4.0-20230504	Silver	%R < CL	UJ (NDs)	6L

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- MS/MSD analysis was not performed on samples evaluated in this report.

Laboratory Duplicate

Laboratory duplicate analysis measures precision of the analytical method. The relative percent difference (RPD) is measured between parent and duplicate sample results. The Laboratory duplicate RPDs must be within laboratory-established acceptance limits.

- The lab duplicate analysis was not performed on samples evaluated in this report.

Serial Dilution

The serial dilution analysis indicates the presence matrix interferences. Sample results greater than 50 times the MDL are evaluated, and percent difference (%D) is measured between undiluted and diluted sample results. A control limit of 20% is applied.

- The serial dilution analysis was not performed on samples evaluated in this report.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Initial Calibration and Continuing Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. Continuing calibration standards are used to assess calibration drift.

- ICVs and CCVs were within the specified control.

Reporting Limits and Analyte Quantitation

- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Overall system performance was acceptable.

Please contact the undersigned if you have any questions or need further information.

Data Qualifiers

J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

UJ = The analyte was not detected above the sample reporting limit; and the reporting limit is approximate.

U = The analyte was analyzed for but was not detected above the method detection limit.

R = The sample results is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

Reason Codes

1	Holding time violation
2	Method blank contamination
3	Surrogate recovery
4	MS/MSD recovery
5	MS/MSD precision outside limits
6	LCS recovery
7	Field blank contamination
8	Field duplicate precision outside limits
9	Other deficiencies (including cooler temperature)
A	Absence of supporting QC
S	ICV, CCV or column performance check problem
Y	Initial and continuing calibration blank problem
M	Interference check samples problem
O	Post digestion spike outside of 85-115%
F	MSA correlation coefficient <0.995, or MSA not done
G	Serial dilution problem
K	DFTPP or BFB tuning problem
Q	Initial calibration problem
X	Internal standard recovery problem
V	Second source standard calibration verification problem
L	Low bias
Z	Retention time problem
N	Counting time error (radionuclide chemistry)
W	Detector instability (radionuclide chemistry)
C	Co-elution of compounds
E	Value exceeds linear calibration range
I	Interferences present during analysis
T	Trace level compound, poor quantitation
P	1C/2C precision outside limits
B	LCS/LCSD precision outside limits
D	Lab Dup/Rep precision outside limits
H	High bias

Data validation was performed on the analytical data for nine (9) samples collected between May 8 and May 9, 2023, by Yu and Associates at the Gowanus Site in New York. The samples were analyzed under the Environmental Protection Agency (USEPA) "Test Methods for Evaluating Solid Waste Physical/Chemical SW-846 Method" described below.

Specific method references are as follows:

Analysis	Method References
Semivolatile Organic Compounds (SVOCs)	USEPA SW-846 8270E
Volatile Organic Compounds (VOCs)	USEPA SW-846 8260D
Semivolatiles - Alkylated PAHs	USEPA SW-846 8270D-SIM
Pesticides	USEPA SW-846 8081B
Herbicides	USEPA SW-846 8151A
PCBs	USEPA SW-846 8082A
Metals	USEPA SW846 6010D
Mercury	USEPA 7473/245.1
Cyanide	USEPA SW846 9014
Free Cyanide	SM 4500NC-E(M)

Data were reviewed in accordance with the USEPA National Functional Guidelines (NFGs) listed below and appropriate method specific USEPA Region II Data Validation Standard Operating Procedures (SOPs). The USEPA NFGs were developed for the Contract Laboratory Program (CLP) methods and may not be applicable to the analytical methods and procedures utilized by the laboratory for this data set. Results were also qualified using analytical method criteria and the reviewer's professional judgement where specific guidance was not applicable.

- USEPA Contract Laboratory Program Region II Data Validation SOPs (HW-2, HW-22, HW-24, HW-44, HW-45)

The following items/criteria were reviewed for this report:

- Data Completeness
- Chain of Custody
- Holding times and sample preservation
- Field Duplicate Accuracy
- Internal Standard Area and RT
- Surrogates
- Laboratory Control Sample (LCS) recoveries
- Matric Spike and Matrix Spike Duplicate Samples
- Method and field blank contamination
- Laboratory Duplicate Samples
- Serial Dilution
- Initial and continuing calibration summaries
- Compound Quantitation
- Reporting Limits
- Sample comments and Quality Control Summaries

Overall Usability Issues:

- Overall, the data is acceptable for the intended purposes. Minor analytical issues were found with the following data quality indicators resulting in qualified results: continuing calibration, surrogates, laboratory control samples, and blanks.

Chain of Custody:

- Aqua Protech Labs (APL) subcontracted alkylated PAHs and Free Cyanide analyses to Alpha laboratories.
- Samples FB_20230508 and FB_20230509 were listed for Alkylated PAH analysis; these samples were not analyzed for this parameter.

