3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjusting:

1. Upon completion of the installation, the Contractor shall adjust all HVAC fans for their intended use.

a. Assembled fans shall then be dynamically balanced using a vibration analyzer to measure velocity.

b. The final reading shall not exceed 0.1-in./sec at the fan shaft speed.

c. The exact level of vibration will be recorded on the fan as proof of the final dynamic balance.

B. Protection:

1. The HVAC fans shall be protected as per the requirements of the Contract Documents. The use of HVAC fans shall not be permitted until permission is given by the Engineer.

a. When permission is given, the Contractor shall operate each HVAC fan to ensure their performance.

C. Cleaning:

1. In addition to the requirements of the Contract Documents, the Contractor shall thoroughly clean all surfaces of the installed HVAC fans and remove all debris and waste materials resulting from installation.

END OF SECTION

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified, and required to furnish, install, and test intake and relief vents, complete and operational.

B. The following index of this Section is presented for convenience:

C. All gravity ventilators shall be provided in accordance with the schedule shown on the Contract Drawings.

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Not Used

1.04 REFERENCES

A. Not Used

1.05 DESCRIPTION

A. This Section includes requirements for providing gravity ventilators as well as accessories in accordance with applicable standards and regulations. In addition:

1. Gravity ventilators shall be furnished complete with all accessories, special tools, spare parts, mountings, anchor bolts, and other appurtenances as specified and/or required for proper installation.

1.06 QUALITY ASSURANCE

A. Requirements of Regulatory Agencies: Comply with the applicable provisions of the standards organizations and regulatory agencies, below:

1. Underwriters Laboratories, Inc.
2. National Fire Protection Association.
3. National Electrical Code.
4. Local and State Building Codes and Ordinances:
   a. Building Code of the City of New York.
   b. New York City Fire Code.
   c. New York City Energy Conservation Code.

B. Qualifications of Manufacturer:

1. All components of the gravity ventilators shall be provided by the Contractor through a single gravity ventilator vendor.
   a. The vendor shall engage manufacturer(s) which can show successful experience in the fabrication and manufacture of the equipment specified herein.
      1) The manufacturer(s) shall (each) have at least five (5) years' experience in the installation of Work specified.
   b. The Contractor (through the gravity ventilator vendor), shall have the sole responsibility of matching all components and providing equipment which functions together as a system.
2. The gravity ventilator shall be the standard equipment of the manufacturer(s).

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited, to:

1. Action Submittals:

a. Manufacturer's literature, illustrations, specifications, and Engineering data including:

1) Dimensions.

2) Materials of construction.

3) Details of installation.

4) Prefabricated curb details.

5) Air velocity through throat (fpm).

6) Air pressure drop through unit (in. W.G.).

b. Drawings showing:

1) The general arrangement of the equipment and methods of installation with detailed mounting information.

c. Documentation from the factory substantiating painting systems in accordance with the specifications. Include types applied and dry film thicknesses. Include color chart for color selection.

d. Operation and maintenance manuals

2. Information Submittals:

a. Spare parts list

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. The cleaning, preservation and packing of the gravity ventilator for shipment shall be in accordance with the manufacturer's commercial practice.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. The gravity ventilator shall be handled in such a manner that they may be transported and unloaded without being over-stressed, deformed, or otherwise damaged.

2. The gravity ventilator shall be protected from corrosion and deterioration and shall be stored in a dry area.

a. Materials stored outdoors shall be supported above ground surfaces on wood runners and protected with effective and durable waterproof covers approved by the Engineer.

3. Interiors shall be kept free from dirt and foreign matter.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall provide spare parts and special tools necessary to service, disassemble, repair and adjust the equipment provided under this Section, and as

per the requirements of the Contract Documents and/or as recommended by the manufacturer.

B. Tools: Provide standard and special tools and supplies necessary to service, disassemble, repair, and adjust the equipment.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Gravity Ventilators:

1. Model TRE, as manufactured by Loren Cook Company, Powder Springs GA;
2. Greenheck Fan Corporation, Valley Forge, PA;
3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Air Intake and Relief Vents:

1. Capacity: As shown on the Contract Drawings.
2. General:
   a. Provide low contour, rectangular or square hood type, as shown on the Contract Drawings.
   b. Provide multitier louver type as shown on the Contract Drawings.
3. Construction:
   a. Housing:
      1) Minimum 0.081 gauge extruded aluminum tiers.
      2) Minimum 8-gauge aluminum support structure.
      3) Hood shall be constructed of minimum 0.063 aluminum with anti-condensate coating.
   b. Base:
      1) Welded aluminum construction.

B. Accessories:

1. Bird Screen: ½-in. (13 mm) mesh Type 316 stainless steel screen securely anchored to housing at gravity ventilator.

2. Curb Gasket: Self-adhesive gasket of Buna-N, EPDM, or Hypalon cemented to inner edge of curb to provide air and water seal between curb and housing.

3. Base to Curb Fasteners: Type 316 stainless steel lag screws and bolts.

4. Prefabricated Roof Curb:

   a. Weatherproof, continuous welded minimum 14 ga. aluminum construction.

   b. Insulated with 2-in. minimum fiberglass sandwiched between inner and outer walls of curb.

   c. 45° canted type sides.

   d. Provide curb with gasket as per above and wood blocking to mount curb. Provide flashing and counter flashing at curb as required to make watertight installation.

   e. 12-in. minimum curb height measured from finished roof to top of pressure treated wood nailer.

   f. Curb to Roof Deck Fasteners: Type 316 stainless steel lag screws and bolts.

   g. Refer to architectural Contract Drawings for curb flashing details.

   h. Contractor shall furnish prefabricated roof curbs from the same manufacturer as the air intakes and relief vents.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Painting:

1. All exterior and interior surfaces of equipment, including all accessories, shall be coated with a dry phenolic coating system.

   a. Finish and color to match housing.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Inspection:

1. The Contractor shall not install damaged items until repairs are made in accordance with manufacturer's written instructions and approval by Engineer.

   a. Only minor repair work will be permitted in the field.

b. All damaged items requiring remedial work shall be returned to the manufacturer for repair or replacement

B. Examine curbs to receive air intake and relief vents for:

1. Horizontal mounting surface.

2. Water tightness.

3. Proper anchoring and flashing of prefabricated curb to roof deck.

4. Unevenness, irregularities, and incorrect dimensions that would affect quality and execution of installation.

C. Do not proceed with installation of air intake and relief vents until curbs conform to Contract requirements.

3.02 INSTALLATION

A. Roof openings and penetrations shall be capped to prevent weather from entering building prior to installation of air intakes or relief vents.

B. Install gravity ventilator in complete accordance with manufacturer's printed installation instructions and the approved shop drawings.

C. Anchor base to wood nailer on curb with lag screws or bolts in manner that allows for easy removal for damper service.

D. Check proper connections for electrical wiring hook-ups for motorized dampers.

3.03 FIELD TESTING / QUALITY CONTROL

A. Furnish the services of a qualified manufacturer's representative to check and approve all installations before operation, in accordance with the requirements of the Contract documents. In addition:

1. The Contractor shall verify that all work furnished and installed conforms to the requirements the Contract Documents.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjusting:

1. Upon completion of the installation, the Contractor shall adjust all air intake and relief vents for their intended use.

B. Protection:

1. The gravity ventilator shall be protected as per the requirements of the Contract Documents. The use of the gravity ventilator shall not be permitted until permission is given by the Engineer.

C. Cleaning:

1. In addition to the requirements of the Contract Documents, the Contractor shall thoroughly remove all debris and waste materials resulting from installation.
2. Clean tar, dirt, and marks from exterior of units.
3. Touch up all chips in factory finishes.

1. UL 1995 – Heating and Cooling Equipment.

1.05 DESCRIPTION

A. This Section includes requirements for providing ductless split systems and accessories in accordance with applicable standards and regulations. In addition:

1. Ductless split systems shall be furnished complete with all accessories, special tools, spare parts, base attachments, mountings, anchor bolts and other appurtenances as specified and/or required for proper installation.

1.06 QUALITY ASSURANCE

A. Requirements of Regulatory Agencies: Comply with the applicable provisions of the standards organizations and regulatory agencies, below:

1. Underwriters Laboratories, Inc.

2. National Fire Protection Association.

3. National Electrical Code.

4. Local and State Building Codes and ordinances

a. Building Code of the City of New York.

b. New York City Fire Code.

5. Permits: Contractor shall obtain and pay for all required permits, fees and inspections.

B. Qualifications of Manufacturer:

1. All components of the ductless split system shall be provided by the Contractor through a single ductless split system vendor.
    a. The Contractor (through the ductless split system vendor) shall have the sole responsibility of matching all components and providing equipment which functions together as a system.
2. The ductless split system shall be standard equipment of the manufacturer.
3. The ductless split system shall be designed, constructed, and installed in accordance with the best practices of the trade, and shall operate satisfactorily when installed as shown on the Contract Drawings.
4. Provide units listed by the Underwriters Laboratories, Inc.
5. Require the ductless split-system air-conditioner manufacturer to review and approve or to prepare all Shop Drawings and other submittals for all components furnished under this Section.
6. All components shall be specifically constructed for the specified service conditions and shall be integrated into the overall equipment assembly by the ductless split-system air-conditioner manufacturer.
7. Certifications:
    a. Ductless split-system air-conditioners shall bear an approved label with all the necessary identification marks, electrical data, and any necessary cautions as required by the National Electric Code.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to:

1. Action Submittals:
    a. Drawings showing fabrication methods, assembly, accessories, installation details, and wiring diagrams.
    b. Detailed drawings of each individual component's wiring diagrams.
    c. Detailed drawings of control panel layout.
    d. Detailed installation drawing of each individual component showing:
        1) Mounting requirements.
        2) Locations (panel, field, etc.).
        3) Piping, and wiring connections, labeled and coded.
    e. Setting drawings, templates, and directions for the installation of anchor bolts and other anchorages.
    f. Manufacturer's literature, illustrations, specifications, weight, dimensions, required clearances, materials of construction, and performance data for all equipment.

g. Complete component list.

h. Detailed description of each component.

i. Catalog cut sheets for each component.

j. Fan performance curves with operating points.

k. Deviations from Contract Documents. Any exceptions to the Contract Documents must be clearly defined. Contractor shall be responsible for any additional expenses that may occur due to any exception made.

l. Lubricant Specification: Furnish lubricant specification for type and grade required for equipment furnished.

m. Operation and maintenance manuals.

n. Installation data.

o. Other technical data related to specified material and equipment as requested by Engineer.

2. Informational Submittals: Submit the following:

a. Spare parts list.

b. Special tools list.

c. Reports of Certified Shop Tests.

d. Independent certification reports:

1) UL Label or approved equal.

2) AHRI Label.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. The cleaning, preservation, and packing of the ductless split system for shipment shall be in accordance with the manufacturer's commercial practice.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. The ductless split system shall be handled in such a manner that they may be transported and unloaded without being over-stressed, deformed, or otherwise damaged.

2. The ductless split system shall be protected from corrosion and deterioration and shall be stored in a dry area.

a. Materials stored outdoors shall be supported above ground surfaces on wood runners and protected with effective and durable waterproof covers approved by the Engineer.

3. Interiors shall be kept free from dirt and foreign matter.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall provide spare parts and special tools necessary to service, disassemble, repair, and adjust the equipment provided under this Section, as per the requirements of the Contract Documents and/or as recommended by the manufacturer.

B. Tools: Provide standard and special tools and supplies necessary to service, disassemble, repair, and adjust the equipment.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Indoor Units:

1. Ceiling Cassette:

a. Model PLA, as manufactured by Mitsubishi Electric.

b. LG.

c. Or approved equal.

B. Outdoor Units:

1. Model PUZ, as manufactured by Mitsubishi Electric.

2. LG

3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Equipment Description:

1. Units shall be completely factory assembled and tested, and internally piped and wired. Units shall consist of indoor air conditioners (indoor units) with filters, evaporator coils, supply fans, motors, and remotely located outdoor heat pumps (outdoor units).

2. Units shall include all unit mounted controls, wiring, and accessories.

3. Indoor units and refrigerant pipes shall be purged with dry air before shipment from the factory.

4. Outdoor units shall be pre-charged with refrigerant for a minimum of 70 feet of refrigerant tubing.

B. Design Criteria:

1. Design conditions shall be as indicated on the Equipment Schedule.
2. Units shall conform and be certified to the latest editions of ASHRAE Standard 15 and UL 1995.

C. Performance Criteria:

1. Minimum performance data for each unit shall be as indicated on the Equipment Schedule. Provided equipment shall not exceed scheduled total power.
2. Units shall meet or exceed the Energy Efficiency Ratio (EER) shown on the Equipment Schedule when tested in accordance to the latest editions of AHRI Standard 210/240.
3. Outdoor units shall be capable of cooling operation down to 0-degree F ambient temperature without additional low ambient controls.
4. Outdoor units configured as heat pumps shall be capable of heating operation down to -13 degree F ambient temperature.
5. Outdoor units shall be able to operate with a maximum height difference of 100 feet between indoor and outdoor units.
6. System shall be capable of operating up to a minimum refrigerant tubing length of 100 feet between indoor and outdoor units without the need for line size changes, traps or additional oil.

D. Indoor Unit:

1. Type: Ceiling Cassette Air Conditioners:
    a. Cabinet:
        1) Cabinet shall be formed from galvanized sheet metal coated with high-density foam insulation.
        2) Cabinet shall be for recessed mounting and provided with four corner mounting supports behind removable corner pockets in grille assembly allowing adjustment of mounting height from front of unit.
        3) White grille assembly shall be attached to the front of the cabinet to provide supply air vanes in four directions and a center mounted return air section. Four-way grille shall allow two, three, or four-way blow.
        4) Cabinet panel shall have provisions for a field installed filtered outside air intake.
        5) Cabinet shall have a knock-out to provide a branch air duct for conditioning a secondary space.
    b. Evaporator Coil:

1) Coil shall be of nonferrous construction with pre-coated aluminum strake fins on copper tubing. All tube joints shall be brazed with PhosCopper or silver alloy.

2) Coil shall be pressure tested at the factory.

3) Coil shall be furnished with a condensate pan and drain.

4) Unit shall include a built-in, automatic condensate lift mechanism that will be able to raise condensate 33 inches above the condensate pan. The lift mechanism shall be equipped with a positive acting liquid level sensor to shut down the indoor unit if liquid level in the drain pan reached maximum level.

c. Supply Fans:

1) Direct drive, turbo propeller fan shall be driven by a single motor.

2) Multi-speed fan motor shall have permanently lubricated bearings.

3) Fan shall have a selectable AUTO fan setting that will adjust the fan speed based on the difference between controller setpoint and sensed space temperature.

d. Vanes:

1) Motorized adjustable air outlet system shall provide two-way, three-way, or four-way airflow with switches that can be set to provide optimum airflow based on ceiling height and number of outlets used.

2) Vane angles shall be individually adjustable from the remote controller to customize the airflow pattern for the conditioned space.

3) Vanes shall have five fixed positions and a swing feature that shall be capable of automatically swinging the vanes up and down for uniform air distribution.

4) Vanes shall have the selectable capability to randomly cycle the vanes up and down to evenly heat the space in the heating mode.

e. Filter:

1) Return air shall be filtered by means of an easily removable, washable polypropylene honeycomb filter.

E. Outdoor Units:

1. Units shall be configured as an air-source heat pump and shall include a four-way solenoid valve and compressor muffler.

2. Cabinet:
   a. Casing shall be fabricated of galvanized steel.
   b. Mounting feet shall be provided and shall be welded to the base of the cabinet.
   c. Removable panel sections shall allow easy access to all serviceable parts.
   d. Fan grill shall be constructed from ABS plastic.
   e. Cabinet mounting and construction shall be sufficient to withstand 155 MPH wind speed conditions for use in Hurricane condition areas.
3. Condenser Fans:
   a. Direct drive fan and motor shall be configured for horizontal discharge airflow.
   b. Fan blades shall be of aerodynamic design for quiet operation and the fan motor bearings shall be permanently lubricated.
   c. Fan shall be mounted in front of the coil, pulling air across it from the rear and dispelling it through the front.
   d. Fan shall be provided with a raised guard to prevent external contact with moving parts.
4. Condenser Coil:
   a. Coil shall be of copper tubing with flat aluminum fins.
   b. Coil shall be protected with an integral metal guard.
5. Compressors:
   a. Compressor shall be hermetically sealed, variable speed, rotary or scroll type. Compressor shall be equipped with an internal thermal overload.
   b. Compressor shall be driven by inverter circuit to control compressor speed.
   c. In lieu of a crankcase heater, minimal amount of current shall be automatically and intermittently applied to the compressor motor windings to maintain sufficient heat to vaporize any refrigerant during the off cycle to prevent liquid accumulation.
   d. Compressor shall be mounted so as to avoid transmission of vibration.
6. Refrigeration System:
   a. Refrigerant flow from the condenser shall be controlled by means of an electronic linear expansion valve (LEV) metering device. The LEV shall be control by a microprocessor-controlled step motor.

b. System shall include an accumulator, high pressure safety switch, refrigerant line filter driers (strainers), Schrader type service fittings (stop valves) for liquid and suction connections, and service ports.

F. Accessories:

1. Hangers and Supports:

a. Provide equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.

b. Equipment shall be supported from the building structure.

c. Unless otherwise specified herein, hangers and supports shall also conform to all the requirements of Section 40 05 07, Hangers and Supports for Process Piping.

2. Refrigerant Piping and Insulation:

a. All refrigerant lines between outdoor and indoor units shall be of annealed, refrigeration grade copper tubing, Type ACR, meeting ASTM B280 requirements.

b. Refrigerant piping shall be individually insulated in twin-tube, flexible, closed-cell, CFC-free (ozone depletion potential of zero), elastomeric material.

c. Insulation shall have a maximum thermal conductivity of 0.27 Btu-in/hr-ft2-degree F at 75 degrees F and a maximum water vapor transmission of 0.08 perm-in.

d. Insulation shall have a maximum Flame Spread Index of 25 and a maximum Smoke Developed Index of 50 when tested in accordance with ASTM E84.

e. Insulation thickness shall be a minimum 1-1/2-inch.

3. Weatherproof Insulation Jacketing:

a. General: Provide for refrigerant piping insulation exposed to the outdoors.

b. Aluminum Protective Jacketing:

1) Product and Manufacturer: Provide one of the following:

a) Model Strap-On, as manufactured by Pabco-Childers Metals.

b) Model Insul-Mate, as manufactured by RPR Products, Inc.

c) Or approved equal.

2) Material: Smooth aluminum (Alloy 3003 – H-14).

3) Thickness: 0.016-inch.

4) Moisture Retarder: 3-mil thick coextrusion of polyethylene and DuPont's Surlyn.

5) Fastening: Continuous modified Pittsburgh Z-lock longitudinal seam with self-gauging 2-inch built-in overlap.

6) Bands: 1/2-inch stainless steel bands with wing seals.

7) Fittings:

a) Type: Pre-fabricated aluminum (Alloy 3003 – H-14) fittings.

b) Thickness: 0.016-inch.

4. Indoor units shall be provided with a condensate mini-pump that is capable of lifting condensate 23 inches above the drain pan.

5. Indoor units shall be equipped with a temperature sensor kit that provides uniform temperature detection from floor to ceiling to automatically adjust the temperature setpoint.

6. Outside air temperature and humidity sensor shall be furnished with the units for field installation.

7. Outdoor units shall be provided with wind baffle for low ambient cooling operation.

8. Provide manufacturer's wall mounting bracket.

G. Controls:

1. Refer to Section 23 09 00 - Instrumentation and Control for HVAC, for additional information and sequence of operations. Provide provisions for interfacing with the instrumentation and control (IC) system. Contractor shall coordinate operating system requirements with Section 23 09 00 - Instrumentation and Control for HVAC, for a complete system.

2. Unit shall be completely factory wired with the necessary controls, starters, contactors and terminal blocks for power and control wiring.

3. A color-coded circuit diagram of the approved electrical drawing shall be provided with the unit.

4. All electrical components shall bear the UL label.

5. Unit shall be designed for single point electrical connection. All necessary power transformers shall be factory provided and installed.

6. The system shall be capable of satisfactory operation within voltage limits of 198 VAC to 253 VAC, 1 Phase, 60 Hz.

7. The power to the indoor unit shall be supplied from the outdoor unit. A factory provided three AWG-14 wire conductors with ground shall provide power feed and bi-directional control transmission between the outdoor and

indoor units. The outdoor unit shall have Pulse Amplitude Modulation circuit to utilize 98 percent of input power supply.

8. The control system shall consist of a minimum of two microprocessors, one on each indoor and outdoor unit, interconnected by a single non-polar two-wire cable. The outdoor unit shall be controlled by the microprocessor located in the indoor unit using 24 VDC pulse control signal.

9. The indoor unit control board shall have auxiliary control contact connectors to provide:

   a. Heat Recovery.

   b. Back-up Heat.

   c. Remote Switch.

   d. Central Control.

   e. IP Terminal.

10. The microprocessor located in the indoor unit shall have the capability of monitoring return air temperature and indoor coil temperature, receiving and processing commands from a wireless or wired controller, providing emergency operation and controlling the outdoor unit.

11. The system shall include a 3-minute time delay mechanism, an automatic restart function when power is restored after power interruption, and a test run switch.

12. The system shall have self-diagnostics ability, including total hours of compressor run time. Diagnostics codes for indoor and outdoor units shall be displayed on the controller panel.

13. Remote Controllers:

   a. Wired, Wall Mounted:

      1) Remote controller shall be approximately 5-inch by 5-inch in size and white in color with a light-green LCD display.

      2) The control voltage from the wired controller to the indoor unit shall be 12/24 VDC.

      3) Field wiring shall run directly from the indoor unit to the wall mounted controller with no splices. Up to two wired controllers shall be able to be used to control one unit.

      4) Controller shall support a selection from multiple languages (Spanish, German, Japanese, Chinese, English, Russian, Italian, or French) for display information.

      5) Controller shall include be a built-in weekly timer with up to 8 pattern settings per day.

6) Controller shall consist of an ON/OFF button, Increase/Decrease Set Temperature buttons, a Cool/Auto/Fan/Dry mode selector, a Timer Menu button, a Timer ON/OFF button, Set Time buttons, a Fan Speed selector, a Ventilation button, a Test Run button, and a Check Mode button.

7) Controller shall have a built-in temperature sensor.

8) Temperature shall be displayed in either Fahrenheit (°F) or Celsius (°C), and temperature changes shall be by increments of 1 degree F (0.5 degree C).

9) Controller shall have the capability of controlling up to a maximum of 16 systems, as a group with the same mode and temperature setpoint for all, at a maximum developed control cable distance of 1,500 feet.

10) Basic functions of the controller shall include:

a) ON/OFF for run and stop operation.

b) Operation mode for switching between Cool/Dry/Auto/Fan/Heat.

c) Temperature setpoints:

(1) Cool/Dry: 67-87 degrees F.

(2) Heat: 63-83 degrees F.

(3) Auto: 67-83 degrees F.

d) Fan speed settings.

e) Air flow direction settings.

f) Scheduling.

g) Operating conditions and error code display.

h) Ventilation control.

i) Auto lock out function for setting or releasing of all buttons.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Outdoor units shall be provided with a full seacoast protection package which include the following features:

1. Casings shall be fabricated with alloyed galvanized sheet metal with thermoset polyester-resin coating on internal and external surfaces.

2. Compressor covers shall be fabricated with galvanized-aluminum sheet metal with thermoset polyester-resin coating on internal and external surfaces.

3. Electrical panels shall be fabricated with galvanized-aluminum sheet metal with thermoset polyester-resin coating on external surface.

4. Fan motor supports shall be fabricated with galvanized steel with thermoset polyester-resin coating on internal and external surfaces.

5. Printed circuit boards shall be coated with epoxy resin and polyurethane top coat on external surface.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Equipment shall be completely manufactured and pre-assembled in accordance with Reference Standards. Perform the following tests and inspections at factory before shipment:

1. Tested and inspected for approval as a unit by Underwriters Laboratories Inc., UL Label or approved equal.

2. Factory test equipment to ensure that the entire package has been properly fabricated and assembled, that all the controls function as specified herein and that the package meets the specified performance requirements including manufacturer's data report.

3. Fan wheels and shafts shall be statically and dynamically balanced.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Protection of Surrounding Areas/Surfaces:

1. Openings and penetrations shall be capped to protect the building from outside conditions.

2. Equipment shall be tightly covered and protected against dirt, water, and chemical or mechanical damage.

B. Examine conditions under which materials and equipment will be installed and notify Engineer in writing of conditions detrimental to proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions are corrected.

C. Take field measurements where required prior to installation to ensure proper fitting of Work.

3.02 INSTALLATION

A. Install the equipment in accordance with the Contract Documents and by manufacturer's instructions and recommendations. Obtain written interpretation from Engineer in the event of conflict between manufacturer's instructions and recommendations and the Contract Documents.

B. Install in accordance with Laws and Regulations.

C. Do not modify structures to facilitate installation of equipment, unless approved in writing by Engineer.

D. Installation to conform to requirements of all local and state codes.

3.03 FIELD TESTING / QUALITY CONTROL

A. Furnish the services of a qualified manufacturer's representative to check and approve all installations before operation as well as conduct field testing, in accordance with the requirements of the Contract documents. In addition:

1. The Contractor shall verify that all work furnished and installed conforms to the requirements the Contract Documents.

2. Reports: Submit a report from the manufacturer of each visit to the site. Reports shall provide complete information on time, schedule, tasks performed, persons contacted, problems corrected, test results, training, instruction and all other pertinent information.

3. Perform field tests in accordance with Section 23 05 93 – Testing, Adjusting, and Balancing for HVAC.

3.04 STARTUP / DEMONSTRATION

A. Furnish the service of a qualified manufacturer representative to assist and train the plant operations and maintenance staff in the care, operation, and maintenance of the HVAC fans in accordance with the requirements of the Contract Documents. In addition:

1. The Contractor shall make all adjustments required to place Work in proper operating condition.

2. The Contractor shall include instruction on care and maintenance of the ductless split system in the training of plant personnel.

3. In the event of trouble with the equipment, the manufacturer's representative shall revisit the site as often as required until all troubles are corrected and the installation is entirely satisfactory.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjusting:

1. Adjust all controls for proper settings.

2. While system is operable, balance all equipment to achieve design conditions.

B. Protection:

1. The ductless split systems shall be protected as per the requirements of the Contract Documents. The use of ductless split systems shall not be permitted until permission is given by the Engineer.

a. When permission is given, the Contractor shall operate each HVAC fan to ensure their performance.

C. Cleaning:

1. In addition to the requirements of the Contract Documents, the Contractor shall thoroughly remove all debris and waste materials resulting from installation.

2. Clean tar, dirt, and marks from exterior of units.

3. Touch up all chips in factory finishes.

END OF SECTION

C. All electric heaters shall be provided in accordance with the schedule shown on the Contract Drawings.

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 09 91 00 – Painting

B. Section 23 05 93 – Testing, Adjusting, and Balancing for HVAC

1.04 REFERENCES

A. Reference Standards:

1. UL Standard 1096 - Electrical Central Air Heating Equipment

1.05 DESCRIPTION

A. This Section includes requirements for providing electric heaters and accessories in accordance with applicable standards and regulations. In addition:

1. Electric heaters shall be furnished complete with all accessories, special tools, spare parts, attachments, mountings, anchor bolts, and other appurtenances as specified and/or as may be required for a proper installation.

1.06 QUALITY ASSURANCE

A. Requirements of Regulatory Agencies: Comply with applicable provisions of the standards organizations and regulatory agencies, below.

1. Underwriters Laboratories, Incorporated.
2. National Fire Protection Association.
3. National Electrical Code.
4. Local and State Building Codes and Ordinances.
   a. New York City Building Code.
   b. New York City Fire Code.
   c. New York City Energy Conservation Code.

B. Qualifications of Manufacturer:

1. All components of the electric heaters shall be provided by the Contractor through a single electric heater vendor.
   a. All electric heaters included in the Work shall be one of a single manufacturer and of similar character in a location.
   b. The Contractor (through the electric heater vendor) shall have the sole responsibility of matching all components and providing equipment which functions together as a system.
2. The electric heaters shall be standard equipment of the manufacturer.
3. The electric heaters shall be designed, constructed, and installed in accordance with the best practices of the trade, and shall operate satisfactorily when installed as shown on the Contract Drawings.
4. Provide units listed by the Underwriters Laboratories, Inc.

C. Qualifications of Contractor:

1. The Contractor shall be a New York City licensed plumber.

2. The Contractor shall have at least five (5) years' experience in the installation of the Work specified.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited, to:

1. Action Submittals:

a. Manufacturer's literature, illustrations, specifications, and engineering data, including, but not limited to:

1) Dimensions.

2) Capacities.

3) Materials of construction.

4) Finishes, standard and custom color chart for Engineer's approval.

b. A complete wiring diagram shall be submitted indicating both factory and field connections.

c. Documentation from the factory substantiating painting systems in accordance with the specifications. Include types applied and dry film thicknesses.

d. Deviations from the Contract Documents.

e. Operations and Maintenance Manuals.

2. Information Submittals:

a. Special Tools List.

b. Spare Parts List.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. The cleaning, preservation and packing of the electric heaters for shipment shall be in accordance with the manufacturer's commercial.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. The electric heaters shall be handled in such a manner that they may be transported and unloaded without being over-stressed, deformed, or otherwise damaged.

2. The electric heaters shall be protected from corrosion and deterioration and shall be stored in a dry area.

a. Materials stored outdoors shall be supported above ground surfaces on wood runners and protected with effective and durable waterproof covers approved by the Engineer.

3. Interiors shall be kept free from dirt and foreign matter.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall provide spare parts and special tools necessary to service, disassemble, repair and adjust the equipment provided under this Section, and as per the requirements of the Contract Documents and/or as recommended by the manufacturer. In addition:

1. Provide one (1) motor for up to every four of same size motors for all heaters.

B. Tools: Provide standard and special tools and supplies necessary to service, disassemble, repair, and adjust the equipment.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Unit Heaters:

1. Electric Unit Heaters (Non-Corrosion Resistant):

a. Model LUH, as manufactured by Chromalox, Trane Co., Long Island City, NY;

b. Indeeco, St. Louis, MO:

c. Or approved equal

2. Electric Unit Heaters (Corrosion Resistant):

a. Model HD3D (Hose Down Electric Heater), as manufactured by Chromalox, Pittsburgh, PA;

b. Indeeco, St. Louis, MO:

c. Or approved equal.

3. Electric Duct Heaters:

a. Model Custom Duct Heater, as manufactured by Indeeco, St. Louis, MO:

b. Brasch Manufacturing Company

c. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. General:

1. All electric heaters shall be provided in accordance with the schedule shown on the Contract Drawings; capacity and electrical supply characteristics shall be as shown on the schedule.

2. Provide complete, factory-assembled and wired units.

B. Unit Heaters:

1. Electric Unit Heaters (Non-Corrosion Resistant):

a. Casing:

1) Shall be constructed of minimum 18 ga. steel.

2) Finished in high-gloss coating:

a) Each unit heater shall have a corrosion resistant coating.

b) The entire unit shall be coated internally and externally with a baked phenolic corrosion resistant coating.

3) Adjustable discharge louvers shall be provided to control the direction of air flow.

b. Heating Element:

1) High mass, all steel, tubular finned type.

c. Fan:

1) Axial flow type.

2) Statically and dynamically balanced at the speed at which the unit is scheduled to operate.

d. Motor:

1) Type: Single speed.

2) Enclosure: Totally enclosed.

3) Overload Protection: Internal thermal overload protection.

e. Controls:

1) Sub-divided circuits with individual fuse protection for all heaters with a total current draw of 48 A or greater.

2) Heavy duty magnetic contactors.

3) Thermal cutout with automatic reset.

4) Integral 120 VAC control transformer.

f. Room Thermostat:

1) Heavy duty line voltage SPDT, 120V, single phase.
2) 40° to 100°F range with 1°F differential.
3) Weatherproof NEMA 4X, corrosion resistant construction.
4) Shielded sensing bulb.
5) Neoprene gasket to seal out dust and moisture.
6) Adjustable knob for temperature setting.
7) Positive off by setting unit to low position.
8) For each electric unit heater, provide wall-mounted, field installed

g. Accessories:

1) Each unit heater shall be provided with mounting brackets.

2. Electric Unit Heaters (Corrosion Resistant):

a. Casing:

1) Shall be constructed of minimum 20 ga. steel.

b. Heating Element:

1) Type 316 stainless steel fin tubular elements.

c. Fans:

1) Aluminum spark resistant construction.
2) Attached with rubber vibration isolation.

d. Motor:

1) Enclosure: Totally enclosed
2) Bearings: Permanently lubricated ball bearings.
3) Integral thermal cutout.

e. Air Deflectors:

1) Adjustable louvered outlet grille, finish same as fan.
2) Heavy gauge rear wire grille, finish same as fan.
3) All hardware shall be stainless steel.

f. Built-in Controls:

1) Heating elements, motor and cutout to be factory prewired to junction terminal block for easy hook-up.
2) Furnish all controls (thermostat, relay, transformer etc.) for field installation as necessary for control operation.

3) Provide integral NEMA 4X junction box for the following unit mounted controls:

a) Two (2) power contactors, primary and backup.

b) One (1) motor contactor.

c) One (1) over temperature protection.

d) One (1) thermal fan delay switch.

4) Provide transformer for 120 V control circuit.

g. Coating:

1) All sheet metal parts shall be protected by zinc chromate primer and 2 coats of epoxy enamel, all factory painted in accordance with Section 09 91 00, Painting.

h. Accessories:

1) Each unit shall be provided with Type 316 stainless steel swivel bracket for wall mounting bracket and stainless steel hardware.

C. Electric Duct Heaters:

1. Frame:

a. Framing shall be flanged type suitable for externally insulated ductwork.

b. Frames, reinforcement, and terminal boxes shall be constructed from minimum 16-gauge corrosion resistant Type 316 stainless steel.

c. Terminal boxes shall be NEMA 4X construction with a hinged latching cover and multiple concentric knockouts for field wiring.

d. The backs of terminal boxes shall be insulated with minimum 1/2-inch fiberglass insulation for thermal and condensation protection.

2. Insulation:

a. Insulation of fiberglass at least ½in. thick shall be used between duct heater and control box for maximum condensation protection.

3. Heating Element:

a. Heaters shall be constructed per U.L. standards for zero clearance and shall meet NEC requirements.

b. Heating elements shall be finned tubular Type 301 or 304 stainless steel with internal resistance wire of 80% nickel and 20% chromium; steps shall be arranged to prevent stratification when operating at less than full capacity.

c. Provide insulated element terminals.

d. Terminal box shall be spot welded construction with solid, hinged cover, totally enclosed, without louvers or grilles per UL Standard 1096. NEMA 4X stainless steel.

e. Three phase heaters shall be furnished with balanced phases on each step.

f. Elements shall be rated approximately 50 W/in.^{2} of wire surface area.

4. Controls:

a. Air flow sensing tube for air flow proving switch shall indicate direction of air flow and be field reversible without removing heater from duct.

b. Disc type automatic reset thermal protection shall be provided as the primary protection and shall be mounted on the duct heater directly in the air stream to provide positive, fast response.

c. Provide secondary manual limit-type reset thermal protection in control circuit in series with automatic.

d. Discharge Air Temperature Sensor. Refer to Section 23 09 00, Instrumentation and Control for HVAC for sequence of operations.

5. Wiring Diagrams:

a. A wiring diagram shall be furnished for each type of heater. Diagram shall include recommended supply wire gauges in conformance to the NEC and fuse sizes. Typical wiring diagrams are not acceptable.

6. Duct Size: Shall be as indicated in the Electric Heater Schedule shown on the Contract Drawings.

7. Units shall have full modulation capacity controlled by a Silicon Controlled Rectifier (SCR). A 4-20 mA or 0-10 VDC heating control signal shall be provided to control the amount of heating.

8. Pilot Lights: Built-in, factory wired, transformer coupled, 6V lamped pilot lights shall indicate the following conditions:

a. Heater Energized.

b. Step Energized: 1 per step.

c. When built-in-air flow switch opened.

9. Proof of Air Flow Switch:

a. Provide in accordance with UL Standard 1096.

b. Type: Pressure differential switch.

c. Shall deactivate unit and de-energize heating element if proper air flow is not present.

10. Built-in Options:
    a. Non-mercury Control Contactors.
    b. Main Power Disconnect Switch.
    c. Interlock terminal strip for interlocking supply air fan.
    d. Control Transformers with Fused Primaries for 120 vac and 24 vac circuits.
11. Unit Mounted Control Enclosure:
    a. Standard control box shall be of the hinged, solid cover type, NEMA 4X stainless steel construction.
12. Protective Screens:
    a. Provide 3/8-inch stainless steel wire mesh screens on inlet both sides of heaters.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Identification:
1. Provide in accordance with Section 40 05 97, Identification for Process Equipment.
2. Each unit of equipment shall be identified with the equipment item numbers shown on the Contract Drawings.
3. A corrosion resistant tag and nameplate, securely affixed in a conspicuous place on each unit shall give the equipment item number, manufacturer's name or trademark and such other information as the manufacturer may consider necessary, or as specified, to complete identification.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. All electric heaters shall be as efficient as those have been tested to perform satisfactorily for at least two (2) years and providing equipment, which functions together as a system.

B. Electric Duct Heaters:
1. Heaters shall be electrically tested as follows:
    a. For electric duct heaters rated ≤ 250 V: Test at 1,000 V.
    b. For electric duct heaters rated > 250 V: Test at and 1,000 V plus twice the rated voltage.
2. All heaters shall be tested at manufacturing facilities for assurance of high quality standards and performance by trained personnel.
3. All components shall be tested for function following installation in the heater.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Inspection:

1. The Contractor shall not install damaged items until repairs are made in accordance with manufacturer's written instructions and approval by Engineer.

a. Only minor repair work will be permitted in the field.

b. All damaged items requiring remedial work shall be returned to the manufacturer for repair or replacement.

3.02 INSTALLATION

A. Install electric heaters in complete accordance with the manufacturer's printed installation instructions and the approved shop drawings. In addition:

1. Install cabinets level and plumb.

2. Coordinate with ceiling grid for ceiling recessed units installation.

3. Set air deflectors for proper air delivery.

4. Check room thermostat and wiring connections to heater

3.03 FIELD TESTING / QUALITY CONTROL

A. Furnish the services of a qualified manufacturer's representative to check and approve all installations before operation in accordance with the requirements of the Contract documents. In addition:

1. The Contractor shall verify that all work furnished and installed conforms to the requirements of the Contract Documents.

B. All tests shall be performed in accordance with Section 23 05 93, Testing, Adjusting, and Balancing for HVAC.

3.04 STARTUP / DEMONSTRATION

A. Furnish the service of a qualified manufacturer representative to assist and train the plant operations and maintenance staff in the care, operation, and maintenance of the electric heaters in accordance with the requirements of the Contract Documents. In addition:

1. The Contractor shall make all adjustments required to place Work in proper operating condition.

2. The Contractor shall include instruction on care and maintenance of the electric heaters in the training of plant personnel.

3. In the event of trouble with the equipment, the manufacturer's representative shall revisit the site as often as required until all troubles are corrected and the installation is entirely satisfactory.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjusting:

1. Upon completion of the installation, the Contractor shall adjust all the electric heaters for their intended use.

B. Protection:

1. Electric heaters shall be protected as per the requirements of the Contract Documents. The use of electric heaters shall not be permitted until permission is given by the Engineer.

a. When permission is given, the Contractor shall operate each electric heater to ensure their performance.

C. Cleaning:

1. In addition to the requirements of the Contract Documents, the Contractor shall thoroughly clean all surfaces of the installed electric heaters and remove all debris and waste materials resulting from installation.

2. Clean work as specified in the Contract Documents.

END OF SECTION

SECTION 26 05 11 – GENERAL ELECTRICAL REQUIREMENTS
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials and equipment required to perform the Work in accordance with the general electrical requirements as specified under this Section and shown on the Contract Drawings.

B. The Work shall also include the following:

1. Inserts and other electrical items which shall be installed embedded in concrete, or built into walls, partitions, ceilings or panels constructed by other trades.

2. Installation procedures and schedules shall be reviewed and coordinated with other trades regarding the installation of electrical items that must be installed.

3. Keep informed of the construction so the electrical work shall be installed within such time periods as will not delay the work of the other trades.

4. Notify other trades in advance of the installation of the work included, so they shall have sufficient time for coordination and installation of interrelated items that are included in their contracts and that must be installed in conjunction with the Work included under this Contract.

C. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 09 91 00 - Painting

1.04 REFERENCES

A. NYCEC - New York City Electrical Code

1.05 DESCRIPTION

A. Not Used

1.06 QUALITY ASSURANCE

A. All equipment and devices provided shall be properly connected and interconnected with other equipment and devices so as to render the installations complete for successful operation, regardless of whether all the connections and interconnections are specifically mentioned in the Sections or shown on the Contract Drawings.

B. Similar products shall be by the same manufacturer for uniformity on the Contract.

C. Electrical material and equipment shall be new and shall bear the label of UL, or other nationally recognized, independent testing laboratory, wherever standards have been established and label service regularly applies.

D. Contractor shall make all necessary arrangements in advance with Con Edison in order for Con Edison to establish the new secondary service supplies for each of the two sites shown on the Contract Drawings.

E. Where execution of the work under this Contract requires certain systems and equipment to be modified, the Contractor shall perform the work with due regard to maintenance of operations and construction staging in accordance with the Specifications.

F. The modification work shall be coordinated in advance with the collections personnel and existing conditions. Contractor shall field determine and make such investigations as required to determine the functionality of each circuit and identify circuit terminations as required for the modifications intended to ensure the proper interface of all components for a complete functional system.

G. The Contractor shall retain the services of a wiring coordinator, to prepare the point-to-point field wiring diagrams. The wiring coordinator shall have experience in the development of the diagrams of the type specified and shall have served in a similar role on a project of similar size and complexity.

H. Area Classifications

1. Materials and equipment for all indoor areas shall conform to the area classifications shown on the Contract Drawings or stated in the Specifications.
2. Materials and equipment for all outdoor areas shall conform to corrosive requirements, unless shown otherwise on the Contract Drawings or stated in the Specifications.
3. The locations and requirements shall be in accordance with the following:
   a. Materials, equipment and incidentals installed in corrosive areas shall meet NYCEC and NEMA requirements for corrosive locations. Enclosures installed in corrosive locations shall meet NEMA 4X requirements.
   b. Materials, equipment and incidentals installed in hazardous locations shall meet NYCEC requirements for the Class, Division, and Group designated. Enclosures installed in hazardous locations shall be provided with stainless steel hardware and watertight gasketing.
   c. Materials, equipment and incidentals installed in dusty locations shall meet NYCEC and NEMA 12 requirements.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited, to:
   1. Point-to-point field wiring diagrams.
   2. Qualifications of proposed wiring coordinator who shall prepare the point-to-point field wiring diagrams.

B. Reports
   1. Demonstration of equipment report shall be submitted.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. Secondary Service

1. Provide secondary service equipment in accordance with and as described by Con Edison Specifications for Electric Installations. The secondary service equipment that is required for each of the two sites includes the following:
    a. Property line box for underground service.
    b. Tran-S enclosure for current transformers and CT meter socket.

B. Point-To-Point Field Wiring Diagrams

1. The Contractor shall provide point-to-point field wiring diagrams for all equipment, including equipment provided by other trades.
2. The diagrams shall be developed for performance of the work and to document terminations. The diagrams shall be prepared based upon approved shop drawings and inspections as necessary to complete the diagrams. The diagrams shall include:
    a. External wiring for each piece of equipment, panel, instrument and other devices to control stations, lighting panels and motor controllers. The diagrams shall include control, status, signal and power wiring. Power diagrams shall include connections to switchgear, motor control centers, panelboards, panels and field devices.
    b. Numbered terminal block identification for each wire termination.
    c. Identification of the assigned wire numbers and color coding for all interconnections.
    d. Identification of all wiring by the conduit tag in which the wire is installed.
    e. Terminal, junction, and pull boxes through which wiring is routed.
    f. Identification of equipment with functional name and number to which wiring is to be connected.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Shop Finishes

1. Electrical equipment shall be shop painted in accordance with the requirements of Section 09 91 00- Painting.
2. Exposed ferrous metal surfaces except aluminum, bronze, brass and stainless steel components shall be cleaned with a commercial blast and primed with one coat of rust inhibitive primer.
3. Manufactured assemblies such as switchgear, substations, motor control centers, panelboards and motor controllers shall be shop painted in accordance with the requirements of Section 09 91 00 - Painting.

4. Other equipment shall be painted with the manufacturer's best grade finish paint system compatible with the finish coatings specified in Section 09 91 00 - Painting.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Maintenance of Operations

1. Where execution of the work under this Contract requires certain equipment to be taken out of service, the Contractor shall perform the work with due regard to maintenance of operations and construction staging in accordance with the Specifications.

2. The Contractor shall schedule the work in advance with the Engineer so as not to affect proper plant operations. When the work is scheduled, the Engineer shall be notified 48 hours prior to proceeding with the work to allow time for the collections personnel to perform load switching and alternation of equipment.

3. To the maximum extent possible at the end of the workday, all equipment shall be back in place and ready for its normal service use should a plant emergency arise. In addition, should an emergency condition occur during execution of the work, at the request of collections personnel, the equipment shall be placed back in service immediately and turned over to plant personnel.

4. In the event of accidental shutdown of plant equipment, the Contractor shall notify plant personnel immediately to allow for an orderly restart of affected equipment.