Volatile Organic Compounds (VOCs)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
VOCs by SW-846 8260D	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination with the following exception: The method blank associated with soil samples had TIC detections of "lab contamination." Sample detections less than five times the method blank detection are qualified as rejected, reason code 2.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Surrogate	Exceedance	Qualification	Reason Code
8260D	TB_20230509 FB_20230509	4-Bromofluorobenzene	%R < CL	UJ (NDs) J (Detects)	3L

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS and or LCSD analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8260D	TB_20230509 FB_20230509	1,2,4-Trichlorobenzene	%R < CL	UJ (NDs) J (Detects)	6L
	FB_20230508	Bromomethane	%R < CL	UJ (NDs) J (Detects)	6L

- Compounds not listed were above control limits; where LCS/LCSD percent differences were above control limits and associated samples results were non-detect, qualification was not warranted.

Matric Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- MS/MSD analysis was not performed on samples evaluated in this report.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- ICVs and CCVs were within the specified control limits except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8260D	FB_20230508	2-Hexanone Bromomethane	CCV %D > 20% (decrease in response)	UJ (NDs) J (Detects)	SL
	TB_20230509 FB_20230509	1,2,4-Trichlorobenzene Dichlorodifluoromethane	CCV %D > 20% (decrease in response)	UJ (NDs) J (Detects)	SL

Reporting Limits and Compound Quantitation

GC/MS analysis utilizes retention time and mass spectra criteria to identify detected results.

- Compounds detections met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Mass Spectrometer tuning criteria was within control limits.
- Overall system performance was acceptable.

Semivolatile Organic Compounds (SVOCs)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
SVOCs by SW-846 8270E and 8270D-SIM	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination with the following exception: The method blank associated with soil samples had TIC detections of Hexadecanoic acid, butyl ester, Octadecanoic acid, butyl ester, 4-hydroxy-4-methyl-2-Pentanone and unknowns. Sample detections less than five times the method blank detection are qualified as rejected, reason code 2.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries for all samples.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS and/or LCSD analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte	Exceedance	Qualification	Reason Code
8270E	All soils samples	2-Nitrophenol	%R > CL	No action (NDs)	6H

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- MS/MSD analysis was not performed on samples evaluated in this report.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% RPD is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- ICVs and CCVs were within the specified control limits except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8270D-SIM	0H-SB-40-2.0-3.0_20230509	Naphthalene	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL
8270E	0H-SB-41-3.0-4.0_20230509	1,4-Dioxane Benzaldehyde 4-Chloroaniline bis(2-chloroethoxy)methane bis(2-chloroethyl)ether bis(2-chloroisopropyl)ether	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code

		Hexachlorobenzene	CCV %D > 20% (increase in response)	J (detects) No action (NDs)	SH

Reporting Limits and Compound Quantitation

GC/MS analysis utilizes retention time and mass spectra criteria to identify detected results.

- Compounds detections met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T. Some samples were diluted due to elevated SVOC concentrations and elevated reporting limits are provided.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Mass Spectrometer tuning criteria was within control limits.
- Overall system performance was acceptable.

GC Methods (PCBs, Pesticides, Herbicides)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8081B (Pesticides), 8082A (PCBs) and 8151A (Herbicides)	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. GC analyses requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Surrogate	Exceedance	Qualification	Reason Code
8082A	OH-SB-41-3.0-4.0_20230509	Decachlorobiphenyl Decachlorobiphenyl [2C]	%R <CL>10%	UJ (NDs)	3L
	OH-SB-40-2.0-3.0_20230509	Tetrachloro-m-xylene Decachlorobiphenyl [2C]	%R > CL	No action (NDs)	3H
8081B	OH-SB-40-2.0-3.0_20230509	Decachlorobiphenyl [2C]	%R > CL	J (Detects) UJ (NDs)	3
		Tetrachloro-m-xylene [2C]	%R <CL>10%		
		Tetrachloro-m-xylene	%R > CL	No action (NDs) J (Detects)	3H
	OH-SB-41-1.0-2.0_202	Decachlorobiphenyl [2C]	%R > CL	J (Detects) No action (NDs)	3H

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS and/or LCSD analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte	Exceedance	Qualification	Reason Code
8051A	All soils samples	2,4-D	%R > CL	No action (NDs)	6H
8081B	All soils samples	alpha-Chlordane (cis) Chlordane beta-BHC Endrin aldehyde Endosulfan I Endosulfan sulfate Endrin ketone gamma-Chlordane Heptachlor Epoxide Methoxychlor	%R > CL	J (Detects) No action (NDs)	6H

Matric Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- MS/MSD analysis was not performed on samples evaluated in this report.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed.