3.02 INSTALLATION

A. Not Used

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. The Contractor shall demonstrate, in the presence of the Engineer that all electrical systems and electrically operated equipment operate as specified, designed and as required.

B. The Contractor shall coordinate the demonstration of the electrical systems which are part of other Contracts with the other Prime Contractors.

C. The demonstration of equipment shall include the following:

1. All power circuits shall be operated to verify proper connection and pump rotation of equipment. Mechanical key-interlocks for circuit breakers shall be operated to verify their proper operation. Power shall be removed and reapplied to automatic transfer switches to verify their operation.
2. Emergency power systems shall be activated to verify their automatic start-up, proper operation while running and proper deenergization and cool down upon availability of normal power.
3. All pushbuttons, indicating lights and similar devices shall be operated to verify proper connection and function. All devices, such as pressure and flow switches and similar devices shall be operated to verify that shut-downs and control sequences operate as required.
4. The Contractor, with coordination of the other Prime Contractors, shall operate the systems to verify wiring and adjust the controls, as required, to achieve proper operation. This shall include wiring, timing and switching functions.

D. The Contractor shall provide a demonstration of equipment report. The report shall include complete information on time, schedule, tasks performed, persons contacted, problems corrected, and all other pertinent information.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Restoration

1. The Contractor shall field paint after installation marred or scratched surfaces. All scratches, abrasions and other damage to equipment shall be touch-up painted in accordance with the requirements of Section 09 91 00 - Painting.

END OF SECTION

SECTION 26 05 20 – LOW-VOLTAGE WIRES, CABLES AND ACCESSORIES
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Requirements for providing low-voltage electric wires, cables and accessories.

1. Low-voltage electric wires, cables, and accessories shall be provided in accordance with the requirements specified under this Section, the Specifications and the Contract Drawings.

B. Low-voltage electric wires and cables to be provided shall include all accessories.

C. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 26 06 11 – Cable and Conduit Schedule

1.04 REFERENCES

A. Definitions

1. Low-voltage as used in this Section and the Specifications shall mean all equipment, conductors, insulation systems and accessories intended for operation within the 600 Volt Class.

2. Low-voltage wires and cables shall mean all insulated electric wires and cables intended for use for power, lighting, control, instrumentation, communication, security and alarm circuits.

3. Low-voltage wires and cable accessories shall mean all devices and items intended to provide mechanical protection, terminate, connect, splice, insulate, tag and manage low-voltage wires and cables.

4. Cable is an assembly of insulated wires combined with fillers and separators in an enclosing jacket of insulating material.

5. All references to the Electric Utility or Utility shall mean Consolidated Edison Company or the Local Electric Utility having jurisdiction.

B. Reference Standards

C. Low-voltage wires and cables shall comply with the latest applicable provisions and recommendations of the following:

1. ANSI/ICEA S-95-658/

2. NEMA WC70 - Power Cables Rated 2000 V or Less for the Distribution of Electrical Energy

3. ASTM B5 - Standard Specification for High Conductivity Tough-Pitch Copper Refinery Shapes

4. ASTM B8 - Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft

5. ASTM D69 - Standard Test Methods for Friction Tape

6. ASTM D2301 - Standard Specification for Vinyl Chloride Plastic Pressure-Sensitive Electrical Insulating Tape

7. ASTM D3005 - Standard Specification for Low-Temperature Resistant Vinyl Chloride Plastic Pressure-Sensitive Electrical Insulating Tape

8. ICEA S-58-679 - Standard for Control, Instrumentation and Thermocouple Extension Conductor Identification

9. IEEE 1210 - Standard Tests for Determining Compatibility of Cable-Pulling Lubricants with Wire and Cable

10. NEMA WC 26/
EEMAC 201 - Binational Wire and Cable Packing Standard

11. NETA ATS - NETA Acceptance Testing Specifications

12. NYCEC - NYC Electrical Code

13. NYCCC - NYC Construction Code

14. UL Standard 486A-486B - Wire Connectors

1.05 DESCRIPTION

A. Not Used

1.06 QUALITY ASSURANCE

A. General:

1. All low-voltage wires, cables and accessories shall be made by an approved manufacturer, and in their construction shall be employed the most improved commercial materials and processes of manufacture.

2. Only low-voltage wires, cables and accessories manufactured under high standards of production and meeting the approval of the Engineer shall be used.

3. Friction tape shall be in accordance with ASTM. D69.

4. All low-voltage wire and cable splicing and terminations shall be done by experienced cable splicers who have worked with similar wire and cable for a period of at least 5 years, using materials and procedures recommended by the wire and cable manufacturer. All splicing and terminations of low-voltage wire and cable shall be in accordance with the instructions of the low-voltage wire and cable manufacturer.

5. The low-voltage wire and cable manufacturer shall use a shop test facility that has recently calibrated testing apparatus and qualified, experienced technicians, for all shop tests. Calibration of testing apparatus shall be within one year.

6. All test equipment and instrument calibration shall be in accordance with the latest edition of the accuracy standard of the U.S. National Institute of Standards and Technology and the NETA acceptance testing specification.

7. Field testing of low-voltage wires and cables shall be in accordance with the requirements specified under this Section.

8. The Contractor shall retain the services of an independent testing firm who shall perform acceptance testing on the low-voltage wire and cable installation.

a. The testing firm shall have experience in the inspection and testing of wires and cables of the type specified and shall be a member company of NETA.

b. Provide proof of membership or demonstrate that the standards and experience required for membership are possessed, all to the satisfaction of the Engineer.

c. The testing shall be performed in accordance with the requirements specified under this Section.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. A list of proposed manufacturers shall be submitted with the products they produce proposed for the contract.

2. Manufacturer's Literature, specifications and engineering data for low-voltage wires, cables and accessories including but not limited to:

a. Manufacturer and type of wire or cable.

b. Minimum insulation resistance in megaohms per 1,000 ft. at 20 degrees C.

c. Material, number and size of strands composing each conductor.

d. Conductor insulation thickness in inches with material and voltage rating.

e. Jacket thickness in inches.

f. Average outside diameter of bare conductor.

g. Average outside diameter of finished wire or cable and jacket material.

h. Weight per 1,000 ft. of finished wire or cable.

i. Minimum bending radius, in inches.

j. Minimum pulling temperatures at which cable may be pulled without damage.

k. Maximum pulling tensions which may be applied to the cable without damage.

l. Literature identifying the methods and materials which Contractor proposes to use to make splices and terminations. Submittal shall consist of manufacturer's literature evidencing compatibility of the conductor insulation and jacket of the wire or cable with the splicing or terminating materials and methods which Contractor proposes to use.

m. Manufacturer recommended pulling lubricants.

n. Qualifications of splicing and termination personnel.

3. Description of shop and field testing methods, procedures and apparatus with calibration dates shall be submitted. Testing methods and procedures shall be submitted at least 45 days in advance prior to conformation of witness testing dates and actual testing.

4. Qualifications of proposed testing firm to perform acceptance testing shall be submitted. Submit firm experience records at least 45 days in advance to actual testing, five recent references with phone numbers shall be submitted.

B. Reports:

1. Shop and field test reports shall be submitted.

2. Acceptance testing report shall be submitted.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Low-voltage wires, and cables shall be delivered, stored and handled in accordance with the Specifications and the manufacturer's instructions.

B. Deliver low-voltage cables on factory reels conforming to NEMA WC26. Each end of each length of cable shall be hermetically sealed with the manufacturer's end caps and securely attached to the reel. Reels with unsealed ends will be rejected.

C. Inspect wire and cable protective coverings for evidence of damage during shipment.

D. Accomplish unloading without contacting cable surface or protective coverings or dropping cable reels from the delivering vehicle to the ground.

E. Store wires and cables on reels on elevated hard surfaces in a clean dry locations away from construction equipment, falling objects, sources high heat and chemicals or petroleum products.

F. Seal cut cable ends using properly sized heat shrink cap to prevent moisture ingress and wicking into the cable interior.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Low-voltage single conductor wires for installation in conduit shall be as manufactured by:

1. Southwire, Carrollton, GA;
2. General Cable, Highland Heights, KY;
3. Okonite Company, New York, NY;
4. Or approved equal.

B. Low-voltage cable shall be as manufactured by:

1. Southwire, Carrollton, GA;
2. General Cable, Highland Heights, KY;
3. Belden; Indianapolis, IN
4. Okonite Company, New York, NY;
5. Or approved equal.

C. Low-voltage welding cable shall be manufactured by:

1. General Cable, Highland Heights, KY;
2. Cole Wire and Cable, Lincolnshire, IL
3. Or approved equal.

D. Compression connectors ring tongue type shall be manufactured by:

1. Ideal Industries, Sycamore, IL;
2. Thomas and Betts, Memphis, TN;
3. Burndy, Manchester, NH;
4. Or approved equal.

E. Compression splices shall be manufactured by:

1. Ideal Industries, Sycamore, IL;
2. Thomas and Betts, Memphis, TN;
3. Burndy, Manchester, NH;
4. Or approved equal.

F. Waterproof compression splices shall be manufactured by

1. Ideal Industries, Sycamore, IL;
2. Thomas and Betts, Memphis, TN;
3. Burndy, Manchester, NH;
4. Or approved equal.

G. Spring connector splices shall be manufactured by:

1. Ideal Industries, Sycamore, IL;
2. Thomas and Betts, Memphis, TN;
3. Burndy, Manchester, NH;
4. Or approved equal.

H. Markers shall be as manufactured by:

1. Ideal Industries, Sycamore, IL;
2. Thomas and Betts, Memphis, TN;
3. Brady, Milwaukee, WI;
4. Or approved equal.

I. Pulling lubricant shall be as manufactured by:

1. American Polywater Corporation, Stillwater MN;
2. 3M – St. Paul, MN;
3. Ideal Industries, Sycamore, IL;
4. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Low-voltage Voltage wire and cable

1. Low-voltage wire and cable shall be used for all power, lighting, control instrumentation, alarm and security system circuits. The size and quantity of low-voltage wires and cables shall be as indicated in the conduit and cable schedule. The conductor jacket shall be in accordance with color identification requirements specified under this Section.
2. Low-voltage single conductor wires for installation in conduit shall be in accordance with the following:
   a. Conductors shall be stranded, copper, single conductor wire conforming to ASTM B8, and B33 No. 12 AWG minimum size.
   b. Conductor insulation shall be flame-retardant, moisture and heat resistant thermoset rated 90 degrees C in wet and dry locations and listed by UL as type XHHW-2.
3. Low-voltage cable for installation in conduit shall be in accordance with the following:
   a. Conductors shall be stranded, copper conforming to ASTM B8 and B33, No. 12 AWG minimum size.
   b. Conductor insulation shall be moisture and flame resistant cross-linked polyethylene rated 90 degrees C in wet and dry locations and listed by UL as type XHHW-2.

c. Cable conductors shall be assembled together with flame and moisture resistant filters and tape to make round.

d. Cable shall include an overall protective jacket of polyethylene compound, 45 mils minimum thickness.

4. Variable frequency drive power cable shall be used for motor circuits operated from variable frequency drives. Variable frequency drive power cables sahll be in accordance with the following:

a. Cable shall be VFD type power cable, three-conductors rated 600 Volts, 90 Degrees Celsius Wet or Dry.

b. Conductors shall be stranded, copper with cross-linked polyethylene insulation.

c. Cable shall include three symmetrically placed copper ground conductors and a five-mil copper tape shield.

5. Low-voltage welding cable shall be used for the connection of the portable generator output supply receptacles to the docking station receptacles.

a. Cable shall be Class M welding type, extra flexible, size as indicated on the Contract Drawings.

b. Conductors shall be stranded bare copper conforming to ASTM B172.

c. Conductor insulation shall be moisture and oil resistant thermoset, rated 90 degrees C in wet and dry locations and listed by UL as type RHH/RHW. Color orange.

d. Provide welding cable in five equal lengths of 50 feet per each cable, one cable for each of the 3 phases, one for neutral as required and one for ground. When multiple sets are indicated on the Contract Drawings provide the additional phase, neutral and ground cables for each parallel set.

e. Prepare cables for installation as described under Part 3 of this Section. Provide storage box as indicated on the Contract Drawings for on-site storage of cables.

6. Instrumentation cable shall in addition comply with the following:

a. Conductors shall No 16 AWG minimum size

b. All conductors shall be polyethylene insulated and twisted in pairs with aluminum-mylar shield overlap.

c. Cable jacket shall be low halogen

7. Communication cable shall in addition comply with the following:

a. Conductors shall be No 24 AWG minimum size.

b. Conductor twist and shielding shall be as shown on the Contract Drawings or as stated in this Specification.

c. Cable jacket shall be low halogen

8. Fire Alarm cable shall in addition comply with the following:

a. Conductors shall 18 AWG minimum size

b. Cables shall be UL listed for the intended service

c. Cables intended for use in the installation shall be approved for the intended use by the New York City Building Department, Material and Equipment Acceptance Division.

9. Security system cable shall in addition comply with the following:

a. Conductors shall be No 22, AWG minimum size.

b. Conductor twist and shielding shall be as shown on the Contract Drawings or as stated in this Specification.

c. Coaxial cable shall be as shown on the Contract Drawings or as stated in this Specification.

10. Category 6e Ethernet cable shall be provided where shown on the Contract Drawings. Ethernet cable shall be in accordance with the following:

a. UL 444, flame tested to UL 910 and UL rated type CMP and MMP meeting ANSI/TIA/EIA-568-A.

b. 4 pair, 24 AWG solid copper conductors with FEP insulation, shielded pairs and PVC overall jacket.

c. Characteristic impedance: 100+/-15 ohms.

d. DC resistance: 7 ohms maximum.

e. DC resistance unbalance: 2.5% maximum.

f. Mutual capacitance: 5.6nF/100 meters maximum.

g. Pair to pair capacitance unbalance: 100pF/100 meters maximum.

B. Low-voltage wire and cable accessories

1. Cable connectors shall be provided for terminating low-voltage wire and cable. Connectors shall be solder less type and properly sized to fit fastening device and wire size. Connectors shall be in accordance with the following:

a. For wire sizes up to and including No. 6 AWG, compression type with UL 486A listing shall be used. All cable terminations for conductors No. 10 AWG and smaller shall be terminated using UL listed terminals, nylon insulated connectors, at each terminal board.

b. For wire sizes No. 4 AWG and above, either compression type or bolted type with tin-plated contact faces shall be used.

c. For wire sizes No. 250 kcmil and larger, connectors with at least 2 cable clamping elements or compression indents and provision for at least 2 bolts for joining to apparatus terminal shall be used.

2. Splicing for low-voltage wire and cable shall be performed when terminals are not provided. Splicing shall be in accordance with the following:

   a. For wire sizes No. 8 AWG and larger, splices shall be made up with compression type copper splice fittings with UL 486A listing. Splices shall be taped and covered with materials recommended by the cable manufacturers, to provide insulation equal to that on the conductors.

   b. For wire sizes No. 10 AWG and smaller, splices shall be made up with preinsulated, spring connectors. Connectors shall be flame retardant with UL listing. Spring connectors shall be Twister type.

   c. For wet locations, splices shall be waterproofed. Compression type splices shall be waterproofed by a sealant-filled, thick wall, heat shrinkable, thermosetting tubing or by pouring a thermosetting resin into a mold that surrounds the joined conductor. Waterproof compression splices shall be UL listed, heavy wall type. Spring connector splices shall be UL listed and waterproofed with a sealant-filler. Spring connectors shall be Twister DB type.

3. Compression connectors shall be UL listed terminals.

4. Cable markers shall be provided for the identification of low-voltage wire and cable. Markers shall be in accordance with the following:

   a. Markers shall be vinyl type, moisture, heat and abrasion resistant with adhesive back. Cable identification shall be clearly marked.

5. Low-voltage wire and cable pulling lubricant shall be used to reduce wire and cable tension and side wall pressure and aid in minimizing damage during low-voltage wire and cable installation. Pulling lubricant shall be in accordance with the following:

   a. UL Listed, compatible with the wire insulation or cable jacket, the raceway involved and acceptable to the wire and cable manufacturer. When wire and cable manufacturer shall be provided.

   b. Pulling lubricant shall be water based, with a 0.17 average coefficient of friction and a temperature range of 20 to 120 degrees F.

   c. Pulling lubricant shall confirm to IEEE 1210

   d. Pulling lubricant shall not support combustion.

   e. Pulling lubricant shall not cause residue to cement insulation or jackets to the inside of conduit or ducts.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Certified Shop Tests:

1. Shop testing shall be performed on the low-voltage wire and cable at the manufacturer's plant prior to shipment. Shop test shall be in accordance with the latest revisions of ICEA and UL and shall demonstrate that the wire and cable tested conforms to the requirements specified.

2. The Contractor shall provide a shop test report. The report shall identify the tests performed and the results obtained.

3. All low-voltage wire and cable shall be shop tested in accordance with the requirements of this Specification.

B. Witnessed Shop Tests:

1. The Contractor shall perform witnessed shop tests in accordance with this Specification.

2. The Engineer shall have access during working hours for inspection purposes to all parts of the works where material and cable are being manufactured, and all reasonable inspection and testing facilities shall be provided to him without increase in price. The Engineer may request that dielectric strength tests and measurements be made to verify the cable data furnished by the Contractor. For this purpose the Contractor shall furnish without increase in price, a length of cable, not to exceed 3 feet for each size to be cut from one or more reels as directed by the Engineer. Each sample shall be marked with a tag bearing full description of cable insulation and number of reel from which it is cut.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. All low-voltage wires and cables, with the exception of the welding cables shall be installed within the raceways as shown on the Contract Drawings. They shall be carefully handled so as to avoid twists or kinks in the conductors or damage to the insulation.

B. The Contractor shall ensure that the manufacturer's recommended cable bending radii and pulling are not exceeded and that the number of conductors permitted in a conduit are in accordance with the latest applicable section of the NYCEC.

C. No splices shall be permitted between terminals except at approved junction or terminal boxes. Boxes shall be provided as shown on the Contract Drawings or as required by Code for the pull lengths. No more than two terminations shall be made at each terminal point. Cable and wire runs shall be looped through pull boxes without cutting and splicing where possible. All splices below grade, in manholes, hand holes and wet locations shall be waterproofed.

D. No splicing of instrument wiring shall be permitted. Instrument wiring shall be extended by use of field termination boxes employing labeled terminal strips. Shield continuity shall be maintained. Ultimate shield termination (ground) shall be at one end only.

3.02 INSTALLATION

A. Wire and Cables

1. Cables shall be installed complete with proper terminations at both ends. For each motor circuit, Contractor shall ensure proper phasing, phase sequence and motor rotation.

2. Wire and cable contained within a single conduit shall be pulled simultaneously using insulating pulling compounds containing no mineral oil.

3. Pulling tension on wires and cables shall be continuously monitored using a calibrated Dynamometer type device, having a calibration label within six months of its use.

4. Cables shall be installed with maximum slack at all terminal points, boxes, handholes and manholes.

5. Low-voltage cables located within manholes, handholes and boxes shall be wrapped with fireproofing tape for their entire length on an individual cable basis.

   a. Tape shall be 30 mills thick of self-extinguishing material which will not support combustion.

   b. Tape shall not deteriorate when subjected to water, salt, sewage or fungus and shall be secured with glass cloth tape.

   c. Low-voltage cables shall be fireproofed in accordance with the cable manufacturer's recommendations and then covered with tape extending at least one inch into any duct.

6. Prepare welding cable for connection of the portable generator and docking station, one for each set of the 3 phases, one for neutral as required and one for ground. Connect the generator and docking station furnished Posi-Lok plugs one plug on each end of each welding cable. Color band each cable on each end with color that matches the conductor identification tabulation specified under this section.

B. Conductor Identification

1. Each conductor shall be labeled at each termination point and all splice locations. Carry individual conductor or circuit identification throughout, with circuit numbers or other identification stamped on terminal boards when provided or the cable so it is visible around the cable's circumference.

2. Each conductor shall be identified in junction boxes, cabinets, and terminal boxes. Where no termination is made, use a plastic-coated, self-adhesive,

wire marker. Where termination is made, use a plastic, pre-printed sleeve wire marker. Paper, self-adhesive wire markers shall not be used.

3. In manholes and handholes, each power conductor shall be identified by a laminated plastic tag located so that it can be seen from center of manhole without moving adjoining wires. Bundle and mark control wires as listed in conduit and cable schedule.

4. Multi-conductor control cables shall be color coded in accordance with ICEA S-58-679, Method 1, Table E

5. The following identification scheme shall be used for all low-voltage power circuits:

	Colors				
Voltage	Neutral Conductor	Phase A Conductor	Phase B Conductor	Phase C Conductor	Ground Conductor
208/120V	White	Black	Red	Light Blue	Green
240/120V	White-Gray Strip	Black-Blue Strip	Red-Blue Strip	None	Green
480/277V	Gray	Brown	Orange	Yellow	Green

3.03 FIELD TESTING / QUALITY CONTROL

A. After installation, all low-voltage wire and cable shall be field acceptance tested. The field tests shall be performed by the testing firm who shall furnish all testing equipment. The field tests shall be witnessed by the Engineer and certified by the Contractor. The Contractor shall provide a report identifying the tests performed and the results obtained.

B. Each electrical circuit shall be tested after permanent wires and cables are in place to demonstrate that the circuit and equipment are connected properly and will perform satisfactorily, as required, as intended, and that they are free from improper grounds and short circuits. The tests shall consist of the following:

1. Low-voltage wire and cable mechanical connections shall be individually tested after installation and before they are put in service with a calibrated torque wrench. Values shall be in accordance with manufacturer's recommendations.

2. Low-voltage wires and cables shall be individually acceptance tested for continuity between the required termination points for each ungrounded and grounded conductor. Test wire and cable after installation and before first energization or before they are put in service with an approved continuity tester. Test results shall be as recommended by the wire and cable manufacturer or in accordance with NETA ATS, NEMA, ICEA Standards.

3. Low-voltage wires and cables shall be individually acceptance tested for insulation resistance between ungrounded and grounded conductors, and

from each ungrounded and grounded conductor to ground. Test wire and cable after installation and before first energization or before they are put in service with an approved insulation resistance tester, for one minute at a voltage rating recommended by the cable manufacturer or in accordance with NETA ATS, NEMA, and ICEA Standards.

4. The insulation resistance for any given conductor shall not be less than the value recommended by the cable manufacturer or in accordance with NETA ATS, NEMA and ICEA Standards. Any cable not meeting the recommended value or which fails when tested under full load conditions shall be replaced with a new cable for the full length.

5. Shielded instrumentation cable shields shall be tested with an ohmmeter for continuity along the full length of the cable and for shield continuity to ground.

6. Connect Shielded instrumentation cables shall be connected to a calibrated 4-20 milliamp DC signal transmitter and receiver. Test at 4, 12, and 20 milliamp transmitter settings.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

END OF SECTION

SECTION 26 05 27 – GROUNDING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Requirements for providing grounding.

1. Grounding shall be provided in accordance with the requirements specified under this Section, the Specifications and the Contract Drawings.

2. The grounding Work shall be a complete system for the electrical and instrumentation systems, structures and equipment. The Work shall include grounding of all electrical equipment, transformer neutrals, equipment enclosures, grounding electrodes, fences, and gates.

B. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. Not Used

1.06 QUALITY ASSURANCE

A. The grounding system maximum resistance shall not exceed 5 ohms under normally dry conditions. All structures and metal equipment containing electrical apparatus shall be connected to ground.

B. All grounding associated with the service feeders shall be in accordance with the requirements of the Electric Utility.

C. Retain the service of an independent testing firm who shall perform field acceptance testing of the grounding systems. The testing firm shall have experience in the inspection and testing of the grounding systems and shall be a member company of NETA.

D. Acceptance testing shall be in accordance with the requirements specified under this Section.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. A list of proposed manufacturers with the products they produce proposed for the contract.
2. Manufacturer's catalog cuts for the grounding materials proposed for use.
3. Scaled Plan Drawings showing proposed routing and layout of the grounding system.

B. Field test report shall be submitted.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The grounding equipment shall be delivered, stored and handled in accordance with this Section, the Specifications and the manufacturer's recommendations.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Ground cable shall be as manufactured by:

1. Erico, Solon, OH;
2. Harger, Grayslake, IL;
3. General Cable, KY;
4. Or approved equal.

B. Ground rods shall be as manufactured by:

1. Erico, Solon, OH;
2. Harger, Grayslake, IL;
3. Blackburn/Thomas and Betts, MN;
4. Thompson Lightning Protection Inc, MN;
5. Or approved equal.

C. Bolted or compression grounding connectors shall be as manufactured by:

1. Burndy, Manchester, NH;
2. Harger, Grayslake, IL;

3. Thomas and Betts, Memphis, TN;
4. Or approved equal.

D. Welded grounding connections shall be as manufactured by:
1. Cadwell, Solon OH;
2. Harger, Grayslake, IL;
3. Or approved equal.

E. Ground Resistance Tester shall be as manufactured by:
1. Fluke, Everett, WA.
   a. Model 1625-2 GEO or approved equal.
2. Megger, Dallas, TX.
   a. Model DET 2/3 or approved equal.
3. AEMC Instrument, Dover, NH.
   a. Model 6471 or approved equal
4. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Ground Cable
1. The ground cable shall be soft drawn bare stranded copper conforming to ASTM B8, No. 8 AWG minimum size.
2. The insulated cable for equipment grounding shall conform to the requirements of Section 26 05 20 – Low-Voltage Wires, Cables and Accessories.

B. Ground Rods
1. Ground rods shall be stainless steel, 3/4-inch diameter and 10 feet long.
2. Ground rods shall have a drive point at the lower ends. The upper end of each rod shall be equipped with bronze, clamp type connectors with not less than four bolts.

C. Grounding Bus Bars
1. Bare, copper bars of rectangular cross section complying with ASTM B187. Grounding bus size and number of predrilled holes shall be as required with provisions for 25 percent future expansion and secured to wall with insulated stand-off supports.
2. Bus bar stand-off supports shall be fiberglass reinforced polyester insulators rated 2500 Volt with threaded holes at both ends for bus installation and 304 stainless steel brackets and hardware.

D. Grounding Connectors.

1. Compression connectors shall be heavy duty copper. Bolted connectors shall be copper alloy castings, designed specifically for the items to be connected, and assembled with Durium or silicone bronze bolts, nuts and washers.
2. Welded connections shall be by exothermic process utilizing molds, cartridges and hardware designed specifically for the connection to be made.

2.03 FABRICATION / ASSEMBLING / FINISHES

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. A complete ground grid system shall be installed as shown on the Contract Drawings.

B. Ground cable shall be installed around perimeter of structures at a minimum of 2 feet-6-inches below grade.

C. Ground rods shall be installed 2 feet below grade, 2 feet from foundation walls and shall extend 10 feet vertically into the earth or horizontally not less than 36 inches below grade.

D. Test points shall be installed at locations and in accordance with the details shown on the Contract Drawings.

E. Equipment shall be connected in accordance with the details shown on the Contract Drawings. All steel column and underground connections shall be welded except for test points.

F. Metal casings or supporting frames of electrical equipment, such as transformers, panel boards, control panels, motor control centers, and individual motor controllers shall be grounded. The equipment shall be thoroughly grounded to the facility grounding system. All metal conduits leaving all electrical equipment shall be grounded. Grounding type fittings shall be installed on flexible conduits.

G. An insulated cable for equipment grounding shall be installed with the phase conductors within the conduit for the nominal 120 volt and higher power, lighting and control circuits.

3.03 FIELD TESTING / QUALITY CONTROL

A. After installation, the completed ground system shall be field acceptance tested for operation and conformance. The field acceptance tests shall be witnessed by the

Engineer and certified by the Contractor. The Contractor shall provide testing consisting of the following:

1. Resistance testing shall be made using approve Earth Ground Resistance Testers not less than 48 hours after rainfall.
    a. Resistance values above 5 ohms shall be brought to the Engineer's attention with remedial recommendations.
2. Grounded cables and metal parts shall be continuity tested. The conduit system shall be ground tested in accordance with the requirements of Section 26 05 33 – Raceway and Boxes for Electrical Systems.

B. The Contractor shall provide a Field Test Report, the report shall identify the testing performed and the results obtained.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

END OF SECTION

SECTION 26 05 29 – HANGERS AND SUPPORTS FOR ELECTRICAL SYSTEMS
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Requirements for providing supporting devices.

1. Supporting devices shall be provided in accordance with the requirements specified under this Section, the Specifications and the Contract Drawings.

2. The supporting devices shall be a complete system for the equipment.

3. The Work shall include providing all required support devices to properly mount and secure all equipment furnished under this Contract.

B. This Section also includes equipment anchorage and restraints suitable to meet the specified seismic requirements.

C. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 26 05 33 - Raceways and Boxes for Electrical Systems

1.04 REFERENCES

A. Supporting devices shall comply with the latest applicable provisions and recommendations of the following:

1. ASTM A1011/A1011M - Standard Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength, Low- Alloy, High-Strength, Low-Alloy with Improved Formability, and Ultra-High Strength
2. ASTM B633 - Standard Specification for Electrodeposited Coatings of Zinc on Iron and Steel
3. MFMA 103 - Guidelines for the Use of Metal Framing
4. MFMA 4 - Metal Framing Standards Publication
5. ASTM A123 and A153 – Hot Dipped Galvanized Finish
6. ASTM B117 – Salt Fog Spray Test
7. ASTM A1046 and 1059 - Defender Finish

1.05 DESCRIPTION

A. Not Used

1.06 QUALITY ASSURANCE

A. General

1. All channels, fittings and hardware used in the supporting system shall be in accordance with MFMA 4 and MFA 103.
2. The design of the support system shall be the responsibility of the Contractor. The Contractor shall provide the proper sized rods, channels, fittings, brackets and appurtenances necessary to adequately support the equipment.
3. The Contractor shall retain the services of a licensed Professional Engineer, registered in the State of New York, to prepare support details for equipment exceeding 50 pounds in weight. The Professional Engineer shall stamp the support system design details.

B. Seismic Requirements

1. Equipment assemblies such as secondary unit substations, switchgear, transformers, motor control centers and panelboards shall be certified to meet seismic requirements of the New York City Building Code.
2. The Contractor shall provide equipment anchorage details for all equipment certified to meet seismic requirements. The details shall be coordinated with the manufacturer’s equipment mounting provisions.

3. The Contractor shall retain the services of a licensed Professional Engineer, registered in the State of New York, to prepare the seismic anchorage and restraint details. The Professional Engineer shall stamp the seismic anchorage and restraint details.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings and material specifications for approval by the Engineer.

B. Submittals shall include, but not be limited to the following:

1. Manufacturer's catalog cuts for the supporting devices proposed for use with specifications and other data required to demonstrate compliance with the specified requirements.

2. Scaled Shop drawings showing dimensions and locations of all items and clearance requirements.

3. Support design details and equipment seismic anchorage and restraint details, stamped by a Licensed Engineer as required.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The supporting devices shall be delivered, stored and handled in accordance with this Section, the Specifications and the manufacturer's recommendations.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Supporting devices shall be manufactured by:

1. B-Line, Highland, IL;

2. Atkore Unistrut/Power Strut, Harvey, IL;

3. Thomas and Betts Kindorf, Memphis, TN;

4. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Channels, Fittings and Brackets

1. The Contractor shall provide channels, fittings, brackets and related hardware for mounting and supporting the electrical equipment. Anchor bolts, concrete inserts and related hardware for proper support of equipment

shall also be provided. All equipment necessary to meet the seismic requirements specified shall be provided.

2. Channels shall conform to ASTM A1011/A1011M. Channels shall have a minimum thickness of 12 gauge. The cross sectional width dimension shall be 1-1/2 inch minimum. The depth shall be as required to satisfy load requirements.

3. Attachment holes, when required, shall be factory punched on hole centers approximately equal to the cross sectional width and shall be 9/16 inch diameter.

4. Fittings and brackets shall have 9/16 inch diameter holes on centers identical to the channel or as required to align with the channel holes. Fittings and brackets shall have the same width as the channel and shall be 1/4 inch thick minimum. Fittings and brackets shall mate properly with the channel.

5. All channels, fittings, brackets and related hardware shall be steel and have an electro-plated zinc; for wet areas, outdoor locations, roofs or vents use hot dipped galvanized or defender with self-healing properties finish according to ASTM B633, ASTM A123 and A153, ASTM B117, ASTM A1046 and ASTM A1059.

6. In corrosive and classified areas, channels, fittings, brackets and related hardware shall be type 316 stainless steel. Dissimilar metals shall be avoided when installing stainless steel channels.

B. Conduit Hangers, Supports and Inserts

1. The Contractor shall provide channels, rods, straps, anchors and related hardware for support of the exposed electric conduit system.

2. The Contractor shall also provide anchor bolts, concrete inserts and related hardware for proper support of equipment. All equipment necessary to meet the seismic requirements specified shall be provided.

3. Conduit hangers, supports and inserts shall be in accordance with Section 26 05 33 – Raceway and Boxes for Electrical Systems.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. All supporting devices shall be installed level, parallel and perpendicular to building walls and floors, such that the support system is installed in a neat and professional manner.

B. All holes in hung ceilings for support rods and other equipment shall be made adjacent to bars where possible, to facilitate removal of ceiling panels.

C. The channels, fittings and brackets shall be rigidly bolted together and braced to make a substantial supporting framework support system.

D. Where motor control centers, switchgear, unit substations and other electrical equipment is being installed on concrete pads, the Contractor shall furnish leveling channels and shall install the leveling channel in the concrete pads. Seismic certified equipment shall be anchored in accordance with the seismic anchorage details.

E. All equipment fastenings to steel columns, beams and trusses shall be by beam clamps. In lieu of beam clamps, equipment may be welded to steel structures, subject to Engineer approval.

F. No holes shall be drilled in any steel columns, beams and trusses.

G. Hanger rod supports shall be installed such that threaded rod is parallel to building walls and perpendicular to floors.

3.03 FIELD TESTING / QUALITY CONTROL

SECTION 26 05 33 – RACEWAYS AND BOXES FOR ELECTRICAL SYSTEMS
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Requirements for providing conduit system.

1. The conduit system shall be provided in accordance with the requirements specified under this Section, the Specifications and the Contract Drawings.

2. The conduit system required shall be provided with all rigid and flexible conduits, boxes, fittings, supports, hangers and inserts and other conduit accessories as required for the installation of the electric wire and cable.

B. The following index of this Section is presented for convenience:

1.04 REFERENCES

A. Definitions

1. Conduit System: Shall mean a complete installation comprising all rigid conduit and flexible connections, boxes, fittings, supports, hangers, inserts and other conduit accessories as required for the installation of electric wires and cables.

2. Conduit Accessories: Shall mean all fittings required to ensure a complete conduit system installation. Conduit accessories shall include, but is not limited to, expansion, deflection, seal and drain fittings, hubs, bushings, duct seal, tags, markers, thruwall seals and bushings.

B. References

1. Electric conduit system shall comply with the latest applicable provisions and recommendations of the following:

2. NYCEC - New York City Electrical Code

3. UL 6 - Electrical Rigid Metal Conduit - Steel

4. UL 360 - Standard for Liquid-Tight Flexible Metal Conduit

5. UL 514A - Metallic Outlet Boxes

1.06 QUALITY ASSURANCE

A. Not Used

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. A list of proposed manufacturers with the products they produce proposed for the Contract.
2. Manufacturer's catalog cuts for the conduit, boxes, fittings and supports proposed for use.
3. Construction details of conduit racks and other conduit support systems with seismic restraint details and calculations signed by a licensed Professional Engineer, registered in the State on New York.
4. Scaled Shop Drawings showing proposed routing of all conduits, inclusive of conduits embedded in structural concrete and conduits directly buried in earth.
5. Scaled Shop Drawings showing locations of pull and junction boxes and all penetrations in walls and floor slabs.
6. Field test report.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Electric conduit system shall be delivered, stored and handled in accordance with the Specifications, the manufacturer's instructions and the following:

1. Conduit shall be delivered to the Site in standard bundles having each length suitably marked with the manufacturer's name or trademark and bearing the label of the Underwriters' Laboratories, Incorporated inspection service.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer’s standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Rigid steel conduit shall be as manufactured by:
   1. Atkore/Allied Tube and Conduit Corporation, Harvey, IL;
   2. Wheatland Tube Company, Sharon, PA;
   3. Republic Conduit, Louisville, KY;
   4. Or approved equal.

B. PVC coated rigid steel conduit shall be as manufactured by:
   1. Robroy Industries, Gilmer, TX;
   2. OCAL by Thomas & Betts, Memphis, TN;
   3. Atkore/Calbond, Harvey, IL;
   4. Or approved equal.

C. Hangers, Supports and Inserts shall be as manufactured by:
   1. B-Line, Highland, IL;
   2. Atkore Unistrut / Power Strut Harvey, IL
   3. Kindorf, Harahan, LA;
   4. Or approved equal.

D. Flexible conduit shall be as manufactured by:
   1. Anaconda American Brass Company, Rolling Meadows, IL;
   2. Atkore AFC Cable New Bedford MA
   3. Electric-Flex Company, Roselle, IL;
   4. Or approved equal.

E. Hazardous area flexible conduit shall be as manufactured by:
   1. Crouse Hinds Company, Syracuse, NY;
   2. Appleton Electric Company, Rosemont, IL;
   3. Or approved equal.

F. Unions in hazardous locations shall be as manufactured by:
   1. Crouse-Hinds Syracuse, NY;
   2. Atkore/Calbond/Calbrite, Harvey, IL;
   3. Or approved equal.

G. Unions in non-hazardous areas shall be as manufactured by:
   1. Thomas & Betts, Memphis, TN;

2. Or approved equal.

H. Expansion and deflection fittings shall be as manufactured by:

1. Crouse-Hinds, Syracuse, NY;
2. Atkore/Calbond, Harvey, IL;
3. Appleton Electric, Rosemont, IL;
4. Or approved equal.

I. Sealing fittings shall be as manufactured by:

1. Crouse-Hinds, Syracuse, NY;
2. Appleton Electric, Rosemont, IL;
3. Or approved equal.

J. Drain fittings shall be as manufactured by:

1. Crouse-Hinds, Syracuse, NY;
2. Atkore Calbrite, Harvey, IL;
3. Appleton Electric, Rosemont, IL;
4. Or approved equal.

K. Conduit hubs shall be as manufactured by:

1. O-Z/Gedney Rosemont, IL;
2. Atkore/Calbond, Harvey, IL;
3. Thomas and Betts, Memphis, TN;
4. Or approved equal.

L. Conduit bushings and locknuts shall be as manufactured by:

1. a. O-Z/Gedney, Rosemont, IL;
2. b. Thomas and Betts, Memphis, TN;
3. c. Or approved equal.

M. Duct seal shall be as manufactured by:

1. American Polywater Corp, Stillwater, MN;
2. O-Z/Gedney, Rosemont, IL;
3. Ideal Industries, Sycamore, IL;
4. Or approved equal.

N. Thruwall seals shall be as manufactured by:

1. O-Z/Gedney Rosemont, IL;
2. Or approved equal.

O. Floor seals shall be as manufactured by:

1. O-Z/Gedney, Rosemont, IL.;
2. Or approved equal.

P. Sealing bushings shall be as manufactured by:

1. O-Z/Gedney, Rosemont, IL;
2. Or approved equal.

Q. Fire stop fittings shall be as manufactured by:

1. O-Z/Gedney, Rosemont, IL;
2. Or approved equal.

R. Thru-wall barriers shall be as manufactured by:

1. Crouse-Hinds, Syracuse, NY;
2. Or approved equal.

S. Conduit tags shall be as manufactured by:

1. Seton Nameplate Corporation, Branford, CT;
2. Or approved equal.

T. Conduit markers shall be as manufactured by:

1. Thomas and Betts, Memphis, TN;
2. Or approved equal.

U. Terminal blocks shall be as manufactured by:

1. Allen-Bradley Company, Milwaukee, WI;
2. General Electric Company, Fairfield, CT;
3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Rigid Steel Conduit

1. The Contractor shall provide PVC coated rigid steel conduit for all exposed runs and direct buried underground runs. All steel conduit shall comply with the requirements of ANSI C80.1, and UL 6.
2. Both the inside and outside surfaces of the rigid steel conduit shall be protected against corrosion by a coating of zinc applied by the hot-dip galvanizing process.
3. Conduits, elbows and couplings shall be rigid, heavy wall, mild steel, hot dip galvanized. Conduits, elbows and couplings shall have a smooth interior with tapered threads and carefully reamed ends. Conduit size shall be 3/4-inch minimum and shall conform to UL 6.

4. Conduits, elbows and couplings shall include a PVC coating for all areas.

5. PVC coating of conduit shall be factory applied and shall include a smooth 2 mil thick urethane interior coating and 40 mil thick polyvinyl chloride exterior coating. PVC coated conduit shall conform to NEMA RN-1, ASTM D870, ASTM D1735, ETL-PVC 001, and UL 6. The exterior PVC coating color shall be gray and listed UL DYJC. The threads of conduits that have been cut in the field to size shall have the same PVC coating applied.

B. Hangers, Supports and Inserts

1. The Contractor shall provide hangers, supports and inserts for support of the electric conduit system. The supports shall securely attach the electric conduit system to the channel and structure.

2. When indicated on the Contract Drawings the electric conduit system shall be designed, constructed and installed suitable for earthquake regulations in accordance with the seismic requirements of the New York City Building Code and the Uniform Building Code for Zone 2A application.

3. Transverse and longitudinal bracing shall be provided as required to brace the electric conduit for the seismic requirements specified.

4. All drilled in type concrete inserts shall be expansion shields or anchors conforming to Section 05 05 23.02 – Miscellaneous Metal Fastenings and 40 05 07 - Hangers and Supports for Process Piping. In corrosive and Class 1 and Division 1 locations, concrete inserts shall be 316 stainless steel.

5. Hangers and supports shall be in accordance with the requirements of Section 26 05 29 Hangers and Supports for Electrical Systems and Section 40 05 07 - Hangers and Supports for Process Piping except beam clamps, hanger rods and hardware shall be steel with electro-plated zinc finish, hot dipped galvanized or defender finish. This shall also include bolts, nuts and washers. In corrosive locations, hangers and support hardware shall be type 316 stainless steel.

C. Flexible Metallic Conduit

1. The Contractor shall provide flexible metallic conduit where required to permit movement of connected devices and where it is impracticable to complete runs with rigid conduit subject to the limitations imposed by the NYCEC.

2. Flexible conduit used indoor in non-hazardous dry dusty areas shall be non-liquid-tight, with a steel core.

3. Flexible conduit used indoors/outdoors and in non-hazardous, wet and corrosive areas shall be UL Listed and include a hot dipped galvanized steel core with a liquid-tight, polyvinyl chloride cover and shall include a built-in copper ground for sizes 3/4-inch through 1-1/4 inch.

4. For hazardous areas flexible conduit shall include a brass inner core with a bronze outer braid and protective neoprene plastic coating. End fittings shall be stainless steel.

D. Outlet Boxes and Fittings

1. The Contractor shall provide outlet boxes and fittings for rigid and flexible conduit. The outlet boxes and fittings required for the work which constitutes a part of the conduit system, shall be of approved types.

2. Fittings, bodies and boxes installed on PVC coated conduits shall be stainless steel. Dissimilar metals shall be avoided.

3. For outdoor, wet and corrosive areas, conduit fittings and outlet bodies shall be stainless steel NEMA 4X bodies and covers. All units shall be gasketed, watertight, and threaded with five full threads and shall have rust-proofing in accordance with the requirements of this Section.

4. Stainless steel NEMA 4X hub type outlet boxes shall be used throughout, except in the interior walls of superstructures and in roof slabs protected by built-up roofing where pressed steel boxes shall be installed. Cast iron or alloy outlet boxes of the proper size and depths for the application, complete with watertight gaskets and covers secured by brass screws, shall be furnished and installed as indicated on the Contract Drawings or as required by the conduit run. Outlet boxes, furnished and installed for the installation of lighting fixtures, switches and receptacles in a future contract, shall be furnished with watertight gaskets and blank covers.

5. For non-hazardous, indoor dry dusty areas pressed steel boxes of the proper size and depths for the application shall be provided. Boxes shall be rated NEMA 12, not less than No. 14 U.S. Standard Gauge (0.078 inch). The conduit openings shall be provided with oil-resistant gaskets. Conduits shall be fastened to these boxes with locknuts and bushings, and all unused outlets or holes shall be left sealed.

6. All outlet boxes intended for the support of fixtures shall be provided with approved fixture studs.

7. For concealed conduit runs in outside walls and all exposed conduit work, connections to boxes and fittings shall be made through threaded holes, unless otherwise approved by the Engineer. For concealed conduit work in non-hazardous areas in other than outside walls, connections between conduit and boxes may be made with drilled holes, using locknuts and bushings.

8. Where necessary unions may be used.

   a. In non-hazardous locations unions shall be universal or Erickson

   b. In hazardous locations unions shall be type UNF, UNL or YNY.

9. All boxes installed for concealed conduit, shall be provided with extension rings or plaster rings and covers as required. For non-hazardous, dry indoor areas stainless 316, satin beveled steel cover and device plates for surface mounted boxes shall be used. For corrosive locations, stainless steel 316 metal cover and device plates with neoprene gaskets shall be used.

E. Conduit Accessories

1. The Contractor shall provide conduit accessories for use with the conduit system. The conduit accessories shall be of approved types.

2. Expansion and Deflection Fittings:

   a. Expansion and deflection fittings shall be made up of non-corrodible parts and shall provide for ample longitudinal and lateral movement. A suitable bond shall provide a low resistance, continuous longitudinal path for ground currents.

   b. Expansion and deflection fittings shall be watertight stainless steel. Fittings shall be corrosion-resistant, UL listed and compatible with the conduit system.

   c. Expansion /deflection fittings shall be stainless steel and provide both expansion and deflection in a single fitting in accordance with the following:

      1) Axial expansion or contraction up to 3/4-inch.

      2) Angular misalignment up to 30 degrees.

      3) Parallel misalignment up to 3/4-inch.

      4) Expansion fittings shall provide expansion /contraction with eight-inch total movement.

3. Sealing Fittings:

   a. Sealing fittings shall be stainless steel.

   b. Sealing fittings shall have an ample opening with threaded closure for access to conduit hub for making dam. Sealing fiber and compound shall be suitable for use with the fitting and shall be the products of the fitting manufacturer.

4. Drain Fittings:

   a. Drain fittings shall be a combination device designed to provide ventilation to minimize condensation and drains accumulated condensate.

   b. The combination drain/breather fitting shall be 3/8 inch male thread size with stainless steel body.

5. Conduit Hubs:

a. Conduit hubs shall be threaded, insulated throat type with bonding screw locknut.

b. The conduit hub and locknut shall be stainless steel malleable iron or zinc and shall include a 90-degree C insulating surface and a sealing ring for a water tight and dust tight connection. Dissimilar metals shall be avoided.

6. Conduit Bushings:

a. Conduit bushings shall be insulated, grounding type with lay-in-lug connection. Two locknuts shall be provided for each bushing.

b. The conduit bushing and locknuts shall be stainless steel. The bushing shall include a 90 degrees C insulating surface.

7. Duct Seal:

a. Duct seal shall be a suitable for forming a water and gas tight seal between cables and conduits.

b. Completed seal shall be resistant to gasoline, oils, dilute acids and bases.

c. The completed seal shall be capable of blocking water pressure of at least 10 psi.

8. Thruwall Seals and Bushings:

a. New Construction

1) WSK and WCSC type thruwall seals shall be used for conduits and cables passing through exterior subsurface walls and exterior concrete walls.

2) CSMI type seal bushings at the inside and CSMC type seal bushings at the outside of the structure in the same core bit-drilled hole shall be used for conduits passing through interior concrete wall, interior floors, interior block walls, exterior block walls, exterior subsurface walls, exterior concrete walls, floor slabs.

3) CFS and or CFSI type fire stop fittings shall be used for conduits passing through fire rated floors and walls.

4) TW type thru wall type barriers shall be use for multiple conduit runs passing through interior or exterior and fire rated walls.

b. Existing Construction

1) SK and FSCS type seals shall be used for conduits and cables passing through concrete floors and floor slabs.

2) CSMI type seal bushings at the inside and CSMC type seal bushings at the outside of the structure in the same core bit-drilled hole shall be used for conduits passing through interior concrete wall, interior floors, interior block walls, exterior block walls, exterior subsurface walls, exterior concrete walls, floor slabs.

3) CFS and or CFSI type fire stop fittings shall be used for conduits passing through fire rated floors and walls.

4) TW type thru wall type barriers shall be use for multiple conduit runs passing through interior or exterior and fire rated walls.

9. Conduit Tags:

a. Conduit tags shall be 19 gauge, 1-1/2-inch diameter round brass which shall be secured to the conduit with annealed brass wire.

b. Conduit tags shall be clearly stamped with the conduit number in conformity with the Contract Drawings or as directed by the Engineer.

10. Conduit Markers:

a. Conduit identification markers shall be self-sticking color-coded tape. Identification tape shall be two inches wide and colored in accordance with the color banding specified under this Section.

F. Terminal, Junction and Pull Boxes.

1. The Contractor shall provide terminal, junction and pull boxes as shown on the Contract Drawings and where otherwise required, or as directed by the Engineer.

2. Boxes located indoor in dry, dusty areas shall be NEMA Type 12, constructed of welded and galvanized sheet steel. Boxes of dimensions 24 inches and less shall be 14 USS standard gauge metal. Boxes of dimensions greater than 24 shall be 12 USS standard gauge metal, except 10 USS standard gauge shall be used for boxes with any dimension of 36 inches or more. Boxes located in other areas shall conform to the following area classifications:

a. For wet locations boxes shall be watertight NEMA Type 4X. Boxes shall be constructed of 316 stainless steel and shall include gasketed, bolt on covers, with tapped holes in bosses or hubs for conduit entrance. Boxes shall be provided with cast mounting lugs for installation in concrete.

b. For hazardous locations boxes shall be explosion proof NEMA Type 7. Boxes shall be constructed of cast iron and shall include threaded connections and ground joint surfaces.

c. For corrosive locations boxes shall be corrosion resistant, NEMA Type 4X. Boxes shall be constructed of 316 stainless steel material with sealed seams.

3. Pull and junction boxes shall be provided with covers held in place by brass screws. Terminal boxes shall be provided with terminal block supports and approved hinged covers fitted tightly against a gasket and secured by lug bolts and wing nuts. Hinges, lug bolts, wing nuts and other fittings shall be made of an approved, non-ferrous, non-corrodible metal. All boxes shall be provided with rabbeted gaskets or flange gaskets securely held in place.

4. Tapping for threaded connections to outlet boxes, junction boxes, pull boxes and conduit fittings in non-explosion proof construction shall conform to the following:

   a. All threads shall be tapered.

   b. If threads for connection of conduit are tapped all the way through a hole in an enclosure, or if an equivalent construction is employed, there shall be not less than 3-1/2 threads in the metal and the construction of the enclosure shall be such that a suitable conduit bushing can be properly attached.

   c. If threads for connections of conduit are not all the way through a hole in a box wall, conduit hub or the like, there shall be not less than five full threads in the metal and there shall be a smooth, well rounded inlet hole for the conductors, which shall afford protection to the conductors equivalent to that provided by a standard conduit bushing and which shall have an internal diameter approximately the same as that of the corresponding trade size of rigid conduit. The threaded hole shall be provided with a conduit end stop.

   d. Tapping for threaded connections for explosion proof construction shall conform to the requirements of the NYCEC for construction in Class I, Division 1, and hazardous locations.

5. Cast iron or cast ferrous alloy outlet boxes, junction boxes, pull boxes, conduit fittings and conduit accessories such as box covers shall be rust-proofed by zinc coating applied by the "hot-dip" process or shall be given a rust protective coating applied by either of the following methods:

   a. Method A:

      1) Castings shall be given a mechanical and chemical cleaning.

      2) Castings shall be given a phosphoric acid type dip.

      3) Then a coating of zinc chromate primer shall be applied, and finally

      4) A coating of baked enamel finish shall be applied over the outside and inside surfaces of the castings.

b. Method B:

1) Castings shall be given a mechanical and chemical cleaning.

2) Then a coating of cadmium shall be deposited electrolytically.

3) Then a coating of zinc shall be applied by electroplating.

4) Then a vinyl resin base aluminum lacquer shall be applied.

6. Stamped steel outlet boxes, junction boxes and box covers shall be rust-proofed by a zinc coating applied by an electro-galvanizing or sherardizing process. Fabricated sheet steel boxes shall be formed from galvanized sheet steel. Welded joints shall be touched up with aluminum lacquer and boxes and covers shall be given a shop priming coat of zinc chromate rust inhibiting paint.

7. Terminal blocks shall be used within terminal boxes for termination of prepared conductors No. 10 AWG and smaller. Terminal blocks shall be in accordance with the following:

a. Terminal blocks shall be high density, screw terminal type suitable for rail mounting with quantities sufficient for the conductors to be terminated plus 20 percent spare.

b. Terminal blocks shall be NEMA rated, 600 volt, 35 ampere suitable for 85 degrees C.

c. Terminal block components shall have stainless steel and tin plated copper alloy components, backed out captive screws and marking surface.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. All conduits shall be installed in accordance with the requirements specified under this Section and in conformity with the sizes stated in the Specifications or shown on the Contract Drawings. They shall be installed complete with all accessories, fittings and boxes, in an approved and workmanlike manner so as to provide proper raceways for electrical conductors.

B. The Contractor's attention is called to the fact that all conduit runs indicated on the Contract Drawings are shown diagrammatically for the purpose of outlining the general method of routing the conduits to avoid interference. Where conduit runs

are not shown, it shall be the responsibility of the Contractor to establish the runs required based upon the various systems shown on the Contract Drawings.

C. Should any structural difficulties prevent the setting of cabinets, boxes, conduits, etc., at points shown on the plans, deviations therefrom as determined by the Engineer will be permitted and shall be made without additional cost.

D. All exposed steel conduits, fittings, boxes, straps, racks and hangers shall be painted in conformity with Section 09 91 00 - Painting. PVC coated conduit systems shall not be painted. Paint shall match the gray color of the PVC coated conduits.

E. Conduits shall be tagged using conduit tags. Conduit tags shall be installed where conduits terminate in equipment and enclosures.

F. Exposed conduits shall be color banded using conduit markers. Markers shall also include operating voltage when over 600 volts. Conduit markers shall be installed 360 degrees, double wrap around conduit exterior. Conduit markers shall be installed where conduits enter equipment, boxes, within each room, at wall penetrations and 50 feet on centers in each area. When exposed conduits are to be painted, markers shall be installed after the conduits are painted. Color banding shall be in accordance with to the extent applicable the following:

1. 120/208 volt AC: Gray.
2. 277/480 volt or 480 volt AC: Sand.
3. 4160 volt AC: Silver.
4. 13800 volt AC: Brown.
5. Fire Detection and Alarm: Red.
6. Telephone: Blue.
7. Intercommunication: Yellow.
8. Security System: Rust.
9. Low Voltage Switching, Instrumentation and Controls System: Black.

G. All enclosing cases, including condulets, boxes and conduit bodies, for fire, sprinkler, smoke detection, and associated systems alarm apparatus and equipment shall be painted or colored Fire Department “RED”, in accordance with New York City Building Code, unless otherwise required by the local Authority Having Jurisdiction (AHJ).

3.02 INSTALLATION

A. Installation of Raceways

1. The Contractor shall install all exposed raceways parallel or at right angles to walls and ceiling beams. Changes in directions shall be made with bends, elbows and pull boxes. All parallel runs shall be spaced uniformly throughout and secured in place with hangers and fasteners. Brace raceways

to satisfy the specified seismic requirements in accordance with the restraint details.

2. Conduits, where exposed, shall in all cases be substantially supported in an approved manner, but they shall not be fastened to or come in contact with any other pipes, ducts or other work of a similar nature. In all exposed work, approved channel or angle iron hangers, racks, one-hole straps or a combination thereof shall be provided to support the conduits. Where conduits are supported with one-hole straps, spacers shall be used to provide 1/4-inch minimum clearance between the conduits and walls or ceilings.

3. Hanger rods for trapeze type hangers shall be not less than 3/8 inch diameter. Conduit supports shall be located at intervals not exceeding 8 feet. Conduits shall be securely fastened to each support with U-bolts, straps or clamps.

4. All concealed conduits shall be placed in walls, floors, ceilings or slabs at the proper time in accordance with the progress of the structural Work. The Contractor shall cooperate in every respect in meeting schedules and shall not delay the structural Work unnecessarily.

5. Conduits embedded in concrete shall be blocked and braced in place by use of adequate conduit separators to prevent displacement during the pouring of concrete. The Contractor will be held responsible for proper position of conduits and shall rearrange any conduit that may be displaced while concrete is poured, without additional cost.

6. Where conduit runs are to be concealed and the Contractor fails to place such conduit in sufficient time to be included in the structures and the structures are completed without such conduit, the Contractor shall install such runs either concealed or exposed as directed by the Engineer, with no extra payment for additional work or for more conduit than the original lengths.

7. Embedded conduit shall be run in structural concrete in the center of slabs and walls and above waterstops. Conduit connections shall be made watertight. Contractor shall confirm that concrete thickness is sufficient for embedding the quantity of conduits intended. Unless specifically shown otherwise on the Contract Drawings or stated in this Specification or the Specifications, embedded conduits shall be in accordance with the following criteria:

   a. Minimum concrete thickness shall be as follows:

      1) For concrete 16 inches thick and less, the minimum concrete thickness shall be 11.5 inches plus the depth of the largest conduit assembly. The conduit assembly depth shall be from the top of the uppermost conduit to the bottom of the lowest conduit.

2) For concrete greater than 16 inches thick, the minimum concrete thickness shall be 13.5 inches plus the depth of the largest conduit assembly.

3) For concrete at foundation slabs, an additional inch shall be added to the minimum concrete thicknesses previously stated.

b. Conduit spacing shall be as follows:

1) Conduits shall be separated three times outer diameter of larger conduit center to center.

2) For multiple conduit layer assemblies, conduits shall be separated vertically three times outer diameter of larger conduit center to center.

3) When conduits cross at a given point, the conduits may be in direct contact and the angle of cross shall be 45 degrees or greater. Conduits may also cross within the vertical spacing of a multi-conduit layer assembly.

4) When conduits cross a structural expansion joint, conduits shall be separated three times outer diameter of larger conduit fitting center to center.

8. A run of conduit between outlet and outlet, between fitting and fitting or between outlet and fitting shall not contain more than the equivalent of three quarter bends, including those bends located immediately at the outlet or fitting.

9. Factory-made conduit bends or elbows shall be used wherever possible in making necessary changes in direction. Field bends shall be carefully made so as to prevent conduit damage or reduction in the internal areas. The radius shall not be less than six times the nominal diameters for the conduit with carefully matched bends on parallel runs so as to present a neat appearance.

10. All conduits, where cut, shall be carefully reamed to remove burrs. No running threads will be permitted. All screw joints shall be watertight. Conduits shall be fitted in an approved manner to all devices and boxes. The ends of all conduits shall be equipped with suitable approved conduit fittings. The ends of all empty conduits shall stub up six inches above the slab and shall be capped.

11. As far as practicable, conduits shall be pitched to drain to outlet boxes or otherwise so installed as to avoid trapping moisture. Trapped conduits in concealed construction shall be provided with outlet boxes for drainage. Where necessary drainage in outlet boxes or where dips are unavoidable in exposed conduits, a drain fitting shall be installed at the low point.

12. Thruwall type seals and conduit sealing bushings shall be installed for all conduits passing through concrete slabs, floors, walls or block walls.

13. Conduit runs shall be installed so as to avoid flues, heat sources, and steam or hot water pipes. A minimum separation of 12 inches shall be maintained where conduit crosses or parallels hot water, steam pipes or heat sources.

14. Where conduit enter or leave equipment located within electrical and control rooms the conduit shall be sealed and packed with a suitable duct seal compound.

15. A 250 pound tested polyethylene pull tape shall be provided in all empty conduits, with a minimum 8 inch of slack, double backed into the conduit. Conduit shall be protected immediately after installation by installing flat non-corrosive metallic discs and steel bushings designed for this purpose at each end. Discs shall not be removed until it is necessary to clean the conduit.

16. All conduit that is cut on the job shall be cut square and taper reamed to remove burrs before installation. Where steel conduit is cut and threaded on the site, it shall be coated before and after making connections.

17. PVC coated conduit shall be installed in compliance with the latest version of the National Electrical Code and other applicable codes and standards as indicated in these specifications.

18. PVC coated conduit shall be installed in accordance with NECA National Electrical Installation Standards (NEIS) 101. Standards for installing steel conduit.

19. Conduits embedded in concrete shall stub up 6 inches above the slab. A three inch high curb extending three inches from the outer surface of the conduit penetrating the floor shall be provided to prevent corrosion. Conduit stub-ups shall be terminated in couplings, slightly above the finished concrete curb.

B. Conduit Connections to Equipment.

1. At each motor, limit switch, solenoid valve, electrical control device or other electrically controlled or operated equipment, the Contractor shall install a complete conduit connection between the conduit system and the terminal box of the motor or the conduit connection point of the equipment.

2. Conduits installed in the conduit system shall be terminated in such locations as to permit direct connections to motors, devices or equipment.

3. Connections shall be made with rigid conduit if equipment is fixed and not subject to adjustment, mechanical movement or vibration. Rigid connections shall be provided with union fittings to permit removal of equipment without cutting, breaking or burning conduit.

4. Motors, transformers and equipment subject to adjustment, mechanical movement or vibration shall be connected with flexible metallic conduit.

5. Devices such as solenoid valves, small limit switches, etc., shall be connected with flexible metallic conduit arranged to prevent strain and distortion.

6. Flexible conduit connections shall be watertight unless the area of installation requires explosion-proof construction.

C. Installation of Boxes and Fittings.

1. All concealed outlet boxes shall be set in such a manner that they will be plumb and flush with the finished surface.

2. Boxes shall be installed rigidly and securely to the structure. Independent supports shall be provided where no walls or other structural surface exists.

3. Expansion and expansion/deflection fittings shall be installed where conduits cross structural expansion joints and at locations shown on the Contract Drawings. Fittings shall be installed on each conduit and incorporated into the expansion joints of structures, at right angles to the joint, to insure their proper functioning and preservation.

4. Expansion fittings shall be installed on exposed conduit runs exceeding 200 feet. Unless specifically shown otherwise on the Contract Drawings or stated in this Specification or the Specifications, when crossing structural expansion joints larger than one inch, an expansion fitting shall also be installed together with an expansion/deflection fitting. The fittings shall be installed on each conduit run in accordance with manufacture's recommendations to provide the additional movement necessary.

5. All conduit connections in wet and corrosive locations shall be made up watertight and shall terminate at enclosures with an approved conduit hubs.

6. All conduit connections in dry and dusty locations shall terminate at enclosures with bushings and lock nuts. Terminations shall include one bushing and two lock nuts at each location. Lock nuts shall be installed one inside and one lock nut outside the enclosure. All conduit shall be bonded to the safety ground.

7. At pull and junction boxes having any box dimension in excess of 18 inches, jumper type grounding bushings shall be installed on conduit ends and jumper wires shall be installed to bond all conduits and to bond conduits to boxes.

8. All insulated grounding bushings shall be bonded together and to the structure of the enclosure by a continuous, copper bonding wire.

9. Removable, flame-retardant, insulating cable supports shall be provided in all boxes with any dimension exceeding 3 feet.

10. Scratched PVC coated boxes and fittings damaged as a result of installation work shall be touched up by field applying PVC coatings. All touch up work shall be in strict conformance with manufacturer's recommendations.

D. Installation within Hazardous Areas.

1. Explosion-proof boxes and fittings shall be of a type approved by the Engineer. Boxes and fittings shall be of cast iron with finish as specified hereinbefore or of an aluminum alloy specially developed for use in hazardous areas.

2. Explosion-proof boxes shall be suitable for the installation of explosion-proof switches, receptacles, lighting fixtures or other devices as indicated. All conduit connections to such boxes shall be made with threaded fittings. Bushings and locknut connections shall not be used.

3. Conduits terminating at explosion-proof boxes, enclosing circuit opening equipment, shall be sealed at the entrance to the box with an approved compound-filled sealing fitting to prevent passage of explosive or combustible gases through the conduit. Where construction prevents the use of sealing fittings, the ends of the conduits shall be properly sealed with sealing compound.

4. Sealing fittings shall be installed to seal each conduit leading from or entering into hazardous locations. Exposed conduits passing through hazardous locations shall be sealed at point of exit and entrance.

5. The installation of explosion-proof boxes, fittings and all conduits in connection therewith shall conform to the hazardous location requirements of the NYCEC for Class , Division and Group D locations shown on the Contract Drawings.

3.03 FIELD TESTING / QUALITY CONTROL

A. After installation, the electric conduit system shall be field tested. The field tests shall be witnessed by the Engineer and certified by the Contractor. The Contractor shall provide testing consisting of the following:

1. Each conduit shall be tested by pulling through a cylindrical mandrel as specified under this Section. Maintain a record of all conduits testing clear.

2. Conduit systems shall be ground tested in the presence of the Engineer, who will inspect all enclosures, pull and junction boxes for bonding to the safety green conductor pulled with the nominal 120 volt and higher power and control circuits, and for bonding of the conduit grounding bushing to this safety ground.

3. The separation of above safety grounding system from the instrumentation signal grounding shall be verified.

4. The Contractor shall provide a Field Test Report. The Report shall identify the testing performed and the results obtained.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. All conduits shall be carefully cleaned before and after installation and all inside surfaces shall be free from all imperfections likely to injure the cable. Conduits shall be cleaned in accordance with the following:

1. After erection of complete conduit runs, conduits shall be snaked with a suitable swab to which shall be attached an approved tube cleaner equipped with an approved cylindrical mandrel of a diameter not less than 85 percent of the nominal diameter of the conduit.
2. All conduits through which the mandrel will not pass shall be removed and replaced by the Contractor at its own expense.
3. After snaking, the ends of the dead-ended conduits shall be protected with standard malleable iron caps to prevent the entrance of water or other foreign matter.
4. Conduit ends shall be protected after cleaning with caps to prevent entrance of water, concrete, debris or other foreign substance.

END OF SECTION

SECTION 26 05 43 – UNDERGROUND DUCTS, MANHOLES AND RACEWAYS FOR ELECTRICAL SYSTEMS
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Requirements for providing underground ducts, electric manholes and raceways for electrical systems.

1. This Section also includes requirements for providing electric handholes.

2. Underground ducts, electric manholes, electric handholes and raceways shall be provided in accordance with the requirements specified under this Section, the Specifications and the Contract Drawings.

3. Underground ducts shall be concrete encased. The Contractor shall provide reinforced concrete encasement for the duct system.

B. The Contractor shall perform all excavations, complete all forms, and do backfilling and tamping, as required, unless specifically shown otherwise on the Contract Drawings or stated in the Specifications.

C. The following index of this Section is presented for convenience:

1.04 REFERENCES

A. Definitions

1. All references to the Utility or Electric Utility shall refer Consolidated Edison Company of New York or the Local Electric Utility Having Jurisdiction.

B. Reference Standards

1. Underground ducts, electric manholes, handholes and raceways shall comply with the latest applicable provisions and recommendations of the following:

a.	NEMA TC2	-	Electrical Polyvinyl Chloride (PVC) Tubing and Conduit.
b.	NESC	-	National Electrical Safety Code
c.	NYCEC	-	New York City Electrical Code
d.	UL 651	-	UL Standard for Safety Schedule 40, 80, Type EB and A Rigid PVC Conduit and Fittings.
e.	UL 2420	-	UL Standard for Safety Below ground Reinforced Thermosetting Resin conduit (RTRC) and Fittings.

1.05 DESCRIPTION

A. Not Used

1.06 QUALITY ASSURANCE

A. Not Used

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited, to:

1. A list of proposed manufacturers with the products they produce proposed for the contract.

2. Manufacturer's technical information with name, designation and catalog number for all products for the underground ducts systems, manholes, handholes, raceways and accessories proposed for use.

3. Drawings showing interior and exterior dimensions and details of openings, jointing, inserts and reinforcing.

4. Scaled Shop Drawings showing the routing of the duct banks and the location of manholes, handholes and the principal outline of buildings and structures. Reference duct banks dimensionally from fixed objects or structures. Include profiles of duct banks showing crossings with piping and other underground systems.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Underground ducts, manhole, handholes and raceways shall be delivered, stored and handled in accordance with this Section, the Specifications and the manufacturer's instructions.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Rigid Steel Conduit: See Section 26 05 33 - Raceway and Boxes for Electrical Systems.

B. Warning tape shall be as manufactured by:

1. Seton, Branford, CT.

2. Ideal Industries, Sycamore, IL.

3. Or approved equal.

C. Duct Seal: See Section 26 05 33 - Raceway and Boxes for Electrical Systems.

D. Reinforced Concrete: See Section 03 30 10 – Low Carbon Cast-in-Place Concrete and Section 03 21 00 – Reinforcing Steel.

E. Expansion and Deflection Fittings: See Section 26 05 33 - Raceway and Boxes for Electrical Systems.

F. Conduit Bushings: See Section 26 05 33 - Raceway and Boxes for Electrical Systems.

2.02 MATERIALS / EQUIPMENT

A. Rigid Steel Conduit

1. Rigid Steel conduit without a PVC coating shall be used for all ducts. Rigid Steel Conduit Rigid Steel Conduit shall be in accordance with the requirements of Section 26 05 33 - Raceway and Boxes for Electrical Systems.

B. Underground Duct Accessories and Fittings

1. Conduit Spacers

a. Factory fabricated conduit spacers shall be nonmetallic, vertical and horizontal interlocking type to maintain spacing between conduits. Spacers shall be suitable for all types of conduit in multiple sizes.

2. Warning Ribbon

a. Warning ribbon shall be a three inch wide, four mil polyethylene or polyvinyl chloride detectable tape. The tape shall red color and be permanently imprinted in black color, “CAUTION BURIED ELECTRIC LINE BELOW.”

3. Duct Seal

a. Duct seal for conduits shall be in accordance with the requirements of Section 26 05 33 - Raceway and Boxes for Electrical Systems.

4. Reinforced Concrete

a. Concrete for envelope shall be in accordance with the requirements of Section 03 30 10 – Low Carbon Cast-in-Place Concrete. Steel reinforcement shall be in accordance with the requirements of Section 05 12 00 - Structural Steel Framing.

5. Expansion and Deflection Fittings

a. Where specifically shown on the Contract Drawings, expansion and deflection fittings shall be provided at the structural joints of the underground duct system.

b. Expansion and deflection fittings shall be in accordance with Section 26 05 33 - Raceway and Boxes for Electrical Systems.

6. Conduit Bushings

a. Conduit bushings shall be provided for the termination of rigid steel conduits at each manhole.

b. Conduit bushings shall be in accordance with Section 26 05 33 - Raceway and Boxes for Electrical Systems.

C. Manholes and Handholes

1. Manholes and handholes shall be cast-in-place type of reinforced concrete. Where specifically shown on the Contract Drawings or stated in the Specifications, the use of precast type manholes and handholes shall be permitted.

2. Manholes associated with service feeders shall be in accordance with the requirements of the Utility.

3. Concrete for manholes and handholes shall be in accordance with the requirements of Section 03 30 10 – Low Carbon Cast-in-Place Concrete. Manholes and handholes shall be constructed to withstand ground water pressure when completely submerged by rising water table.

4. Steel reinforcement shall be as shown on the details on the Contract Drawings and shall be in accordance with the requirements of 05 12 00 - Structural Framing.

5. Manholes and handholes shall have dimensions as shown on the Contract Drawings and shall be provided with all duct entrances sized and located to suit duct banks.

6. Concrete floor shall be sloped towards the drain sump at the center of each manhole and handhole.

7. All manhole and handhole hardware shall be hot dipped galvanized steel.

D. Manhole and Handhole Accessories

1. Frames and Covers

a. Each manhole and handhole shall be provided with a cast-iron watertight manhole frame with inside and outside covers.

b. All frames and covers shall be in accordance with the requirements of Section 05 05 23 - Miscellaneous Metal Castings. Frames and covers shall be annealed, high quality, gray cast iron, free from blowholes, sandholes, scabs, fins, scales and other defects. They shall be uniform in form and dimensions, and shall be as approved by the Engineer.

c. The frames shall be so set that the completed installation will provide a proper alignment of the outside covers with the roadways or other surrounding areas. Manhole and handhole covers shall fit the frame without undue play.

d. The following words shall be cast in the top of all manhole and hand hole covers, as appropriate.

1) "ELECTRIC POWER, LOW VOLTAGE"

2) "ELECTRIC POWER, MEDIUM VOLTAGE"

3) "COMMUNICATIONS / INSTRUMENTATION"

2. Cable Supports

a. Manholes shall be furnished with cable racks, cable hooks and insulators to effectively support all cables indicated for present and future installation.

1) Cable racks shall be made from steel channel with ample strength to support cables. Racks shall be firmly anchored to walls.

2) Cable hooks shall be made from malleable iron.

3) Racks and hooks shall have hot-dipped galvanized finish.

4) Insulators shall be made of high-grade dry-process porcelain with smooth glazed surfaces and shall fit hooks in such manner as to prevent wobbling and insure minimum movement.

3. Pulling Irons

a. Galvanized steel pulling irons shall be provided for each manhole and handhole. Pulling irons shall be cast in the wall opposite to the centerline of each incoming duct bank and 12 inches below centerline of bottom line of ducts.

4. Grounding

a. Each manhole shall be provided with a grounding system. The grounding system shall consists of ground rods and cable in accordance with the details shown on the Contract Drawings.

b. Ground rods and cable shall be in accordance with the requirements of Section 26 05 27 - Grounding.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Duct Banks

1. The duct system shall be installed to avoid interferences with structures, piping and other underground systems. Conduit duct banks shall be sized, arranged and installed in a reinforced concrete envelope as shown on the Contract Drawings.

2. Trenches for duct banks shall be in accordance with the requirements of Section 31 23 15 - Excavation. Duct bank trenches shall have the bottom tamped firm and even, and suitably braced side forms shall be employed in forming the envelope.

3. Duct banks shall follow straight lines as far as possible. Where deviation from a straight line becomes necessary, offsets shall be made using 5 degree angle coupling or make bend with sweeps. The sweep radius shall be 48 inch for 90 and 45 degree bends and 36 inch for 30 degree bends. Where directed by the Engineer, bends shall be made up with standard factory bends or other approved curved sections.

4. Duct bank installations and penetrations through foundation walls shall be made watertight.

5. Duct banks shall be assembled using non-magnetic saddles, spacers and separators. Separators shall be positioned to provide 3-inch minimum concrete separation between the outer surfaces of the ducts.

6. Concrete covering shall be provided on both sides, top and bottom of the concrete envelopes around conduits. Concrete covering shall be in accordance with the detail shown on the Contract Drawings. Top of concrete encasement shall not be less than thirty inches below finish grade. Add red dye to concrete used for envelopes or trowel a coloring on the concrete for easy identification during subsequent excavation.

7. Before pouring concrete, written approval shall be obtained from the inspecting engineer.

8. Ducts shall be firmly fixed in place during pouring of concrete. Concrete shall be carefully spaded and vibrated to insure filling of all spaces between ducts.

9. A transition shall be made from rigid steel conduit where duct banks enter structures or turn upward for continuation above grade. Rigid steel ducts shall be terminated using insulated grounding bushings. Ducts inside buildings shall be continued using PVC coated rigid steel conduits.

10. Rigid steel ducts shall be terminated using insulated grounding bushings.

11. Backfilling for duct banks shall be in accordance with the requirements of Section 31 23 25 - Fill. Backfilling shall be permitted when directed by the engineer to proceed. Backfilling shall not be with material containing large rock, paving materials, cinders, large or sharply angular substances, corrosive material or other materials which can damage or contribute to corrosion of ducts or cables or prevent adequate compaction of fill.

12. Duct runs shall be sloped for drainage toward manholes and away from buildings with a slope of approximately 3 inches per 100 feet.

13. Where specifically shown on the Contract Drawings, a ground cable shall be installed in each duct bank envelope. Cable shall be in accordance with the requirements of Section 26 05 27 - Grounding. The ground shall be made electrically continuous throughout the entire duct bank system. Ground cable shall be connected to the building, station ground grid, equipment ground buses and to each conduit grounding bushing of the underground duct system. The ground cable shall be terminated at the last manhole or handhole for outlying structures.

14. A warning ribbon shall be installed approximately 12 inches below finished grade over all underground duct banks carrying cables of 480 volts and higher.

15. All ducts entering buildings and structures shall be sealed. All empty spare ducts shall be sealed and plugged.

16. An expansion and deflection fitting shall be installed on each conduit at each of the structural expansion joints when shown on the Contract Drawings. Joints shall be located as defined by the criteria noted on the Contract Drawings.

B. Manholes and Handholes

1. Manholes and handholes shall be installed where shown on the Contract Drawings. Place each manhole and handhole on a 12-inch crushed-stone base and make level.

2. Manhole and handhole excavation shall be in accordance with the requirements of Section 31 25 15 - Excavation. Backfilling for manholes and handholes shall be in accordance with the requirements of Section 31 23 25 - Fill.

3. Manhole and handhole installation shall be completed so that structure is watertight. All penetrations through manhole walls and bottoms to facilitate equipment such as ground rods shall be made through cast in place sleeves. Sleeves shall be made watertight after the installation of equipment. Two coats of bituminous waterproofing material shall be applied to exterior surface of each manhole and handhole. A waterproof gasket shall be provided all around removable precast manhole cap.

4. Cable racks shall be installed within each manhole for the support of cables. Cable racks shall be in accordance with the following:

   a. Attach racks with 3-inch by 3/8-inch diameter tamp-in studs mounted in 1-inch holes drilled into walls of manholes in the absence of inserts. Apply PVC coating to all racks.

   b. Provide cable hooks to support each cable on each rack along the cable run within the manholes. Apply PVC coating to all hooks.

   c. Individually support each cable at each hook on porcelain insulators. Provide sufficient slack for each cable.

   d. In the manhole securely tie each cable in place at each insulator block to prevent excessive movement of insulators, cables, or fireproof tape. Tie cables with non-metallic 3/4-inch strapping tape as manufactured by 3M or tie down with nylon straps.

5. A grounding system shall be installed for each manhole. All exposed metal, manhole frame and cover, accessories and the concrete reinforcing rods shall be bonded with No. 4 AWG minimum bare copper wire and connected to the duct bank ground in accordance with the details shown on the Contract Drawings.

6. Concrete curb shall be provided for manholes when required to adjust manhole cover to proper grade. Curb shall be constructed on the roof slab or cone section on which the manhole frame and cover shall be placed. The height of the curb shall be such as is necessary to bring the manhole frame to the proper grade.

7. For cast in place type manholes and handholes, pulling irons shall be set and other built-in items shall be in place before placing concrete.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Cleaning and Protection

1. After installation each conduit in each duct bank shall be cleaned and cleared of obstructions and foreign matter by rodding and by the passage of cleaning brushes or cutting mandrels.
2. After cleaning, the clearance of each conduit shall be checked by passing a 12 inch long mandrel, of diameter 1/2 inch less than the nominal duct diameter, through the entire length of duct run. Ducts which do not permit passage of the mandrel shall be cleared, cut out and replaced or sealed and replaced by additional construction. The duct bank conduit cleaning shall be included in the electric conduit system field test report specified in Section 26 05 33 - Raceways and Boxes for Electrical Systems.

END OF SECTION

SECTION 26 05 53 – IDENTIFICATION FOR ELECTRICAL SYSTEMS
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Requirements for providing labeling and identification.

1. Labeling and identification shall be provided in accordance with the requirements specified under this Section, the Specifications and the Contract Drawings.

2. Labeling and identification shall be provided for the identification of electrical equipment.

B. The work shall include providing all voltage signs, equipment nameplates, markers, tags and arc flash labels for all electrical equipment furnished under this Contract.

C. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. Not Used

1.06 QUALITY ASSURANCE

A. All labeling and identification signs and nameplates shall be provided in accordance with the NYCEC, NFPA 70E and OSHA 1910 Subpart S.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include but not be limited to:

1. Submit signs, nameplates and other labeling and identification devices proposed for use with specifications and other data required to demonstrate compliance with the specified requirements.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The labeling and identification devices shall be delivered, stored and handled in accordance with the Specifications and the manufacturer's recommendations.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Labels shall be as manufactured by:

1. Brady, Milwaukee, WI;
2. Seton Nameplate Corporation, North Branford, CT;
3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Equipment Nameplates

1. Equipment nameplates shall be provided in addition to the manufacturer's nameplate, to identify the equipment number and the item's function and the equipment to which it serves.
2. Equipment nameplates shall be provided in accordance with the requirements specified under this Section and Section 40 05 97 – Identification for Process Equipment.
3. Equipment nameplates shall be laminated plastic with black letters on a white background.
4. Nameplates for equipment identification shall have 1/2-inch high letter engravings.
5. Nameplates for pilot device identification shall have 1/4-inch high letter engravings.
6. Nameplates for distribution equipment shall have the following information:
    a. Equipment name and number.
    b. Voltage.
    c. Phases and number of wires.
7. Pull boxes, junction boxes and control stations shall have a nameplate identifying the equipment name and number.
8. All feeders and branch circuit devices shall have nameplates identifying the served equipment name and number.
9. Where execution of the Work under this Contract requires certain feeders and branch circuit devices to be modified, the Contractor shall provide new nameplates reflecting the modifications. The nameplates shall identify the served equipment name and number.
10. All control and indicating devices shall have individual nameplates identifying device function.
11. Nameplate mounting screws shall be 3/16 inch diameter, round-head, stainless steel and self-tapping type. Adhesives shall not be used.

B. Conduit Markers and Tags

1. Conduit markers and tags shall be provided for the identification of the electric conduit system.

2. Conduit markers and tags shall be in accordance with Section 26 05 33 - Raceways and Boxes for Electrical Systems.

C. Cable and Wire Markers

1. Cable and wire markers shall be provided for the identification of the electric wire and cable.

2. Cable and wire markers shall be in accordance with Section 26 05 20 - Low-Voltage Wires, Cables and Accessories.

D. Arc Flash Labels

1. Labels shall be provided in addition to the manufacturers nameplate and equipment nameplate, to identify equipment name, and system information such as bolted fault and arcing fault current levels, flash protection boundary distances, working distances, personal-protective equipment classes and AFIE (Arc Flash Incident Energy) levels. System information shall be a determined by the specified studies under Section 26 05 73 Power System Studies and Section 26 05 75 Shock Hazard and Arc Flash Studies.

2. Labels shall be able to withstand their usage environment, the print shall not fade, and adhesive should be aggressive enough to avoid peeling.

3. Arc flash labels shall be printed on a durable polyester base over-laminated to protect the text and graphics.

4. The back of the labels shall employ an acrylic adhesive, which allows the labels to be securely and permanently affixed to a wide range of surfaces.

5. Labels shall include no field markings.

6. Labels shall be generally in accordance with ANSI Z535.4.

7. Labels shall include at a minimum the following information based on the Arc Flash Hazard Analysis performed:

a. Nominal Voltage of the Equipment

b. Flash Protection Boundary

c. Arc Flash Incident Energy Value (cal/cm^2) at the working distance

d. Limited and Restricted Boundaries

e. Study Report Number and Issue Date

f. Location of Study Report.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Signs and Nameplates

1. All signs, nameplates and tags shall be installed neatly, properly and as recommended by the manufacturers.

2. Signs and nameplates shall be mounted with screws.

a. Where mounting of signs or nameplates with screws is impractical, the Contractor shall alert the Engineer.

B. Signal Wire and Cable

1. Control, signal and status wire and cable shall be identified by a unique number. The numbering system shall reflect the actual identification used in the Work and shall be documented on the point-to-point wiring diagrams.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

PART 1 GENERAL

1.01 SUMMARY

A. Requirements for providing Power System Studies and field testing. The Contractor shall provide Power System Studies and field testing in accordance with the requirements specified under this Section, the Specifications and the Contract Drawings.

B. The Power System Studies shall include a load flow study, a short circuit study, a protective device evaluation study and a protective device coordination study for a completely coordinated power distribution system.

C. Three separate and distinct power system studies shall be provided, one for each of the three site locations shown on the Contract Drawings.

D. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Not used

1.04 REFERENCES

A. Definitions

1. Power System as used in this Section shall mean all of the electrical distribution network from the Utility connection to all loads. This includes all on site generating sources, all branches and all nodes.
2. Low-Voltage as used in this Section and the Specifications shall mean all equipment, conductors, insulation systems and accessories intended for operation at less than 1000 volts and within the 600 V Class.
3. Medium-voltage as used in this Section and the Specifications shall mean all equipment, conductors, insulation systems and accessories intended for operation above 1000 volts and below 99000 volts.
4. Node as used in this Section shall mean any point in the Power System where two or more pieces of electrical equipment connect.
5. Branch as used in this Section shall mean any element of the Power System connecting any two nodes.
6. Major Node as used in this Section shall mean any node representing actual real world connection points of branches of the Power System such as busses in switchgears, MCCs or panelboards or the connection points of cables to load and equipment.
7. Dummy Node as used in this Section shall mean any fictitious node created within the modelling software to facilitate modelling of the Power System.
8. Major Branch as used in this Section shall mean any branch representing actual real world elements of the Power System such as feeders, breakers, transformers, and cables.
9. Dummy Branch as used in this Section shall mean any fictitious branches created within the modelling software to facilitate modelling of the Power System.
10. All references to the Electric Utility or Utility shall mean the Local Electric Utility having jurisdiction as defined in this Section.
11. The Electric Utility is Con Edison.

B. Reference Standards

1.	NYCEC	-	New York City Electrical Code
2.	IEEE 141	-	IEEE Recommended Practice for Electric Power Distribution in Industrial Plants
3.	IEEE 399	-	IEEE Recommended Practice for Industrial and Commercial Power System Analysis

4.	IEEE 1015	-	IEEE Recommended Practice for Applying Low-Voltage Breakers Used in Industrial and Commercial Power Systems
5.	IEEE 3002.2	-	IEEE Recommended Practice for Conducting Load-Flow Studies and Analysis of Industrial and Commercial Power Systems
6.	IEEE 3002.3	-	IEEE Recommended Practice for Conducting Short-Circuit Studies and Analysis of Industrial and Commercial Power Systems
7.	NETA ATS	-	NETA Acceptance Testing Specification

1.05 DESCRIPTION

A. Power Systems Studies shall be completed to the extent applicable by modelling the entire low-voltage and medium-voltage equipment of the Power System in the software detailed in this Section. The studies shall encompass existing systems and the proposed systems.

B. The model shall comprise all major nodes and major branches of the Power System.

C. The model shall also comprise dummy nodes and dummy branches to attain a level of connectivity similar to the Single Line Diagram representation of the Power System.

D. The model shall completely facilitate the examination of normal operations, and alternate operations of the Power System which could result in deviations from the normal operating values at major nodes and in major branches of the Power System.

1.06 QUALITY ASSURANCE

A. Modelling:

1. The Power System studies shall be performed in accordance with the latest applicable provisions and recommendations of the Reference Standards in this Section.

2. The Contractor shall retain the services of a licensed Professional Engineer, registered in the State of New York, to perform the Power System Studies.

3. The licensed Professional Engineer shall be from an independent consulting firm or the equipment manufacturer and shall have a minimum of 5 years of experience in performing Industrial Power System Studies.

4. It shall be the responsibility of the licensed Professional Engineer to:

a. Evaluate all devices.

b. Evaluate all equipment.

c. Establish the settings of all protection functions.

d. Establish the settings required to secure selective coordination among protective devices.

5. Power System Studies shall be completed using the software program listed in this Section.

6. The Contractor shall coordinate with the licensed Professional Engineer performing the studies and assist the Professional Engineer in the collection of all information necessary to complete the studies specified.

7. All test equipment and instrument calibration shall be in accordance with the latest edition of the accuracy standard of the NIST and NETA ATS.

8. The Contractor is responsible to coordinate with and obtain from utility company of the available minimum and maximum three phase and line to ground fault current with associated X/R ratios and voltage.

B. Field Testing:

1. The Power System shall be field tested. The field testing shall be performed in accordance with the requirements specified under this Section.

2. The Contractor shall retain the service of an independent testing firm who shall perform field testing of the Power System. The testing firm shall have experience in the inspection and testing of the system equipment and shall be a member company of NETA. Provide proof of membership, or demonstrate that the standards and experience required for membership are possessed, all to the satisfaction of the Engineer

1.07 SUBMITTALS

A. Submittals

1. Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

a. Experience of the licensed Professional Engineer who will perform the Power Systems Studies

b. Version of the software to be used to conduct Power Systems Studies

c. Calculations and results of the Power System Studies shall be submitted. The submission of calculation and results shall consist of:

1) A report detailing all the findings, recommendations and settings arising from the studies. The report shall be stamped and signed by the licensed Professional Engineer.

2) The complete software files produced by the study software, and corresponding to the findings, recommendations and settings contained in the report. Two copies of the software files shall be submitted, one copy shall be write protected and the other shall not.

2. The Power System Studies shall be submitted for approval prior to receiving the final approval of the Power System equipment and/or prior to the release of equipment drawings for manufacturing.

3. Power System Studies shall be submitted for approval prior to the Engineer giving approval for drawings to be submitted for review by the Utility.

4. In the event that formal completion of the Power System Studies may cause delay in the approval of equipment or Utility drawings then a preliminary submission of the Power System Studies shall be made. The Engineer will determine whether the preliminary submission is sufficient to allow approval of equipment and Utility drawings.

5. Work sequence for the field testing shall be submitted. The sequence shall indicate the schedule of Work, time frame and downtime for the equipment. The work sequence shall be submitted at least 60 days in advance prior to conformation of field testing dates.

6. Qualifications of proposed testing firm to perform field testing shall be submitted. Submit firm experience records at least 60 days in advance to actual testing along with five recent references with phone numbers.

B. Reports

1. Field test report shall be submitted.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Studies shall be performed using the latest version of commercially available computer software as manufactured by

1. SKM.

2. Easy Power.

3. ETAP

4. Or Approved Equal.

2.02 MATERIALS / EQUIPMENT

A. Not Used

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Load Flow Study:

1. The load flow study shall be preliminary to all the other studies and for all proposed operating conditions of the Power System. The load flow study shall be used to

a. Preset the study parameters as applicable for each of the studies listed under this Section.

b. Confirm the layout and balance of the power flows across the major branches

c. Establish the voltage profiles at all major nodes.

d. Identify real and reactive power flows into nodes and across the branches of the Power System.

e. Determine real and reactive power losses in the Power System.

f. Identify proposed transformer tap settings.

g. Problem areas or equipment capacity inadequacies shall be promptly brought to the Engineer's attention.

B. Short Circuit Study:

1. Short-circuit momentary duties and interrupting duties shall be calculated on the basis of maximum available fault current at each major node and through major branches and other significant locations through the system.