- CCVs exhibited compounds above control limits; however, associated samples results were non-detect, and qualification was not warranted.

- The original lab report had issues affecting how pesticide and PCB calibration factors were reported in the CCV summaries. That information was later corrected and provided as an addendum to the data package.

Reporting Limits and Compound Quantitation

GC methods utilizes retention time and dual column analysis to identify detected results. When dual column analysis is performed the percent difference (%D) of detected sample results must be less than 25%.

- Compounds detections met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.
- Dual column comparison was not provided as part of the data package.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Overall system performance was acceptable.

Metals and General Chemistry

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
Metals by SW-846 601D	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to <6 °C.
Mercury by SW-846 7473	Soil	28 days from collection to analysis	Cool to <6 °C.
Mercury by EPA 245.1	Water	28 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.
Cyanide by SW-846 9014	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
	Soil	14 days from collection to analysis	Cool to <6 °C.
Cyanide by SM 4500CN-E(M)	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
	Soil	14 days from collection to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks - Method, Trip, Field, ICBs and CCBs

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
6010D	FB_20230508 FB_20230509	Silver	%R < CL	UJ (NDs)	6L

Matric Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD

percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- MS/MSD analysis was not performed on samples evaluated in this report.

Laboratory Duplicate

Laboratory duplicate analysis measures precision of the analytical method. The relative percent difference (RPD) is measured between parent and duplicate sample results. The Laboratory duplicate RPDs must be within laboratory-established acceptance limits.

- The lab duplicate analysis was not performed on samples evaluated in this report.

Serial Dilution

The serial dilution analysis indicates the presence matrix interferences. Sample results greater than 50 times the MDL are evaluated, and percent difference (%D) is measured between undiluted and diluted sample results. A control limit of 20% is applied.

- The serial dilution analysis was not performed on samples evaluated in this report.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Initial Calibration and Continuing Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. Continuing calibration standards are used to assess calibration drift.

- ICVs and CCVs were within the specified control limits except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
6010	FB_20230508 FB_20230509	Thallium	SCV %R > CL	No Action (NDs)	SH

Reporting Limits and Analyte Quantitation

- Analyte detections met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Overall system performance was acceptable.

Please contact the undersigned if you have any questions or need further information.

Data Qualifiers

J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

UJ = The analyte was not detected above the sample reporting limit; and the reporting limit is approximate.

U = The analyte was analyzed for but was not detected above the method detection limit.

R = The sample results is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

Reason Codes

1	Holding time violation
2	Method blank contamination
3	Surrogate recovery
4	MS/MSD recovery
5	MS/MSD precision outside limits
6	LCS recovery
7	Field blank contamination
8	Field duplicate precision outside limits
9	Other deficiencies (including cooler temperature)
A	Absence of supporting QC
S	ICV, CCV or column performance check problem
Y	Initial and continuing calibration blank problem
M	Interference check samples problem
O	Post digestion spike outside of 85-115%
F	MSA correlation coefficient <0.995, or MSA not done
G	Serial dilution problem
K	DFTPP or BFB tuning problem
Q	Initial calibration problem
X	Internal standard recovery problem
V	Second source standard calibration verification problem
L	Low bias
Z	Retention time problem
N	Counting time error (radionuclide chemistry)
W	Detector instability (radionuclide chemistry)
C	Co-elution of compounds
E	Value exceeds linear calibration range
I	Interferences present during analysis
T	Trace level compound, poor quantitation
P	1C/2C precision outside limits
B	LCS/LCSD precision outside limits
D	Lab Dup/Rep precision outside limits
H	High bias

General Chemistry Methods:

Various general chemistry methods are taken from "Standard Methods for the Examination of Water and Wastewater, 19th Edition".

Specific method citations can be found on the Analytical Results Summary page of this report listed under 'Method'.

** A complete list of APL's certified Methods are accessible on the Standards And Docs page of the Results Retrieval System

MDL:

Method Detection Limit. The minimum reportable concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. The value is calculated from the analysis of seven replicates of a spike sample. On analytical reports this value is corrected for percent moisture and any concentration or dilution factors.

RL:

Reporting Limit. The Concentration of the lowest calibration standard that was included in the initial calibration of the instrument. On analytical reports this value is corrected for percent moisture and any concentration or dilution factors.

Concentration (Conc) / Result:

If the compound is detected, the measured concentration is reported. If this column is left blank, or contains a 'less than' (<) symbol, the compound was not detected.

Tentatively Identified Compound (TIC):

A TIC is a non-targeted compound, not included in the calibration, identified by a mass spectral library search.