2. The short circuit tabulations shall include symmetrical fault currents, and X/R ratios.

3. For each fault location, the total duty on the major nodes, as well as the individual contribution from each connected branch, including motor back EMF current contributions shall be listed with its respective X/R ratio.

C. Protective Device Evaluation Study:

1. The protective device evaluation study shall be performed to determine the adequacy of circuit breakers, controllers, surge arresters, busways, switches, and fuses by tabulating and comparing the short-circuit ratings of these devices with the prospective fault currents.

2. Appropriate multiplying factors based upon system X/R ratios and protective device rating standards shall be applied.

D. Protective Device Coordination Study:

1. The protective device coordination study shall be performed to select or to check the selections of the power fuse ratings, protective relay characteristics and settings, ratios and characteristics of associated voltage and current transformers, and low-voltage breaker trip characteristics and setting.

2. The device settings computed in the coordination study shall provide complete selectivity.
   a. The system shall be selectively coordinated such that only the device nearest a fault will operate to remove a faulted circuit.
   b. System selectively shall be based on both the magnitude and the duration of a fault current.
3. The coordination study shall include all voltage classes of equipment starting at the utility's incoming feeder protective device down to and including each of the medium and low voltage load. The phase and ground overcurrent and ground fault protection shall be included, as well as settings for all other adjustable protective devices.
4. The time-current characteristics of the installed protective devices shall be plotted on the appropriate log-log paper. Reasonable coordination intervals and separation of characteristic curves shall be maintained. The coordination plots for phase and ground protective devices shall be provided on a complete system basis. Sufficient curves shall be used to clearly indicate selective coordination achieved to the utility main breaker, power distribution feeder breakers, and the overcurrent devices at each major load center.
5. There shall be a maximum of six protective devices per plot. Each plot shall be appropriately titled. Plots shall include the following information as required for the circuits shown:
   a. Representative one-line diagram, legend and types of protective devices selected.
   b. Utility’s relays or fuse characteristics.
   c. Significant motor starting characteristics.
   d. Parameters of transformers, ANSI magnetizing inrush and withstand curves.
   e. Operating bands of low voltage circuit breaker trip curves, and fuse curves.
   f. Relay taps, time dial and instantaneous trip settings.
   g. Cable damage curves.
   h. Symmetrical and asymmetrical fault currents.
6. The selection and settings of the protective devices shall be provided separately in a tabulated form listing circuit identification, IEEE device number, current transformer ratios, manufacturer, type, range of adjustment, and recommended settings. A tabulation of the recommended power fuse selection shall be provided for all fuses in the system.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Study Input

1. The Contractor shall be responsible to ensure that all data to complete the Power System Studies is provided and is input to the software model including but not limited to:

a. Selection of suitable base MVA, base voltage and base current.

b. Utility and on site generation, single and three phase fault current contributions including X/R ratios.

c. Motor contributions and sequence impedances including X/R ratios.

d. Sequence resistance and reactance of all major branches.

e. Transformer impedance, X/R ratios, winding connection, tap ranges and base ratings.

f. Models, test results or characterization of Harmonic Sources.

g. All other circuit parameter to permit the complete and accurate modelling of the Power System.

3.02 INSTALLATION

A. Study Report

B. The results of the Power System Studies shall be summarized in a final typewritten report. Three separate reports are required, one for each of the three site locations. Each report shall include the following Sections:

1. Executive Summary, Description, purpose, basis, written scope

2. Load Flow

a. Tabulations of load flow study results inclusive of normal, minimum and maximum branch loadings along with normal, minimum and maximum voltages at nodes.

b. Tabulations of power losses for the Power System elements and the total power loss for the Power System.

3. Short Circuit

a. Tabulations of short circuit study results including a definition of terms and guide for interpretation.

4. Protective Device Evaluation

a. Tabulations of circuit breaker, fuses, and other equipment ratings versus calculated short-circuit duties, and commentary regarding same.

5. Protective Device Coordination

a. Protective device time versus current coordination curves.

b. Tabulations of relay and circuit breaker trip settings, fuse selection, and commentary regarding same.

c. Tabulation of appropriate tap settings for relay seal-in units.

6. Diagrams

a. Single line diagram along with suitable and relevant back annotation shall be included for each alternative of the Power System studied.

b. An impedance diagram along with suitable and relevant back annotation shall be included for each alternative of the Power System studied.

7. Software Model Files

a. The contractor shall provide two copies of the software files used to provide the Power System Studies

1) One copy of the software file shall be write protected and shall be capable of all its elements being viewed in the software program stated in this Section.

2) The second copy of the software file shall not be write protected and shall be capable of all its elements being modified by the software program stated in this Section.

3.03 FIELD TESTING / QUALITY CONTROL

A. Field Testing

1. The Contractor shall provide field testing of each Power System.

2. All field testing shall be performed by the testing firm, after the completion and approval of the Power System Studies.

3. The field testing shall be witnessed by the Engineer and certified by the Contractor.

4. The testing firm shall adjust, set, calibrate and test all protective devices. All protective relays and meters in the medium and low voltage equipment shall be set, adjusted, calibrated and tested in accordance with the manufacturer's recommendations, the coordination study and best industry practice.

5. Proper operation of all equipment associated with the device under test and its compartment, shall be verified, as well as complete resistance, continuity and polarity tests of power, protective and metering circuits. Any minor adjustments, repairs and/or lubrication necessary to achieve proper operation shall be considered part of this Contract.

6. All solid state trip devices shall be checked and tested for setting and operation.

7. Circuit breakers and/or contactors associated with the trip devices shall be tested for trip and close function with their protective device.

8. All tests shall be in accordance with the manufacturer's recommendations and NETA, ATS.

9. The Contractor shall provide a field testing report. The report shall be in accordance with NETA, ATS.

3.04 STARTUP / DEMONSTRATION

A. Maintenance of Operations

1. Where the field testing Work specified requires equipment be taken out of service, the Contractor shall perform field testing with due regard to maintenance of operations and construction staging in accordance with this Section and the Specifications.

2. All testing procedures and schedules must be scheduled in advance prior to any work beginning.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

END OF SECTION

SECTION 26 05 75 – SHOCK HAZARD AND ARC FLASH STUDIES
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Requirements for providing Shock Hazard and Arc Flash studies: Studies for determining Shock Hazard Boundaries and Arc Flash Incident Energies, in and around all electrical equipment, and notifying all personnel of boundaries and energies, shall be provided in accordance with the requirements of the Contract Drawings and the Specifications and this Section.

B. Three separate and distinct Arc Flash studies shall be provided, one for each of the three site locations shown on the Contract Drawings.

C. The Shock Hazard and Arc Flash Studies shall include a short circuit study and a protective device coordination study. Approval shall be obtained for the use of information from existing short circuit and protective device coordination studies.

8. NFPA 70E - Standard for Electrical Safety in the Workplace
9. NYCEC - New York City Electrical Code
10. OSHA 1910 Subpart S - Electrical

1.05 DESCRIPTION

A. AC Arc Flash Study Outline. The AC arc flash study shall be conducted on all electrical equipment powered by AC sources. The equipment to be studied shall include all electrical equipment from the Electric Utility Point of Service (POS) to the electrical energy utilization point. This includes but is not limited to:

1. All sources of energy including the electric utility, alternative energy sources, emergency generators, legally required generators, optional standby generators and motors.
2. All medium and low-voltage equipment inclusive of equipment of nominal operating voltage less than 120 VAC.
3. All medium and low-voltage electric distribution equipment including but not limited to switchgears, current limiting reactors, motor control centers (MCC), distribution and lighting panelboards, automatic transfer switches (ATS) and control panels.
4. All feeder and branch circuits.
5. All protective devices.

B. Arc Flash Study Modes

C. The arc flash study shall be conducted for different modes of electric equipment operation and the modes producing the most severe arc flash incident energy and the most restrictive shock hazard boundary shall be selected for the display on the required labels. Modes will be as directed by the Engineer but at a minimum shall be as listed below:

1. Mode 1 – All electric utilization equipment which are normally operated, are in the ON STATE and connected in their normal configurations to the normal sources. In the normal configuration, devices such as tie breakers which are normally in the open state remain in the open state for this mode.
2. Mode 2 – As Mode 1 but with all electric utilization equipment in the OFF STATE.
3. Mode 3 – All emergency and standby electric utilization equipment are in the ON STATE and connected to sources activated by the loss of the normal sources.
4. Mode 4 – As Mode 3 but with all emergency and standby electric utilization equipment in the OFF STATE.

1.06 QUALITY ASSURANCE

A. General:

1. Arc Flash Studies shall be completed using the approved computer software programs detailed in this Section.
2. Arc Flash Studies completed manually will not be accepted.
3. The Arc Flash Studies shall be performed in accordance with the latest applicable provisions and recommendations of the Reference Standards listed in this Section.
4. The Contractor shall retain the services of a Licensed Professional Engineer to perform Arc Flash Studies. The Licensed Engineer shall be from an independent engineering firm, or as directed by the Engineer. The

Licensed Engineer shall have at least five (5) years' experience in conducting Industrial Power System Studies inclusive of Arc Flash Studies for projects of similar scope.

5. The Contractor shall coordinate with the Licensed Engineer performing the studies whether or not the Licensed Engineer has been selected by the Contractor, and assist the Licensed Engineer in the collection of all information necessary to complete the studies specified.

1.07 SUBMITTALS

A. Submittals General

1. Contractor shall submit working drawings, shop drawings and material specifications for the approval of the Engineer in accordance with the requirements of this Section and the Specifications.

a. Qualifications of proposed Licensed Professional Engineers/ Engineering firms that will conduct arc flash studies shall be submitted.

1) Submit firm experience records demonstrating at least five (5) years conducting power system studies inclusive of shock hazard and arc flash studies along with the contact information of five (5) references for installations where arc flash studies have been completed.

2) The contact information shall include name, phone numbers, email and address of the references.

3) The contacts shall be able to speak about the work done at the reference locations.

b. Confirmation of the name and version of the approved software package that will be used in the Arc Flash Studies. The software package shall be capable of producing samples of all equipment labels recommended even if final labels will be produced by a third party vendor.

c. Calculations and results of the arc flash studies shall be submitted. The arc flash studies shall be submitted in a report format. The report shall contain recommended samples of the labels required for each type of equipment where personnel shall be required to interface with electrical equipment for operation, adjustment, repair or modification. The report shall be stamped and signed by the Licensed Engineer.

d. Electronic copies of the results of the arc flash studies shall be submitted in addition to the above report. The format of the electronic submissions files shall permit and allow the following:

1) The review of all submittals in the approved software program detailed in this Section.

2) The review of all submittals by common readers such as Adobe Acrobat.

e. Work sequence for the application of equipment labels shall be submitted. The sequence shall indicate the schedule of work, time frame and downtime if any for the equipment. The work sequence shall be submitted at least 45 days in advance prior to confirmation of field labeling dates.

B. Preliminary Arc Flash Studies

1. Preliminary Arc Flash Studies shall be submitted to the Engineer prior to receiving final approval of the distribution equipment shop drawings and/or prior to release of equipment drawings for manufacturing. If completion of the preliminary study may cause delays in equipment shipments, approval from the Engineer shall be obtained for a preliminary submittal of data to ensure that the selection of device ratings and characteristics will be satisfactory to properly select the distribution equipment. Final formal arc flash studies shall be provided to verify preliminary findings.

C. Label Application Reports

1. A report shall be submitted detailing the equipment labeled and whether it was not possible to accomplish the labeling of specific pieces of equipment and the reasons for this.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Arc Flash Study shall be performed using the latest version of commercially available computer software as manufactured by

1. SKM.

2. Easy Power.

3. ETAP

4. Or Approved Equal.

2.02 MATERIALS / EQUIPMENT

A. Not Used

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Shock Hazard Study

1. For each piece of equipment a shock hazard analysis complying with the requirements of NFPA70E shall be completed and shall detail the following as minimum:

a. Equipment and subpart if applicable

b. Nominal voltage

c. Restricted approach boundary

d. Limited approach boundary

e. Flash protection boundary

f. Short Circuit Amps

g. Protective Device clearing time.

B. Arc Flash Study

1. The Arc Flash analysis shall cover the Modes of operation detailed in this Section, ensuring that each node is studied for each of maximum and minimum short circuit contribution of the energy sources connected to the system. The following shall be completed:

a. Confirm the results of Section 26 05 73 - Power System Studies

b. Extend the results of Section 26 05 73 - Power System Studies as required to complete the arc-flash study

c. Calculate the arc fault currents

d. Determine the protective device operating times

e. Determine the incident energies

f. Determine the flash protection boundaries

g. Determine the incident energies at the boundaries determined in the shock hazard analysis and at the working distance.

h. Determine the Hazard/Risk categories at the boundaries determined in this Section.

i. Recommend the appropriate required level of PPE for workers within the flash protection boundaries, the shock hazard boundaries and the working distance.

C. Reports

1. A report shall be submitted detailing the results of this study, and color copies of labels that will be prepared for each piece of equipment. Three

separate reports are required, one for each of the three site locations. Each report shall contain at the minimum the following information:

a. Executive Summary including Introduction, Scope of Work and Results/Recommendations

b. All raw data collected and organized by common category

c. Study One Line Diagrams for each configuration

d. Impedance Diagrams for each configuration

e. Complete Fault and Protective Device Coordination Study

f. Shock Hazard/Arc Flash Analysis results, inclusive of tabular listing showing for each piece of equipment the following minimum information:

1) Equipment and Subpart

2) Nominal Operating Voltage

3) Restricted Approach Boundary

4) Limited Approach Boundary

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Approval Data Sources

1. The Contractor shall ensure that all other provisions of the Contract are satisfied inclusive of all vendors of electrical equipment has been approved, all working drawings and as built data relating to all equipment submitted and approved.

2. The Contractor shall ensure that the results of Section 26 05 73 – Power System Studies have been submitted and the settings of all protective devices have been approved.

3. The Contractor shall not commence the arc flash study until all prior studies and submittals to be reused in the arc flash study has been submitted and approved.

4. Arc Flash studies based on equipment or equipment data and settings which have not been approved, as required in an earlier stage of the project, will be rejected outright.

B. Data Collection and Modelling

1. The Contractor shall ensure that the collection of all data required to support studies under Section 26 05 73 – Power System Studies and

Studies under this Section are input into a comprehensive and accurate software model of the electrical distribution system.

2. Data shall include but not be limited to:

   a. Maximum and minimum short circuit infeed data of all sources including current magnitudes, X/R ratios and sequence values.

   b. Information on all installed equipment such as cable lengths, cable sizes, and cable impedance per unit length.

   c. All data to determine clearing times of protective devices.

3. An accurate and comprehensive model of the electrical distribution system shall permit the evaluation of the short circuit currents at all nodes in the system. The model shall also permit the coordination of protection devices installed at nodes upstream and downstream of a specific node.

4. All nodes incorporated in the model shall be approved before any analyses are commenced.

3.02 INSTALLATION

A. Arc Flash Labels

1. Arc Flash labels shall be provided in accordance with Section 26 05 53 - Identification for Electrical Systems.

2. The Contractor shall affix arc flash labels to each piece of equipment.

3. The arc flash labels shall contain the results of this Section.

4. The label content and the schedule governing the placement of labels shall be approved by the Engineer before affixing the labels to the equipment.

5. Each label shall indicate location in the facility of a copy of the studies generating the labels.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Training

1. The Contractor shall conduct training of the owner's qualified electrical personnel on the potential arc flash hazards associated with the working of the energized equipment.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

END OF SECTION

PART 1 GENERAL

1.01 SUMMARY

A. Requirements for providing low-voltage electric motors. Low-voltage electric motors shall be provided in accordance with the requirements specified under this Section and the Contract Drawings.

B. The following index of this Section is presented for convenience:

Article	Title	Section Page
PART 1	GENERAL	1
1.01	Summary	1
1.02	Payment	1

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 40 05 97 – Identification for Process Equipment.

1.04 REFERENCES

A. Definitions

1. Low-voltage as used in this Section and the Specifications shall mean all equipment, conductors, insulation systems and accessories intended for operation within the 600 Volt Class.

1.05 DESCRIPTION

A. Motor Data

1. Motor data is specified under the Section of the Specification detailing the requirements of the driven equipment with which the motor is supplied. These data include voltage, rpm, HP and enclosure types.

B. Motor Types

1. The motor types specified under this Section shall include:

a. Single Phase, alternating current, fractional horsepower induction motors.

b. Three Phase, alternating current, NEMA frame, squirrel cage, induction motors.

c. Three Phase, alternating current, above NEMA frame, squirrel cage, induction motors.

d. Three Phase, alternating current, submersible, squirrel cage, induction motors.

e. Three Phase, alternating current, wound-rotor, squirrel cage, induction motors.

f. Direct current, small motors.

1.06 QUALITY ASSURANCE

A. Electric Motors shall comply with the requirements of NYC EPPR.

B. The motor manufacturer shall maintain a documented Quality Assurance Program implementing suitable procedures and controls to monitor all aspects of production and testing.

C. The Quality Assurance Program shall be the manufacturer's standard program specifically dedicated to ensure each motor is designed, assembled and tested in accordance with the requirements specified in this Section, the Specifications and the Contract Drawings,

D. Motor manufacturer shall use a shop test facility that has calibrated testing apparatus, inclusive of a calibrated dynamometer and qualified experienced technicians for all shop tests. Calibration of all testing apparatus shall be within one year.

E. All test equipment, instrument calibration and test reports shall be in accordance with the latest edition of the accuracy standard of The U.S. NIST and NETA ATS.

F. Nameplates shall be provided for each motor. Nameplates shall clearly indicate information in accordance with NEMA requirements. Nameplates shall be engraved or embossed on stainless steel and fastened to the motor frame with stainless steel screws or drive pins.

G. Field Tests:

1. The motors shall be field tested.

2. Field testing shall be performed in accordance with the requirements specified under this Section and the Specifications.

3. Retain the services of the motor manufacturer for field service.

4. Field service shall be in accordance with the requirements specified under this Section and the Specifications.

5. For motors larger than 200 horsepower an independent testing firm shall be retained to perform acceptance testing of the motors.

   a. The testing firm shall have experience in the inspection and testing of motors and shall be a member company of NETA.

   b. Provide proof of membership or demonstrate that the standards and experience required for membership are possessed, all to the satisfaction of the Engineer.

   c. Acceptance testing shall be in accordance with the requirements specified under this Section.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. A list of proposed manufacturers with the products they produce proposed for the contract.

2. For fractional horsepower motors, data sheets showing nameplate data shall be submitted.

3. For motors rated one horsepower or greater, Motor Test Data Sheets shall be submitted. All values shall be from tests of previously manufactured, electrically duplicate motors or calculated data. Sheets shall be marked to indicate motor application location, manufacturer, type, frame size, bearing type, lubrication medium and enclosure type. Data Sheets shall at a minimum include:

   a. Winding resistances.

   b. Torques.

   c. Efficiencies.

   d. Power factors.

   e. Slip.

   f. Full load.

   g. Locked rotor and no load amperes.

   h. Rotor voltage and amperes for wound rotor units.

   i. Nameplates temperature and results of dielectric tests.

4. An outline drawing or an outline data sheet showing complete motor dimensions shall be submitted to cover every motor rated greater than 1/3 horsepower. Several motors of the same type and rating for the same application may be covered by a single drawing or outline sheet. Drawings or sheets shall bear complete identifying data including frame size, speed, horsepower ratings and application for each particular unit.

5. Description of proposed shop and field testing methods, procedures and apparatus with calibration dates shall be submitted. Testing methods and procedures shall be submitted in advance prior to conformation of witness testing dates and actual testing as follows:

   a. At least 60 days in advance for test locations in the US.

   b. At least 90 days in advance for test location outside of the US.

6. Qualifications of proposed testing firm to perform acceptance testing shall be submitted. Submit firm experience records at least 60 days in advance to actual testing, five recent references with phone numbers shall be submitted.

7. All motor accessories, heaters, detectors, etc., shall be submitted.

8. Bill of Materials for the proposed motors shall be submitted.

B. Certificates of Compliance:

1. Certified copies of motor characteristic curves and all other data necessary for establishing control and protective equipment settings shall be submitted.

2. Results of shop tests shall be certified. When routine tests are made in conjunction with complete initial tests, unwitnessed results shall be certified and copies shall be submitted. Results shall be included for each test.

3. Data and results of witness tests shall be submitted with copies of certified initial tests, accompanied by a certificate of authenticity sworn to before a notary public by an officer of the manufacturing company. Upon approval, release for shipment to site shall proceed and the Engineer shall be notified of the arrival date.

C. Reports:

1. Shop test and field test reports shall be submitted.

2. Manufacturer’s site visit and acceptance testing reports shall be submitted.

D. Operation and Maintenance Manuals.

1. Operation and Maintenance Manuals shall be submitted in accordance with this Section and the Specifications.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Low-voltage electric motors shall be delivered, stored and handled in accordance with this Section, the Specifications, the motor manufacturer's instructions and the following:

1. Motors shall be inspected for shipping damage when received.

2. All sleeve or oil lubricated bearings motors shall be identified and the bearing reservoirs filled to normal level.

3. Motors shall be handled using motor base lifting lugs. Avoid pounding or bumping of motor which may damage motor. A hoist and spreader bar arrangement shall be used to avoid damage.

4. Motors shall be stored indoors in clean, dry heated areas.

5. Motor space heaters shall be energized to prevent moisture condensation throughout the storage and construction period.

6. Motors shall not be stored in areas subject to continuous vibration. A small quantity of grease shall be injected into each bearing on a monthly basis. Purged grease shall be inspected for water or rust. Motor shaft shall be rotated by hand to check for binding.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Spare Parts

1. The Contractor shall furnish and deliver to the Engineer, at that part of the site and at such time as the Engineer may direct, spare parts for the low-voltage electric motors in accordance with this Section and the Specifications.

2. The spare parts shall be listed in an index and packed in containers suitable for long term storage, bearing labels clearly designating the manufacturer's part number with complete information for use and reordering.

3. Spare parts shall be furnished in accordance with the manufacturer's recommendations for the motor size and type. Spare parts shall include at a minimum the following:

a. One complete set of bearing linings, or renewable ball or roller bearings shall be provided for each three (or less) of each type and size of motor. Spare bearings shall be furnished for all motor types. When sleeve bearing motors are provided, spare oil rings shall be furnished for those motors.

b. One set of brushes shall be provided for each DC type motor and wound rotor type motor requiring them.

c. One complete assembly of brush holders and supports shall be provided for each size of DC type motor and wound rotor type motor requiring them.

d. One complete assembly of collector rings shall be provided for each size of wound rotor type motor requiring them.

e. One complete set of fans and guards shall be provided (per each set of three or less) for each size totally enclosed fan cooled type motor.

f. One set of bearing temperature detectors shall be provided (per each set of three, or less) of each type of motor 250 horsepower and larger.

g. One set of upper and outer seal assemblies shall be provided (per each set of three or less) for each size submersible type motor.

h. One set of O ring kit shall be provided (per each set of three or less) for each size submersible type motor.

i. One set of wear rings shall be provided (per each set of three or less) for each size submersible type motor.

B. Lubricants

1. The Contractor shall furnish as part of the bulk lubricant order the quantity of lubricants required to operate and maintain the motors furnished under this section for a period of one year after acceptance. As a minimum, there shall be provided sufficient oil and grease to make a least one lubricant change for each motor as applicable.

2. Replace all lubricants used during startup and testing prior to acceptance of equipment. Furnish this replacement lubricant in addition to the lubricants included in the bulk order.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Driven Equipment

1. The motor manufacturers are as shown on the Contract Drawings or stated in the Sections detailing the driven equipment.

2.02 MATERIALS / EQUIPMENT

A. Design Requirements

1. Motors shall be designed, built, and tested in accordance with the latest applicable editions of ANSI/IEEE, NEMA, UL and NYCEC. The

classifications, ratings, performance and testing of all motors shall be in accordance with the latest edition of NEMA MG1.

2. Motor winding shall be copper.

3. Motors shall be premium efficiency type and shall have nominal efficiencies in accordance with NEMA MG1. Motors with horsepower or rpm's not listed by NEMA shall conform to comparable standards of construction and materials as those for listed NEMA motors.

4. Motors shall be of sufficient capacity to operate the driven equipment under all conditions of operation without loading the motors beyond their rated nameplates current and power under all operating conditions imposed by the driven equipment.

5. The rating of the motors offered shall in no case be less than the horsepower shown on the Contract Drawings or stated in the Specifications. Both the rating and the characteristics of the motor shall be suitable for the successful operation of the driven equipment, under load conditions, within nameplates values of service factor and ambient temperatures.

6. Motors shall be of three phase construction for ratings above 1/3 horsepower and single phase construction for 1/3 horsepower or less.

7. Low-voltage motors shall be of a type approved for starting characteristics and ruggedness as may be required under the actual conditions of operation.

8. Low-voltage motors shall be designed for full voltage starting.

9. Reduced voltage starters, shall ensure that the motor develops ample torque and is able to accelerate and attain its operating speed under the load conditions imposed by the driven equipment.

10. Multi-speed motors shall have a separate winding for each speed.

11. Portable devices shall have totally enclosed motors and approved cord with provisions for grounding. They shall be suitable for the available power supply.

12. All motors shall be continuous time rated suitable for operation in a 40 degrees C ambient.

13. Motors shall comply with the EPAct 1992 and EISA 2007.

14. Variable-speed motors shall comply with NEMA MG1.

15. Variable-speed motors operated from variable frequency drives shall comply with NEMA MG1 and shall be inverter duty rated.

B. Single Phase Motors

1. Single phase motors shall be rated 115 or 230 volt, capacitor start. Small fan motors may be split-phase or shaded pole type if such are standard for the equipment.

2. Bearings for single phase, open, enclosed and explosion-proof motors shall be grease-lubricated ball type with grease fittings or with lubrication for 10 years of normal operation.

3. Motors shall be totally-enclosed except small fan motors may be open type if suitably protected from moisture, dripping water, and lint accumulation. Motor features shall be in accordance with the following:

   a. Open motors shall be split phase or capacitor start in accordance with torque requirements, 1.35 Service Factor, 40 degrees C Ambient Class B Insulation.

   b. Enclosed motors shall be capacitor start, fan cooled 1.15 service factor, 40 degrees C ambient, Class F, treated insulation. Enclosed motors shall be totally enclosed fan cooled, or non-ventilated. Enclosed motors shall be designed to withstand chemical corrosion and shall be severe duty type equipped with cast iron end shields, neoprene gaskets, stainless steel shaft, heavy pressed steel fan cover and provision for threaded conduit connection.

   c. Explosion-proof motors shall be fan cooled, split phase or capacitor start in accordance with torque requirements, 1.0 service factor, 40 degrees C ambient, equipped with swivel conduit connector and long leads for external connection.

   d. Direct drive fan motors shall be shaded pole or permanent split capacitor, 1.35 service factor, 40 degrees C ambient.

C. Three Phase Motors

1. General

   a. Three phase motors shall be squirrel cage induction type, designed for operation on a 3 phase, 60 hertz alternating current system.

   b. Three phase squirrel cage motors shall be severe duty and shall conform to the requirements of IEEE 841

   c. Motor voltage shall be as shown on the Contract Drawings.

   d. Motors used with adjustable frequency controllers shall be as stated in this Section, the Specifications and the Contract Drawings.

   e. Unless otherwise required by the load, all motors shall be NEMA Design B, normal starting torque. Locked rotor KVA/HP shall not exceed NEMA Code Letter G for 20 HP motors and larger.

   f. The design of the stator, rotor and shaft shall be in accordance with the approved practice of leading manufacturers. The motor frame shall be a rigid structure, designed to maintain the lamination in correct alignment and shall not be dependent on the lamination or bolts for rigidity.

g. Motors having considerable core length shall be provided with approved means for taking up shrinkage in length.

h. Motor rotors shall be of cast or fabricated aluminum or fabricated copper or copper alloy as required to meet the motor performance characteristics of slip, torque, and efficiency.

2. Bearings

a. Horizontal motors shall be provided with either the rolling element (anti-friction) or sliding element (sleeve) type bearings. Anti-friction type bearings shall be used for all NEMA frame motors. Where greater power and speeds are required by the driven equipment, sleeve type bearings shall be used. The bearings for all motors larger than 200 horsepower shall be insulated to prevent shaft currents and related bearing damage.

b. Bearings for 3 phase drip-proof, enclosed and explosion-proof motors shall be grease lubricated, ball type. Bearings shall be fitted with inlet fittings and outlet plugs. Motor bearings and grease reservoirs shall be protected from the entry of contaminants.

c. Bearings for direct drive fan motor shall be of the oil lubricated sleeve type.

d. When anti-friction bearings are furnished on horizontal motors for ratings to 500 horsepower and speeds to 3600 RPM they shall have a minimum bearing life of 100,000 hours as defined by AFBMA. Suitable fittings shall be provided to permit convenient positive purging of old grease during regreasing operation. Close running shaft seals shall prevent leakage of grease as well as prevent the entrance of foreign materials such as water and dirt into the bearing area. Motors equipped with anti-friction bearings shall have the appropriate AFBMA number stamped on a nameplate attached to the motor.

e. When furnished, sleeve bearings shall be ring-oiled with an adequate, integral self-cooled oil reservoir. The bearing sleeves shall be lined with a high tin content babbitt to minimize oil contamination. Close running shaft seals shall prevent oil leakage as well as prevent entrance of foreign material such as water and dirt into the bearing area. Oil level sight gages with permanently marked easily discernible oil level shall be provided. In addition, inspection openings to observe the oil rings shall also be provided.

f. When required by motor speed and bearing size, provision shall be made for forced lubrication. The oil supply shall be supplied with motor. In addition, oil rings and an adequate oil reservoir in the bearing housings shall be provided to permit orderly shutdown of the motor in the event of failure of the formed feed lubrication system.

g. Vertical motors shall be provided with thrust bearings adequate for all thrusts to which they can be subjected. The rated minimum life of the thrust bearings shall be at least 15,000 hours when operated at rated speed and full load thrust. The driven equipment manufacturer shall supply the motor manufacturer with the speed and thrust conditions required by the driven equipment.

h. Submersible motor bearings shall be permanently sealed and lubricated. Anti-friction guide and thrust bearings shall be replaceable. Bearings shall have a rated minimum life of 15,000 hours.

3. Insulation

a. The insulation system for three phase AC motors shall be rated Class F, with a service factor of 1.15 times the nameplate horsepower rating when operated on a sine wave supply and a service factor of 1.0 on an adjustable frequency supply. Temperature rise shall be limited to Class B insulation system when motor is operated continuously at rated horsepower with an ambient temperature not exceeding 40 degrees C.

b. Windings shall be epoxy coated. The windings shall be thoroughly treated with approved insulating compound suitable for protection against moisture, salt air and slightly acid or alkaline conditions. The insulation system for enclosed motors shall be upgraded by additional dips and bakes to increase moisture resistance.

c. Motors for outdoor service and all motors larger than 200 horsepower shall have vacuum/pressure impregnated epoxy insulation (VPI) for moisture resistance. Motors shall be preheated before VPI and baked in a temperature-controlled oven.

d. Motors applied in speed varying service and operated from variable frequency controllers shall have an inverter grade insulation system designed and built in accordance with NEMA MG1 Part 31.

e. The stator windings and end turn connections shall be fully brazed to withstand full voltage starting regardless of the starting method indicated in this Section, the Specifications and the Contract Drawings. The bracing system shall essentially eliminate coil vibration under the high current conditions of starting as well as during normal operation. If a tied system is used, it shall be such that no tie depends on the integrity of any other tie within the system.

f. Motors larger than 200 horsepower shall be form wound. Form wound coils with a micaceous ground wall insulation is required with additional insulation similar to Mica 5 and hot pressed to make a sealed system. Coils shall be form wound with mica

insulation and each separate coil shall be vacuum pressure impregnated before inserting into slots.

4. Enclosures

a. Wound rotor motors shall be drip-proof, except for crane and hoist installations and where specified otherwise.

b. Motors shall have a steel or cast iron frame and a cast iron or steel conduit box. For wound rotor motors separate boxes for stator and rotor connections shall be provided. For NEMA frame size motors cast aluminum frames and terminal boxes may be used.

c. Motor enclosures shall conform to the NEMA classifications specified and to the following:

1) Open Drip proof: Motors shall have a steel or cast iron frame, cast iron end brackets and steel conduit box. Vertical motors of the open type shall be provided with drip hoods of approved shape and construction. When the drip hood is too heavy to be easily removed, provision shall be made for access for testing. Open motors shall be provided with corrosion resistant screens over the air openings in accordance with NEMA requirements for guarded machines.

2) Totally enclosed fan cooled and non-ventilated motors shall have a cast iron frame, cast iron end brackets and cast iron conduit box. Drain holes shall be provided on each end of motor.

3) Explosion proof motors shall have a cast iron frame, cast iron end brackets and cast iron conduit box. Unless shown otherwise on the Contract Drawings or stated in the Detailed Specifications, explosion proof motors shall be UL listed for Class 1, Division 1, Group D hazardous areas.

4) Severe duty motors shall include a corrosion resistant treatment. Severe duty motors shall have a cast iron frame, cast iron end brackets, cast iron conduit box, stainless steel "T" drains in both end brackets, corrosion resistant fan, and stainless steel hardware.

5) Submersible motors shall be hermetically sealed, watertight with tandem mechanical seals suitable for continuous submergence and listed for Class 1, Division 1, Group D locations.

d. Conduit Boxes

1) Motor conduit box shall be split from top to bottom and shall be capable of being rotated to four positions. Motor conduit box shall be in accordance with the following:

a) Conduit box shall be gasketed and shall include rubber-like gaskets between the frame and the conduit box and between the conduit box and its cover.

b) Conduit boxes or openings in motor housings shall be provided with conduit hub type fittings to permit threaded conduit connections. Single phase, explosion-proof and direct drive fan motors shall be provided with conduit fittings and leads to permit external connection.

c) Conduit box sizes shall be in accordance with code requirements. This shall include appropriate terminations for the rated voltages.

d) Protective and auxiliary devices, shall terminate in auxiliary conduit boxes.

e) Terminal leads shall be flexible and shall be of sufficient length to extend for a distance of not less than ten inches beyond the face of the terminal box. Terminal leads shall be fitted with solder less lugs suitable for attachment to lugs installed on external wiring. Leads shall be sealed with a non-wicking, non-hygroscopic insulating material or an insulating "wrap-cap".

f) Provisions for terminal box size, length of leads, size of conduit openings and type of terminal lugs shall be complied with irrespective of any other standards or practice.

g) A motor frame grounding stud shall be provided inside the conduit box. A drilled and tapped hole shall be included.

D. DC Motors

1. General

a. DC motors shall be designed and built in accordance with NEMA Standard MG1-12 for use on a full wave, single phase, rectified power supply.

b. DC motors shall be heavy duty, industrial SCR drive type, direct current. Motor construction shall be shunt-wound or permanent-magnet type as stated in this Section, the Specifications and the Contract Drawings.

c. DC motors shall provide a constant torque output over the operating speed range, with fixed shunt excitation and variable DC armature voltage.

2. Bearings shall be grease lubricated, double shielded, with shaft seals.

3. Insulation

   a. The insulation system for DC motors shall be Class F, with a service factor of 1.15 times the nameplate horsepower rating.

   b. The windings shall be epoxy coated and include a thermostat protector. Thermostat shall be in accordance with the requirements specified under this Section.

4. Enclosures

   a. DC motor enclosure shall be totally enclosed fan cooled, or non-ventilated. The frame size shall be selected by the manufacturer to prevent overheating when continuously operated at low speeds.

   b. Motor enclosures shall be severe duty type, designed to withstand chemical corrosion, and shall utilize corrosion resistant materials for special finishes in their construction. Motors shall be equipped with cast iron end shield, neoprene gaskets, stainless steel shaft, heavy pressed steel fan cover and provisions for threaded conduit connection.

   c. When stated in this Sections, the Specification and the Contract Drawings, the motor enclosure shall be fitted with a factory mounted tachometer generator. The generator shall be C-face or flange mounted construction.

E. Accessories

1. General

   a. Motor accessories shall be provided in accordance with the requirements specified under this Section, the Specifications and the Contract Drawings.

2. Rotor Grounding

   a. An approved rotor grounding means or mechanism shall be provided to drain induced currents, parasitic and static charges to ground.

3. Space Heaters

   a. Each outdoor motor 5 horsepower and larger shall be provided with space heaters.

   b. Each motor 5 horsepower and larger enclosed motors installed indoors, in damp unheated spaces, shall also be provided with space heaters.

4. Each motor 250 horsepower and larger shall be provided with space heaters.

5. Space heaters for condensation prevention shall be rated 120 volt. Wattage shall be suitable for the particular frame size and type in accordance with the manufacturer's recommendation.

6. Space heater wire leads shall be brought out to an auxiliary conduit box on the motor. Box construction shall match main power conduit box.

F. Winding Protection

1. Winding Protective Devices:

a. Thermostat type protection shall be provided for each motor in accordance with the following:

1) Submersible motors and explosion proof motors.

2) Variable speed motors up to 25 horsepower.

b. Thermistor type protection shall be provided for each motor in accordance with the following:

1) Constant speed motors 50 horsepower and larger up to 200 horsepower.

2) Variable speed motors 30 horsepower and larger up to 200 horsepower.

c. Resistance temperature detectors shall be 100-ohm precision type with calibrated resistance-temperature characteristics. Detectors, two per phase, shall be positioned to detect highest winding temperature and located between coil sides in stator slots. Detector leads shall be wired to a separate NEMA 4X terminal box.

2. Thermostats shall be bi-metal disk or rod type embedded in the stator windings. Thermostat contacts shall be automatic reset type, rated 120-volt AC, 5 amps minimum opening on excessive temperature.

3. Thermistors embedded in each stator phase winding shall be in direct contact with the winding conductors. Each thermistor circuit shall be factory wired to 120-volt solid state control module mounted at the motor in a NEMA 4X box. The control module contacts shall be automatic reset type, rated 120-volt AC, 5 amps minimum opening on excessive temperature.

G. Bearing Temperature Protection

a. Bearing temperature detectors, RTD type similar to the winding detectors specified under this Section shall be provided on each bearing for horizontal motors and on the thrust bearing for vertical motors.

b. Each motor 250 horsepower and larger shall be provided with stator and bearing temperature detectors.

H. Special Application

1. Cranes, elevators, hoists, and other devices complying with special safety codes shall be furnished complete with their control equipment, and with all accessories and safety devices for approved safe and efficient operation.

I. Single Phase Motors

1. Single phase motors requiring auxiliary starting resistors, capacitors or reactors and switching devices shall be furnished as combination units with such auxiliaries either incorporated within motor housings or housed in suitable enclosures, mounted upon motor frames. Each combination unit shall be mounted upon a single base and shall be provided with a single conduit box.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Painting

1. External Surfaces:

a. All severe duty motors shall have all external surfaces pretreated, primed and painted. External surfaces shall be pretreated so the surface is clean and free of contaminants. After pretreatment, the surface shall be primed with an oxide primer and then spray painted with a minimum of 0.003-inch thick epoxy polyamide and semi-gloss coating that is chemical, solvent, salt water, and acid resistant.

b. All other motors shall have external surfaces pretreated, primed and painted in accordance with the manufacturer's standard treatment.

2. Internal Surfaces:

a. All severe duty motors shall have all internal surfaces pretreated, primed and painted. Internal surfaces shall be pretreated so the surface is clean and free of contaminants. After pretreatment, the surface shall be primed with an oxide primer and then painted with an epoxy paint. Machined joints and threaded parts shall be coated with rust inhibiting compound.

b. All other motors shall have internal surfaces pretreated and primed in accordance with the manufacturer's standard treatment.

B. Hardware

1. All machined bolts and screws and other hardware shall be of the hex head type and shall be zinc plated.

2. Stainless steel hardware shall be used on severe duty motors.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Certified Shop Tests:

1. Shop testing shall be performed on the motors at the manufacturer's plant prior to shipment. Shop test shall be in accordance with the latest revisions of IEEE 112 and NEMA MG1 and shall demonstrate that the equipment tested conforms to the requirements specified inclusive of the efficiency requirements stated in this Section.
2. The Contractor shall provide a shop test report. The report shall identify the tests performed and the results obtained.
3. Every motor rated less than 200 horsepower shall be given a routine test at the manufacturer's factory. The routine test shall consist of:
    a. No Load Speed, Voltage and Current at rated frequency.
    b. Locked Rotor Current.
    c. Winding Resistance.
    d. High Potential.
    e. Bearing Inspection.
    f. Measurement of Secondary Volts at standstill for wound-rotor units.
4. Motors rated at 200 horsepower or greater shall be given complete initial tests consisting of:
    a. Full-load Heat Run.
    b. Percent Slip.
    c. No Load Speed, Voltage, Current and losses at rated frequency.
    d. Full Load Current.
    e. Locked rotor Torque.
    f. Locked-rotor Current.
    g. Breakdown Torque (Calculated).
    h. Starting Torque (squirrel-cage).
    i. Winding Resistance.
    j. High Potential.
    k. Sound.
    l. Vibration.
    m. Efficiencies at 125, 100, 75 and 50 percent of full load.
    n. Power Factors at 125, 100, 75 and 50 percent of full load.
    o. Bearing Inspection.
    p. Measurement of Secondary Volts at collector rings for wound-rotor units.

B. Witnessed Shop Tests:

1. The Contractor shall perform witnessed shop tests in accordance with this Section and the Specifications.

2. When stated in this Section and the Specifications, motors shall be witness tested. Motors shall be given a complete test two weeks before and then retested in the presence of the witness.

3. When complete initial or witness tests are required for a group of the same type, rating and horsepower for the same application, all units of the group shall be subjected to the complete test, unless specifically stated otherwise in this Section or the Specifications.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Motors

1. Motors shall be installed in accordance with manufacturer's instructions and recommendations.

2. Each motor shall be carefully and properly aligned with the driven equipment.

3. Equipment shall be secured to mounting surface with anchor bolts. Anchor bolts shall be provided meeting manufacturer's recommendations and of sufficient size and number to secure equipment.

4. Motor nameplates shall be installed for identification of equipment. Nameplates shall be provided in accordance with the requirements of Section 40 05 97- Identification for Process Equipment.

3.03 FIELD TESTING / QUALITY CONTROL

A. Field Tests

1. After installation, motors shall be field tested for operation and conformance. The Contractor shall perform field tests in accordance with this Section, the Specifications and the Contract Drawings. The field tests shall be witnessed by the Engineer and certified by the Contractor.

2. Motor testing shall be performed by the manufacturer's representative, prior to energizing equipment.

3. Equipment shall not be energized without the permission of the Engineer.

4. The testing shall be in accordance with the recommendations of the manufacturer's representative and shall include at a minimum the following:

a. Motors shall be checked to determine that they have been properly installed, lubricated and connected.

b. Motors shall be checked to determine they are not overloading, overheating or defective.

c. Motors shall be phase sequence tested to ensure motor rotation is correct.

d. Motors shall be checked to determine they comply with performance and design parameters.

A. Manufacturer's Field Services

1. A qualified manufacturer's service representative shall assist in the installation of the motors, check the motor installation before it is placed into operation, assist in the performance of field tests, observe and assist initial operations and train the plant operations and maintenance staff in the care, operation and maintenance of the motors.

2. The Contractor shall provide equipment start-up services and training in accordance with this Section, the Specifications and the Contract Drawings.

3. The Contractor shall provide a field report from the manufacturer's representative for each visit to the site. The report shall include complete information on time, schedule, tasks performed, persons contacted, problems corrected, tests results, training, instruction and all other pertinent information.

4. The service representative shall sign in with the Engineer on each day they are at the site.

3.04 STARTUP / DEMONSTRATION

A. Acceptance Testing

1. The Contractor shall provide acceptance testing of the motors. All acceptance testing shall be performed by the testing firm, after the completion of the Field Tests specified under this Section. The acceptance testing shall be witnessed by the Engineer and certified by the Contractor.

2. Acceptance inspection shall be performed on each motor larger than 200 horsepower. Inspection shall include the following:

a. Electrical and grounding connections shall be inspected.

b. Shaft alignment, proper mounting and lubrication shall be inspected.

c. Ventilating air passageways shall be inspected for blockage.

d. Excessive noise shall be inspected.

e. Any overheating shall be inspected.

f. Correct rotation shall be inspected.

g. Protective detectors operation shall be checked.

h. Any excessive vibration shall be checked.

i. Space heater operation shall be checked.

3. Acceptance electrical testing shall be performed on each motor larger than 200 horsepower. Testing shall include the following:

a. Insulation resistance tests shall be performed.

b. Surge comparison testing shall be performed.

c. Vibration tests shall be performed.

d. Bearing insulation resistant tests on insulated bearings shall be performed.

e. Running current and voltage shall be measured and evaluated relative to load conditions and nameplate full-load amperes.

f. High-potential tests shall be performed.

g. For wound rotor motors, additional electrical testing at minimum and normal operating load points and at ring short shall be performed.

h. Motors shall be operated with driven equipment for a minimum of 48 continuous hours and rechecked for overheating and vibration.

4. All tests and values for AC and DC motors shall be in accordance with the manufacturer's recommendations and NETA ATS.

5. The Contractor shall provide an acceptance testing report. The report shall be in accordance with NETA ATS.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

END OF SECTION

SECTION 26 06 11 – CABLE AND CONDUIT SCHEDULE
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install wires, cables, and conduit complete and operational.

B. All wiring, cable and conduit shall be furnished and installed under this Contract, unless specifically noted otherwise.

C. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 26 05 20 – Low-Voltage Wires, Cables and Accessories

B. Section 26 05 53 – Identification for Electrical Systems

1.04 REFERENCES

A. Definitions

1. Conduit shall include all types of raceways provided under this Contract.
2. Install or Installed, as applicable to Conduit, shall mean install all Conduit, raceways, fittings, boxes and accessories required to achieve a complete and functional conduit system.
3. Install or Installed, as applicable to Conduit, shall also include cleaning and swabbing, grounding and bonding of the conduit system and the provision of drag lines in each conduit on completion of the conduit system
4. Installed or Installed, as applicable to wire and cable, shall mean the pulling in of wires or cable, testing wire or cable insulation resistance, continuity and absence from grounds as well as terminating of all conductors and testing for proper connection.

B. Reference Standards

1. NYCEC - New York City Electrical Code

1.05 DESCRIPTION

A. The Wire, Cable, and Conduit Schedule, shown on the Contract Drawings, lists the following information:

1. Conduit number
2. Conduit size
3. Point of origination
4. Point of termination
5. Enclosed wire or cable size and the number and types
6. Purpose of the wire or cable contained in the conduit such as power, control, ground, etc.

B. The Conduit numbering system consists of two parts separated by a hyphen.

1. The first part is the equipment identification number.
2. The second part is the individual conduit identification number which may be presented.

C. In general, the Wire, Cable and Conduit Schedules do not indicate lighting and receptacle circuits, as well as some other wire, cable, and conduit to be provided under this Contract.

D. The Contractor shall refer to Section 26 05 20 - Low Voltage Wires Cables and Accessories, Section 26 05 53 - Identification for Electrical Systems and the Contract Drawings for additional wire, cable, and conduit requirements.

1.06 QUALITY ASSURANCE

A. All Conduits shall contain a separate equipment grounding conductor sized according to the NYCEC.

1.07 SUBMITTALS

A. Cable and Conduit Schedules shall be submitted for approval.

B. Cable and Conduit Schedules shall show all the details of all wires, cables, and conduit to be installed under this Contract, including at a minimum the following information on each Conduit run:

1. Conduit Number
2. Conduit Size
3. Point of origination
4. Point of termination
5. Enclosed wire or cable size and the number and types
6. Purpose of the wire or cable contained in the conduit such as power, control, ground etc.

SECTION 26 08 11 – GENERAL ELECTRICAL TESTING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Electrical testing shall be provided in accordance with this Section, the Specifications and the Contract Drawings.

1. The Contractor shall provide all labor, materials, tools, instruments, power and all services necessary to provide the tests specified for all electrical materials, equipment and systems provided under this Contract.

2. The Contractor shall engage the services of an Independent Testing Company (ITC) to perform specific tests as detailed in this Section and the Specifications.

B. The following index of this Section is presented for convenience:

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Not Used

1.04 REFERENCES

A. Definitions

1. Plant refers to facilities used for the processing and conveyance of water or wastewater and includes pump stations, water and wastewater processing or treatment facilities.

2. Low-voltage as used in this Section and the Specifications shall mean all equipment, conductors, insulation systems and accessories intended for operation within the 600 Volt Class.

3. Medium-voltage as used in this Section and the Specifications shall mean all equipment, conductors, insulation systems and accessories intended for operation at above 1000 volts and below 99000 volts.

4. All references to the Electric Utility or Utility shall mean Consolidated Edison Company or the Local Electric Utility having jurisdiction.

B. Reference Standards

1.	NETA ATS	-	Standard for Acceptance Testing Specifications for Electrical Power Equipment and Systems
2.	Infraspection Institute	-	Standard for Infrared Inspection of Electrical Systems & Rotating Equipment

1.05 DESCRIPTION

A. Upon completion of the electrical installation, the Contractor shall perform tests to demonstrate that the entire electrical system is in proper working condition and is in accordance with the Contract Drawings and the Specifications.

1. Tests shall be as outlined in this Section and those of the individual Sections.

2. Field tests shall be in addition to the factory tests on individual items previously performed at the manufacturer's plant.

3. Perform insulation integrity tests and ground resistance tests before operating tests.

4. Determine proper rotation of motors before permanent connections are made.

1.06 QUALITY ASSURANCE

A. ITCs conducting Electrical Testing shall

a. Have a minimum of 10 years conducting tests as detailed in NETA ATS

b. Be a first tier Subcontractor.

c. Be a firm independent of any Other Contractor.

d. Be a firm independent of the Engineer or the Designer.

e. Be a NETA Accredited Company deploying NETA certified personnel.

B. ITCs conducting Thermographic Testing shall

a. Have a minimum of 10 years conducting tests as detailed by the Infraspection Institute.

b. Be a first tier Subcontractor.

c. Be a firm independent of any Other Contractor.

d. Be a firm independent of the Engineer or the Designer

e. Deploy Infraspection Institute certified personnel.

C. Calibration of Equipment

1. All test instruments and test equipment shall have been calibrated within the 12-month period immediately preceding the dates when they will be used on this Contract.

2. All test instruments and test equipment shall bear the calibration marks, stamps or seals of an approved testing body or agency with reference standards directly traceable to those held by the National Institute of Standards and Technology (NIST).

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer.

B. Submittals shall include, but not be limited to, the following:

1. Organization of the Testing Companies inclusive of details of the specific personnel that will be utilized on specific tests.

2. Documentation detailing firm accreditation

3. Qualifications of testing personnel

4. Proposed testing methods and schedules, test setup and sample data sheets

5. Calibration Reports of test equipment

6. All field test reports.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Factory Tests

1. Factory and witnessed shop testing requirements shall be as detailed in the individual equipment Sections.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Schedules/Scheduling

1. Written notice of the intent to proceed with any scheduled and approved tests shall be given to the Engineer at least two (2) weeks in advance of the commencement of the testing.
2. When testing requires that certain pieces of equipment be taken out of service, all testing procedures and schedules must be submitted to the Engineer for review and approval 45 days prior to the two (2) week notice above.
3. When testing has been scheduled as above, the Plant Superintendent must be notified 48 hours prior to any Work to allow time for load switching and/or alternation of equipment.
4. All testing that requires temporary shutdown of Plant equipment must be coordinated with Plant Superintendent so as not to affect proper Plant operations.
5. At the end of the each workday, all equipment shall be back in place and ready for immediate use should a plant emergency arise.
6. In addition, should an emergency condition occur during testing, at the request of either the Plant Superintendent or the Engineer or the Engineer's designated representative attending the testing, the equipment shall be placed back in service immediately and turned over to Plant.

7. In the event of accidental shutdown of Plant equipment the Contractor shall notify Plant personnel or the Engineer or the Engineer's designated representative immediately to allow for an orderly restart of affected equipment.

3.02 IMPLEMENTATION

A. Test Personnel/Test Equipment

1. The Contractor, and where applicable in conjunction with the ITC, shall furnish all instruments and qualified personnel for all tests.

B. Attendance at Tests

1. All tests shall be made in the presence of the Engineer or a duly authorized representative of the Engineer.

2. A manufacturer's representative in accordance with the requirements of the specific equipment Section shall be present at all equipment tests

3. When the presence of the Engineer or the Engineer's representative is waived, sworn statements, in duplicate, of the tests made and the results thereof shall be furnished to the Engineer by the Contractor.

4. A manufacturer' representative

C. Tests/Testing by Others

1. The Contractor shall make available the electrical system and personnel when required by other trades to test their respective equipment.

2. The Contractor shall coordinate their resources with the other Contractors.

3.03 FIELD TESTING / QUALITY CONTROL

A. Non ITC Testing

1. The Contractor shall complete all testing not required to be completed by an ITC including:

a. All low-voltage equipment testing.

b. All raceway testing not requiring the use of medium-voltage test methods.

c. All low-voltage cable testing utilizing low-voltage or extra-low voltage methods.

d. All phasing verifications utilizing low-voltage or extra-low voltage methods.

e. All continuity testing utilizing low-voltage or extra-low voltage methods

f. All ground system bonding and continuity testing utilizing low-voltage or extra-low voltage methods.

g. All low-voltage voltage and potential testing and verifications.

B. ITC Testing

1. An independent testing company comprised of NETA certified test personnel and project administrators shall be retained by the Contractor to complete to the extent applicable the following:

   a. All medium-voltage equipment testing.

   b. All medium-voltage cable testing.

   c. All dielectric tests.

   d. All low-voltage and medium-voltage protective device testing and setting related to Arc Flash Studies.

   e. All low-voltage and medium-voltage Protective Device testing and calibration.

   f. All potential and current transformer testing and determination of performance curves.

   g. All Primary and Secondary injection tests of protective device systems.

   h. All ground systems testing.

2. Thermographic Testing and Imaging

   a. An independent testing company comprised of Infraspeciton Institute certified test personnel and project administrators shall be retained by the Contractor to complete the following:

      1) All thermographic testing of electrical equipment.

      2) As required by specific Sections.

   b. The level of plant loading of equipment subject to Thermographic Testing shall be as specified in the equipment Section but shall not less than 60 percent of the rated equipment load.

C. Final Field Testing

1. The Contractor shall complete the installation and testing of the electrical installation at least two (2) months prior to the startup and testing of all other Work of the Contract.

2. During the period between the completion of electrical installation and the startup and testing of all other Work, the Contractor shall make all completed and serviceable components of the electrical installation available to the other trades for their use in performing Preliminary and Final Field Tests.

3. Before each test commences, the Contractor shall submit a detailed test procedure and also provide manpower and scheduling for the approval of the Engineer.

4. The Contractor shall furnish detailed test procedures for any of his equipment required as part of the field tests of systems by other contractors.

A. Definitions

1. SWBD as used in this Section and the Specifications shall mean a large single panel, frame, or assembly of panels on which are mounted on the face, back or both, switches, overcurrent and other protective devices, buses, and usually instruments. These assemblies are completely accessible from the front only and are not intended to be installed in cabinets.
2. Low-voltage as used in this Section and the Specifications shall mean all equipment, conductors, insulation systems and accessories intended for operation at less than 1000 volt and within the 600 VAC Class.
3. NIST as used in this Section and the Specifications shall mean the National Institute of Standards and Technology.

B. Reference Standards

1.	IEEE C57.13	-	Instrument Transformers
2.	NEMA PB2	-	Dead-Front Distribution Switchboards
3.	NYCBC	-	New York City Building Code.
4.	NYCEC	-	New York City Electrical Code.
5.	NETA ATS	-	NETA Acceptance Testing Specifications.
6.	UL 98	-	Enclosed and Dead-Front Switchboards.

8.	UL 891	-	Dead-Front Switchboards.
9.	UL 1449	-	Surge Protective Devices

1.05 DESCRIPTION

A. SWBDs installed under this Contract shall be free-standing, dead-front, front-accessible only, low-voltage types intended to serve as marshalling points for the distribution of power within the facilities being constructed under this Contract.

B. SWBDs shall be complete with all accessories and instrumentation and only require installation, connection of source and outgoing circuits and testing to be brought into service

C. The SWBD arrangement shall be as shown on the Contract Drawings.

1.06 QUALITY ASSURANCE

A. SWBD equipment shall be designed, built and tested in accordance with the latest applicable standard editions of IEEE, NEMA, UL, the Utility and NYCEC.

B. The SWBD manufacturer shall be the manufacturer of all the major components of the SWBDs as specified in this Section, the Specifications and as shown on the Contract Drawings.

C. All SWBD equipment shall be new within 6 months of manufacture and complying with the requirements of this Section, the Specifications and the Contract Drawings.

D. The manufacturer of the SWBD equipment shall have produced SWBDs for a minimum period of the last continuous fifteen (15) years.

E. The SWBD manufacturer shall maintain a documented Quality Assurance Program implementing suitable procedures and controls to monitor all aspects of production and testing.

1. The Quality Assurance Program shall be the manufacturer’s standard program specifically dedicated to ensure that each SWBD and its components are designed, assembled and tested in accordance with the requirements specified in this Section, the Specifications and the Contract Drawings.

F. SWBDs shall be UL listed.

G. All cable and wire terminations at the SWBD equipment terminations shall be done by experienced installers who have worked with similar SWBD equipment for a period of at least 5 years, using materials and procedures recommended by the SWBD manufacturer.

H. The Contractor shall provide list of at least five (5) installations with similar SWBD equipment, to that which will provided under this Contract, and demonstrating compliance with these requirements.

1. The Contractor will provide the name, address, telephone number and email of the Company representative who can speak to enquires in the relation to the procurement, installation, commissioning and operation of the SWBD equipment at the above listed five installations.

I. The Contractor shall retain the services of the SWBD manufacturer's representative to certify that the SWBD installation is in accordance with the manufacturer's requirements.

J. Seismic Requirements

1. The Contractor shall provide SWBDs designed, constructed and installed suitable for earthquake regulations in accordance with the seismic requirements of the NYCBC.

K. Testing

1. The SWBD manufacturer shall use a shop test facility that has calibrated testing apparatus and qualified experienced technicians for all shop tests.
2. Calibration of all testing apparatus shall be within one year.
3. Shop testing shall comply with the requirements in this Section, the Specifications and the Contract Drawings.
4. Field testing shall comply with the requirements in this Section, the Specifications and the Contract Drawings.
5. All test equipment, instrument calibration and test reports shall be in accordance with the latest edition of the accuracy standard of NIST and NETA ATS.

1.07 SUBMITTALS

A. Contractor shall submit shop drawings and material specifications for approval by the Engineer.

B. Submittals shall include, but not be limited to, the following:

1. Certified copy of the manufacturer's Design Tests made in accordance with UL-891 Guide: The Switchboard Standard & Requirements, and conducted on SWBD models and type that is being offered for this contract.
2. Certified dimensioned outline drawings showing equipment layouts, front view and floor plan in sufficient detail to define space required for dismantling and maintenance, exact location of and space available for conduit entrance and the interrelationship of the various components.
3. Cross sections and details, as required, to satisfy the Engineer, that all components conform with specification requirements, including design and physical arrangement.
4. Weight of the SWBD.
5. Single-line diagrams
6. Separate customized drawings for each SWBD shall be supplied including individual point-to-point wiring diagram.
7. Complete Bill of Material.
8. Details of special features.
9. Instruction manuals of all protective relays for the equipment.
10. Nameplate schedules.
11. Recommended spare parts list with pricing.
12. List of Special Tools.
13. Painting Procedures.

14. Testing Submittals
    a. Description of shop and field testing methods, procedures and apparatus with calibration dates shall be submitted.
    b. Testing methods and procedures shall be submitted at least 90 days in advance prior to conformation of witness testing dates and actual testing.
    c. Qualifications of proposed testing firm to perform acceptance testing shall be submitted. Submit firm experience records at least 90 days in advance of actual testing., Five recent references with phone numbers shall be submitted.
15. Seismic Criteria
    a. SWBD anchorage details with design calculations signed by NYS Licensed Engineer.
16. Operation and Maintenance Manuals
    a. Preliminary Operation and Maintenance manuals.
    b. Finalized Operation and Maintenance manuals.
17. Certificates of Compliance/Manufacture.
    a. Provide letter signed in the presence of a notary attesting that the SWBD satisfies the requirements stated in this Section.
    b. Seismic qualification certification from the manufacturer including mounting recommendations.
    c. Data and results of witness tests shall be accompanied by a certificate of authenticity sworn to before a notary public by an officer of the manufacturing company. Upon approval, release for shipment to site shall proceed.
18. Reports.
    a. All certified and witnessed shop test reports
    b. All field test reports.
    c. All manufacturer's Site visit reports.

1.08 DELIVERY, STORAGE, AND HANDLING

A. SWBDs shall be delivered, stored, protected and handled in accordance with the manufacturer’s instructions, this Section, the Specifications, the manufacturer’s instructions and the following:
    1. SWBDs shall be inspected when received, for shipping damage, water intrusion which may have entered the equipment during transit or loose parts and a report of any damage made to the carrier within the specified time.

2. SWBDs shall be shipped and delivered in convenient shipping splits, each split not to exceed 6 feet in length.
3. Each split shall be mounted on shipping skids and wrapped for protection.
4. Bus bars with associated hardware for connections between shipping groups/splits shall be shipped inside one of the splits in which it shall be installed.
5. Shipping splits shall contain accessories to permit handling by cranes.
6. SWBDs shall be stored indoors in a well-ventilated, clean, level, dry and cool location with uniform temperature to prevent condensation.
7. SWBD equipment shall be protected in storage with suitable covering and air circulation maintained to ensure the equipment is kept dry and free from condensation.
8. Where dampness or condensation may be encountered, heaters shall be provided for equipment to prevent moisture damage.
9. Embedded electronics shall be shielded from harmful electrical and magnetic energy fields.
10. SWBD equipment shall be lifted, rolled, or jacked into locations shown on the Contract Drawings.
11. Where cranes are not available it shall be possible for splits to be skidded into final positions on rollers and using jacks to raise and lower.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall furnish and deliver to the Engineer, at that part of the Site and at such time as the Engineer may direct, spare parts, special tools and supplies for SWBD in accordance with the requirements of this Section and the Specifications.

B. The Contractor shall furnish for the SWBD, all spare parts, special tools and supplies as recommended by the manufacturer.

C. The spare parts, special tools and supplies shall be listed in an index and packed in containers suitable for long term storage, bearing labels clearly designating the manufacturer's part number with complete information for use and reordering.

D. Furnish the following protective equipment and tools:

1. The Contractor shall furnish one (1) set each of protective equipment and tools for each SWBD.
2. Personnel protective equipment required to satisfy the Arc rating requirements as determined during exceution of the Arc Flash studies specified under Section 26 05 75 – Shock Hazard and Arc Flash Studies. Equipment shall be suitable for the PPE categories but at a minimum shall consist of:
   a. Safety Goggles

b. Face shields

c. Protective Apron

d. Protective Overshoes

e. Carrying case for the above equipment

3. Furnish the following tools for each SWBD:

a. One (1) infrared inspection system for thermo-graphic inspection of the inter-cell cable, bus connections and terminations.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. SWBDs shall be as manufactured by:

1. Schneider Electric, Columbia, SC;

2. Siemens, Washington, DC

3. ABB, Burlington, IA;

4. Eaton Corporation;

5. Or approved equal.

B. Keys and interlock systems shall be as manufactured by:

1. Kirk, Canton OH;

2. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Common Features

1. SWBDs shall be fully self-supporting structures with 90 inch tall vertical sections (excluding lifting eyes and pull boxes) bolted together to form the required arrangement as shown on the Contract Drawings.

2. SWBD frames shall be die formed, 12 gauge steel with reinforced corner gussets.

a. Frame shall be rigidly bolted to support cover plates (code gauge steel), bus bars and installed devices during shipment and installation.

3. All sections may be rolled, moved or lifted into position.

4. SWBDs shall be capable of being bolted directly to the floor without the use of floor sills.
5. All SWBD sections shall have open bottoms and removable top plate(s) to install conduit.
6. Front-Connected SWBD sections shall be rear aligned for placement against a wall.
7. All covers shall be fastened by hex head bolts.
8. Provide hinged doors over metering compartments and individually mounted device compartments.
    a. All doors shall have concealed hinges and be fastened by hex head bolts.
9. SWBD protective devices shall be furnished as listed on drawings and specified herein, including interconnections, instrumentation and control wiring.
10. SWBDs and devices shall be rated for a frequency of 60 Hertz. Voltage, current and short circuit rating shall be as shown on the Contract Drawings.
11. SWBD current ratings, including all devices, shall be based on a maximum ambient temperature of 40 degree C per UL 891.
    a. With no derating required, temperature rise of SWBDs and devices shall not exceed 65 degrees C in a 40 degree C ambient environment.
12. SWBD sections shall have UL listed inspection windows for infrared inspections.
13. Group mounted feeder breaker and/or main devices within SWBDs shall be circuit breakers as indicated on the drawings.
    a. Mounting for group mounted circuit breakers shall be by bolted connections

B. Incoming Section

1. Incoming section shall be direct cable connection to main breakeras shown on Contract drawings.
2. Furnish SWBDs arranged for top entry of incoming cable.
3. Provide crimp compression type lugs in the quantity and size required as shown in Section 26 06 11 - Cable and Conduit Schedule.
    a. All lugs shall be tin-plated copper and UL listed for use with copper cable.
    b. Lugs shall be rated for 75 degree C.

C. Bus Bars

1. All phase, neutral bus bars shall be tin-plated copper.
2. Main horizontal bus bars shall be mounted with all three phases arranged in the same vertical plane.
3. The bus bars shall have sufficient cross sectional area to meet UL 89 temperature rise requirements.
4. Phase and neutral bus ampacity shall be as shown on the plans.
5. The neutral bus shall have the same ampacity as the phase bus.
6. Bus bars shall be mounted on high impact, non-tracking insulated supports.
    a. Joints in the vertical bus are not permitted.
7. Bus bars shall be braced to withstand mechanical forces exerted during short circuit conditions as indicated in drawings, but in no case less than 65 kA RMS symmetrical.
8. Bus joints shall be bolted with high tensile steel Grade 5 bolts and Belleville type washers.
9. Ground Bus shall be sized to meet UL 891(minimum ¼ X 2 inch) and shall the extend full length of SWBD.
10. Buses shall be arranged to be A-B-C from left to right, top to bottom, or front to rear when facing the front of the SWBD.
    a. Where special circuitry precludes this arrangement, bus bars shall be labeled.
11. All feeder device line and load terminations and extensions of, shall be rated to carry the current rating of the device frame.
12. The main incoming bus bars shall be rated for the main protection device frame size.
13. Main horizontal bus bars shall be fully rated and arranged for future extensions.
    a. Tapered horizontal busses are not be permitted.

D. Enclosure

1. SWBDs shall be NEMA 1 dead-front construction as indicated on the Contract Drawings.

E. User Metering

1. User metering shall be UL listed digital multifunction power monitor.
2. The power monitor case shall be fully enclosed and shielded and door mounted to allow access menu and display.

3. Power monitor shall provide complete metering in one package. Monitor shall include self-protection internal fuses. Monitor shall include the following direct reading metered values:
   a. Volts, Amperes
   b. Watts, Vars, VA
   c. Power Factor
   d. Frequency
   e. Watts, VAR, VA Hours
   f. Watts, Var, VA Demand
4. Monitor shall include communication capability, using RS-485, Modbus RTU Protocol or Ethernet. Meter shall include provisions to communicate remotely using Ethernet.
5. All instrument transformers shall be UL listed and classified as indicated in Contract Drawings.
6. Current Transformers shall be provided where shown on the Contract Drawings with burden and accuracy to support connected meters and relays as required by ANSI/IEEE C57.13.

F. SWBD Main Isolation Devices

1. The SWBD Main Isolation Device shall be an individually mounted molded case circuit breaker.
2. Main Isolation Devices shall have a minimum current interrupting capacity of 65 kA symmetrical.

G. SWBD Feeder Isolation Devices

1. Feeder Isolation Devices 1200 amps and smaller shall be group mount molded-case circuit breakers with bolted connections.
2. Feeder Isolation Devices shall have a minimum current interrupting capacity of 65 kA symmetrical.

H. Molded-Case Circuit Breakers

1. Group mounted breakers shall be connected to the vertical bus by bolted connections.
2. Individually mounted molded case circuit breakers shall be stationary mounted.
3. Circuit breaker frames shall be constructed of a high-strength, molded, glass-reinforced polyester case and cover.
4. Breakers shall have an overcenter, toggle handle-operated, trip free mechanism with quick make, quick break action independent of the speed of the toggle handle operation.

a. The design shall provide common tripping of all poles.

b. Breakers shall be suitable for reverse power feeds.

5. Breakers shall have ON and OFF position clearly marked on escutcheon.

a. Breakers shall include a trip-to-test means on the escutcheon for manually tripping the breaker and exercising the mechanism and trip latch.

6. Breakers shall include factory installed mechanical lugs.

a. Lugs shall be UL listed and rated 75 or 60/75 degrees C as appropriate.

b. Breakers shall be [100]/[80] percent rated.

7. The main and feeder breaker with a frame size 400 amps and larger shall have digital electronic trip units as described in this Section.

I. Digital Electronic Trip Unit (DETU) for Molded Case Circuit Breakers

1. Each main, feeder, and tie circuit breaker shall be equipped with a DETU.

2. The main breaker trip unit shall provide protection from overloads, and short circuits.

3. Long time and short time protective functions shall have true RMS sensing technology for harmonic rich currents including up to the 19th harmonic.

4. High contrast liquid crystal display (LCD) unit shall display settings, trip targets, and the specified metering displays.

5. A multi-button keypad shall provide local setup and readout of all trip settings on the LCD.

6. Rating Plug

a. Shall be UL Listed and be interchangeable rating plug.

b. It shall not be necessary to remove the trip unit to change the rating plug.

c. Rating plugs shall be available in sizes from 40% to 100% of the breaker sensor rating.

7. The trip unit shall have an integral test jack for testing via a portable test set and connection to a battery source.

8. Noise immunity shall meet the requirements of IEEE C37.90.

9. The trip unit shall display trip targets for long time, short time, and ground fault, if included.

a. Provide visual illuminated indication of the trip unit (normal, pickup, trip, error).

10. The trip unit shall be provided with a ten event trip real-time history log.
    a. Each trip event shall be recorded with type, phase and magnitude of fault that caused the trip
11. As a minimum, the trip unit shall have the following protective functions:
    a. Current setting or long time pickup, adjustable from 50% to 100% of the rating plug value.
    b. Adjustable long time delay with typical inverse time characteristics (minimum of 10 bands).
        1) In addition, a set of straight line fuse shaped long time delay bands shall be provided to facilitate selectivity with downstream fuses (minimum 7 bands).
    c. Instantaneous pickup, adjustable from 2.0 to 10 times the rating plug in 0.5 increments
    d. Short time pickup and delay.
        1) Short time pickup shall be adjustable from 1.5 to 9 times the long time pickup setting in 0.5 increments with an OFF option.
        2) Provide minimum of 12 short time delay bands with three selectable I2t bands.
12. Surge Protective Devices (SPDs)
    a. Each bus of the SWBD shall be equipped with an integral SPD.
    b. SPDs shall
        1) Comply with Section 26 43 13 – Low-Voltage Surge Protective Devices.
        2) Be fed by its own circuit breaker or disconnect.
        3) Be capable of displaying its status without accessing the interior of the switchgear.

J. Nameplates
1. Nameplates shall clearly indicate information in accordance with NEMA and IEEE requirements.
2. Nameplates shall be engraved or embossed on stainless steel.
3. The switchboard shall have identifying nameplates in accordance with the requirements of Section 26 05 53 Identification for Electrical Systems.
4. Nameplates shall clearly indicate information in accordance with NEMA and IEEE requirements.
5. Nameplates shall be engraved or embossed on stainless steel.

6. A master nameplate shall also be provided mounted on the assembly.

7. The master nameplate shall identify switchboard designation, voltage, ampere and short circuit rating, manufacturer's name, general order number and item number.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Painting

1. All interior and exterior surfaces of the SWBD shall be properly cleaned and provided with a rust-inhibiting phosphatized coating

2. Steel surfaces shall have not less than two finish coats of acid resistant electrostatically applied epoxy ANSI 61 grey paint.

3. Finish coat shall be a minimum of 150 microns

4. Field painting, other that touchup painting, shall not be required.

5. A sufficient quantity of additional coating material and thinner shall be furnished to permit field touchup of damaged coatings.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Certified Shop Tests:

1. Each SWBD shall be completely assembled, wired and tested at the factory, including all buses, connections, insulator, terminals and terminal blocks, to demonstrate that it has been properly manufactured, properly assembled, is not overheating, is not overloading and has no electrical or mechanical defects.

2. Shop testing shall be performed on the SWBD at the manufacturer's plant prior to shipment.

3. Shop test shall be in accordance with the latest revisions of UL 891 Guide: The Switchboard Standard & Requirements.

4. The Contractor shall provide a shop test report.

a. The report shall identify the tests performed and the results obtained.

5. SWBD testing shall include the following:

a. Visual and physical inspection of the interior and exterior of the SWBD including all devices to verify consistency with approved submittals.

1) Check bus layouts and takeoffs confirm with approved submittals.

2) Check bus for proper electrical clearances.

3) Check tightness of all bolted and torqued connections.

4) Verify the polarity of all instrument transformers.

5) Verify the grounding of all instrument transformers.

6) Verify all nameplate engravings.

b. Mechanical operations shall be performed to insure proper functioning of operating mechanisms and interchangeability.

c. Continuity test shall be performed on power and control wires.

d. Functional operations test which shall include pick up, dropout, time delay, sequence and polarity.

e. Primary hi-potential tests shall be performed.

1) Primary current carrying parts shall be tested between phases, phase to ground, and line to load.

2) The applied voltage shall be twice rated voltage plus 1000 for 1 minute.

f. Hi-Potential tests on control and secondary wiring shall be performed.

1) Control circuit wiring shall be tested for 1500 volts to ground for 1 minute.

g. Power cables and buses shall be tested, for insulation breakdown resistance and circuit isolation.

1) Test voltage frequency shall not be less than the frequency of the rated voltage of the equipment tested.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examine installation area to assure there is enough clearance to install SWBD.

B. Verify that installation will yield required working spaces around the SWBD installation.

C. Check concrete pads for uniformity and level surface.

D. Verify field measurements are as shown on the approved Shop Drawings.

E. Verify that required utilities are available, in proper location and ready for use.

3.02 INSTALLATION

A. SWBD and associated equipment and accessories shall be installed in accordance with the manufacturer’s instruction and recommendations.

B. SWBDs shall be bolted to the concrete bases and shall comply with seismic requirements.

C. Identification

1. Identify field-installed conductors, interconnecting wiring, warning signs and components in accordance with Section 26 05 53 – Identification for Electrical Systems.
2. Label each SWBD compartment with nameplates complying with Section 26 05 33 – Identification for Electrical Systems.
3. Provide device nameplates complying with Section 26 05 33 – Identification for Electrical Systems.

3.03 FIELD TESTING / QUALITY CONTROL

A. Field Testing

1. After installation, the SWBD shall be field tested for operation and conformance.
2. Field testing shall conform to the requirements in this Section, Section 01 75 10 – Preliminary and Final Field Tests, NETA ATS and the Manufacturer's recommendations.
3. Field tests shall be witnessed by the Engineer and certified by the Contractor.
4. The services of the SWBD manufacturer shall be retained for field testing.
5. SWBD testing shall be supervised by the Manufacturer's representative, prior to energizing equipment.
6. Equipment shall not be energized without the permission of the Engineer.
7. Retain the service of an independent testing firm who shall perform field testing of the SWBD.
8. The testing firm shall have experience in the inspection and testing of SWBD equipment and shall be a member company of NETA.
    a. Provide proof of membership or demonstrate that the standards and experience required for membership are possessed, all to the satisfaction of the Engineer.

B. Preliminary Field Testing

1. Preliminary Field Test of the SWBD shall be in accordance with the recommendations of the manufacturer's representative, NETA ATS and shall consist at a minimum of the following:
2. Visual and physical inspections shall at a minimum verify the following:
    a. Verify all SWBD equipment are located according to approved submittals.
    b. Verify all nameplates, tags and identification marks in accordance with approved submittal and preliminary As-Builts.
    c. Physical, electrical and mechanical condition shall be inspected.

d. Proper anchorage, required area clearances, physical damage and proper alignment shall be checked.

e. Ventilating air passageways shall be inspected for blockage.

f. Mechanical interlock systems shall be checked for proper operation.

g. Insulators shall be inspected for evidence of damage or contamination.

h. Device settings and adjustments shall be verified.

i. Breakers and vertical sections shall be checked to determine that they have been properly installed, lubricated and connected.

j. Equipment shall be cleaned and lubricated as required.

3. Electrical testing shall at a minimum include:

a. Test continuity of all circuits

b. All connections shall be inspected for high resistance.

c. Electrical interlock systems shall be checked for proper operation.

d. Ground-resistance tests shall be performed.

e. Perform resistance measurements through bolted connections with a low-resistance measuring device.

f. Perform insulation-resistance measurements on each bus section, phase-to-phase, and phase-to-ground for one minute.

g. An over potential test shall be performed on each bus section, each phase-to-ground and on each switch in the closed position. Test each pole with other poles grounded.

h. Contact-resistance test shall be performed.

i. Control and metering wiring performance test shall be performed.

j. Primary and secondary voltage and current injections shall be performed to confirm phasing, polarities, transformation ratios.

k. Circuit breaker trip characteristics shall be determined by primary current injection.

l. Control equipment and connections shall be checked to determine that they are not defective.

C. Preliminary Loading Tests

1. The Contractor may substitute load banks of the type and power factor which are approved by the Engineer to complete Preliminary Load Tests if the actual loads are not ready for energization.

a. The full load rating of the load bank shall be comparable to that of the circuit loads under test.

2. Preliminary Loading Tests shall at the minimum include:

a. Control voltages shall be applied and functional tests verifying the operations of all breakers, controls and displays.

b. Primary voltage shall be applied to the complete primary bus via the SWBD main feeder breakers with tie breakers in the normal operating positions.

1) The primary buses shall remain energized for one hour with no further operations.

a) During this one hour period all voltage and potential transformer secondaries and circuits shall be checked for voltage magnitudes, phasing, phase sequence along with all associated metering displays.

2) Each SWBD distribution feeder breaker shall be closed for one hour to energize its associated load

a) During this one hour period all metering circuits shall be checked for voltage, current, voltamp, and var values, phasing, phase sequence along with all associated metering displays.

D. Infrared testing shall be performed once after initial energization of the SWBD and a second time after full load has been applied continuously for (24) hours.

E. SWBD Final Field Test

1. SWBD Final Field Test shall be considered complete when all the outgoing circuits shall have energized their various loads for the Final Field Test of the respective load.

F. Any deficiencies or issues which may arise during Preliminary Field Tests, Preliminary Loading Test or SWBD Final Field Test shall be remedied by the Contractor at no additional cost to the City.

G. Manufacturer’s Field Services

1. The Contractor shall provide the services of a qualified manufacturer's service representative who shall adequately supervise and assist in the installation of the SWBD, check the SWBD installation before it is placed into operation and assist in the performance of Preliminary and Final Field Tests.

2. The Manufacturer’s representative shall provide SWBD equipment Start-up services and Training of the Contractor and the City’s operations and maintenance staff in the care, operation and maintenance of the SWBD in

accordance with this Section, the Specifications and the Contract Drawings and the following requirements:

a. Minimum number of manufacturer's representative site visits per SWBD:

Construction Phase	No of Visits	8 hour Days per Visit	Total Days per SWBD
Installation and Inspection	1	1	1
Field Testing	1	2	2
Acceptance Testing	1	2	2
Training	2	1	2

b. Additional trips or days that are required to achieve the proper installation, operation or training, such services shall be arranged for by the Contractor at no additional cost to the City.

c. The Engineer shall have the right to reallocate any unused time

3. The Contractor shall provide a field report from the manufacturer's representative for each visit to the site.

a. The report shall include complete information on time, schedule, tasks performed, persons contacted, problems corrected, tests results, training, instruction and all other pertinent information.

b. The SWBD manufacturer's representative shall certify in writing to the Engineer that the SWBD equipment has been installed, setup and tested properly in accordance with Contract requirements and is operating at optimum conditions and capacity.

4. The manufacturer representative shall also make any necessary adjustments and instruct the Site personnel in its operation and maintenance.

5. The service representative shall sign in and out with the Engineer on each day they are at the site.

6. A day shall be understood to be the actual time spent at site and does not include travel to and from the site.

3.04 STARTUP / DEMONSTRATION

A. SWBD Startup

1. SWBD Startup shall comply with the requirements of Section 01 79 05 – Startup and Training and shall be considered completed when all the loads on the SWBD completes their startup requirements.

B. SWBD Training

1. The Contractor shall provide Training on the SWBD in compliance with Section 01 79 05 – Startup and Training.
2. The Contractor shall submit for approval by the Engineer, lesson plans identifying in detail, the training to be conducted.
3. The Contractor shall coordinate training services with the City and the Engineer.
4. The Contractor shall schedule training at least forty-five (45) days prior to delivery of training subject to the approval of the Engineer and the City.
5. The training shall consist of both classroom and field instruction.
6. The purpose of field instruction shall be to reinforce topics covered in the classroom and to identify the location of any control switches and other equipment required for operation; and to identify locations of any maintenance equipment.
7. Any additional time required to achieve successful installation and operation shall be at the expense of the Contractor.
8. The manufacturer's representative shall sign in and out at the office of the Resident representative on each day he is at the project.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

END OF SECTION

NO TEXT ON THIS PAGE

PART 1 GENERAL

1.01 SUMMARY

A. Requirements for providing all new panelboards. Panelboards shall be provided in accordance with the requirements specified under this Section, the Specifications, and the Contract Drawings. This Section also includes requirements for providing an integrated panelboard and transformer.

B. Panelboards shall include all power distribution, lighting, appliance and instrument panelboards.

C. The following index of this Section is included for convenience:

Article	Title	Page
PART 1	GENERAL	1
1.01	Summary	1
1.02	Payment	1
1.03	Related Sections	1
1.04	References	2
1.05	Description	2
1.06	Quality Assurance	2
1.07	Submittals	3
1.08	Delivery, Storage, and Handling	4
1.09	Spare Parts, Special Tools, and Supplies	5
1.10	Warranty	5
PART 2	PRODUCTS	5
2.01	Manufacturers	5
2.02	Materials / Equipment	5
2.03	Fabrication / Assembling / Finishes	9
2.04	Source Quality Control / Shop Tests	9
PART 3	EXECUTION	10

3.02	Installation	10
3.03	Field Testing / Quality Control	11
3.04	Startup / Demonstration	12
3.05	Adjusting / Protection / Cleanup	13

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 26 05 27 - Grounding

B. Section 26 05 53 - Identification for Electrical Systems

C.	Section 26 05 73	-	Power System Studies

F.	UL 489	-	Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures

1.05 DESCRIPTION

A. All panelboards shall be dead-front type with automatic trip-free, bolt-on, molded case circuit breakers.

B. All panelboards shall be equipped with main breakers, 1-pole, 2-pole and 3-pole branch circuit breakers as shown on the Contract Drawings.

C. All panelboards shall be enclosed in flush or surface mounted cabinets as shown on the Contract Drawings.

D. Arc Flash Labels shall be provided for all panelboards in accordance with Section 26 05 75 – Shock Hazard and Arc Flash Studies.

E. All panelboard installation shall comply with the applicable seismic requirements of the NYCBC.

1.06 QUALITY ASSURANCE

A. Panelboards shall be designed, built and tested in accordance with the latest applicable standard editions of IEEE, NEMA, UL, the Utility and NYCEC.

B. The panelboard manufacturer shall be the manufacturer of all the major components of the panelboards as specified in this Section, the Specifications and as shown on the Contract Drawings.

C. All panelboards shall be new within 6 months of manufacture and complying with the requirements of this Section, the Specifications and the Contract Drawings.

D. The manufacturer of the panelboard shall have produced panelboards for a minimum period of the last continuous fifteen (15) years.

E. The panelboard manufacturer shall maintain a documented Quality Assurance Program implementing suitable procedures and controls to monitor all aspects of production and testing.

1. The Quality Assurance Program shall be the manufacturer's standard program specifically dedicated to ensure that each panelboard and its components are designed, assembled and tested in accordance with the requirements specified in this Section, the Specifications and the Contract Drawings.

F. Panelboard shall be UL listed.

G. Whenever applicable, all Work regarding the panelboard equipment shall conform to the requirements of the Utility.

H. All cable and wire terminations at the panelboard shall be done by experienced installers who have worked with similar panelboard for a period of at least 5 years, using materials and procedures recommended by the panelboard manufacturer.

I. The Contractor shall provide list of at least five (5) installations with similar panelboard, to that which will provided under this Contract, and demonstrating compliance with these requirements.

1. The Contractor will provide the name, address, telephone number and email of the Company representative who can speak to enquires in the relation to the procurement, installation, commissioning and operation of the panelboard equipment at the above listed five installations.

J. Seismic Requirements

1. The Contractor shall provide panelboards designed, constructed and installed suitable for earthquake regulations in accordance with the seismic requirements of the NYCBC.

K. Testing

1. The panelboard manufacturer shall use a shop test facility that has calibrated testing apparatus and qualified experienced technicians for all shop tests.

2. Calibration of all testing apparatus shall be within one year.

3. Shop testing shall comply with the requirements in this Section, the Specifications and the Contract Drawings.

4. Field testing shall comply with the requirements in this Section, the Specifications and the Contract Drawings.

5. All test equipment, instrument calibration and test reports shall be in accordance with the latest edition of the accuracy standard of NIST and NETA ATS.

1.07 SUBMITTALS

A. Contractor shall submit shop drawings and material specifications for approval by the Engineer.

B. Submittals shall include, but not be limited to, the following:

1. Certified copy of the manufacturer's Design Tests made in accordance with UL 67 and conducted on panelboard models and type that is being offered for this contract.
2. Certified dimensioned outline drawings showing panelboard layouts, front view and floor plan in sufficient detail to define space required for dismantling and maintenance, exact location of and space available for conduit entrance and the interrelationship of the various components.
3. Weight of the panelboard and all associated equipment.
4. Separate customized drawings for each panelboad shall be supplied.
5. Complete Bill of Material.
    a. A listing of the panelboards with the number and size of circuit breakers identified.
6. Details of special features.
7. Instruction manuals of all protective devices.
8. Nameplate schedules.
9. Recommended spare parts list with pricing.
10. List of Special Tools.
11. Operation and Maintenance Manuals
    a. Preliminary Operation and Maintenance manuals.
    b. Finalized Operation and Maintenance manuals.
12. Certificates of Compliance/Manufacture.
    a. Provide letter signed in the presence of a notary attesting that the panelboard satisfies the requirements stated in this Section.
    b. Seismic qualification certification from the manufacturer including mounting recommendations.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Panelboads shall be delivered, stored, protected and handled in accordance with the manufacturer's instructions, this Section and the following:

1. Panelboards shall be inspected when received, for shipping damage, water intrusion which may have entered the equipment during transit or loose parts and a report of any damage made to the carrier within the specified time.
2. Panelboards shall be shipped and delivered in convenient packages.
3. Each package split shall be mounted on shipping skids and wrapped for protection.
4. Shipping packages shall contain accessories to permit handling by cranes.

5. Panelboards shall be stored indoors in a well-ventilated, clean, level, dry and cool location with uniform temperature to prevent condensation.

6. Panelboard equipment shall be protected in storage with suitable covering and air circulation maintained to ensure the equipment is kept dry and free from condensation.

7. Where dampness or condensation may be encountered, heaters shall be provided for equipment to prevent moisture damage.

8. Embedded electronics shall be shielded from harmful electrical and magnetic energy fields.

9. Panelboard equipment shall be lifted into locations shown on the Contract Drawings.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall furnish all spare parts, special tools and supplies for the panelboards as recommended by the manufacturer.

B. The spare parts, special tools and supplies shall be listed in an index and packed in containers suitable for long term storage, bearing labels clearly designating the manufacturer's part number with complete information for use and reordering.

C. Furnish in addition the following spare parts for each panelboard installation:

1. One spare key shall be provided for each key interlock system.

2. One (1) set of complete replacement power fuses for each size and type installed.

3. One (1) spare breaker for each size and type installed.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer’s standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Panelboards shall be as manufactured by:

1. Schneider, Seneca, SC

2. Siemens, Washington, DC

3. ABB, Mebane, NC.

4. Eaton Corporation;

5. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Panelboards

1. Ratings:
   a. Panelboard frequency shall be 60 Hz.
   b. Panelboard ampacities, voltage, number of phases and wires shall be as shown on the Contract Drawings.
   c. Panelboards shall be labeled with a UL short circuit rating. All panelboards shall be fully rated.
   d. Available short circuit infeed at the panelboard shall be no more than seventy percent of the panelboard short circuit rating.
   e. Panelboards rated 240VAC or less shall have a minimum short circuit rating of 22,000A RMS symmetrical and 65,000 RMS symmetrical when shown on the Contract Drawings.
   f. Panelboards rated 480VAC shall have a minimum short circuit rating of 65,000A RMS symmetrical.
2. Cabinets:
   a. Cabinets shall be constructed of 12-gauge galvanized steel with stainless steel hardware.
   b. Cabinets shall be NEMA 12 for dry, indoor areas and NEMA 4X for wet or corrosive areas. In hazardous locations, panelboards shall have a NEMA 7 rating.
   c. Cabinets shall have wiring gutters on the sides.
   d. Cabinets shall be at least 5-3/4 inches deep and 20 inches wide for panelboards with maximum branch circuit breakers of 100A. When branch circuit breakers are above 100A, cabinets shall be at least 9-1/2 inches deep and 31 inches wide.
   e. Trims for panelboards shall consist of a hinged trim door which does not leave any live parts uncovered and permits the operation of all circuit breakers. In addition, a door-in-door arrangement shall form the dead front panel door covering all parts not covered by the hinged trim door. Both doors shall have concealed hinges with flush type catches and locks. All locks shall be keyed alike.
   f. Cabinet shall have a UL listed inspection window for infrared inspections.
   g. Cabinets shall have identifying nameplates in accordance with the requirements of Section 26 05 53 – Identification for Electrical Systems.
3. Bus Bars:
   a. Bus bars shall be copper sized in accordance with UL standards to limit temperature rise on any current carrying part to a maximum of 65 degrees C above an ambient of 40 degrees C maximum.

b. Bus bar taps for single-pole branches shall be arranged for sequence phasing of the branch circuit devices.

c. A bonded ground bus shall be included in all panels.

d. Full-size neutral bars shall be provided for panelboards, unless noted otherwise on the Contract Drawings.

e. Where specifically shown on the Contract Drawings panelboards shall be provided with a 200 percent rated neutral bus suitable for use with non-linear loads. Neutral busing shall have a suitable lug for each outgoing feeder requiring a neutral connection.