Qualifiers:

- **U:** Indicates the compound was analyzed for but was not detected.
- **J:** Indicates an estimated value. All tentatively identified compounds (TICs) and results below the RL receive this qualifier.
- **B:** Indicates the analyte was found in the method blank as well as the sample.
- **N:** Used when reporting a specific tentatively identified compound.
- **E:** Indicates that the concentration of the compound exceeds the calibration range of the instrument. The results of a diluted analysis will also be reported. The results of the dilution should be used for those compounds exceeding the calibration range in the undiluted analysis.

QUALITY CONTROL
Conformance/Non-Conformance Summary

ANALYSIS: INORGANICS [6010D / 200.7 / 7473 / 245.1 / 9014 / SM 4500-CN C-16 plus E-16]

Method 6010D:
The percent recovery for Silver was outside of the QC limits for the blank spike (slightly low).
The percent recoveries for several metals were outside of the QC limits for the matrix spike and matrix spike duplicate (low).

Method 200.7
The percent recovery for Silver was outside of the QC limits for the blank spike (slightly low).
The percent recoveries for some metals were outside of the QC limits for the matrix spike and matrix spike duplicate (low). The blank spike met all QC criteria.

Method 9014:
The percent recovery for Cyanide was outside of the QC limits for the matrix spike (low). The blank spike met all QC criteria.

Methods 7473 / 245.1 / SM 4500-CN C-16 plus E-16:
All samples met the QC criteria.

ANALYSIS: Herbicides [8151A]
All samples met the QC criteria.

ANALYSIS: PCBs [8082A]
Samples 23E0462-06 and -09 have surrogates outside of the QC limits (low and high), due to matrix interferences.

ANALYSIS: PESTICIDES [8081B]
Samples 23E0462-06, -08 and -09 have surrogates outside of the QC limits (low and high), due to matrix interferences.

ANALYSIS: VOLATILES BY GC/MS [8260D]
The continuing calibrations were outside of the QC limits for some compounds (low and high).

The percent recoveries for some compounds were outside of the QC limits for the blank spike duplicates, matrix spike, and matrix spike duplicate (low).

Samples 23E0462-03 (TB) and -07 (FB) have one surrogate (4-Bromofluorobenzene) outside of the QC limits (low).

ANALYSIS: SEMI-VOLATILES BY GC/MS [8270E]
The continuing calibrations were outside of the QC limits for some compounds (low and high).

The percent recoveries for some compounds were outside of the QC limits for the matrix spike and matrix spike duplicate (low).
The blank spike met all QC criteria.

ND, U - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

ND, U - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

ND, U - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

ND, U - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

ND, U - Indicates compound analyzed for but not detected
J - Indicates estimated value
B - Indicates compound found in associated blank
E - Concentration exceeds highest calibration standard
D - Indicates result is based on a dilution
H - Indicates a Hold Time violation
P - Greater than 25% diff. between 2 GC columns.
MDL - Minimum detection limit, **RL** - Reporting limit
D1 - Sample was Decanted (Dissolved)

DATA USABILITY SUMMARY REPORT
GOWANUS FORMER SITE

Client: Brown and Caldwell, Albany, New York
SDGs: L2326380 and 23E0505
Laboratory: Aqua Pro-tech Laboratories, Fairfield, New Jersey
Site: Gowanus, NY
Date: April 1, 2024

Client Sample ID	Laboratory Sample ID	Date Collected	Matrix
FB_20230510	23E0505-01	5/10/2023	Water
OH-SB-39_1.0-2.0_20230510	23E0505-02 L2326380-01	5/10/2023	Soil
OH-SB-39_2.0-3.0_20230510	23E0505-03 L2326380-02	5/10/2023	Soil

Data validation was performed on the analytical data for three (3) samples collected on May 10, 2023 by Yu and associates at the Gowanus Site in New York. The samples were analyzed under the Environmental Protection Agency (USEPA) "Test Methods for Evaluating Solid Waste Physical/Chemical SW-846 Method" described below.

Specific method references are as follows:

Analysis	Method References
Semivolatile Organic Compounds (SVOCs)	USEPA SW-846 8270E
Volatile Organic Compounds (VOCs)	USEPA SW-846 8260D
Semivolatiles - Alkylated PAHs	USEPA SW-846 8270E-SIM
Pesticides	USEPA SW-846 8081B
Herbicides	USEPA SW-846 8151A
PCBs	USEPA SW-846 8082A
Metals	USEPA SW-846 6010D/200.7
Mercury	USEPA 7473/245.1
Cyanide	USEPA SW-846 9014
Free Cyanide	SM 4500NC-E(M)

Data were reviewed in accordance with the USEPA National Functional Guidelines (NFGs) listed below and appropriate method specific USEPA Region II Data Validation Standard Operating Procedures (SOPs). The USEPA NFGs were developed for the Contract Laboratory Program (CLP) methods and may not be applicable to the analytical methods and procedures utilized by the laboratory for this data set. Results were also qualified using analytical method criteria and the reviewer's professional judgement where specific guidance was not applicable.

- USEPA Contract Laboratory Program Region II Data Validation SOPs (HW-2, HW-22, HW-24, HW-44, HW-45)

The following items/criteria were reviewed for this report:

- Data Completeness
- Chain of Custody
- Holding times and sample preservation
- Field Duplicate Accuracy
- Internal Standard Area and RT
- Surrogates
- Laboratory Control Sample (LCS) recoveries
- Matrix Spike and Matrix Spike Duplicate Samples
- Method and field blank contamination
- Laboratory Duplicate Samples
- Serial Dilution
- Initial and continuing calibration summaries
- Compound Quantitation
- Reporting Limits
- Sample comments and Quality Control Summaries

Overall Usability Issues:

- Overall, the data is acceptable for the intended purposes. Minor analytical issues were found with the following data quality indicators resulting in qualified results: initial calibration, continuing calibration, surrogates, and laboratory control samples.

Chain of Custody:

- Aqua Protech Labs (APL) subcontracted alkylated PAHs and Free Cyanide analyses to Alpha labs and transferred samples to Alpha using the APL lab IDs.

Volatile Organic Compounds (VOCs)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
VOCs by SW-846 8260D	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures. All QA/QC blanks were free of contamination with the following exceptions:

- The method blank [BAE0547-BLK1] associated with soil samples had TIC detections of "lab contamination" (0.00602 mg/kg wet). Samples were non-detect for "lab contamination."
- The field blank had detections of Methylene Chloride (6.91 ug/L). Associated sample non-detections are not qualified.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS analysis exhibited acceptable recoveries.

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- MS/MSD analysis was not performed on subject samples evaluated in this report.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8260D	FB_20230510	Tert-Butyl Alcohol	RRF < 0.05	J (Detects) UJ (NDs)	Q
8260D	All soil samples	Tert-Butyl Alcohol	RRF < 0.05	J (Detects) UJ (NDs)	Q
		Methyl Acetate	%RSD >20% & supporting information not provided to verify correlation coefficient >0.99	J (Detects) UJ (ND)	Q

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- ICVs and CCVs were within the specified control limits except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8260D	FB_20230510	1,2,4-Trichlorobenzene 2-Hexanone	CCV %D > 20% (decrease in response)	UJ (NDs) J (Detects)	SL

Reporting Limits and Compound Quantitation

GC/MS analysis utilizes retention time and mass spectra criteria to identify detected results.

- All identified compounds met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.
- Tentatively Identified Compounds (TICs) are qualified as estimated, J, reason code A.

System Performance and Overall Assessment (Sequence/Tune)

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Mass Spectrometer tuning criteria was within control limits.
- Overall system performance was acceptable.

Semivolatile Organic Compounds (SVOCs)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
SVOCs by SW-846 8270E and 8270E-SIM	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination with the following exception: The method blank associated with soil samples had TIC detections of Hexadecanoic acid, butyl ester (0.933 mg/kg wet), n-Butyl myristate (1.03 mg/kg wet), and unknowns (0.326 mg/kg wet). Samples were non-detect for these TICs, except for unknowns, and therefore are not qualified. Sample detections of unknowns were not qualified based on professional judgment.
- The method blank associated with soil samples had detections of Naphthalene (0.337 ug/kg, method 8270E-SIM). Sample detections greater than five times the method blank detection (1.685 ug/kg) are not qualified.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Surrogate	Exceedance	Qualification	Reason Code
8270E	FB_20230510	Phenol-d6 (PHN-D6)	%R < CL	No Qualification based on only one surrogate < CL	N/A

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS analysis exhibited acceptable recoveries.

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- MS/MSD analysis was not performed on samples evaluated in this report.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% RPD is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included in this report.

Internal Standard Areas

Internal standards are used to monitor instrument performance and ensure instrument sensitivity and response are stable during sample analysis. The internal standard area count must within a (50-200%) range of the associated standard. The retention time of the internal standard must not vary by more than ±10 seconds from the associated continuing calibration standard.

- All samples exhibited acceptable internal standard values.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8270D-SIM	FB_20230510 All Soil Samples	Benzaldehyde	%RSD >20% and correlation coefficient <0.99	J (Detects) UJ (Non-Detects)	Q

- All recoveries and/or correlation coefficient criteria were met except for analytes presented in the following table.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed. The RRF control limit is (0.05) or (0.01) for poor responding compounds.