4. Circuit Breakers:

a. Circuit breakers shall be the molded case type conforming to UL 489.

b. Breakers shall be the heavy-duty, bolt-on type with quick-make quick-break toggle mechanism for manual as well as automatic operation.

c. Breakers shall have 100-amp frames, with 15-amp trip elements as minimum, unless otherwise shown on the Contract Drawings.

d. All 100-amp frame breakers shall be fixed thermal magnetic trip units.

e. Frame sizes above 100 amp shall have interchangeable thermal magnetic trip units or electronic trip units.

f. Where specifically shown on the Contract Drawings breakers shall be provided with electronic trip units. Electronic trip units shall provide long time, short time, and instantaneous settings and time adjustments as a minimum.

g. Where specifically shown on the Contract Drawings ground fault circuit interrupters shall be provided. Ground fault breakers shall be equipped with solid state sensing and 5 milliamp sensitivity.

h. Breakers used for lighting circuit switching shall be suitable for the purpose and shall be marked "SWD". Breakers requiring continuous operation shall be provided with a lock-on device.

i. Where specifically shown on the Contract Drawings shunt trips, bell alarms, and auxiliary devices shall be provided.

5. Metering:

a. Where shown on the Contract drawings a UL listed microprocessor metering device (MMD) shall be installed in the panelboard.

b. The MMD shall have the capability to monitor all the panelboard outgoing and spare circuits including capacity for an additional twenty percent spare circuits.

c. The MMD shall be able to monitor and time stamp at a minimum the following per phase and line values for each circuit:

1) Voltage, Current, Power, Power Factor, VAR, VA and Frequency.

2) Watt,VAR and VA Demand.

3) Watt Hour,VA Hour and Var Hour both forward and reverse.

d. The Mmd shall be able to auto-detect sensor rating

e. The Mmd shall store the energy profile for each circuit in a non-volatile memory for a minimum of one year. The demand interval shall be 15 minutes.

f. Mmd communications ports and protocols shall have capability using RS-485, Modbus RTU protocol or Ethernet. Device shall include provisions to communicate remotely using Ethernet.

6. Surge Protection:

a. The panelboard shall be provided with surge protective devices complying with Section 26 43 13 – Low-voltage Surge Protective Devices.

7. Directories:

a. Each panel shall be provided with a directory.

b. The directory shall be protected by a glass or noncombustible plastic cover.

c. The Contractor shall maintain in each panel, during the duration of the Contract, a handwritten directory clearly indicating the circuit breakers in service and the number of spares.

1) This directory shall be updated as work progresses, and final, typewritten directories shall be provided at the end of the Contract.

d. Where execution of the work under this Contract requires certain circuits to be modified, the Contractor shall update or provide panelboard directories to reflect the modifications.

1) Final typewritten directories shall be provided at the end of the Contract.

B. Integrated Panelboard and Transformer, (Mini Power Center)

1. The power center shall consist of primary and secondary main circuit breaker disconnects, transformer and a secondary panelboard all in one enclosure.

2. Transformer shall be dry type, resin encapsulated, 60 Hertz with KVA, primary and secondary voltage and number of phases as shown on the

Contract Drawings. Transformer windings shall be copper with 180 degrees C insulation system and 115 degrees C winding temperature rise.

3. Circuit breakers shall be molded case, thermal magnetic type. The main breakers sizes shall be suitable for the KVA rating of the transformer. Panelboard branch circuit breakers shall be plug-in type with the number of breakers and poles and trip ratings as shown on the Contract Drawings.

4. The enclosure shall be heavy gauge stainless steel rated NEMA 3R. The enclosure shall be pad lockable and be equipped with a grounding terminal.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Painting

1. All metal surfaces of the panelboard enclosures shall be thoroughly cleaned and given one coat of zinc chromate primer.

2. All interior surfaces shall then be given one shop finishing coat of a nitro-cellulose enamel lacquer.

3. All exterior surfaces shall be given three coats of the same lacquer. The color of finishing coats shall be light gray ANSI No. 61.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Certified Shop Tests:

1. Each panelboard shall be completely assembled, wired and tested at the factory, including all buses, connections, insulator, terminals and terminal blocks, to demonstrate that it has been properly manufactured, properly assembled, is not overheating, is not overloading and has no electrical or mechanical defects.

2. Shop testing shall be performed on the panelboard at the manufacturer's plant prior to shipment.

3. Shop test shall be in accordance with the latest revisions of UL, IEEE and ANSI and shall demonstrate that the equipment tested conforms to the requirements specified.

4. The Contractor shall provide a Certified Shop Test Report.

   a. The report shall identify the tests performed and the results obtained.

5. Panelboard shop tests shall include the following:

   a. Visual and physical inspection of the interior and exterior of the panelboard including all devices to verify consistency with approved submittals.

      1) Check bus layouts, breaker types, sizes and quantities confirm with approved submittals.

      2) Check bus for proper electrical clearances.

      3) Check tightness of all bolted and torqued connections.

4) Verify all grounding provisions.

5) Verify all nameplate engravings.

b. Mechanical operations shall be performed to insure proper functioning of operating mechanisms and interchangeability.

c. Continuity test shall be performed on power and control wires.

d. Functional operations test which shall include pick up, dropout, time delay, sequence and polarity.

e. Primary hi-potential tests shall be performed.

1) Primary current carrying parts shall be tested between phases, phase to ground, and line to load.

2) The applied voltage shall be twice rated voltage plus 1000 for 1 minute, 1500 volts minimum.

f. Verify connectivity and communication of devices to be connected to the EMCS.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examine installation area to assure there is enough clearance to install panelboard.

B. Verify that installation will yield required working spaces around the panelboard installation.

C. Check installation surfaces for uniformity and level surface.

D. Verify field measurements are as shown on the approved Shop Drawings.

E. Verify that required utilities are available, conduit runs etc. are in required location and ready for use.

3.02 INSTALLATION

A. Equipment shall be mounted rigidly and securely to the building structure or to supporting devices which are rigidly and securely supported by the building structure.

B. Equipment shall be fastened with bolts and expansion shields on concrete or brick, with toggle bolts on hollow masonry units, and with machine screws or welded studs on metal.

C. Mount all equipment parallel or perpendicular to walls, such that panelboards are installed in a neat and professional manner.

D. All wiring shall be neat within the panelboards. Wires shall be run vertically in the wire gutter and then terminate horizontally at a breaker.

E. The Contractor shall install blanking devices within panelboard spaces, so bus bars are not exposed.

F. Install panelboard nameplates for identification of equipment.

G. Panelboard circuits shall be installed so to balance the loads on each of the panelboards.

3.03 FIELD TESTING / QUALITY CONTROL

A. Field Testing

1. After installation, the equipment shall be field tested for operation and conformance.
2. Field testing shall conform to the requirements in this Section, Section 01 75 10 – Preliminary and Final Field Tests, NETA ATS and the Manufacturer's recommendations.
3. Field tests shall be certified by the Contractor.
4. Equipment shall not be energized without the permission of the Engineer.

B. Preliminary Field Testing

1. Preliminary field test of the panelboard shall be in accordance with the recommendations of the manufacturer, NETA ATS and shall consist at a minimum of the following:
2. Visual and physical inspections shall at a minimum verify the following:
   a. Verify all panelboard equipment are located according to approved submittals.
   b. Verify all directories, nameplates, tags and identification marks in accordance with approved submittal and preliminary As-Builts.
   c. Physical, electrical and mechanical condition shall be inspected.
   d. Proper anchorage, required area clearances, physical damage and proper alignment shall be checked.
   e. Mechanical interlock systems shall be checked for proper operation.
   f. Insulators shall be inspected for evidence of damage or contamination.
   g. Breaker settings and adjustments shall be verified.
   h. Breakers and vertical sections shall be checked to determine that they have been properly installed, and connected.
   i. Equipment shall be cleaned as required.
3. Electrical testing shall at a minimum include:
   a. Test continuity of all outgoing circuits.
   b. All connections shall be inspected for high resistance.
   c. Electrical interlock systems shall be checked for proper operation.
   d. Ground-resistance tests shall be performed.

e. Perform resistance measurements through bolted connections with a low-resistance measuring device.

f. Perform insulation-resistance measurements on each bus, phase-to-phase, and phase-to-ground for one minute.

g. An over potential test shall be performed on each bus, each phase-to-ground and on each switch in the closed position. Test each pole with other poles grounded.

h. Control and metering wiring performance test shall be performed.

C. Preliminary Loading Tests

1. The Contractor may substitute load banks of the type and power factor which are approved by the Engineer to complete preliminary load tests if the actual loads are not ready for energization.

a. The full load rating of the load bank shall be comparable to that of the circuit loads under test.

2. Preliminary loading tests shall at the minimum include:

a. Primary voltage shall be applied to the complete primary bus via the panelboard main breakers.

1) The primary bus shall remain energized for [one hour] with no further operations.

a) During this one hour period all voltage circuits shall be checked for voltage magnitudes, phasing, phase sequence along with any associated metering displays.

2) Each panelboard circuit breaker shall be closed for one hour to energize its associated load. During this one hour period all circuits shall be checked for voltage, current, voltamp, and var values, phasing, phase sequence along with any associated metering displays.

D. Infrared testing shall be performed once after initial energization of the panelboard and a second time after full load has been applied continuously for (24) hours.

E. Panel Final Field Test

1. Panel final field test shall be considered complete when all the outgoing circuits shall have energized their various loads for the Final Field Test of the respective load.

F. Any deficiencies or issues which may arise during preliminary field tests, preliminary loading tests or panelboard final field tests shall be remedied by the Contractor at no additional cost to the City.

3.04 STARTUP / DEMONSTRATION

A. Panelboard Startup

1. Panelboard startup shall comply with the requirements of Section 01 79 05 – Startup and Training and shall be considered completed when all the circuit loads on the panelboard completes their startup requirements.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Not Used

1.04 REFERENCES

A. Definitions

1. Low-voltage as used in this Section and other Specifications shall mean all equipment, conductors, insulation systems and accessories intended for operation within the 600 Volt Class.

B. Reference Standards: Low-voltage fuses shall comply with the latest applicable provisions and recommendations of the following even if not specifically listed in this Section:

1. UL 248 - Low-voltage Fuses.

2. NEMA FU1 - Low-Voltage Cartridge Fuses.

1.05 DESCRIPTION

A. Not Used

1.06 QUALITY ASSURANCE

1. Low-voltage fuses shall be designed, built and tested in accordance with UL 248.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. Manufacturer's catalog cuts for the fuses proposed for use with specifications and other data required to demonstrate compliance with the specified requirements.

2. Time-current curves for the fuses proposed for use.

B. Reports

1. Field Test Reports shall be submitted.

2. Manufacturer's Site visit report shall be submitted.

C. Operation and Maintenance Manual

1. Operation and Maintenance Manuals shall be submitted in accordance with this Section and the Specifications.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Fuses shall be delivered, stored and handled in accordance with this Section, the Specifications and the manufacturer's recommendations.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Spares

1. The Contractor shall furnish and deliver to the Engineer, at that part of the site and at such time as the Engineer may direct, spare fuses in accordance with this Section and the Specifications.

2. The spare fuses shall be listed in an index and packed in containers suitable for long term storage, bearing labels clearly designating the

manufacturer's part number with complete information for use and reordering.

3. Spare fuses shall include at a minimum the following:

a. 10 percent of each rating used.

b. Minimum of three of each rating.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Low-voltage fuses shall be as manufactured by:

1. Mersen Ferraz Shawmut, San Francisco, CA;

2. Littlefuse, Chicago, IL;

3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. General:

1. Fuses shall be compatible with the system operating voltage shown on the Contract Drawings.

2. Low-voltage fuse ampere ratings shall be as shown on the Contract Drawings.

B. Low-voltage Fuses:

1. Low-voltage fuses shall be current limiting, time delay type or non-time delay type where specified. Low-voltage fuses shall have a 200,000 RMS symmetrical ampere interrupting rating.

2. Low-voltage fuses with current ratings up to 600 ampere shall be UL class RK1, except fuses that serve the fire alarm system shall be UL class J.

3. Low-voltage fuses with current ratings greater than 600 ampere shall be UL class L.

1.05 DESCRIPTION

A. Not Used

1.06 QUALITY ASSURANCE

A. Unless otherwise shown on the Contract Drawings, or directed by the standards and codes referenced under this Section, the Contractor shall provide for each low-voltage motor or other power device, complete equipment for starting, stopping and control.

B. The starting, stopping and control equipment shall be provided with features of protection, current limitation, functioning and be complete with all accessories, appurtenances and supporting structures.

C. Control equipment shall be UL listed and properly designed with relation to the characteristics of operation of the motor and or device controlled.

D. Unless otherwise shown on the Contract Drawings or stated in the Specifications, each motor shall be provided with control equipment consisting of apparatus as follows:

1. Motors of 1/4 HP or less may, in the absence of other requirements, be controlled by a manual motor starter having thermal overload protection at all times.

2. Motors larger than 1/4 HP shall be controlled by a magnetic motor starter.

E. Each motor shall include overload protection based on latest standards.

1.07 SUBMITTALS

A. Shop Drawings

1. Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

a. Manufacturer's catalog cuts, technical information and enclosure details for the equipment proposed.

B. Operations and Maintenance Manuals

1. Operations and Maintenance Manuals

a. Operation and Maintenance Manuals shall be submitted in accordance with the Specifications.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Equipment shall be delivered, stored and handled in accordance with the Specifications and the manufacturer's instructions

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall furnish and deliver to the Engineer, at that part of the site and at such time as the Engineer may direct, spare parts for the enclosed controllers in accordance with this Section and the Specifications.

B. The spare parts shall be listed in an index and packed in containers suitable for long term storage, bearing labels clearly designating the manufacturer's part number with complete information for use and reordering.

C. The following spare parts shall be furnished:

1. One (1) set of contact tips, shunts and coils shall be provided for each 6 or less of each size motor starter.

2. One (1) auxiliary contact unit or one set of auxiliary contact tips shall be provided for each 6 or less motor starter.

3. Two (2) sets of arc chutes shall be provided for each type and rating of magnetic contactor.

4. One (1) timing relay shall be provided of each type installed as part of control equipment installation.

5. One (1) complete auxiliary relay shall be provided of each type installed as part of control equipment installation.

6. One (1) control transformer shall be provided of each rating and type installed as part of control equipment installation.

7. Two (2) complete sets of fuse replacements shall be provided of each rating and type installed as part of control equipment installation.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Switching devices shall be as manufactured by:
   1. General Electric Company, Stamford, CT
   2. Siemens, Washington, DC
   3. Or approved equal.

B. Magnetic motor starters shall be as manufactured by:
   1. General Electric Company, Stamford, CT
   2. Siemens, Washington, DC
   3. Or approved equal

C. Manual motor starters shall be as manufactured by:
   1. General Electric Company, Stamford, CT
   2. Siemens, Washington, DC
   3. Or approved equal

D. Control stations shall be as manufactured by:
   1. General Electric Company, Stamford, CT
   2. Siemens, Washington, DC
   3. Or approved equal

E. Docking Station shall be as manufactured by:
   1. Trystar, Fairbault, MN
   2. ESL Power Systems, Corona, CA
   3. Eaton Corporation
   4. Or approved equal

2.02 MATERIALS / EQUIPMENT

A. Switching Devices
   1. Switching devices shall be low-voltage devices provided in accordance with the details shown on the Contract Drawings. The switching devices required under this Section shall be the disconnect switch and circuit breaker types.

2. Switching devices shall be enclosed in NEMA type enclosures in accordance with the requirements specified under this Section, the Specifications and the Contract Drawings.

3. Switching device line and load terminals shall be provided with shields to prevent accidental contact with them. In addition, instrument probe holes shall be provided within the shields to permit investigation of the state of the terminals, by authorized personnel and approved procedures.

   a. Disconnect switch type switching devices shall be in accordance with the following:

      1) Switches shall be heavy duty type with number of poles, voltage and current ratings as shown on the Contract Drawings.

      2) Switches shall be capable of interrupting the full rated current at full rated voltage.

      3) Switch enclosure shall be provided with a viewing window through which it shall be permissible to observe the state of the main contacts and surge protective devices when provided.

      4) Where specifically shown on the Contract Drawings, disconnect switches shall be complete with fuses, surge protective devices and remote operation.

      5) Switches shall be the quick make and quick break type covered with an arc resisting barrier. The switch shall be provided with provision for locking in either open or closed position. The ratings shall be as follows:

Switch Rating in Amperes	Motor Horsepower	
	208-240 Volts	480Volts
60	Over 5 to 15	Over 5 to 30
100	Over 15 to 25	Over 30 to 60
200	Over 30 to 50	Over 60 to 125
400	Over 50 to 75	Over 125 to 200

   b. Circuit breaker type switching devices shall be in accordance with the following:

      1) The enclosed main and generator circuit breakers shall be the molded case type with number of poles, voltage, current and short circuit ratings as shown on the Contract Drawings. The main service breaker shall be UL listed as service entrance type.

2) Where indicated on the Contract Drawings, the main service breaker enclosure shall be equipped with a 120 Volt supply side fire alarm system tap ahead of the main service breaker with provisions for close coupling the fire alarm disconnect adjacent to the main circuit breaker enclosure.

3) Breakers shall be manually operated solid state type. Contacts shall be nonwelding silver alloy and arc extinction shall be accomplished by means of arc chutes.

4) Breakers shall have 100 amp frames as a minimum. Overload protection shall be provided on all poles, with trip settings as shown on the Contract Drawings.

5) Breakers shall be operated by a toggle-type handle and shall have a quick-make/quick-break over-center switching mechanism that is mechanically trip-free. Automatic tripping of the breaker shall be clearly indicated by the handle position.

6) Breaker enclosures shall be equipped with an external lockable handle with provision for locking in the closed or open position. The main circuit breakers open-close operation handles shall be suitable for remote operation using the remote switch operator system.

7) Where shown on the Contract Drawings breakers shall be provided with electronic trip units. Electronic trip units shall be RMS type and include long time, short time, and instantaneous settings as minimum.

8) Where specifically shown on the Contract Drawings breakers shall be provided with zone interlocking features, shunt trips, provisions for annunciation of status and auxiliary devices.

B. Motor Starters

1. Magnetic

1) Magnetic motor starters shall be provided complete with fused control power transformer, pilot devices, auxiliary contacts and accessories as shown on the Contract Drawings or stated in the Detailed Specifications. Motor starters shall not be smaller than NEMA size 1.

2) Magnetic motor starters shall be enclosed in NEMA type enclosures in accordance with the requirements specified under this Section. The starter shall be combination type. The enclosure shall be equipped with an external operable, pad lockable handle, arranged so that it is impossible to open the door unless the breaker is open.

3) The starter shall be magnetic coil operated, and shall include a magnetic or solid state motor circuit protector with trip unit range adjustable from 700 to 1300 percent of full load.

4) The combination starters shall be suitable for interrupting the available low-voltage short circuit infeed at the line terminals of the enclosure.

5) Magnetic contactors shall be 3 pole, single throw, 60 Hz with auxiliary contacts for under-voltage protection. Contactors shall be mounted upon steel bases with insulated mountings or upon bases of insulating material. Contactors shall be provided with necessary barriers and arc chutes.

6) Contactors shall be NEMA rated as follows:

NEMA Size of Contactor	Motor Horsepower	
	208-240 Volts	480Volts
1	¼ to 71/2	¼ to 10
2	Over 71/2 to 10	Over 10 to 25
3	Over 15 to 25	Over 25 to 50
4	Over 30 to 40	Over 50 to 100
5	Over 40 to 75	Over 100 to 200

7) Contactors in Sizes 1 through 4 shall have double break, silver to silver main contacts. Contactors in Size 5 shall have silver plated tips which close with rolling action and which have self-aligning and self-cleaning features. Auxiliary and interlocking contacts for all sizes shall be of the silver button type. All contact tips shall be easily renewable. Flexible shunts shall be tinned copper braid or tinned extra flexible copper cable.

8) Overload relays shall be of the ambient temperature compensated bi-metallic or solid state type with interchangeable sensors and manual reset feature. Relay shall include a normally open auxiliary contact for remote alarm purposes. Sensors for overload relays shall be selected to match full load currents of the motors to allow motor operation at maximum safe loads without damage to equipment. Full load current data shall be obtained from nameplates of motors actually installed.

9) Pilot devices shall be heavy duty type, rated 10 amp continuous. Pushbuttons, selector switches, indicating lights, and other devices shall be located on the starter

enclosure. Indicating lights shall be push-to-test, LED, transformer type with 12 volt secondaries.

10) Relays shall be standard, latching type and pneumatic or solid state time delay type. Relays shall be provided with contacts rated 10 amp with number as required.

11) Special overload protection shall be provided where definite purpose motors cannot be protected by standard thermal overload relay applications.

2. Manual

a. Manual motor starters shall be provided complete with pilot devices as shown on the Contract Drawings.

b. Manual motor starters shall be enclosed in NEMA type enclosures in accordance with the requirements specified under this Section.

c. Manual motor starters shall be toggle operated, NEMA horsepower rated, single phase type with thermal overload protection unless shown otherwise on the Contract Drawings. Pilot devices when required shall be in accordance with the requirements specified under this Section.

d. Where shown on the Contract Drawings, manual motor starters shall be low-voltage, three phase type without overload protection for use as manual starting disconnect switches. The switches shall be horsepower rated, as required for the application intended.

3. Control Stations

a. Control Stations shall be provided in accordance with the details on the Contract Drawings.

b. Control Stations shall be enclosed in NEMA type enclosures in accordance with the requirements specified under this Section.

c. Control stations shall be industrial, heavy duty, oil tight construction with clearly marked legend plates. Stations shall have operating devices as shown on the Contract Drawings.

d. Contact ratings shall be 10 amp minimum. All indicating lights shall be LED, transformer type, lens color shall be as shown on the Contract Drawings.

4. Enclosures

a. Enclosures shall be provided for the enclosed controllers, switching devices, motor starters and control stations.

b. Enclosures located indoors in dry, dusty areas shall be gasketed and shall be constructed of 14-gauge sheet steel.

c. Cabinet type enclosures shall include hinged and gasketed front doors.

d. Enclosures shall be provided in accordance with NEMA requirements as required for the area classifications indicated on the Contract Drawings.

1) For dry, dusty locations, enclosures shall meet NEMA 12 requirements.

2) For wet or corrosive locations, enclosures shall meet NEMA 4X requirements. NEMA 4X enclosures shall be fabricated from 316 stainless steel.

3) Enclosures within hazardous locations shall meet Class 1, Division 1, Group D requirements. Hazardous enclosures shall be fabricated from cast metal

C. Remote Switch Operator System:

1. Provide a remote switch operator and actuator system, CBS ArcSafe Chicken Switch, to enable operating personnel to stand outside the arc flash protection boundary while opening and closing the enclosed main circuit breaker for the two service entrance main circuit breakers, one located at the TI-010 Dechlorination site and the other located at the TI-011 Disinfection site.

2. The system operator shall include a portable base unit that includes a 24 Volt DC power supply and a radio remote control. The system actuator shall be suitable to open and close the enclosed molded case main circuit breakers.

3. The system actuator shall be matched to the actual manufacturer's breaker type and mounting. Contractor shall coordinate the actuator requirements with the information of the approved circuit breakers to be installed.

D. Docking Stations:

1. Provide docking stations for connection of a portable generator at each location shown on the Contract Drawings.

2. Docking stations shall be UL listed suitable for 65KA short circuit rating and 208/120 Volt, 4 pole, 3 phase operation or 480 Volt, 3 phase operation and continuous ampere rating as shown on the Contract Drawings.

3. Docking station enclosures shall be stainless steel construction rated NEMA 4X. Enclosures shall include a pad lockable door and removable

panels suitable for conduit entry with access to terminations. Enclosure shall be suitable for bottom entry of the portable cables.

4. Docking stations shall be equipped with tin plated copper bus bars, and mechanical lugs terminations sufficient for the quantity and size of cables shown on the Contract Drawings. Docking station shall also include Posi-Lok panel mounted, male receptacles rated 600Volt suitable for 3 phase, neutral and ground as required with protective covers. When multiple sets are indicated on the Contract Drawings provide the additional phase, neutral and ground receptacles for each parallel set. Provide matching Posi-Lok female plugs, one for each receptacle.

5. The docking stations shall include a phase rotation monitor and two 120 Volt, single phase receptacle outlets. One outlet shall be duplex type, rated 20 amperes and the second single outlet shall be rated 30 amperes.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Equipment shall be mounted so that sufficient access and working space is provided for ready and safe operation and maintenance.

B. Equipment shall be securely fastened to walls or other surfaces on which they are mounted.

C. Independent supports shall be provided where no wall or other surface exists.

D. Connect the generator supply cables at the docking station to comply with DEP standard of clockwise ABC phase rotation.

E. Enclosed controllers shall be installed in conformance with the NYCEC.

3.03 FIELD TESTING / QUALITY CONTROL

A. Test phase rotation of the Con Edison service supplies to verify suitability with the generator supply standard for clockwise ABC phase rotation. Adjust, if necessary, the Con Edison supply connections to ensure compatible rotation.

B. Provide testing for the main and generator service circuit breakers. Testing for these breakers shall be included as a part of the panelboard testing. Test the main and generator service circuit breakers in accordance with the applicable requirements specified under Section 26 24 16, Panelboards.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

SECTION 26 29 23 – VARIABLE-FREQUENCY MOTOR CONTROLLERS
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Requirements for providing Variable-Frequency Motor Controllers known as Variable Frequency Drives (VFD/s). VFDs shall be provided in accordance with the requirements specified under this Section, the Specifications and the Contract Drawings.

B. The VFDs required under this Section shall be the low-voltage, 18 pulse converter, voltage source pulse -width modulated inverter types.

C. The following index of this Section is presented for convenience:

Article	Title	Section Page
PART 1	GENERAL	1
1.01	Summary	1

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 26 05 27 - Grounding

B. Section 26 05 53 – Identification for Electrical Systems

C. Section 26 05 91 – Low-Voltage Electric Motors

1.04 REFERENCES

A. Definitions

1. All references to the Electric Utility or the Utility shall mean the Local Electric Utility having jurisdiction.

2. The Electric Utility is Con Edison.

3. Low-voltage as used in this Section and the Specifications shall mean all equipment, conductors, insulation systems and accessories intended for operation at less than 1000 volt and within the 600 V Class

B. Reference Standards. VFD shall comply with the latest applicable provisions and recommendations of the following:

1.	NYCEC	-	New York City Electrical Code.
2.	NEMA ICS 2	-	Industrial Control and System Controllers, Contactors and Overload Relays Rated 600 volts.
3.	NEMA ICS 7	-	Adjustable Speed Drive Systems.
4.	NEMA MG-1	-	Motors and Generators.
5.	NETA ATS	-	NETA Acceptance Testing Specification.
6.	NIST	-	National Institute of Standards and Technology.
7.	IEEE 519	-	Recommended Practices and Requirements for Harmonic Control in Electrical Power Systems.
8.	ANSI/UL 508	-	Industrial Control Equipment.
9.	UL 489	-	Molded-Case Circuit Breakers, Molded-Case Switches and Circuit Breaker Enclosures.
10.	BWT Design Guideline	-	Motor Starting for Low-voltage applications.

1.05 DESCRIPTION

A. VFD General

1. Each VFD unit shall consist of an adjustable frequency controller and associated controls for continuous speed adjustment and protection of the driven equipment.

2. The adjustable frequency controller shall be a microprocessor-based, pulse-width modulated design, suitable for operation on a low-voltage, 3 phase, 60 Hz supply.

3. The controller shall consist of

   a. a power factor /harmonic filter unit (if required)

   b. 18 pulse, minimum, diode-bridge converter fed by rectifier-grade phase-shifting transformer

   c. a fixed DC bus section

   d. and an IGBT based power transistor inverter output section.

4. The controller shall produce an adjustable AC voltage/frequency output to vary the speed of the driven equipment and maintain the drive motor V/Hz rating.

1.06 QUALITY ASSURANCE

A. VFDs shall be designed, built and tested in accordance with the latest applicable editions of ANSI/IEEE, NEMA, and UL. The VFDs shall be a custom package solution to satisfy the 18 pulse specified requirement due to the low horsepower of the driven equipment.

B. The VFD shall be UL listed.

C. The VFD manufacturer shall have 10 years' experience in the design and be regularly engaged in manufacturing and servicing equipment for installations of the type and size specified under this Section.

D. Each VFD shall be totally compatible with the driven equipment and motors. The VFD shall be matched to the driven equipment specific load requirements for each system specified in this Section or as shown on the Contract Drawings.

E. Output speed control of the controlled motor shall be continuous throughout speed range of 2 to 60 Hertz under variable torque load or constant torque load as specified for the driven equipment.

F. Operation of the variable frequency drive shall not over stress the driven motor insulation system.

G. Each and multiple VFD/s installation/s shall meet the requirements in IEEE 519 for individual and total harmonic voltage and current distortion on both the utility and emergency generator.

H. In order to centralize responsibility and to ensure that all equipment is properly coordinated, the VFDs specified under this Section shall be obtained from the driven equipment suppliers.

I. All VFDs that comprise a given system shall be similarly equipped. Similar components of each system shall be the product of a single manufacturer.

J. All materials, equipment and parts comprising the each VFD shall be new, of current manufacture and of the highest grade. All components shall be covered by the manufacturer's standard warranty on new VFDs.

K. The VFD manufacturer shall have complete parts and service facilities and a factory-trained serviceman, located within a hundred miles of the project site, available on a 24-hour basis. Services shall be readily available so to avoid long periods of interruption or require extensive spare parts inventory.

L. Unless otherwise authorized by the Engineer, the manufacturer's service representative shall be direct employee of the equipment manufacturer, with at least five (5) years of experience in the installation, testing and startup of equipment specified herein.

M. Manufacturer's sales and marketing representatives shall not be accepted as manufacturer's service representative

N. The VFD manufacturer shall use a shop test facility that has recently calibrated testing apparatus and qualified, experienced technicians, for all shop tests.

O. Calibration of testing apparatus shall be within one year.

P. All test equipment and instrument calibration shall be in accordance with the latest edition of the accuracy standard of the NIST.

Q. Field Tests:

1. VFDs shall be field tested. Field testing shall be performed in accordance with the requirements specified under this Section.

2. Retain the services of the VFD manufacturer for field service. Field service shall be in accordance with the requirements specified under this Section.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. A list of proposed manufacturers with the products they produce proposed for the contract.

2. Manufacturer's technical information which shall include:

a. Dimensional information and construction details of enclosures. Enclosure details shall consist of exterior and interior front door with nameplate legends, interior door front and rear views and terminal block layout.

b. Three-line power and control schematic diagrams.

c. Technical specifications.

d. Catalog cuts.

e. Wiring diagrams showing the interconnection of conductors to remote devices with terminal assignments.

f. Harmonic analysis which shall include all voltage and current harmonics up to the 49th.

3. Description of shop and field testing methods and procedures, and apparatus with calibration dates shall be submitted.

4. Qualifications of proposed service firm who will perform the service and maintenance agreement. Five recent references with phone numbers shall be submitted.

B. Certificates of Compliance

1. Certification letters from the VFD and motor manufacturers that the approved driven equipment has been reviewed and that the VFDs and motors are compatible and shall be provided in accordance with the requirements specified.

C. Reports

1. Manufacturer's written determination as to whether reforming of DC bus capacitors is required before the commencement of Field Tests

2. Shop test and field test reports shall be submitted.

3. Manufacturer's site visit report shall be submitted.

D. Software

1. Software shall be submitted and provided to permit the Engineer or other selected authorized personnel:

a. To set or modify VFD parameters

b. Perform analysis of VFD operation

c. View and analyze VFD faults.

E. Operation and Maintenance Manuals

1. Operation and Maintenance Manuals shall be submitted in accordance with this Section and the Specifications.

1.08 DELIVERY, STORAGE, AND HANDLING

A. VFDs shall be delivered, stored and handled in accordance with this Section and the Specifications, the manufacturer's instructions and the following:

1. VFD equipment shall be inspected for shipping damage or loose parts when received.

2. Evidence of water which may have entered equipment during transit shall be checked for.

3. VFD equipment shall be stored in a clean, dry location in which a uniform temperature is maintained. Equipment shall be protected with coverings and air circulation shall be maintained.

4. Where dampness or condensation may be encountered, heaters shall be provided for equipment to prevent moisture damage.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall furnish and deliver to the Engineer, at that part of the site and at such time as the Engineer may direct, spare parts for the VFD in accordance with this Section and the Specifications.

B. The spare parts shall be listed in an index and packed in containers suitable for long term storage, bearing labels clearly designating the manufacturer's part number with complete information for use and reordering.

C. Spare parts shall be furnished and shall include one set for every four drives installed per horsepower rating. Each spare part set shall consist of the manufacturer's recommended spare parts inventory and shall include at a minimum the following:

1. One set of transistor and diode modules with accessories
2. One power supply module
3. One set of fans
4. One set of power fuses of each size and type used.
5. Two sets of control power fuses of each type and size used.
6. Two per ten of pilot lights of each type used.

D. A rugged portable microprocessor based viewer shall be provided to run software provided to set or modify VFD parameters, perform analysis of VFD operation and view and analyze VFD faults.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer’s standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. VFDs shall be as manufactured by:

1. Siemens, Alpharetta, GA;
2. Schneider Electric;
3. ABB, New Berlin, Wisconsin;
4. Rockwell Automation
5. Or approved equal.

B. The VFD shall be customized by:

1. ABB

2. Engineered Drive Solutions.
3. Electronic Drives and Controls
4. Integrated Controls
5. Or approved equal

2.02 MATERIALS / EQUIPMENT

A. Enclosure

1. Each VFD shall be provided with a free standing, dead-front, front access, grounded, NEMA 12, filtered and gasketed enclosure. Each enclosure shall be suitable for mounting all components required of a given unit.
2. Each enclosure shall provide adequate cooling for the components within and shall include positive ventilation.
3. Each enclosure shall include a circuit breaker disconnect switch. The switch handle shall be suitable for padlocking and shall be through-the-door type. Operation of the switch shall remove the service supply from all internal components. Power devices shall be suitable for the interrupting capacity shown on the Contract Drawings. Include current limiting semi-conductor fuses where required for protection of solid state components.
4. Each enclosure door shall include an operator interface for access to controller's digital keypad and display.
5. The enclosure shall have identifying nameplates in accordance with the requirements of Section 26 05 53 Identification for Electrical Systems.
6. Each enclosure shall be equipped with phenolic type terminal blocks suitably labeled for all internal and remote wiring requirements plus 20 percent spare.

B. Adjustable Frequency Controller

1. General
   a. The adjustable frequency controller shall be microprocessor-based, pulse width modulated design, suitable for operation on a low-voltage, 3 phase, 60 Hz supply. The supply voltage shall be as shown on the Contract Drawings.
   b. The controller shall produce an adjustable AC voltage/frequency output to vary the speed of the driven equipment and maintain the drive motor V/Hz rating.
   c. The controller shall consist of
      1) A power factor /harmonic filter unit (if required)
      2) 18 pulse, minimum, diode-bridge converter fed by rectifier-grade phase-shifting transformer.
      3) A fixed DC bus section

4) A 3 percent DC bus reactor or input line reactor.

5) An IGBT based power transistor inverter output section.

d. The controllers' solid state converter input section switching devices shall have a 1600-volt PIV rating.

e. The controller shall have an overload rating of 110 percent variable torque, 150 percent constant torque for one minute.

f. RMS harmonic content of output current shall be less than 5 percent of fundamental current.

g. Controller shall be able to withstand output terminal line-to-line short circuits without component failure.

2. Operating Criteria

a. The controller's operating criteria shall be in accordance with the following:

1) Ambient temperature range shall be 0 degrees C to 40 degrees C.

2) Operational humidity shall be up to 90 percent non-condensing.

3) Altitude shall be below 3,300 feet above sea level.

4) Nominal input voltage variation shall range from plus 10 percent to minus 10 percent.

5) The controller shall include an undervoltage feature to permit trip-free operation down to 35 percent undervoltage.

6) Nominal frequency shall be 60 Hertz plus or minus 3 Hz.

7) Input power factor shall be 95 percent displacement power factor at all operating speeds.

8) Efficiency shall be a minimum of 96 percent at full speed and full load.

9) Losses in the efficiency calculations shall include those of the input transformer, harmonic filter and power factor correction if applicable, convertor, output filter if applicable, auxiliary controls, internal boards and cooling equipment.

3. Features

a. The controller shall have features in accordance with the following:

1) Digital keypad and display module shall provide parameter setting, adjustments and monitoring of control functions and faults. Display messages shall be in English.

2) Serial communication port shall allow connecting to a programmable logic controller interface.

3) Independent acceleration/deceleration rates shall provide 2 to 600 seconds minimum. When called to stop, the motor shall decelerate to minimum speed before stopping.

4) Power loss feature shall allow ride through capability.

5) Time delay automatic restart shall allow restart after controller fault conditions with programmable attempts.

6) Coasting motor restart shall permit the controller to restart into a coasting motor without damage or tripping.

7) The coasting motor restart feature shall allow switching from bypass mode to VFD mode while operating without shutdown.

8) Control inputs and outputs shall be isolated.

4. Protection and Logging of faults

a. The controller shall have protective functions in accordance with the following:

1) Input line surge protective device shall provide transient protection.

2) Electronic over-current trip shall provide instantaneous and inverse time overload protection.

3) Over-temperature trip shall provide temperature protection.

4) Current limit trip shall provide current protection.

5) Input line over and under voltage trip shall provide voltage protection.

6) Ground fault trip shall provide ground protection.

b. The controller shall have a built in fault log in accordance with the following:

1) All faults shall be retained indefinitely in the log.

2) The date and time of each fault shall be part of the information describing the fault.

3) It shall be possible to download the complete fault log into a CSV file for off controller analysis.

C. Output Filter

1. General

a. An output filter shall be provided to prevent overstressing the motor insulation system. An output filter shall be included for each VFD,

whenever the cable length between the motor and VFD exceeds the following based upon the noted switching frequencies.

1) 1 KHZ switching frequency, 200 feet cable length.

2) 3 KHZ switching frequency, 175 feet cable length.

3) 12 KHZ switching frequency, 100 feet cable length.

b. Output filters shall be provided in all other cases, based upon the recommendations of the VFD and motor manufacturer's, whenever the actual voltage peaks at the motor terminals exceed the NEMA-MG1 limits.

2. Filter Design:

a. The filter shall be three phase, low-voltage class motor-protecting type consisting of suitable values of inductance, capacitance and resistance to form a damped, low pass filter.

b. The filter shall be a low-loss type specifically designed to reduce the voltage wave form dV/dT. The filter shall allow cable lengths at minimum exceeding the actual application distances with a waveform resulting in voltage spikes at the motor terminal which are within the NEMA-MG1-Part 31 voltage stress levels.

c. The filter shall be suitable for mounting within the VFD enclosure.

D. Overload Relays:

1. Overload relays shall be provided as required to protect the motor from overload where the controller overload protective function exceeds the motor capability.

2. Overload relays shall be solid state or thermal ambient temperature compensated type sized for the full load amperes of the actual motors furnished.

3. Overload relays shall include manual reset capability and a normally open auxiliary contact for alarm indication,

E. Controls

1. General

a. Each VFD control system shall be equipped with all control and pilot devices and other components required for a complete functional system.

b. Each VFD control shall be powered from a suitably sized and protected control power transformer.

c. Each VFD control shall include status indicators, controller and system fault condition displays and operating controls.

d. Status indicators and operating controls associated with the drives control shall be installed on the front door of the enclosure.

e. The control arrangement shall be such that the VFD internal electronic supply voltage is isolated from all field wiring.

2. Control and Pilot Devices:

a. Relays shall be standard, latching type and solid state time delay type.

b. Relays shall be provided with contacts rated 10 amp with number as required.

c. Pilot devices shall be heavy duty type, rated 10 amp continuous.

d. Indicating lights shall be push-to-test LED type.

F. Controls:

1. Stop/Start and Speed Control for all VFDs: VFDs shall respond to remote field mounted control station that includes a Local-Off-Remote selector switch, start/stop pushbuttons and a potentiometer. Field mounted control station shall also include speed indication. With the switch in remote position, stop/start and speed control shall be based upon a remote stop/start contact and a 4-20mADC speed signal from the control system. In local position, stop/start and speed control shall be from the remote field mounted control station's, start/stop pushbutton and potentiometer.

2. Protective Controls: The VFDs shall be provided with the following protective controls:

a. High Pressure Shutdown: The high pressure control shall respond to a remote pressure switch that activates at high pressure. When high pressure is activated, VFD shall shutdown after an adjustable delay.

b. Leak Detection Shutdown: The leak detection control shall respond to a remote leakage switch that activates when leakage is detected. When the leak switch is activated, VFD shall shutdown after an adjustable delay. Include provisions to remotely supply 120 Volt to the leakage switch.

c. Motor Overtemperature Shutdown: The motor over-temperature control shall respond to a remote normally closed thermal contact that activates on motor over-temperature. When the thermal contact is activated, VFD shall shutdown.

G. Auxiliary Features:

1. Each VFD shall be provided with the following auxiliary features.

a. Status indicators shall include separate pilot lights for indication of

1) Motor run –Red.

2) Control power on - White.

b. Shutdown and alarm indicators shall include separate pilot lights

1) Amber for each of the shutdown and alarm condition.

c. Shutdown indication circuitry shall be arranged such that when activated, the indicator will require manual reset.

d. Contact outputs shall include separate dry contacts for remote indication of Local-Off-Remote selector switch not in remote, motor run, each shutdown condition and controller faults.

e. Speed output shall include a 4-20 MA signal for remote indication of motor speed.

2. Field Mounted Control Station; Provide field mounted control station (Nema 4X) for each VFD with the following functionality:

a. Local-Off-Remote Switch

b. Start/Stop Pushbutton

c. Speed Potentiometer

d. Common malfunction indicating light

e. Speed indicator

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Finishes

1. All metal surfaces of the VFD shall be thoroughly cleaned and given one coat of zinc chromate primer.

2. All interior surfaces shall then be given one shop finishing coat of a nitro-cellulose lacquer enamel.

3. All exterior surfaces shall be given three coats of the same lacquer. The color of the exterior finishing coats shall be light gray ANSI No. 61.

4. All printed circuit boards shall be coated with a conformal coating to provide protection for all components.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Certified Shop Tests:

1. Shop testing shall be performed at the VFD manufacturer's plant prior to shipment.

2. Shop test shall demonstrate that the equipment tested conforms to the requirements specified.

3. Manufacturers standard factory tests shall be performed on each VFD and shall in addition include:

a. Operating the VFD with a motor of ratings similar to the driven equipment motor through all of the speed and load ranges in a heated environment for a minimum of two hours.

b. Simulation of each control signal and each alarm function to verify proper and correct drive action.

4. The Contractor shall provide a Shop Test Report. The report shall identify the tests performed and the results obtained.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. VFD equipment shall be installed in accordance with manufacturer's instructions and recommendations.

B. VFD equipment shall be installed so that sufficient access and working space is provided for ready and safe operation and maintenance.

C. VFD equipment shall be installed on concrete pads at locations shown on the Contract Drawings.

D. Steel channels shall be provided for support of equipment. Equipment shall be secured to mounting surface with anchor bolts of sufficient size and number to secure equipment.

E. Install nameplates for identification of equipment.

3.03 FIELD TESTING / QUALITY CONTROL

A. After installation, VFD shall be field tested for operation and conformance. The Contractor shall perform field tests in accordance with this Section and Specifications.

B. VFD testing shall be performed by the manufacturer's representative, prior to energizing equipment.

C. Equipment shall not be energized without the permission of the Engineer.

D. The testing shall be in accordance with the recommendations of the manufacturer's representative and shall consist at a minimum of the following:

1. Manufacturer’s determination of whether the reforming of DC bus capacitors is required,

2. Device settings and drive adjustments shall be verified.

3. Mechanical and electrical interlocks shall be inspected and controls shall be checked for proper operation.

4. Each drive shall be tested through the specified speed ranges and loads for a minimum of two hours.

5. Each drive shall be tested by using the actual control signal for remote and local operation.

6. Each drive alarm function shall be tested.

7. Tests to verify the Harmonic analysis submitted. Test shall be conducted at the input to the drive and shall be conducted with and without the VFD operating.

E. Manufacturer's Field Services

1. The Contractor shall provide the services of a qualified manufacturer's service representative who shall adequately supervise and assist in the installation of the generator sets, check the generator set installation before it is placed into operation, assist in the performance of field tests, observe and assist initial operations and train the Contractor and the City's operations and maintenance staff in the care, operation and maintenance of the generator sets.

2. The Contractor shall provide equipment start-up services and training in accordance with this Section, the Specifications and the Contract Drawings and the following requirements:

a. Minimum number of manufacturer's representative site visits per type of generator set:

Construction Phase	No of Visits	Person-days per visit
Installation	5	2
Field Tests	3	2
Training	3	2

3. Any additional time required to achieve a successful installation shall be at the expense of the Contractor.

4. The Engineer shall have the right to reallocate any unused person-days.

5. The Contractor shall provide a field report from the manufacturer's representative for each visit to the site. The report shall include complete information on time, schedule, tasks performed, persons contacted, problems corrected, tests results, training, instruction and all other pertinent information.

6. The service representative shall sign in and out with the Engineer on each day they are at the site. Person-days shall be understood to be the actual time spent at site and does not include travel to and from the site.

SECTION 26 31 00 – PHOTOVOLTAIC POWER SYSTEM
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Requirements for providing photovoltaic power systems. Photovoltaic power systems shall be provided in accordance with the requirements specified under this Section, the Specifications, and the Contract Drawings.