- ICVs and CCVs were within the specified control limits except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
8270E (APL)	All Soil Samples	Benzaldehyde Bis(2-chloroisopropyl)ether	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL
		2,4-Dinitrophenol 2,6-Dinitrotoluene 4,6-Dinitro-2-methylphenol 4-Bromophenyl-phenyl ether Hexachlorobenzene	CCV %D > 20% (increase in response)	J (detects) No action (NDs)	SH
	FB_20230510	4-Nitrophenol Benzaldehyde n-Nitroso-dimethylamine n-Nitroso-di-n-propylamine	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL
8270E-SIM (Alpha)	OH-SB-39_1.0-2.0_20230510 [23E0505-02]	Naphthalene	CCV %D > 20% (decrease in response)	J (detects) UJ (non-detects)	SL

Reporting Limits and Compound Quantitation

GC/MS analysis utilizes retention time and mass spectra criteria to identify detected results.

- All identified compounds met the specified criteria.
- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T. Some samples were diluted due to elevated SVOC concentrations and elevated reporting limits are provided.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Mass Spectrometer tuning criteria was within control limits.
- Overall system performance was acceptable.

GC Methods (PCBs, Pesticides, Herbicides)

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8081B (Pesticides), 8082A (PCBs) and 8151A (Herbicides)	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Surrogates

Surrogate compounds are spiked prior to sample preparation and are used to monitor the overall performance of the analytical method. GC analyses requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

- Surrogates exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Surrogate	Exceedance	Qualification	Reason Code
8081B	OH-SB-39_1.0-2.0_20230510 [23E0505-02]	Decachlorobiphenyl (Column 1 and 2)	%R > CL	J (detects) No action (NDs)	3H
	OH-SB-39_2.0-3.0_20230510 [23E0505-03]	Decachlorobiphenyl (Column 2	%R > CL	J (detects) No action (NDs)	3H

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS and/or LCSD analysis and LCS/LCSD RPDs exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte	Exceedance	Qualification	Reason Code
8081B	FB_20230510	Endosulfan sulfate	%R < CL	J (Detects) UJ (NDs)	6L
		Endrin aldehyde Endrin ketone Methoxychlor	%R > CL	J (Detects) No action (NDs)	6H

Method	Sample	Analyte	Exceedance	Qualification	Reason Code
8081B	OH-SB-39_1.0-2.0_20230510 OH-SB-39_2.0-3.0_20230510	4,4'-DDD 4,4'-DDE alpha-BHC beta-BHC Endosulfan II	%R < CL	J (Detects) UJ (NDs)	6L

- In the original report, an LCS and/or LCSD analysis was not reported for method 8151A for water sample FB_20230510; an addendum was provided on 6/27/2024 that included this missing information.
- In the original report, an LCS and/or LCSD analysis was not reported for method 8081B for soil samples OH-SB-39_1.0-2.0_20230510 and OH-SB-39_2.0-3.0_20230510; an addendum was provided on 6/27/2024 that included this missing information.

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- An MS/MSD analysis was performed on soil sample OH-SB-39_2.0-3.0_20230510 for method 8081B. The MS/MSD analysis exhibited acceptable recoveries and RPDs.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Initial Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. The method specifies percent relative standard deviation (%RSD) limits for select compounds. A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99.

- All recoveries and/or correlation coefficient criteria were met.
- The original lab report was missing correlation coefficients for analytes that were evaluated with a different curve fit. That information was later provided as an addendum to the data package.

Continuing Calibration

The continuing calibration is used to assess calibration drift. A maximum percent difference (%D) of 20% is allowed.

- The original lab report had issues affecting how pesticide and PCB calibration factors were reported in the CCV summaries. That information was later corrected and provided as an addendum to the data package.
- ICVs and CCVs were within the specified control limits.

Reporting Limits and Compound Quantitation

GC methods utilizes retention time and dual column analysis to identify detected results. When dual column analysis is performed the percent difference (%D) of detected sample results must be less than 25%.

- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.
- Tentatively Identified Compounds (TICs) are qualified as estimated, reason code A.
- Dual column comparison was not provided as part of the data package.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Overall system performance was acceptable.

Metals and General Chemistry

Holding Times and Preservation

Samples must be extracted and/or analyzed within method-specific holding times and meet the preservation requirements listed in the following table.

Method	Matrix	Holding Time	Preservation
Metals by EPA 200.7	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
Metals by SW 846 6010D	Soil	180 days from collection to analysis	Cool to <6 °C.
Mercury by EPA 245.1	Water	28 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.
Mercury by SW-846 7473	Soil	28 days from collection to analysis	Cool to <6 °C.
Cyanide by SM 4500CN-E(M)	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Cyanide by SM 846 9014	Soil	14 days from collection to analysis	Cool to <6 °C.

- All samples were received properly preserved and holding times were achieved for all analyses.

Blanks - Method, Trip, Field, ICBs and CCBs

Quality assurance (QA) blanks (i.e., method, trip, field, or rinse blanks) are prepared to identify and measure contamination which may have been introduced into samples during sample preparation or field sampling procedures.

- All QA/QC blanks were free of contamination.

Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Samples

The LCS (and LCSD) and is used to assess the accuracy and precision of the analytical method independent of sample matrix. Percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- LCS analysis exhibited acceptable recoveries except for analytes presented in the following table.

Method	Sample	Analyte(s)	Exceedance	Qualification	Reason Code
200.7	FB_20230510	Arsenic	%R > CL	J (Detects) No Action (NDs)	6H
		Silver	%R < CL	J (Detects) UJ (NDs)	6L

Matrix Spike and Matrix Spike Duplicate (MS/MSD) Samples

Matrix spike/matrix spike duplicate analysis is utilized to assess the accuracy and precision of the method by measuring the effects of interferences caused by the sample matrix. The MS/MSD percent recoveries and relative percent differences (RPDs) must be within laboratory-established acceptance limits.

- MS/MSD analysis was not performed on samples evaluated in this report.

Laboratory Duplicate

Laboratory duplicate analysis measures precision of the analytical method. The relative percent difference (RPD) is measured between parent and duplicate sample results. The Laboratory duplicate RPDs must be within laboratory-established acceptance limits.

- The lab duplicate analysis was not performed on samples evaluated in this report.

Serial Dilution

The serial dilution analysis indicates the presence matrix interferences. Sample results greater than 50 times the MDL are evaluated, and percent difference (%D) is measured between undiluted and diluted sample results. A control limit of 20% is applied.

- The serial dilution analysis was not performed on samples evaluated in this report.

Field Duplicate Accuracy

The field duplicate analysis is employed to measure precision in both the field and laboratory. The relative percent difference (RPD) is measured between parent and duplicate sample results. When both results are greater than or equal to five time the reporting limit (RL), a control limit of 30% relative percent difference (RPD) is applied for water samples and 50% RPD for soil samples. When parent and/or duplicate sample results are less than five times the RL, the absolute difference between the two results is compared to two times the RL for water samples and four times the RL for soil samples.

- Field duplicates were not included for the SDGs evaluated in this report.

Initial Calibration and Continuing Calibration

The initial calibration curve is developed by plotting instrument response of analytes versus the known concentrations of analyte standards, and linearity ensures the instrument can produce quantitative data. Continuing calibration standards are used to assess calibration drift.

- ICVs and CCVs were within the specified control limits.

Reporting Limits and Analyte Quantitation

- All sample detections detected above the MDL and below the RL are appropriately qualified as estimated, J, by the laboratory, reason code T.

System Performance and Overall Assessment

Instrument performance indicators were evaluated, and overall analytical integrity was assessed.

- Overall system performance was acceptable.

Data Qualifiers

J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

UJ = The analyte was not detected above the sample reporting limit; and the reporting limit is approximate.

U = The analyte was analyzed for but was not detected above the method detection limit.

R = The sample results is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

Reason Codes

1	Holding time violation
2	Method blank contamination
3	Surrogate recovery
4	MS/MSD recovery
5	MS/MSD precision outside limits
6	LCS recovery
7	Field blank contamination
8	Field duplicate precision outside limits
9	Other deficiencies (including cooler temperature)
A	Absence of supporting QC
S	ICV, CCV or column performance check problem
Y	Initial and continuing calibration blank problem
M	Interference check samples problem
O	Post digestion spike outside of 85-115%
F	MSA correlation coefficient <0.995, or MSA not done
G	Serial dilution problem
K	DFTPP or BFB tuning problem
Q	Initial calibration problem
X	Internal standard recovery problem
V	Second source standard calibration verification problem
L	Low bias
Z	Retention time problem
N	Counting time error (radionuclide chemistry)
W	Detector instability (radionuclide chemistry)
C	Co-elution of compounds
E	Value exceeds linear calibration range
I	Interferences present during analysis
T	Trace level compound, poor quantitation
P	1C/2C precision outside limits
B	LCS/LCSD precision outside limits
D	Lab Dup/Rep precision outside limits
H	High bias

Extractable Petroleum Hydrocarbons:

Gas Chromatography/Flame Ionization Detector

New Jersey Department of Environmental Protection Site Remediation Program Extractable Petroleum Hydrocarbons Methodology (Version 3.0).
USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8015B or NJDEP Office of Quality Assurance Quantitation of Semi-Volatile Petroleum Products in Water, Soil and Sediment OQA-QAM-025, Revision 6.

Metals:

Inductively-Coupled Plasma Atomic Emission Spectrometry or Inductively-Coupled Plasma Mass Spectroscopy

Wastewater and Groundwater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 200.7, Method 200.8.
Soil Samples: USEPA Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 6010D.