B. The Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install photovoltaic power systems complete and operational.

C. Two separate and distinct photovoltaic power systems are required, one located at the TI-010 Dechlorination Facility and one located at the TI-011 Disinfection Facility as shown on the Contract Drawings.

D. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the

applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 26 05 53 - Identification for Electrical Systems

1.04 REFERENCES

A. Photovoltaic power systems shall comply with the latest applicable provisions and recommendations of the following:

1. New York City Electrical Code.
2. NFPA 70, National Electric Code
3. UL 1699B, Standard for Photovoltaic DC Arc-Fault Circuit Protection
4. UL 1703, Standard for Safety Flat-Plate Photovoltaic Modules and Panels.
5. UL 1741, Standard for Inverters, Converters, Controllers, and Interconnection System Equipment for Use with Distributed Energy Resources.
6. IEC 61215, International Standard for Crystalline Silicon Terrestrial Photovoltaic Modules – Design Qualifications and Type Approval
7. FCC Part 15 Class B, Code of Federal Regulations.
8. ASCE 7-05, Standard for Minimum Design Loads for Buildings and Structures
9. IBC, International Building Code.
10. NABCEP, North American Board of Certified Professional and Associates.

1.05 DESCRIPTION

A. The photovoltaic power systems required under this section includes providing roof mounted solar panels, associated supports and interconnecting wiring and conduits. Each system shall be grid connected and include an inverter to supply a 208 Volt AC single or three phase output from the DC supply of the interconnected solar panels as shown on the Contract Drawings.

B. The solar array pitch shall be 10 Degrees and an array azimuth of 180 Degrees. The interconnected solar panel system shall have a total peak power output of 4.0 KW for the TI-010 Dechlorination facility and 9 KW for the TI-O11 Disinfection facility. Total peak power output shall be DC-STC (Standard Test Conditions) of 1000 W/m2 solar irradiance and 25 degrees C PV module temperature.

C. The Contract Drawings show the overall system arrangements. The drawings are for purposes of guidance and for showing the functional features and spacing

required. The drawings do not show all components required and the photovoltaic power system shall incorporate all necessary requirements for proper functionality and operation.

D. The photovoltaic power systems shown on the Contract Drawings and specified under this Section is based upon information from the specified manufacturers and is the basis of the design presented.

1.06 QUALITY ASSURANCE

A. General:

1. Photovoltaic panels and inverters shall be designed, built and tested in accordance with the latest applicable editions of UL and IEC standards. Photovoltaic panels and inverter shall be UL listed.

2. The photovoltaic panels and inverters manufacturers shall have experience in the design and be regularly engaged in manufacturing equipment for installations of the type and size specified.

B. Photovoltaic Power System Installer:

1. In order to centralize responsibility, the Contractor shall retain the services of a photovoltaic power system licensed NABCEP installation professional. The system installer shall have experience with photovoltaic power systems with a minimum of five successful grid-connected projects of comparable size and complexity.

2. The system installer shall provide a turnkey installation and be responsible for the photovoltaic power system designs and overall supervision of each installation utilizing the available free roof space shown on the Contract Drawings.

3. All equipment provided under this Specification shall be obtained from the system installer who shall assume full responsibility for the completeness of each system and shall be the source of information on all equipment furnished regardless of the manufacturing source of that equipment.

4. Provide the services of one of the following system installers:

a. Solar Liberty.

b. Buffalo Solar.

c. CIR Solar.

C. Field Tests and Services:

1. The photovoltaic power systems shall be field acceptance tested. The photovoltaic power system installer shall be retained for field testing and services. Field testing and services shall be in accordance with the requirements specified under this Section.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited, to:

B. Manufacturer's technical Information which shall include for each system:

1. Manufacturer's specifications and other data. Data shall be submitted for each component to be provided. Data shall include type, ratings, settings, catalog cuts and other technical information.

2. A completed materials list with outline and summary sheets and schedule of components and supporting system.

3. Site plan drawing showing the solar panel roof mounted arrangement along with system summary information and legend.

4. Wiring diagrams showing the inverter and solar panel wiring interconnections and sizes.

5. Solar panel support details.

C. Reports:

1. Field test and site visit reports shall be submitted.

1.08 DELIVERY, STORAGE, AND HANDLING

A. All equipment shall be delivered, stored, and handled in accordance with this Section, the Specifications, and the manufacturer's recommendations and the following:

1. Equipment shall be inspected for shipping damage or loose parts when received. Evidence of water which may have entered equipment during transit shall be checked.

2. Equipment shall be stored in a clean, dry location in which a uniform temperature is maintained. Equipment shall be protected with coverings and air circulation shall be maintained.

B. Where dampness or condensation may be encountered, heaters shall be provided for equipment to prevent moisture damage.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

1.11 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall furnish manufacturer's recommended spare parts, special tools and supplies that match products installed and that are packaged with protective covering for storage and identified with labels describing contents with the manufacturer's name and part number with complete information for use and reordering.

B. Spare parts, special tools and supplies shall consist of the system installer's recommended inventory. Special tools that are required to assemble, repair and maintain the photovoltaic power system shall be provided.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Provide photovoltaic panels manufactured by one of the following:

1. Hanwha, model Q-cells.
2. Canada Solar, model CS6P.
3. LG Solar, model LG250
4. Or approved equal.

B. Provide inverter manufactured by one of the following:

1. Solar edge.
2. SMA.
3. Enphase.
4. Or approved equal.

C. Provide racking system manufactured by one of the following:

1. DynoRaxx.
2. Unirac.
3. Iron Ridge
4. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Photovoltaic Panels:

1. The photovoltaic panels shall be monocrystalline modules rated 250 watts, STC complying with UL 1703 and IEC 61215.

2. Panel construction shall include an anodized aluminum frame with pre-stressed anti-reflection glass front cover and composite film back cover.

3. Panels shall be equipped with combiner box with bypass diodes, cable and connector as required for the system interconnections.

B. Inverter:

1. Inverters shall be grid connected to a utility supply. Inverter power input and operating characteristics shall be compatible with the PV panel supply.

2. Inverters shall be certified to meet the requirements of UL-1741, IEEE 1547 and FCC part 15 class B.

3. Inverter features shall include the following:

   a. Automatic rapid shutdown upon AC grid disconnection.

   b. Integrated arc fault protection

   c. RS-485 surge protection.

   d. Reverse polarity protection.

   e. Integrated DC disconnect switch.

4. The electrical requirements of each inverter shall include:

   a. Maximum Input Voltage: 500 VDC or less.

   b. AC Grid Connection: TI-010 Single phase, TI-011 three phase, 208 Vac

   c. Nominal AC Voltage Range: 183 to 229 Volts

   d. Nominal AC Frequency: 60 Hz

   e. Rated AC Power Output: TI-010 4150 VA and TI-011 9000 VA

   f. CEC Efficiency 97% or greater

   g. Maximum DC Power TI-010 5100 Watts and TI-011 12150 Watts

5. Inverter environmental and mechanical features shall include:

   a. Enclosure Rating NEMA 12 minimum.

   b. Relative Humidity: 0-95%

   c. Ambient Temperature -10ºC to +50ºC

C. Combiner Boxes:

1. Combiner boxes shall be NEMA 4X rated and UL listed as an accessory to UL 1741 for combining multiple photovoltaic circuits. Combiner boxes shall be equipped with terminals, fuses, surge protection, grounding and all required hardware necessary for proper operation and protection of the photovoltaic circuits.

D. Mounting System:

1. The solar panels shall be mounted on a ballasted racking system. The racking system shall be suitable for mounting on flat roof surfaces and slightly sloped roofs, 5 degrees or less without the need for roof penetrations.

2. The racking system shall be wind tunnel tested and certified by a Professional Engineer licensed in the State of New York and compliant with ASCE 7-05, and the IBC.

3. The racking system shall be non-corrosive construction consisting of fiberglass, thermoplastic resin or glass reinforced composite with Type 304 stainless steel clamps.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Equipment shall be installed in accordance with the system installer's instructions and recommendations.

B. Equipment shall be installed at locations shown on the Contract Drawings. Install solar panels at available free roof space when accounting for both fire code and equipment access.

C. Install nameplates for identification of equipment.

3.03 FIELD TESTING / QUALITY CONTROL

A. Field Commissioning and Testing:

1. After installation, each system shall be field commissioned, and tested for operation and conformance. The Contractor shall perform field commissioning and testing in accordance with this Section.

2. The field commissioning and testing shall be witnessed by the Engineer and Certified by the Contractor.

3. The field commissioning and testing of each shall be performed by the system installer skilled representatives, prior to energizing equipment. All commissioning and testing shall be in accordance with the procedures and recommendations of the system installer's representatives.

4. Equipment shall not be energized without the permission of the Engineer.

B. System Installer's Field Services:

1. The Contractor shall furnish the services of the system installer qualified service representatives who shall supervise in the installation of each system, check the equipment installation before it is placed into operation, perform field commissioning and testing, observe and assist initial operations.

2. The Contractor shall provide equipment start-up services in accordance with this Section and the Specifications.

3. The Contractor shall provide the services of the representatives for the number of site visit and time durations necessary to perform each of the specified services and as required to successfully place the equipment of each system in proper operation.

4. The Contractor shall provide field reports for each system from the system installer representatives for each visit to the site. The report shall include complete information on time, schedule, tasks performed, persons contacted, problems corrected, tests results, training, instruction, and all other pertinent information.

5. The system installer representatives shall sign in with the Engineer on each day they are at the site.

6. The system installer shall provide system training for City's staff on the operation and maintenance of the system equipment. The training shall be conducted by the system installer representative who shall be skilled at providing training programs of the type required. The training shall be conducted during separate two 8-hour sessions and shall include both classroom and field instruction at times selected by the City. The training program shall be video-taped and turned over to the City.

PART 1 GENERAL

1.01 SUMMARY

A. This section includes the requirements for providing three mobile power generator sets. The mobile portable generator sets shall be purchased and delivered to the Site for inspection and testing and when completed, the mobile generator set shall be turned over to the City.

B. The generator sets shall be a self-contained transportable trailer mounted and truck towed for a mobile generating system suitable for transporting across New York City streets. The portable system shall contain all necessary items for a complete operating power plant and requiring only fuel oil, and generator output connections to make it functional. Starting shall be accomplished by a battery system contained within the module.

C. The three generator sets required include one generator set for the TI-010 Chlorination site (existing Flushing Bay CSO Facility), one generator set for the TI-010 Dechlorination Facility and one generator set for the TI-011Disinfection Facility.

D. The following index of this Specification is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Not Used

1.04 REFERENCES

A. Mobile generator power shall comply with the latest applicable provisions and recommendations of the following:

1. Electrical Code of the City of New York.
2. NEMA MG1 - Motors and Generators.
3. NEMA MG2 - Safety Standard for Construction and Guide for Selection, Installation and Use of Motors and Generators.
4. ISO STD 8528 - Reciprocating Internal Combustion Engines.
5. ISO STD 3046 - Performance Standard for Reciprocating Internal Combustion Engines.
6. UL 508 - Industrial Control Equipment.

1.05 DESCRIPTION

A. Design Requirements

1. The generator sets shall be designed, built and tested in accordance with the latest applicable standards of NEMA MG1 and MG2, ISO 8528 and 3046 508 and UL 508.
2. The generator sets shall operate at 1800 rpm, 60 hertz from ultra-low sulfur diesel fuel and be equipped with all necessary accessories.
3. The generator sets shall be prime power rated sufficient for unlimited operation with a variable type of load of up to the nameplate KW as defined by ISO 8528.
4. The generator sets shall have the following minimum ratings:
5. 0.8 power factor, 3 phase, 4 wire, 60 Hz with switchable output voltage of 208/120 Volt and 480/277Volt. The prime rated kW of each generator set shall not be less than the size indicated on the Contract Drawings.
6. The generator set shall be rated for the specified KW without overload when operating under the following environmental conditions:

a. Ambient temperature - 50 degrees C.

b. Height above sea Level - 1500 Feet.

c. Relative Humidity - 95 percent.

7. The generator set shall meet the latest U. S. EPA Tier 4F air emission requirements applicable at the time of installation and be certified for mobile applications.

1.06 QUALITY ASSURANCE

A. General:

1. Generator sets shall be of current manufacture from a firm regularly engaged in the production of such equipment.

2. The generator sets manufacturer shall have a minimum of 5 years experience in designing, supplying, and supporting engine generators sets.

3. Generator sets shall be factory assembled in an ISO 9001 certified manufacture facility and tested to determine that it is free from electrical or mechanical defects and to assure that it meets design specifications.

4. Generator sets shall be adequately guarded both physically and electrically for protection of operating personnel.

5. All materials, equipment and parts comprising the generator sets shall be new, of current manufacturer and of the highest grade. All components shall be covered by the manufacturer’s warranty.

6. The generator sets manufacturer shall have complete parts and service facilities and a factory trained serviceman, located within one hundred miles of the project site, available on a 24-hour basis. Services shall be readily available so to avoid long periods of interruption or require extensive spare parts inventory.

1.07 SUBMITTALS

A. Shop Drawings: Submit for approval the copies of manufacturer's technical information, which shall include:

1. Standard published curves of engine-generator set rating. Special or maximum ratings are not acceptable.

2. Published data of the generator line and machine constants.

3. Published data of fuel and oil consumption estimates, based on engine manufacturer's data.

4. Published manufacturers estimated data of cooling and combustion air flow requirements, plus heat rejection of the engine and generator when operating at full load.

5. Exhaust emissions data.

6. Sound attenuating calculations showing conformance to specified requirements.

7. Complete installation drawings with wiring diagrams and interconnections.

8. Complete generator enclosure and trailer details, including equipment arrangement drawings and specifications.

9. Manufacturer's literature, specifications, engineering data and installation instructions necessary to fully describe engine-generator set and all appurtenances and to substantiate compliance with the specified requirements.

10. Description of shop and field testing methods, procedures, and apparatus. Submit at least 45 days in advance of confirmation of testing dates.

B. Reports:

1. Shop test and field test reports shall be submitted.

2. Manufacturer's site visit testing report shall be submitted.

C. Operation and maintenance manuals shall be submitted and shall include the following information:

1. Detailed Operating Instructions: Instructions at a minimum shall cover starting, stopping, protection of circuits, automatic controls, battery charging and safety considerations.

2. Detailed Adjustments Methods: Adjustments at a minimum shall cover speed, output voltage and control timers.

3. Detailed Performance Parameters: Parameters shall include nominal values and acceptable limits for operator's guidance, at a minimum output voltage, frequency, load, engine temperature and oil pressure shall be included.

4. Circuit drawings with component identifications.

5. Maintenance Procedure Outline: Outline for scheduled maintenance, for all equipment supplied, to be affected on a daily, weekly, monthly or on an hourly run basis.

6. Selection Guidance: Guidance with respect to selection of fuel oil, lubricating oil, use of water treatment and anti-freeze.

7. Troubleshooting Procedure: Procedure shall be available to enable the speedy diagnosis of any defect considered likely to occur in service.

1.08 DELIVERY, STORAGE AND HANDLING

A. Generator sets shall be delivered, stored, and handled in accordance with the generator manufacturer's instructions and the following:

1. Inspect the generator sets for shipping damage when receive.

2. Generator sets shall be stored indoors in clean, dry heated areas until ready for testing. Provisions, such as maintaining battery charge and energization of heaters, shall be made to prevent moisture from condensing within or on the generator sets and its accessories.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall furnish and deliver to the Engineer, at that part of the Site(s) and at such time as the Engineer may direct, spare parts, special tools and supplies for the generator sets.

B. The spare parts, special tools and supplies shall be listed in an index and packed in containers suitable for long term storage, bearing labels clearly designating the manufacturer's part number with complete information for use and reordering.

C. Spare parts, special tools and supplies shall be furnished in accordance this Section, the Specifications and the manufacturer's recommendations for the generator size and type.

D. Spare parts which shall be provided shall include at a minimum for each generator set the following:

1. Two complete sets of air, oil and fuel filters of each type and size used.

2. One complete set of belts and hoses of each type and size used.

3. Two sets of control power fuses of each type and size used.

4. Two per ten pilot lights of each size and type used.

E. The Contractor shall furnish as part of the bulk lubricant order the quantity of lubricants required to operate and maintain each generator set furnished under this Section for a period of one year after acceptance.

1. As a minimum, there shall be provided sufficient oil and grease to make a least one lubricant change for each generator as applicable.

2. Replace all lubricants used during startup and testing prior to acceptance of equipment. Furnish this replacement lubricant in addition to the lubricants included in the bulk order.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Mobile generator sets shall be as manufactured by:

1. Caterpillar, Inc.
2. Cummins, Inc.
3. Detroit Diesel Corporation.
4. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Engine:

1. The engine shall be configured for generator set service and be of the internal combustion-diesel, four cycle design. The engine shall be equipped to operate on ultra-low sulfur diesel fuel.
2. The rated net horsepower of the engine at the generator synchronous speed, with all accessories, shall not be less than that required to produce the output kW indicated on the Contract Drawings.
3. The engine shall be constructed with a package mounted aftertreatment system suitable for Tier 4 Final based upon the manufacturer's standard arrangement which shall consist of but not limited to a particulate filter and selective catalytic reduction.
4. The engine shall be equipped with a solid state electronic governor, isochronous type to maintain frequency within 1/4 percent of its mean value for constant loads from no load to full load. The engine shall have a 4 second maximum transient recovery time for one-step load acceptance and a 20 percent maximum transient frequency dip on one-step application of a 0.8 power factor load at 80 percent of unit full load rating. Random frequency variation with steady load from no load to full load shall not exceed +/- 0.25 percent.
5. Engine shall include a cooling system consisting of an engine mounted radiator with blower type fan, sized to maintain safe operation. The coolant system shall be filled with a 50 percent solution of ethylene glycol and be equipped with coolant and level shutdowns.

6. Engine shall include a filtration system consisting of a cartridge-type air filter with service indicator, fuel filter with upstream pre-filter and water separator and lube oil filter with oil pressure shutdown.

7. The engine shall be equipped with an automatically controlled jacket water heater. Heaters shall be of sufficient capacity to keep the jacket water at a suitable temperature for trouble-free starting.

B. Alternator:

1. The alternator shall be engine-driven, single or two bearing type, 4-pole, synchronous, revolving field with brushless excitation and drip-proof, guarded construction. The alternator shall be coupling connected to the engine flywheel housing to ensure permanent alignment.

2. The winding insulation shall be Class H in accordance with NEMA MG1. Temperature rise shall not exceed 130 degrees C rise over 40 degrees C ambient. The windings shall be impregnated with a heavy coat of anti-tracking, acid resisting vanish for protection against oils, moisture, and condensation.

3. The rotor shall be dynamically balanced and include amortisseur windings to minimize voltage deviations and heating effects under unbalanced load conditions.

4. The alternator shall be equipped with a static electronic voltage regulator to maintain voltage within plus or minus 1/2 percent under load, from no load to 100 percent load. The regulator shall also maintain the random voltage variation for constant loads within plus or minus 1/2 percent under load, from no load to 100 percent load.

5. The alternator shall be equipped with an excitation support system. The system shall consist of a permanent magnet exciter to provide a dedicated source of power for the exciter field. The permanent magnet exciter shall isolate the excitation system and sustain 300 percent short circuit current, under any short circuit condition, for up to 10 seconds.

6. The alternator shall be equipped with space heaters. Space heaters shall be 120 volt, single phase, of sufficient wattage to maintain the temperature approximately 5 degrees above ambient when the generator is idle. Space heaters shall be disconnected when generator is running.

C. Air Supply/Exhaust System:

1. Generator sets shall be provided with an air supply/exhaust system. The system shall consist of a heavy duty air cleaner, silencer and exhaust piping of suitable size, configuration, and material in accordance with engine manufacturer's recommendations.

2. The silencer shall be critical grade type, constructed of double plate sheet with condensate drain ports.

3. Exhaust piping shall be welded schedule 40 stainless steel with standard bend radius and stainless steel flexible exhaust fittings.

D. Starting System:

1. Generator sets shall be provided with a battery system. The system shall consist of batteries, cables, and a battery charger. The system shall include a treated battery tray resistant to electrolyte deterioration constructed to contain spillage for housing the batteries.

2. Batteries shall be heavy duty lead acid type, with number of cells, voltage, and rating in accordance with requirements of the engine manufacturer. The batteries shall be sized for a minimum of four crank cycles of the specified engine and have sufficient current available for break-away of the particular engine at worst case temperature.

3. Battery cables and connectors shall connect the starting motor and the generator control panel and circuit breaker to the battery supply.

4. Battery charger shall be automatic float type, current limited with 120 volts, 60 Hertz input. The battery charger shall be capable of recharging a discharged battery in 12 hours while carrying normal loads. The battery charger shall be equipped with DC voltage and ampere meters, cranking disconnect relay and voltage alarm relays.

E. Fuel System:

1. Day Tank:

a. The generator sets shall be provided with a fuel tank sufficient for 24 hours of run time at 75 percent of the prime rated KW. The day tank shall be double wall welded steel construction.

b. The day tank shall be constructed in accordance with the United States Department of Transportation Title 30-75.1906 requirements.

c. The tank shall include fittings and vents as required for engine supply, return, manual fill, normal and emergency venting. The tank shall be treated with rust inhibiting primer and standard finish paint.

d. The tank shall be equipped with the level indicator and level and leak switches per the manufacturer's recommendations.

F. Control Panel:

1. The generator sets shall be provided with a control panel. The control panel shall include the necessary controls, instruments, lights, and devices to be able to manually and automatically start, stop, monitor and protect each generator unit.

2. The control shall be UL 508 listed. The panel control shall be microprocessor based with programmable adjustments and shall provide monitoring, metering and control of the system based upon the manufacturer's standard arrangement. Control power to the panel shall be DC supplied from the starting battery system.

3. The panel controls shall include the following:

   a. Cranking controls which automatically disconnect while engine is running.

   b. Four 7 seconds minimum cranking cycles with cranking attempts separated by appropriate rest periods.

   c. Cranking controls locked out, requiring manual reset, if engine fails to start at the completion of the starting program.

   d. Overspeed shutdown.

   e. Overcrank shutdown.

   f. 30 minute adjustable timer for cool down.

   g. Hand-Off-Auto switch with provisions for two wire remote start connection terminals.

   h. Start-stop and Emergency stop pushbuttons.

   i. Voltage adjusting rheostat.

4. The panel shall be equipped with malfunction protection, status and alarm indicators and accessories as recommended by the manufacturer. An alarm horn with silence feature shall be included for alarm conditions.

5. The control panel shall be completely pre-wired. All instruments, controls and indicating lights shall be suitably mounted and properly identified. All wires and terminals shall be individually identified.

6. The control panel shall be mounted in a 14 gauge steel enclosure with a hinged, lockable door.

G. Power Distribution:

1. The generator sets power distribution shall include a main circuit breaker and distribution accessories mounted within the enclosure that houses the control panel.

2. The main circuit breaker shall be sized as required for protecting each unit. The circuit breaker shall be a molded case with electronic trip unit and shunt trip. The electronic trip unit shall include adjustable long, short, instantaneous fault time delay functions with delay.

3. The distribution accessories shall include the following:

   a. Switch for selection of output voltage, 480/277 Volt, 3 phase or 208/120Volt 3 phase.

   b. Posi-Lok main power distribution 400 ampere female receptacles on each generator set rated 600 Volt, suitable for 3 phase, neutral and ground power output. Provide a total of six doors for each parallel phase which includes one pair for the additional phase, the neutral phase and the ground receptacles. Provide matching Posi-Lok male plugs, one for each receptacle, to be attached to the power cables.

   c. 20 ampere, 120 Volt, GFCI receptacle circuit breaker protected for auxiliary power output.

   d. 30 ampere, 120 Volt receptacle circuit breaker protected for auxiliary input power for block heater, battery charger and space heater.

H. Enclosure:

1. Generator sets shall be provided with a weatherproof steel enclosure, completely enclosing the entire generator set.

2. The enclosure shall be built with suitable access doors for proper access of the components within with exterior drains for coolant and oil and fuel connections. The enclosure shall be sound attenuated to limit noise to 73 dBA at 23 feet for the 175 KW unit and 77 dBA at 23 feet for the 250 KW unit.

I. Trailer:

1. The generator sets trailer shall be welded frame construction, equipped with towing rig. The trailer capacity shall be suitable for the generator set weight with axles and wheel arrangement suitable for short radius turns in both the forward and reverse direction.

2. The trailer bed shall be of sufficient size to permanently mount the generator set, enclosure and skid. The trailer shall be equipped with devices in accordance with the manufacturer's recommendations for the generator size and type, which shall include at a minimum the following:

   a. Side and rear reflectors.

   b. Stop and turn signals.

c. License plate holder and light.

d. Six ply tires with high-speed wheels for highway towing.

e. Trailer brakes complete with controls.

f. Safety chains, towing eye and miscellaneous hardware.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. All ferrous metal surfaces to be cleaned and painted with a rust inhibiting primer and manufacturer's standard finish paint.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Certified Shop Tests:

1. Shop testing shall be performed for each generator, for each circuit breaker, and the associated controls at the manufacturer's plant.

2. A shop test report identifying the tests performed and the results obtained, shall be submitted.

3. The generator shop test shall be in accordance with the latest revisions of NEMA MG1 and shall demonstrate that the equipment tested conforms to the requirements specified. The generator set shall be tested for a period of two hours at full load, 0.8 power factor with suitable load banks.

4. The generator set test may include the manufacturer's standard test procedure, but at minimum shall include the following:

a. Verify generator set assembly, prior to operation, including all mechanical and electrical connections.

b. Verify fuel and lubrication systems are clean and filled with proper grades of fuel and lubricants.

c. Adjust as required the governor and voltage regulator controls.

d. Inspect operation of all gauges, switches, meters, and devices. Verify generator set monitoring meters against calibrated load bank meters.

e. Verify operation of all safeties and alarms.

f. Maintain records of unit operation, at 15-minute intervals, for duration of test. Records at a minimum shall include, water temperature, oil pressure, ambient air temperature, voltage, current, frequency, kilowatts, and power factor.

5. The generator sets manufacturer shall use a shop test facility that has recently calibrated testing apparatus and qualified, experienced

technicians, for all factory tests. Calibration of testing apparatus shall be within one year.

6. All test equipment and instrument calibration shall be in accordance with the latest edition of the accuracy standard of the U.S. National Institute of Standards and Technology and the NETA maintenance testing specification.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Deliver the generator sets to each site and park the unit at a location designated by the Engineer.

3.03 FIELD TESTING / QUALITY CONTROL

A. Manufacturer’s Services:

1. A qualified manufacturer's service representative shall check each generator set before it is placed into operation, assist in the performance of field tests, observe, and assist initial operations and train the plant operations and maintenance staff in the care, operation and maintenance of the generator set.

2. A separate field report for each generator set from the manufacturer's representatives shall be submitted for each visit to the site. The report shall include complete information on time, schedule, tasks performed, persons contacted, problems corrected, tests results, training, instruction, and all other pertinent information.

3. Training for plant staff shall be scheduled at a time suitable to the City when the work is substantially completed.

4. The service representative shall sign in with the Engineer on each day they are at the site.

3.04 FIELD TESTS

A. Each generator set shall be field tested in the presence of the Engineer prior to being turned over to the City. The Contractor shall provide protection of the generator set and associated cables from potential damage during testing.

B. Generator set testing shall be performed under the supervision of the manufacturer's representative. The generator set shall be tested in accordance with NYPA-110. Provide all materials and equipment, including load banks fuel and lubricants required for site testing. Verify the following:

1. That the entire installation is in accordance with the approved manufacturer's drawings, and that the unit and all auxiliaries are ready for operation.

2. That fuel coolant and lubrication systems are complete, clean and filled with the proper grades of coolant and lubricants.

3. That the unit and all subsystems start, operate, and shutdown in accordance with manufacturer's recommendations.

4. at all safeties, alarms and shut-downs function at the correct set points and sequence.

5. That the unit accepts load, governs speed, and regulates voltage.

C. The generator sets shall be tested using portable resistance type load banks and station loads. Load testing shall include the following:

1. Operate the engine generator set for 1 hour at 50 percent of rated load using load bank.

2. Increase load to 75 percent of rated load and operate the generator set for 1 hour.

3. Increase load to 100 percent of rated load and operate the engine generator for 2 hours.

4. Operate the engine generator set for 1 hour using plant loads.

5. Records shall be maintained at 30 minute intervals for duration of test. Records at a minimum shall include fuel consumption, water temperature, oil pressure, ambient air temperature, voltage, current, frequency, kilowatts and power factor.

D. All tests and values shall be in accordance with the manufacturer's recommendations.

END OF SECTION

SECTION 26 36 23 – AUTOMATIC TRANSFER SWITCHES
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Requirements for providing low-voltage open transition Automatic Transfer Switches (ATSs).

1. The Contractor shall provide all labor, materials, equipment and incidentals, and is required to furnish and install ATSs complete and operational, as specified herein and as shown on the Contract Drawings.

2. Each ATS shall be provided in an enclosure.

B. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 26 05 11 – General Electrical Requirements

B. Section 26 05 27 – Grounding

C. Section 25 05 29 – Hangers and Supports for Electrical Systems

D. Section 26 05 53 – Identification for Electrical Systems

1.04 REFERENCES

A. Definitions

1. Low-voltage as used in this Section and the Specifications shall mean all equipment, conductors, insulation systems and accessories intended for operation within the 600 Volt Class.

2. All references to the Electric Utility or Utility shall mean Consolidated Edison Company or the Local Electric Utility having jurisdiction.

B. Reference Standards: The ATSs shall comply with the latest applicable provisions and recommendations of the following:

1.	IEEE-446	-	Recommended Practice for Emergency and Standby Power Systems for Industrial and Commercial Applications
2.	ISO 9001	-	Quality management systems - Requirements
3.	NEMA ICS 10 Part 1	–	Electromechanical AC Transfer Switch Equipment
4.	NEMA ICS 10 Part 4	–	Guide to the Application of Low-Voltage Automatic Transfer Switch Equipment
5.	NFPA 110	–	Emergency and Standby Power Systems
6.	NYCEC	-	New York City Electrical Code
7.	UL 508	–	Industrial Control Equipment
8.	UL 1008	-	Transfer Switch Equipment

1.05 DESCRIPTION

A. ATSs shall be rated for the voltage, ampacity and number of poles as shown on the Contract Drawings.

B. Switches shall have 600 volt insulation on all parts in accordance with NEMA standards.

C. The current rating shall be a continuous when the switch is installed in a non-ventilated enclosure, and shall conform to NEMA temperature rise standards.

D. ATSs shall be rated based on all classes of loads, resistive, tungsten, ballast and inductive loads.

E. ATs shall have a short circuit and withstand ratings as shown on the Contract Drawings and shall withstand the magnitude of fault current without welding of contacts.

F. ATSs shall include, but not be limited to the following:

1. ATS Mechanism permitting alternate connection to Source No. 1 or Source No. 2
2. Control Panel
3. Enclosure

G. Source No. 1 and Source No. 2 shall be as shown on the Contract Drawings.

H. All ATS lugs shall be tin-plated copper.

1.06 QUALITY ASSURANCE

A. ATSs shall comply with UL 1008, UL 508 and NEMA ICS 10.

B. The ATS manufacturer shall use a shop test facility, for all factory tests, that has recently calibrated testing apparatus and qualified and experienced technicians.

1. Calibration of testing apparatus shall be within one year.

C. The ATSs shall be field tested.

1. Field testing shall be performed in accordance with the requirements specified under this Section.

D. The services of the ATS manufacturer shall be retained for field service.

1. Field service shall be in accordance with the requirements specified under this Section.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings and material specifications for the approval by the Engineer.

B. Submittals shall include, but not be limited to:

1. The proposed manufacturer along with the location of its closest service facility from which the ATSs shall be serviced and location of closest parts inventory.
2. Manufacturer’s catalog cuts and technical information required to demonstrate compliance with the specific requirements.
3. A completed materials list showing all items proposed for use.
4. Control and wiring diagrams
5. Construction details of enclosures.
6. Description of shop and field testing methods, procedures and apparatus with calibration dates.
    a. Testing methods and procedures shall be submitted at least 60 days in advance prior to confirmation of witness testing dates and actual testing.
7. Qualifications of proposed testing firm to perform acceptance testing.

a. Submit firm experience records and five (5) recent references with phone numbers, at least 60 days in advance to actual testing.

C. Certificate of Compliance:

1. Seismic qualification certification from the manufacturer including mounting recommendations.

2. Data and results of witness tests accompanied by a certificate of authenticity sworn to before a notary public by an officer of the manufacturing company.

D. Reports:

1. Shop test and field test reports.

2. Manufacturer's site visit and acceptance testing reports.

E. Operation and Maintenance (O&M) Manuals

1.08 DELIVERY, STORAGE, AND HANDLING

A. Deliver ATSs to ensure uninterrupted progress of the work.

B. Releases of ATSs for shipment shall occur only upon approval of data and results of witness test reports.

C. Ship, handle and protect ATSs in accordance with the Specifications.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall furnish and deliver to the Engineer, at that part of the site and at such time as the Engineer may direct, spare parts for ATSs.

B. The spare parts shall be listed in an index and packed in containers suitable for long term storage, bearing labels clearly designating the manufacturer's part number with complete information for use and reordering.

C. Spare parts shall be as recommended by the manufacturer.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer’s standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. ATSs shall be as manufactured by:

1. ASCO, Florham Park, NJ

2. Russelectric, Hingham, MA.

3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Power section:

1. The ATSs shall be an open transition switch of double throw construction whose operation in either direction shall be initiated by a reliable electrical mechanism that is momentarily energized and the switch mechanically held in its required position.
2. Designs are not acceptable, that utilize components of molded-case breakers, contactors or parts thereof and which are not intended for continuous duty, repetitive switching or transfer between Source No. 1 and Source No. 2.
3. There shall be a direct mechanical coupling of Source No. 1 and Source No. 2 mechanisms to facilitate transfer switch operation in three cycles or less.
4. The Source No. 1 and Source No. 2 contacts shall be mechanically interlocked such that failure of any coil or disarrangement of any part shall not permit a neutral position or connection of both sources to the common load connection.
5. The mechanical interlocking shall be such that the switch is unaffected by momentary outages so that contact pressure is maintained at a constant value and temperature rise at the contacts is minimized for maximum reliability and operating life.
6. The ATSs shall have sufficient arc interrupting capabilities for 60 cycles of operation between Source No. 1 and Source No. 2, which are 120 degrees out of phase at rated voltage, 600% of rated current at 0.50 power factor to ensure that there will be no current flow between the two isolated sources during switching.
7. The contact structure shall consist of a main current carrying silver alloy contact, with a minimum of 50% silver content.
8. The current carrying contacts shall be protected by silver tungsten arcing contacts on all sizes.
9. Inspection of all switch components shall be possible from the front of the switch without the disassembly of operating linkages and without the disconnection of power conductors.
10. Maintenance of all switch components shall also be possible from the front of the switch with access to all components.
11. The transfer switches shall have a minimum short circuit withstand rating as shown on the Contract Drawings or as required by short circuit studies but not less than 65 kA symmetrical.
12. When the isolation switch is in the "Test" or "Open" mode, the bypass switch shall function as a manual transfer switch.

B. Controls:

1. Solid State Control System

a. The control system for the ATS shall be solid state based and shall also contain all logic devices including control, voltage sensing, time delays and any auxiliary equipment required for to properly implement the functions detailed under this Section.

b. Control system shall have a programmable microprocessor controller with keypad and LCD display.

2. The panel shall be shielded and door mounted on the inside door of the switch enclosure.

3. All components shall be connected with a numbered wiring harness equipped with a disconnect plug that allows isolation of the control panel.

4. The solid state panel controls shall include adjustable three phase under voltage setting on each of the two sources to provide the following sequence of operation:

a. When the voltage of any phase of Source No. 1 is reduced to 80 percent of nominal voltage for a period of 1 second (fixed), the transfer switch shall be signaled to transfer to Source No. 2, after an adjustable time delay (0 -30 seconds).

b. The transfer switch shall remain in the Source No. 2 position indefinitely. Should any phase of the Source No. 2 source be reduced to less than 80 percent of nominal voltage for a period of 1 second (fixed), the transfer switch shall be signaled to transfer to Source No. 1, after an adjustable time delay (0 -30 seconds), if the Source No. 1 is available for operation.

c. The option of automatic transfer from Source No. 2 to Source No.1, as soon as Source No. 1 is available for operation shall also be provided

5. The transfer switches shall contain red indicating lights. The lights shall indicate switch position. The indicating lights shall be push-to-test, heavy-duty transformer LED type. Indicating light voltage shall be 12 Volts.

6. All relays shall be continuous duty industrial type with wiping contacts. Customer interface contacts shall be rated 10 amperes minimum. Coils, relays, timers and accessories shall be readily front accessible.

7. The transfer switches shall contain door mounted transfer/re-transfer pushbuttons. It shall allow an operator to switch from Source No.1 to Source No.2 and from Source No.2 to Source No.1. Transfer between sources shall be immediate.

8. ATS-1 and ATS-2 at TI-010 Chlorination Facility shall have dry contact for remote start stop control of generator.

9. ATS-1 and ATS-2 at TI-010 Chlorination Facility shall have dry contact for remotely signaling power on of each source. One normally open contact shall be provided that closes when the switch is in Source No.1 position.

One normally open contact shall be provided that closes when the switch is in Source No.2 position.

10. ATS-1 and ATS-2 at TI-010 Chlorination Facility shall have dry contact for remotely signaling source failure of each source. One normally open contact shall be provided that closes after time delay upon failure of Source No.1. One normally open contact shall be provided that closes after time delay upon failure of Source No.2.

11. ATS-1 and ATS-2 at TI-010 Chlorination Facility shall have dry contact for remotely signaling source is available of each source. One normally open contact shall be provided that closes after time delay when Source No.1 is available. One normally open contact shall be provided that closes after time delay when Source No.2 is available.

C. Power Meter

1. ATS-1 at the DeChlorination and Disinfection Facilities shall have a power meter load side connected for monitoring either of the two supply sources. The power meter shall be a microprocessor based metering device with liquid crystal display that provides real time three phase power of each phase, neutral and average measurements for the following:

2. Voltage.

3. Current.

4. Frequency.

5. Percent unbalance voltage and current.

6. Real, reactive, and apparent power.

7. Real and reactive energy with maximum demand recall.

8. Power factor.

D. Enclosure:

1. The entire ATS shall be completely assembled within one enclosure. The enclosure shall be NEMA 12, painted gray, ANSI 61.

2. Terminal blocks shall be provided within the switch enclosure facilitate the connection of off enclosure signals and auxiliary power provisions.

   a. Twenty percent spare terminals, two minimum, shall be provided.

   b. Terminals shall be lettered or numbered to conform to the wiring diagrams.

3. The wires within automatic transfer switch shall be neatly harnessed to prevent the door damaging the wires and to prevent the wires hampering the door operation. All wires shall have identification markers on each end.

4. The enclosure shall be provided with a thermostatically controlled strip heater to keep humidity and temperature within acceptable levels.

5. The enclosure shall have identifying nameplates in accordance with the requirements of Section 26 05 53 – Identification for Electrical Systems.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Painting

1. The enclosure shall be painted gray, ANSI 61.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Certified Shop Tests:

1. Shop testing shall be performed on the ATSs at the manufacturer's plant prior to shipment.

2. Shop tests shall demonstrate that the equipment conforms to the requirements specified.

3. The tests shall include the manufacturer's standard tests and the following at a minimum.

a. Operational tests to ensure proper operation of the components and sequence of operation.

b. High potential test in accordance with NEMA standard.

4. The Contractor shall provide a shop test report. The report shall identify the tests performed and the results obtained.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. ATSs shall be installed in accordance with 26 05 11– General Electrical Requirements, Section 26 05 29 – Hangers and Supports for Electrical Systems, this Section and the manufacturer's instruction and recommendations.

B. ATSs shall be fully assembled with all required devices, wiring, nameplates, terminal blocks and enclosures.

C. ATSs shall be rigidly and securely mounted to the building structure or to supporting devices, which are rigidly and securely supported to the building structure.

D. ATSs shall be installed with sides parallel or perpendicular to walls or equipment, in a neat and professional manner.

E. ATSs shall be installed such that door swing is not hampered.

F. ATSs shall be securely fastened in position with bolts and expansion shields on concrete or brick, with toggle bolts on hollow masonry units, and with machine screws or welded studs on steel work.

G. ATSs shall be grounded in accordance with Section 26 05 27 - Grounding and NYCEC requirements.

H. Install nameplates for identification of equipment in accordance with Section 26 05 53– Identification for Electrical Systems.

3.03 FIELD TESTING / QUALITY CONTROL

A. Field Tests

1. After installation, ATSs shall be field tested for operation and conformance in presence of the Engineer.

2. The Contractor shall perform field testing in accordance with the Specifications, and as described in this Section.

3. ATS testing shall be performed by the manufacturer's representative, prior to energizing equipment. The testing shall be in accordance with the recommendations of the manufacturer and shall include the following at a minimum.

a. Mechanical and electrical components shall be inspected.

b. The switches shall be sequence operated to verify proper operation.

B. Manufacturer's Field Services

1. A qualified manufacturer's representative shall check the ATSs before it is placed into operation, assist in the performance of field tests, observe and assist initial operations and train the plant operations and maintenance staff in the care, operation and maintenance of the ATSs.

2. The Contractor shall provide equipment start-up services and training in accordance with the Specifications.

3. The Contractor shall provide a field report from the manufacturer's representative for each visit to the Site.

a. The report shall include complete information on time, schedule, tasks performed, persons contacted, problems corrected, tests results, training, instruction and all other pertinent information.

4. The service representative shall sign in and sign out with the Engineer on each day they are at the site.

3.04 STARTUP / DEMONSTRATION

SECTION 26 41 13 – LIGHTNING PROTECTION FOR STRUCTURES
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Requirements for providing lightning protection of structures.

B. Lightning Protection Systems (LPS) for structures or buildings shall be provided in accordance with the requirements specified under this Section, the Specifications and the Contract Drawings.

C. The Contractor shall retain the services of a Certified LPS Installer.

D. The Certified LPS Installer shall furnish all labor, materials, equipment, services and incidentals necessary for the installation of a functional and complete LPS as specified herein.

E. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 25 05 27 - Grounding

B. Section 26 05 53 - Identification for Electrical Circuits

C. Section 26 24 16 - Panelboards

D. Section 26 43 13 - Low-Voltage Surge Protective Devices.

1.04 REFERENCES

A. Definitions

1. Certified LPS Installer is a Subcontractor who is UL Master Labelled Certified Lightning Protection System Installer or Lightning Protection Institute Certified Installer.
2. Certificate of Inspection, where used in this Section, shall mean UL Lightning Protection Master Label Certificate.
3. Letter of Findings, where used in this Section, shall mean an official UL report detailing inspection of a LPS with intentional noncompliance due to construction or limitations of scope outlined by the installer that render an LPS ineligible for a UL Lightning Protection Master Label Certificate.
4. Low-voltage as used in this Section and the Specifications shall mean all equipment, conductors, insulation systems and accessories intended for operation within the 600 Volt Class.
5. All references to the AHJ (Authority Having Jurisdiction) shall mean the NYCEC.
6. All references to the Electric Utility or Utility shall mean Consolidated Edison Company or the Local Electric Utility having jurisdiction.
7. LPI – Lightning Protection Institute.

B. Reference Standards

1. LPI 175 - Standard for the Design-Installation-Inspection of Lightning Protection Systems.
2. NFPA 780 - Standard for the Installation of Lightning Protection Systems
3. NYCEC - New York City Electrical Code.
4. UL 96 - Standard for Lightning Components.
5. UL 96A - Standard for Installation Requirements for Lightning Protection Systems.
6. UL 467 - Grounding and Bonding Equipment
7. UL 651 - Schedule 40, 80, Type EG and A Rigid PVC Conduit and Fittings.
8. UL LPS Guide - UL Marking and Application Guide – Lightning Protection.
9. ANSI/IEEE 141 - Recommended Practice for Electric Power Distribution for Industrial Plants.

10. IEEE 1100 - Recommended Practice for Powering and Grounding Electronic Equipment.

1.05 DESCRIPTION

A. Not Used

1.06 QUALITY ASSURANCE

A. Installer

1. The LPS Installer shall be a Certified LPS Installer.
2. Provide proof of the certification, or demonstrate that the standards and experience required for certification are possessed, all to the satisfaction of the Engineer.

B. Materials

1. All materials shall be new and shall comply in weight, size and composition as required by UL 96A and NFPA 780 and for the structures or building to be protected.
2. Class I materials shall be used for systems on structures not exceeding 75 feet in height.
3. Class II materials shall be used for systems on structures exceeding 75 feet above grade.
4. All materials used in the installation shall be labeled or listed by UL for use in LPSs
5. All materials shall be of copper and high copper-content bronze castings or stainless steel.
6. LPS materials shall be selected to ensure that electrolytic or galvanic action does not occur at the contact points or surfaces.
7. Where dissimilar metals are in contact care must be taken to ensure that bimetallic connecting accessories are used and permit only similar metals to be in contact.

C. Certification of the Installation

1. The Engineer shall be given 96 hours notice of the intent to cover or conceal all parts of the LPS which will not be visible after completion and turn over of the installation.
2. The completed system shall be in accordance with UL 96A and NFPA 780 or LPI 175 but not both.
3. A Certificate of Inspection shall be provided for the completed LPS.
4. For installation areas, where a Certificate of Inspection is not available, a Letter of Finding shall be obtained.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer.