Mercury:

Cold Vapor Atomic Absorption Spectrometry

Wastewater and Groundwater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 245.1.
Soil Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 7471B.

Volatile Organic Compounds:

Purge and Trap Gas Chromatography/Mass Spectroscopy

Drinking Water Samples: USEPA Methods for the Determination of Organic Compounds in Drinking Water, Method 524.2.
Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 624.1, Method 8260C.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8260C.

Semi-Volatile Organic Compounds:

Gas Chromatography/Mass Spectroscopy

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 625.1, Method 8270D.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8270D.

PFAS Compounds:

Liquid Chromatography/Tandem Mass Spectroscopy

Drinking Water Samples: USEPA Methods for the Determination of Selected Perfluorinated Alkyl Acids in Drinking Water by Solid Phase Extraction and Liquid Chromatography/Tandem Mass Spectrometry (LC/MS/MS), Method 537.

Pesticides:

Gas Chromatography/Electron Capture Detector

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 608.3, Method 8081B.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8081B.

Polychlorinated Biphenyls (PCBs):

Gas Chromatography/Electron Capture Detector

Wastewater Samples: USEPA Methods for the Analysis of Water and Wastes, Method 608.3, Method 8082A.
Soil and Groundwater Samples: USEPA SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods Update III, Method 8082A.

General Chemistry Methods:

Various general chemistry methods are taken from "Standard Methods for the Examination of Water and Wastewater, 19th Edition".

Specific method citations can be found on the Analytical Results Summary page of this report listed under 'Method'.

** A complete list of APL's certified Methods are accessible on the Standards And Docs page of the Results Retrieval System

MDL:

Method Detection Limit. The minimum reportable concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. The value is calculated from the analysis of seven replicates of a spike sample. On analytical reports this value is corrected for percent moisture and any concentration or dilution factors.

RL:

Reporting Limit. The Concentration of the lowest calibration standard that was included in the initial calibration of the instrument. On analytical reports this value is corrected for percent moisture and any concentration or dilution factors.

Concentration (Conc) / Result:

If the compound is detected, the measured concentration is reported. If this column is left blank, or contains a 'less than' (<) symbol, the compound was not detected.

Tentatively Identified Compound (TIC):

A TIC is a non-targeted compound, not included in the calibration, identified by a mass spectral library search.

Qualifiers:

- **U:** Indicates the compound was analyzed for but was not detected.
- **J:** Indicates an estimated value. All tentatively identified compounds (TICs) and results below the RL receive this qualifier.
- **B:** Indicates the analyte was found in the method blank as well as the sample.
- **N:** Used when reporting a specific tentatively identified compound.
- **E:** Indicates that the concentration of the compound exceeds the calibration range of the instrument. The results of a diluted analysis will also be reported. The results of the dilution should be used for those compounds exceeding the calibration range in the undiluted analysis.

QUALITY CONTROL
Conformance/Non-Conformance Summary

ANALYSIS: INORGANICS [6010D / 200.7 / 7473 / 9014 / SM 4500-CN C-16 plus E-16]
Method 6010D:
The percent recoveries for several metals were outside of the QC limits for the matrix spike and matrix spike duplicate (low).
The blank spike met all QC criteria.

Method 200.7:
The percent recovery for Silver was outside of the QC limits for the blank spike (low).
The percent recoveries for some metals were outside of the QC limits for the matrix spike and matrix spike duplicate (low).

Method 9014:
The percent recovery for Cyanide was outside of the QC limits for the matrix spike (low). The blank spike met all QC criteria.

Methods 7473 / 245.1 / SM 4500-CN C-16 plus E-16:
All samples met the QC criteria.

ANALYSIS: Herbicides [8151A]
Sample 23E0505-02 has one surrogate (2,4-DCAA [2C]) outside of the QC limits (low), due to matrix interference.

ANALYSIS: PCBs [8082A]
All samples met the QC criteria.

ANALYSIS: PESTICIDES [8081B]
Samples 23E0505-02 and -03 have surrogates outside of the QC limits (high), due to matrix interferences.

The percent recovery for Endosulfan sulfate was outside of the QC limits for the blank spike (low).

ANALYSIS: VOLATILES BY GC/MS [8260D]
The continuing calibrations were outside of the QC limits for some compounds (low and high).

The percent recoveries for several compounds were outside of the QC limits for the matrix spike and matrix spike duplicate (low).
The blank spike met all QC criteria.

Sample 23E0505-01 has one surrogate (4-Bromofluorobenzene) outside of the QC limits (low).

ANALYSIS: SEMI-VOLATILES BY GC/MS [8270E]
The continuing calibrations were outside of the QC limits for some compounds (low and high).