B. Submittals shall include, but not be limited to:

1. Qualifications of proposed Certified LPS Installer.
    a. Submit experience records at least 45 days in advance to equipment submittals.
    b. Five recent references with phone numbers shall be submitted.
2. Manufacturer's catalog cuts and technical information for the LPS materials proposed for use in this Contract.
    a. Submittals shall demonstrate the mechanism that will be used to isolate dissimilar materials.
3. Scaled Shop Drawings showing proposed routing and layout of the LPS with installation details. Drawings shall include the stamp of the Certified Installer- Designer responsible for the system design.
4. Photographic and video documentation to show how the LPSs were installed in-ground and all concealed portions of the installation.

C. Certificates of Compliance:
1. Certificate of Inspection or Letter of Finding shall be submitted.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Lightning protection system materials shall be delivered, stored and handled in accordance with the manufacturer's recommendations and this Section.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The lightning protection system shall be as manufactured by:
1. Heary Brothers Lightning Protection Company, Springville, NY.
2. Thompson Lightning Protection Company, West St Paul, MN.
3. East Coast Lightning Equipment, Winsted, CT.
4. Pentair Erico, Solon, OH
5. Harger, Grayslake, IL;
6. Or approved equal.

B. Non-metallic conduit and fittings shall be by as manufactured by:
1. Carlon (Thomas & Betts) - Memphis, TN.
2. Cantex Inc., Fort Worth, TX

3. Or approved equal.

C. Not Used

2.02 MATERIALS / EQUIPMENT

A. All materials used in the installation shall be new and shall comply in weight, size and composition as required by UL 96A and NFPA 780

B. All lightning protection system fittings shall be heavy duty type.

C. All bolts, screws and hardware shall be stainless steel.

D. Air Terminals and Accessories

1. Air terminals shall be not less than 18 inches long, not less than 5/8-inch in diameter and may be manufactured in separate parts if longer than 10 inches.

2. Air terminals shall include a cast bronze point protector, stainless steel adapter and copper base.

3. Air terminals shall be provided with an integral base support, or shall have not less than five full threads of engagement with a separate attachment base mounted to the structure.

4. If the air terminal has internal threads the wall thickness shall be not less than 1/16 inch at the base of the threads.

5. Air terminals longer than 24 inches shall have bracing at half its height and listed for the purpose.

6. Air terminal bases are permitted to be stamped or cast construction.

a. Copper bases shall 0.061 minimum for copper material. If cast either copper or aluminum shall be at least 3/32 inches thick.

b. Air terminal base support must incorporate a connector fitting for connection of the lightning conductor.

1) The conductor contact area must be at least 1-1/2 inches on all sides of the cable.

E. Conductors

1. Class I

a. Main conductors shall be stranded copper conductors and shall be at least 57,400 circular mils at 187 lbs per 1000 ft.

b. Secondary or bonding conductors minimum size shall be 26,240 cir. mils for copper.

2. Class II

a. Main conductors; shall be not less than 115,000 cir. mils for copper conductor at 375 lbs per 1000 ft.

b. Secondary or bonding conductors minimum size shall be 26,240 cir. mils for copper.

F. Grounding Electrodes

1. Ground rod electrodes shall be stainless steel, a minimum 5/8" diameter and 10 feet long.
2. Ground rods shall conform to the requirements of Section 26 05 27 - Grounding.

G. Ground Cables:

1. Ground cables shall be copper or aluminum where necessary to prevent dissimilar metal reaction.
2. Ground cable stranding, number and size shall be suitable for the classification of the structure to be protected.
3. All ground cable where exposed shall be corrosion resistant.

H. Non-metallic conduit shall be schedule 80 PVC plastic, 90 degrees C rated, conforming to UL No. 651.

I. Non-metallic fittings shall be of same material and manufacturer as base conduit. Cement shall be provided for joining fittings to the conduit and shall be the same manufacturer as the base conduit.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Air Terminals and Air Terminal Accessories

1. Air terminals shall extend a minimum of ten inches above the object or area they are to protect.
2. Air terminals shall be located at intervals not exceeding 20'-0" along ridges of pitched roofs and along the perimeter of flat or gently sloping roofs (flat or gently sloping roofs include roofs that have a pitch less than 3:12).
3. Flat or gently sloping roofs exceeding 50'-0" in width shall be provided with additional air terminals located at intervals not exceeding 50'.
4. Air terminals shall be located within two feet of the ends of ridges, roof edges and outside corners of protected areas.
5. Air terminals shall be installed on stacks, flues, mechanical units and other objects not located within a zone of protection.

6. Permanent metal objects on the structure having an exposed metal thickness 3/16" or greater may be substituted for air terminals and shall connected to the lightning protection system as required by the specified standards using main size conductor and bonding plates having a minimum of 3 square inches of surface contact area.

7. Air terminal bases shall be securely fastened to the structure in accordance with the specified standards.

   a. Fasteners may include stainless steel screws, bolts, nails or anchors.

   b. Adhesives shall only be used to complete other types of fasteners and shall be compatible with the fastener and structure material.

   c. Any protective sheets or pads that may be required by the roofing system manufacturer shall be furnished and installed by the Contractor.

8. Air terminal spacing exceeding these dimensions shall be permitted so long as the area protected lies within a zone of protection.

9. Air terminals shall be installed for stacks, flues, mechanical equipment, and other objects, having a metal thickness of less than 3/16 of an inch, and not located within a zone of protection.

   a. Permanent metal objects having a metal thickness 3/16 of an inch or greater shall be connected to the LPS in lieu of air terminals by main size conductors and bonding plates having a minimum of 3 square inches of surface contact area.

10. Flat or gently sloping roofs exceeding 50 feet in width, shall be protected with additional air terminals located at intervals not exceeding 50 feet in the flat or gently sloping area.

B. Conductors and Accessories

1. Conductors shall provide a two way, horizontal or downward path from each strike or air terminal to connections to the lightning protection ground electrode system.

2. Down conductors shall be sized as Class I or Class II materials in accordance with the specified standards.

   a. Down conductors where required as shown on the Contract Drawings shall be concealed in the exterior wall construction.

   b. Class II conductors from a higher portion of a structure shall continue to connections to the lightning protection ground electrode system.

   c. Down conductors shall be spaced at intervals averaging not more than 100 feet around the perimeter of the structure.

   d. In no case shall a structure have fewer than two down conductors.

   e. Where down conductors are installed exposed on the exterior of a structure and are subject to physical damage or displacement, guards

shall be used to protect the conductor a minimum of 6 feet above grade.

f. Metallic guards shall be bonded at each end.

3. In the case of structural steel frame construction, down conductors may be omitted and roof conductors shall be connected to the structural steel frame at intervals averaging not more than 100 feet around the perimeter of the structure.

a. Connections to the steel frame shall be made with bonding plates having an area of a minimum of 8 square inches.

4. Conductors shall be installed free of excessive splices and sharp bends.

5. Conductor bends shall form an included angle of not less than 90 degrees nor have a radius of bend of less than 8 inches.

6. Conductors shall be secured to the structure at intervals not exceeding 3 feet.

a. Fasteners shall be of the same material or of a material equally resistant to corrosion as that of the conductor.

b. Any protective sheets or pads that may be required by the roofing system shall be furnished and installed by the Contractor.

7. Connector fittings shall be listed for the purpose and of the same material as the conductor or of electrolytically compatible materials.

C. Ground Electrodes and Accessories

1. Each down conductor shall terminate at a ground electrode dedicated to the LPS, or to a building or facility ground electrode system that consists of multiple ground electrodes that are interconnected with a ground ring conductor.

2. The down conductor shall be connected to the ground electrode by a bolted connection.

3. Ground rod electrodes shall be located a minimum of 2 feet below grade and shall be installed below the frost line where possible (excluding shallow topsoil conditions).

4. Where it is not possible to drive ground rod electrodes because of bedrock or shallow topsoil conditions, ground plate electrodes, radial electrodes, ground ring electrodes, concrete- encased electrodes, or combinations of these may be used in accordance with NFPA 780.

5. Where the structural steel framework is utilized as down conductors for the system, ground electrodes shall be connected to columns around the perimeter of the structure at intervals averaging not more than 60 feet apart.

a. The grounding connection at the columns shall be made using either bonding plates having 8 square inches of surface contact area or by exothermically welded connections.

D. Common Bonding of Grounded Systems

1. Common bonding of all grounded systems within the building shall be ensured by interconnecting them to the LPS using main size conductor and fittings.
2. For structures exceeding 60 feet in height, the interconnection of the LPS ground electrodes and other grounded systems shall be in the form of a ground loop conductor.
3. These grounded systems to be interconnected shall include but are not limited to the electrical service, communication, and antenna system grounds as well as all underground metallic piping systems including water, gas, sewer, underground metallic conduits, etc.
4. Interconnection to service lines or conduits shall be made on the customer's side of the meter.
5. Ground Electrodes in test wells shall be bonded to the ground system by a bronze ground rod clamp having at least 1-1/2 inches of contact between the rod and the conductor, measured parallel to the axis of the rod.
6. The system shall be installed with common grounding by interconnecting ground mediums entering the building using main size conductors and fittings. Grounded metal bodies shall be bonded to the system using bonding connections and fittings. Ground conductors where installed in conduit, shall be non - metallic type.

E. Potential Equalization

1. Grounded metal bodies located within the required bonding distance as determined by the bonding distance formula in NFPA780 shall be bonded to the LPS using the required bonding conductors and connections.

F. Roof Penetrations

1. Roof penetrations required for down conductors or for connection to structural steel framework shall be made using thru-roof assemblies with solid riser bars or conduits and appropriate roof flashing.
2. Conductors shall not pass directly through the roof.
    a. The Contractor shall furnish and install the materials required to properly seal all roof penetrations of the LPS components and any additional roofing materials or preparations required by the roofing manufacturer for lightning conductor runs to assure compatibility with the warranty for the roof including roof pads that may be required to protect the roof under each of the lightning protection components.

G. Surge Protective Devices (SPD)

1. SPDs shall be provided at all power services entrances and at entrances of conductive signal and data communication devices.
2. SPDs shall comply with Section 26 43 13 – Low-Voltage Surge Protective Devices.

3.03 FIELD TESTING / QUALITY CONTROL

A. The Contractor shall have the master installer or inspector perform field inspection of the lightning protection system at several stages during the installation in accordance with LPI requirements.

B. Upon completion of the lightning protection system the Contractor shall arrange for a final inspection of the system. The final inspection shall be performed by the master installer or inspector in accordance with LPI requirements.

C. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

END OF SECTION

PART 1 GENERAL

1.01 SUMMARY

A. Requirements for providing surge protective devices (SPDs).

B. SPDs shall be provided in accordance with the requirements specified under this Section and the Contract Drawings.

C. SPDs shall utilized to limit repetitive transient voltage and current surges in low-voltage AC power circuits.

D. The Contractor shall furnish all labor, materials, equipment, services and incidentals necessary for the installation of the SPDs as specified herein.

E. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. SPDs shall be Type 1, 2 or 3.as defined by UL 1449.

1. Type 1 SPDs shall be

a. Permanently connected and intended for installation between the secondary of the service transformer and the line side of service equipment.

b. Installed without use of external overcurrent protective device.

2. Type 2 SPDs shall be

a. Permanently connected and intended for installation on the load side of the service equipment overcurrent device.

3. Type 3 SPDs shall be

a. Permanently installed at the point of utilization.

b. Installed at a minimum conductor length of 10 meters (30 feet) from the electrical service panel.

c. Not used at the utilization point if the distance criteria of a. and b. above cannot be satisfied.

1.06 QUALITY ASSURANCE

A. SPDs shall be designed, built and tested in accordance with the latest applicable editions of NEMA, ANSI/IEEE, UL and NFPA.

B. SPDs shall be UL listed.

C. SPDs of the types and ratings required are of those acceptable manufacturers who have been regularly engaged in the development, design, testing, listing, manufacture and servicing of SPDs for a period of ten years or more and whose products have been in satisfactory use for 10 years or more.

D. SPD manufacturers shall maintain a documented Quality Assurance Program implementing suitable procedures and controls to monitor all aspects of production and testing.

E. The Quality Assurance Program shall be the manufacturer’s standard program specifically dedicated to ensure each SPD is designed, assembled and tested in accordance with the requirements specified herein.

F. Testing shall be done in accordance with UL 1449 on the complete SPDs with lead length comparable to that which will be required to connect the SPDs to the equipment to be protected and as shown on the Contract Drawings.

G. Only qualified personnel or licensed electricians shall actually install SPDs.

H. The Contractor shall retain the services of the SPD manufacturer for field service.

I. Field service shall be in accordance with the requirements specified under this Section and the Specifications.

1.07 SUBMITTALS

A. Contractor shall submit working drawings, shop drawings and material specifications for the approval of the Engineer.

1. Upon request, suppliers or manufacturers shall provide a list of not less than three (3) customer references showing satisfactory installation and operation.

2. Catalog cuts indicating selected ratings and mechanical drawings of SPDs, shall be submitted for approval by the Engineer.

3. Submittals shall contain the required published device specifications and Drawings to show conformance with all parts of this Section.

4. Instructions for installation and connection shall be provided with the SPDs.

5. All Let-Through voltage data shall be measured on an "As Installed" lead length basis, simulating actual installation. At the module or at the bus "Zero lead length" data is not acceptable.

6. Copy of the ISO 9001:1994 Certificate of Registration will accompany the submittal.

7. The connection lead length from the SPD enclosure to the connection point of protected circuit must be detailed in the submitted documentation.

B. Report Submittals:

1. Surge Protective Device (SPD) shop test reports shall include test data verifying let-through voltage, surge current rating and noise attenuation.

2. Manufacturer’s field report

3. Surge Life (Repetitive Surge) rating

4. Maximum Continuous Operating Voltage (MCOV) rating

5. Voltage Protection Ratings for all modes (VPR)

6. Nominal Discharge Current (In)

C. Operation and Maintenance (O&M) manuals shall be submitted for approval.

1.08 DELIVERY, STORAGE, AND HANDLING

A. SPDs shall be delivered, stored and handled in accordance with the Specifications and the manufacturer’s recommendations.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. SPDs shall be as manufactured by:

1. Schneider, Seneca, SC;
2. Siemens, Washington, DC;
3. ABB, New Berlin WI;
4. Eaton Corporation;
5. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Electrical Requirements

1. The SPD operating voltage and configuration shall be as shown on the Drawings.
2. The Maximum Continuous Operating Voltage (MCOV) shall not be less than 115% of the nominal system operating voltage.
3. The suppression system shall incorporate thermally protected metal-oxide varistors (MOVs) as the core surge suppression component for the service entrance and all other distribution levels.
    a. Each thermally protected MOV shall have an end of life indicator and the suppression system shall be continuously self-monitoring.
    b. End of life mode to be open circuit.
    c. SPDs with end of life short-circuit mode are not acceptable.
    d. The system shall not utilize silicon avalanche diodes, selenium cells, air gaps, or other components that may crowbar the system voltage leading to system upset or create any environmental hazards.
4. SPDs must not require external OCPD or replaceable internal OCPD for the UL Listing.
5. The SPD must protect all modes of the electrical system being utilized, i.e. Normal (L-L, L-N) & Common (N-G, L-G).
6. The Nominal Discharge Current (I_n) for all SPDS shall not be less 20 kA regardless of Type.
7. The surge current rating per phase shall be 240 kA for category C locations, 160 kA for category B locations and 120 kA for category A locations.

8. The Voltage Protection Rating (VPR) of the SPDs shall not exceed the following:

Mode	208Y/120	480Y/277	600Y/347
L-N; L-G; N-G	700	1200	1500
L-L	1200	2000	3000

B. Features

1. Balanced Suppression Platform

   a. Surge current shall be equally distributed to all MOV components to ensure equal stressing and maximum performance.

   b. The surge suppression platform must provide equal impedance paths to each matched MOV.

   c. SPDs containing items such as single-mode replaceable modules, replaceable fuses, or replaceable batteries shall not be accepted.

2. SPDs requiring user intervention to test the unit via a diagnostic test kit or similar device shall not be accepted.

3. Each thermally protected MOV shall have an end of life indicator and the suppression system shall be continuously self-monitoring.

4. SPDs with removable covers or doors shall be equipped with internal safety barriers having lockout provisions to prevent contact with energized components.

5. Internal Connections

   a. No plug-in single-mode modules or printed circuit boards shall be used as surge current conductors.

   b. All internal components shall be soldered, hardwired with connections utilizing low impedance conductors.

6. Electrical Noise Filter

   a. Each Type 2 unit shall include a high-performance EMI/RFI noise rejection filter.

   b. Noise attenuation for electric line noise shall be [50 dB] or [40 dB] minimum from 10 kHz to 100 MHz using the MIL-STD-220A insertion loss test method. Products unable to meet this specification shall not be accepted.

   c. Type 2 units with filtering shall be co-listed to UL 1283 5th Edition or later.

   d. Type 1 units shall not contain filtering nor can they have a UL 1283 5th Edition Listing.

7. Monitoring and Diagnostics

a. Protection Status Indicator

1) Each SPD shall have a green/red solid-state indicator lights that reports the status of the protection on each phase.

a) For wye configured units, the indicator lights must report the status of all protection elements and circuitry in the L-N and L-G modes.

b) Wye configured units shall also contain solid-state indicator lights that report the status of the protection elements and circuitry in the N-G mode.

c) SPDs that indicate only the status of the L-N and L-G modes shall not be accepted.

d) For delta configured units, the indicator lights must report the status of all protection elements and circuitry in the L-G and L-L modes.

e) The absence of a green light and the presence of a red/yellow light shall indicate that damage has occurred on the respective phase or mode.

f) All protection status indicators must indicate the actual status of the protection on each phase or mode.

g) If power is removed from any one phase, the indicator lights must continue to indicate the status of the protection on all other phases and protection modes.

h) Diagnostics packages that simply indicate whether power is present on a particular phase shall not be accepted.

b. Remote Status Monitor

1) SPDs, where shown on the Contract Drawings, must include Form C dry contacts (one NO and one NC) for remote annunciation of SPD status.

2) Both the NO and NC contacts shall change state under any fault condition.

c. Audible Alarm

1) SPDs shall contain an audible alarm that will be activated under any fault condition.

2) There shall also be an audible alarm silence button used to silence the audible alarm after it has been activated.

d. Surge Counter

1) SPDs shall be equipped with an LCD display that indicates to the user how many surges have occurred at the location.

2) The surge counter shall register a count for each surge event clamped by the SPD.

3) A reset pushbutton shall also be standard, allowing the surge counter to be zeroed.

4) In order to prevent accidental resetting, the surge counter reset button shall be depressed for a minimum of 2 seconds in order to clear the surge count total.

5) If power to the SPD is completely interrupted, the ongoing count indicated on the surge counter's display prior to the interruption shall be stored in non-volatile memory and displayed after power is restored.

6) The surge counter's memory shall not require a backup battery in order to achieve this functionality.

8. MOV Protection

a. SPDs shall contain thermally protected MOVs.

b. The self-protected MOVs shall have a thermal protection element integrated with the MOV and a mechanical disconnect with arc quenching capabilities in order to achieve overcurrent protection of the MOV.

c. The thermal protection assembly shall disconnect the MOV(s) from the system in a fail-safe manner should a condition occur that would cause them to enter a thermal runaway condition.

d. Each thermally protected MOV shall have an end of life indicator and the suppression system shall be continuously self-monitoring.

9. Overcurrent Protection

a. The unit shall not require external overcurrent protective device (OCPD) as part of the UL 1449 listing.

b. If the AHJ requires overcurrent protection of the conductors connecting the SPD to the system then OCPD shall be sized based on governing AHJ electrical code requirements.

10. Fully Integrated Component Design

a. All of the SPD's components and diagnostics shall be contained within one discrete assembly.

b. The use of plug in single-mode modules that must be ganged together in order to achieve higher surge current ratings or other functionality shall not be accepted.

11. Safety Requirements

a. The SPD shall minimize potential arc flash hazards by containing no single-mode plug in user serviceable/replaceable parts and shall not require periodic maintenance.

b. SPDs containing items such as replaceable single-mode plug in modules, replaceable fuses, or replaceable batteries shall not be accepted.

c. SPDs requiring user intervention to test the unit via a diagnostic test kit or similar device can pose a safety hazard and shall not be accepted.

d. SPDs designed to interface with the electrical assembly via conductors shall require no user contact with the inside of the unit or shall have barriers that block access to harmful voltages.

e. Lockout provisions, capable of accepting a padlock, shall be provided on units with a disconnecting internal breaker if applicable.

f. SPDs without barriers or lockout provisions shall be factory sealed to reduce exposure to harmful voltages.

g. Factory sealed units shall have installed phase, neutral, ground and remote status contact conductors and shall have a pigtail set of conductors protruding outside of the enclosure for field installation.

12. The manufacturer shall certify that all materials and processes used as a component of the SPD units, and used in the process of manufacturing and packaging of the units are in accordance with The Federal Clean Air Act Amendments of 1990, Sections 602 and 611, prohibiting the use of Class I or Class II ozone depleting chemicals.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. SPDs shall be factory mounted within the equipment as shown on the Contract Drawings. A circuit breaker disconnect shall be provided to protect and isolate the SPD from the main supply.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Certified Shop Tests:

1. Shop testing shall be performed on the SPD at the manufacturer’s plant prior to shipment.

2. Shop tests shall include the manufacturer’s standard tests and shall demonstrate quality assurance inspection and testing procedures for the equipment.

3. The Contractor shall provide a shop test report. The report shall identify the tests performed and the results obtained.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. SPDs of the appropriate listing shall be installed at locations shown on the Contract Drawings

B. Installation locations shall include Service Entrance Equipment, Distribution Equipment and Utilization Equipment.

C. SPD installations shall confirm to the manufacturer's written instructions and recognized installation practices including:

1. Proximity to the protected equipment
2. Strict adherence to the total length of conductors feeding the SPD.
3. Minimum bend radius of feed conductors.
4. Maximum number of bends in the feed conductors.
5. Whether the grounded conductor is to be bonded at the SPD.
6. Grounding of both the SPD and the protected equipment.

D. The SPD manufacturer shall make available experienced, qualified, power-quality application and field supervision engineering services during installation and start-up.

E. The Contractor shall verify the proper application of the SPDs (i.e. voltage, phase, etc.) and coordinate with upstream and downstream SPDs.

F. The Contractor shall assure that all neutral conductors are bonded to the system ground at the service entrance or at separately derived system point, prior to installation of the associated SPDs.

G. Install nameplates for identification of equipment.

3.03 FIELD TESTING / QUALITY CONTROL

A. Manufacturer's Representative

1. A qualified representative from the SPD manufacturer shall assist in the installation of the SPDs, check the installation before it is placed into operation, observe and assist initial operations and train operations and maintenance staff in the care, operation and maintenance of the SPDs.
2. The service representative shall sign in with the Engineer on each day they are at the site.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

SECTION 26 46 20 - FIRE DETECTION AND ALARM SYSTEM

CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall design, furnish, install, test and place into satisfactory operation fire detection and alarm systems as specified herein and in compliance with the Contract Drawings and all applicable codes and standards listed in this section.

B. Two separate and distinct fire detection and alarm systems are required, one at each of two of the three sites shown on the Contract Drawings. Each fire alarm and detection system shall be microprocessor based, addressable supervised fire detection and alarm system.

C. Each System shall include, but not be limited to: Fire Alarm Control Panel (FACP), Fire Alarm Communicator, power supplies and fire alarm initiating and notification devices including addressable monitor and control relay modules as indicated on the Contract Drawings.

D. Each fire alarm system shall include conduit, wire, fittings, and all required system accessories required to provide a complete operating system.

E. Each FACP shall display system information to the extent applicable including system status, alarms, trouble, and supervisory indications. Each fire alarm system shall be able to remotely transmit alarms to the Central Station Monitoring.

F. All charges and fees required by the NYC Fire Department local Authority having jurisdiction (AHJ) to inspect each the installation and implement fire alarm notifications are to be included by the Contractor under this section at no additional cost to the City.

G. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

B. Pay under the lump sum for all fees and give all notices, file all plans, obtain certificates and obtain all necessary approvals from NYC Fire Department. Deliver all certificates of inspection to the NYC Fire Department. No work shall be covered before examination and approval by NYC Fire Department. Replace imperfect or condemned work to conform to inspectional requirements, satisfactory to the City, Engineer, and NYC Fire Department without extra cost to the City. If Work is covered before inspection and acceptance, pay costs of uncovering and reinstalling the covering, whether it meets contract requirements or not.

1.05 DESCRIPTION

A. Type of System:

1. Fire Alarm Systems: Each fire alarm system shall operate as a low voltage addressable type system and shall automatically be placed into an alarm condition whenever any manual or automatic fire detecting devices or monitor modules are placed into an alarm mode. The system shall indicate areas of alarm and sound local alarms at the FACP.
2. The systems shall be capable of operating with a single break or ground fault condition in the initiating, notification, and data communication circuits.
3. Signaling line circuits for initiating devices, monitor modules, control relay modules and any other required addressable devices shall utilize Class X wiring as described in NFPA 72. Notification appliance circuits for horns, strobes, speakers, and any other notification appliances shall utilize Class A wiring as described in NFPA 72.
4. Power Supply for the Systems: The power supply for each FACP and fire alarm communicator shall be provided in accordance with NYC Electrical Code Article 760 and shall consist of the following:
    a. Normal power shall be obtained from the service entrance supply tapped ahead of the main service disconnecting means. A second alternate power supply tapped ahead of generator main disconnection means shall enable each FACP to be supplied from the generator. The normal and alternate power distribution shall include the fused disconnect switches and auto transfer switch and fused cutouts as indicated on the Contract Drawings. Dedicated fuses at the fused cutout shall be provided, one for the FACP and one for the alarm communicator.
    b. Backup power shall be obtained from a manufacturer provided battery backup system consisting of rechargeable, sealed type storage batteries and battery charger mounted within each FACP.

Additional external power supplies required by the system at the discretion of the fire alarm system manufacturer or due to circuit load or length shall be provided from a dedicated fuse at the fused cutout.

5. Each system shall interface with HVAC systems and other building systems using monitor modules and control relay modules as shown on the Contract Drawings and as required by NFPA 72 to provide all required monitoring and control functions.

B. Standards and Codes:

1. Each fire alarm system shall comply with the NFPA, UL and State and Local Codes as referenced under Article 1.04.

C. Sequence of Operation:

1. When a fire-alarm condition is detected by one of the system's initiating devices, the following functions shall immediately occur, refer to Contract Drawings for detailed sequence of operation:

a. Automatic programs assigned to the alarm point shall be executed and the associated indicating devices and relays activated.

b. Fire-alarm notification devices in the building shall operate.

c. The Audio/Visual alarm notification devices shall operate.

d. The system alarm on the FACP shall indicate condition.

e. The alarm shall be transmitted to the Central Station Monitoring.

f. Shutdown of all HVAC equipment and any defined exhaust and pressurization operations to be initiated.

2. When a trouble or supervisory condition is detected by one of the system's initiating, indicating circuits, or upon loss of AC power the following functions shall immediately occur, refer to Contract Drawings for detailed sequence of operation:

a. System Trouble or Supervisory will be indicated on FACP.

b. A local trouble-sounding device in the FACP shall be activated. This sound shall be distinct from the alarm sound.

c. The trouble alarm shall be transmitted to the Central Station Monitoring.

1.06 QUALITY ASSURANCE

A. Telephone and Cellular Services:

1. Contractor shall make all necessary arrangements in advance with Verizon as required to obtain new telephone and cellular services for the purpose of communicating system alarms to the Central Station Monitoring.

2. Per the requirements of the NYC Fire Code, two separate means of communication are required: one primary and one secondary. The primary

means of communication shall be via a redundant pair of telephone landlines, and the secondary means shall be via a LTE cellular network service.

3. All work regarding the connection and installation of Verizon telephone and cellular services shall comply with the requirements of Verizon. Contractor shall coordinate the service requirements with Verizon in advance.

4. Contractor shall be responsible to establish the Verizon accounts and pay the Verizon monthly bills for each of the services until Substantial Completion or until the accounts can be transferred to the City.

5. Contractor shall be responsible to facilitate and coordinate with Verizon and the City regarding the transfer of the service accounts.

B. Comply with the requirements specified in Section 01 43 10 – Quality Assurance Inspections.

C. Standard Products: Material and equipment shall be the latest standard products of a single manufacturer regularly engaged in the manufacture of the product for the 5 years as a minimum.

D. Obtain NYC Department of Building work permits in accordance requirements specified under Section 01 41 00 – Regulatory Requirements.

E. Qualifications of the installer before commencing work: The fire alarm vendor shall hold a NYC Fire Department issued fire alarm company certificate. Submit the following information:

1. Fire alarm company certificate issued by NYC Fire Department.

2. Identify the employment of staff who are to be used and certify they have performed NYC Fire Department approved fire alarm installations, inspections, and testing services.

F. Nameplates: The components of equipment shall have the manufacturer's name, address, type or style, contract tag number and catalog number on a plate securely attached to the equipment.

G. Tags: Tags with stamped identification number shall be furnished for keys and locks. Tags shall be furnished to identify cable and conduit runs, wiring circuits, and all spare parts furnished for Authority's stock to maintain the system.

H. Keys and Locks: All locks shall be keyed alike.

I. Verification of Dimensions: Become familiar with details of the work and verify dimensions in the field.

J. Compliance: The fire detection and internal alarm system shall be configured in accordance with NFPA 72. The equipment furnished shall be UL listed and in accordance with the applicable NFPA standards.

K. Verify conduit size and wire quantity, size, and type are suitable for the equipment supplied. Review the proper installation of each type of device with the equipment supplier.

L. Review the NYC Fire Department submittal documents for completeness prior to submission to the Fire Department.

1.07 SUBMITTALS

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Copy of this Section with addenda and all referenced Contract Sections with addenda checkmark each paragraph to indicate specification compliance or indicate deviation and reason for deviation.

a. Failure to include a copy of the marked-up Contract Sections will result in return of the entire submittal with no further review and consideration.

2. Installer and system supplier certification qualifications and list of three similar projects with name and phone number of contact person.

3. Complete list of equipment and materials, including manufacturer's descriptive and technical literature, catalog cuts. Shop drawings shall contain complete conduit riser diagrams, wiring diagrams, plan layout drawings, schematic diagrams, and sequence of operations for all equipment, devices, conduits, and cables furnished. Riser diagrams shall identify cable sizes and quantities, equipment layout, and any other details required to demonstrate that the system has been coordinated and will properly function as a unit.

4. Manufacturer’s printed installation instructions.

5. Battery capacity calculations to demonstrate that the battery size selected is a minimum of 125 percent of the calculated requirement. Calculation to include supervisory power requirements for all equipment, and alarm power requirements for all equipment including notification circuits.

6. Wiring diagrams from the fire alarm system integrator or supplier differentiating clearly between factory and field installed wiring. Include diagrams for equipment and for system with all terminals and interconnections identified. Identify all diagrams to be specific to this project and distinguish between field and factory wiring.

7. Voltage drop calculations based on field measured wiring distances indicating that signaling and notification appliance circuits do not exceed the manufacturer’s recommended maximum voltage drop for each type of circuit.

B. Spare Parts Data:

1. After approval of the list of shop drawings, and not later than six months prior to the date of substantial completion, furnish copies of spare parts data for each different item of materials and equipment specified. The data shall include a complete list of parts and supplies with current unit prices and source of supply, a list of supplies that are either normally furnished at no extra cost with the purchase of the equipment or specified to be furnished in accordance with paragraph Special Tools and Spare Parts and a list of

additional items recommended by the manufacturer to assure efficient operation for a period of 120 days.

C. Operating and Maintenance Instruction Manuals:

1. Submit operation and maintenance manuals as specified in 01 78 25 – Operation and Maintenance Manuals, outlining the step-by-step procedures required for system startup and operation. The manual shall include the manufacturer's name, model number, service manual parts list and detailed description of all equipment and their basic operating features. The manuals shall include all approved riser, plan, wiring and schematic drawings as well as detailed sequence of operations tables.

2. Maintenance instructions manuals outlining maintenance procedures shall be furnished. The manual shall include a troubleshooting guide listing possible breakdown and repairs and a simplified connection wiring diagram for the system as installed. Provide the names, addresses, and telephone numbers of service organizations that provide technical assistance and carry stock of repair parts for the system to be furnished.

3. Performance Test Reports: Upon completion of the installed system, submit in field tests performed to prove compliance with the specified performance criteria and as detailed in Part 3 of this specification.

D. Submit Certificate of Compliance, signed by manufacturers of fire alarm system components certifying that their products comply with specified requirements.

E. Submission to NYC Fire Department: In addition to submission of the above material, make submission to the NYC Fire Department. Submit copies of each fire alarm system approved riser and plan Shop Drawings and related information as needed to facilitate Fire Department review. Upon receipt of comments from the NYC Fire Department, provide clarifications and revisions and make resubmittals of Shop Drawings until Fire Department approval is obtained.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Comply with the requirements specified in Section 01 65 00.

B. Equipment placed into storage shall be protected from the weather, humidity and temperature variations, dirt, dust, and other contaminants.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Comply with the requirements specified in Section 01 78 24 – Spare Parts and Maintenance Materials.

B. Provide for each fire alarm system one spare FACP motherboard and one spare of each FACP enclosure component including but not limited to signal circuit cards, notification circuit cards, network interface cards, and PLFA power supplies. At a minimum provide an additional 10 percent quantity (or minimum of 2) of each initiating device type, notification device type, control relay module and monitor module. The manufacturer shall also submit a list of recommended spare parts to be furnished for review by the Engineer.

C. Three sets of all special tools necessary for the maintenance of the equipment shall be furnished. The list of special tools to be furnished shall be submitted for review by the Engineer. Two spare sets of fuses of each type and size required and five spare lamps for each type shall be furnished.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Siemens - Cerebrus Pro

B. Honeywell

C. Simplex – Grinnell

D. Or approved equal

2.02 MATERIAL / EQUIPMENT

A. General Product Description:

1. Each Fire-Alarm Control Panel (FACP) shall be capable of fire detection, equipment supervision, data/network communication and control, alarm management, and historical data collection and archiving. The FACP shall have a minimum capacity of 500 addressable points and 100 notification appliance circuits.

B. Communications:

1. Each FACP shall have sufficient memory to support its operating system and databases including:

a. Fire management

b. Alarm management

c. Historical/Trend Data

d. Maintenance Support Applications

e. Custom Processes

f. Operator I/O

2. Integrated On-Line Diagnostics: The FACP shall continuously perform self-diagnostics, communication diagnostics and diagnostics on all subsidiary equipment.

3. Surge and Transient Protection: Isolation shall be provided at all field point terminations to suppress induced voltage transients where required. Surge arrestors shall provide protection from all non-signal electrical surges that

could cause damage to the equipment. Line surge arrestors shall be isolated from the electrical circuitry that they are protecting.

C. System Software Features:

1. Provide software to form a complete operating system as described in this Section and as shown on the Contract Drawings.

2. The software programs specified in this section shall be provided as an integral part of the panel and shall not be dependent upon any higher level computer for execution.

3. Alarm Management: Alarm management shall be provided to monitor, buffer, and direct alarm reports to operator devices and memory files. The control unit shall have capability of performing alarm analysis and signaling. The panel alarms shall be secure and at no time shall be overridden.

4. Status Change Report: All alarm or point change reports shall include the point's description in English along with the time and date of occurrence.

5. Prioritization: The user shall be able to define the specific system reaction for each point. Alarms shall be prioritized to minimize nuisance reporting and to speed operator response to critical alarms. A minimum of three priority levels shall be provided.

6. Report Routing: Alarm reports shall be archived for future recall.

7. Alarm Messages: In addition to the point's description and the time and date, the user shall be able to print, display or store a custom alarm message to more fully describe the alarm condition or direct operator response.

8. The FACP shall be capable of storing a library of at least 2500 events.

9. History Mode:

   a. The system shall be able to store and display at least 2500 system events that have occurred in a non-volatile buffer memory. Display of these events shall be accomplished on-site through the use of the front control panel indicators and switches.

10. Field Configurable:

    a. The system shall be fully configurable and expandable without the need for erasable programmable read-only memory. All configurations shall be accomplished through downloading of programs from a computer. Reconfiguration shall not require knowledge of any programming languages or require any special training. All programs shall be stored in non-volatile memory. Entry into program mode shall require a special key and a special password entered into the front panel.

D. Addressable Device Interface:

1. The Addressable Device Interface will be capable of supporting devices as indicated on the Contract Drawings with minimum 25 percent spare capacity for future devices on each loop as well as 25 percent spare capacity for interface cards within the FACP enclosure.
2. The addressable device interface shall contain its own microprocessor control interfaced with FACP motherboard and operating system software.
3. The addressable device interface shall communicate and provide power to all devices on its loop over a single pair of wires. The fire-alarm system signaling circuits shall function as a Class X system as described in NFPA 72.
4. The addressable device interface board shall receive information from all addressable devices and shall process this information to determine normal, alarm, or trouble conditions. The information shall also be used for automatic test and determination of maintenance requirements.
5. Communication with connected devices shall be performed every 5 seconds or less. Average time to detect an alarm shall be less than 10 seconds (longer for alarm verification detectors).

E. Notification Appliance Circuit:

1. Each FACP shall provide supervised Class A notification circuits as indicated on Contract Drawings with 25 percent spare capacity for future devices on each circuit and 25% spare capacity of notification circuit cards/interface boards within the FACP. The circuit capacity shall be 2.0 amperes maximum per circuit, maximum of 8.0 amperes from the FACP's power supply. If a short-circuit trouble occurs on one of the circuits, it will not affect the operation of the remaining circuits. The manufacturer shall submit notification appliance circuit calculations showing load of each circuit and field setting of each visual (cd) or audio (dBA) device on the circuit.
2. Booster Power Supplies (BPS) shall be provided for notification circuits where the notification circuit load exceeds the capacity of the FACP power supply and/or where the voltage drop on a notification circuit exceeds manufacturer recommended voltage drop.

F. Function Relays:

1. Each FACP shall be provided with a minimum of five relays with Form "C" relay contacts, rated at 2 A at 120 VAC. Three relays shall be dedicated for fire alarm and shall be programmed to activate for detection of fire from the system detectors or the manual pull stations. Two relays shall be dedicated one for trouble alarm and shall be programmed to activate for detection of system trouble conditions and the second for supervisory alarm and shall be programmed to activate for detection of sprinkler tamper switches. Relay dry contacts shall be hard wired to terminals for remote indication of the following:
   a. Fire alarm to telemetry panel.

b. Trouble alarm to telemetry panel

c. Supervisory alarm to telemetry panel.

G. Central Processing Unit (CPU):

1. The CPU shall communicate with the operator interface, LCD display, LED display and control other modules in the panel. Removal, disconnection, or failure of any control panel shall be detected and reported by the Central Processing Unit.

2. The CPU shall contain and execute all control-by-event programs for specific action to be taken if a fire situation is detected in the system. Such control-by-event programs shall be held in non-volatile programmable memory and shall not be lost even if system primary and secondary power failure occurs. The CPU shall also provide a real time clock for time annotation on the display and remote optional printer.

H. Operator Display:

1. The operator display shall provide controls and indicators used by the system operator. The display shall contain, and display as needed, custom alphanumeric message for all intelligent detectors and addressable modules. Such message information shall be stored in programmable non-volatile memory.

2. The display board shall provide a backlit 80-character alphanumeric Liquid Crystal Display (LCD). It shall also have LEDs for system indication such as AC POWER; SYSTEM ALARM; SYSTEM TROUBLE; ACKNOWLEDGE; SIGNAL SILENCE, etc.

3. Factory programmable system indications shall be available for standard unique functions. Programmable functions shall be secure and password protected.

4. The Display Interface shall provide a key touch keypad with control capability to command all system functions, and entry of any numeric information. The keypad shall include means to enter a minimum of two different passwords to prevent unauthorized manual control.

5. Ground fault, short circuit, and open circuit indications shall be displayed on an overall system basis as well as by signaling circuit, and notification circuit.

I. Communications Ports:

1. Each system shall provide communication ports to the extent applicable for the following interfaces:

a. System Annunciators.

b. Alarm communicator.

c. Service and field programming.

d. Printer.

J. Fire Alarm System Panels:

1. The panel enclosures shall comply with the requirements of UL 864. Panels shall be housed in enclosures that are designed for mounting recessed or directly to a wall or vertical surface. The back box and door shall be constructed with provisions for electrical conduit connections. The door shall provide a key lock and shall include an opening for viewing.

2. The panels shall be modular in structure for ease of installation and maintenance.

3. Enclosures having doors over 48 inch (1200 mm) in height shall be provided with a three-point catch and lock; all other doors shall contain a cabinet type cylinder lock. Inserts shall be blind fastened so that no screws show on the panel front.

4. Enclosures shall be provided with ample gutter space to allow proper clearance between the enclosure and live parts of the panel equipment. If more than one modular unit is required to form a control panel, the units shall be installed in a single cabinet large enough to accommodate all units and allow ample gutter space for interconnections of panels and field wires.

5. The enclosures shall be painted red and labelled as Fire Alarm System with equipment designation with decal or approved markings.

K. One Person Test Feature: The control unit shall include a special one person test feature, which will allow a single person to test all initiating devices and indicating appliance in a system without returning to the panel to reset the system. A special password shall be required to enter the test mode. The service-technician shall be able to re-select the initiating and indicating circuits that are to be included in the one person test mode. The Walk-Test shall include a special audible indication that a trouble has been detected on an analog device, for the service-technician to check proper system wiring.

L. Provide addressable monitor modules on signaling circuits to interface FACP to non-addressable detection components and subsystems as required and as indicated on the Contract Drawings. Each module shall be capable of receiving a minimum of one dry contact indication from the component/system being monitored. The modules shall be capable of being mounted in a 4 x 4 x 2 1/8 inch (100 x 100 x 54 mm) junction box.

M. Provide addressable control relay modules on signaling circuits to interface FACP to HVAC systems, auxiliary audible and visual devices and other control components as required and as indicated on the Contract Drawings. Each module shall have a minimum of one Form C dry contact capable of sending control inputs to two separate devices/systems. Control relay modules shall have an external LED to indicate when the relay function has been activated. The modules shall be capable of being mounted in a 4 x 4 x 2 1/8 inch (100 x 100 x 54 mm) junction box.

N. Fire-Alarm Initiating Devices:

1. Addressable Devices: All addressable detectors shall:

a. Provide a test means whereby they will simulate an alarm condition and report that condition to the FACP. Such a test shall be initiated from the FACP or via a field programmable electronic device communicating with the detectors. All detectors shall have self-diagnostic capabilities and report change in health status to the FACP.

b. Provide address-setting means using the FACP software and a field programmable electronic device. The detectors shall also store an internal identifying code which the FACP shall use to identify the type of detector.

c. Provide dual alarm and power LEDs. Both LEDs shall flash under normal conditions, indicating that the detector is operational and in regular communication with the control panel. Both LEDs may be placed into steady illumination by the control panel, indicating that an alarm condition has been detected. An output connection shall also be provided in the base to connect an external remote alarm LED.

2. Addressable pull stations shall, on command from the control panel, send data to the panel representing the state of the manual switch and the addressable communication module status. They shall use a key operated test-reset lock and shall be designed so that after actual emergency operation, they cannot be restored to normal use except by the use of a key. Operated stations shall have a positive, visual indication of operation and utilize a key type reset. Manual stations shall be constructed of Lexan with clearly visible operating instructions provided on the cover. The word FIRE shall appear on the front of the stations in raised letters, 1.75 inch (45 mm) or larger. Mount stations inside a red, weatherproof enclosure with a clear polycarbonate hinged front cover.

3. Addressable Area Photoelectric Smoke Detectors: Photoelectric Smoke Detectors shall use the photoelectric principle to measure smoke density and shall, on command from the FACP send data to the panel representing the analog level of smoke density. These addressable detectors shall connect via a two wire signaling circuit to one of the FACP addressable input circuits. Each detector shall utilize a dust-resistant, field cleanable photoelectric detection chamber with microprocessor based electronics. The detector shall be capable of differentiating between an actual fire and other similar phenomena (i.e. dust, cigarette smoke).

4. Addressable Heat Detectors: Heat detectors shall use an electronic sensor to respond to temperatures exceeding 135 degrees F (57 degrees C) or 190 degrees F (88 degrees C) as noted on the plans. The sensing element shall be a thermistor or other equivalent electronic heat sensing element. The sensing element shall be capable of being replaced without removing the detector base. The detector shall, on command from the control panel, send data to the panel representing the analog temperature level. These

addressable detectors shall connect via a two wire signaling circuit to one of the FACP addressable input circuits.

5. Each detector shall be provided with a steel mounting plate, and the entire unit shall mount on a double gang electrical box.

6. Addressable Duct Smoke Detectors:

   a. The detectors shall be an air sampling type duct smoke detector and shall be provided with a remote test and alarm indicating station. Provide cable required to interconnect the remote test station and alarm indicating station with the detector.

   b. The detectors shall, on command from the control panel, send data to the panel representing the analog level of smoke intensity.

   c. The duct detectors shall be suitable for operation in the following environment: Temperature: -4 degrees Fahrenheit to 158 degrees Fahrenheit, Humidity: 0-93 percent RH, non-condensing.

7. Provide devices suitable for the area classifications as indicated on the Contract Drawings.

O. Fire Alarm Indicating Devices:

1. Visual appliances shall be installed as shown on the Contract Drawings in accordance with the requirements of the UL 1971 standard and NFPA 72. Where multiple visual signals are visible from any location, circuitry shall be incorporated for the synchronization of the flash rate.

   a. UL 1971 Listed for Emergency Devices for Hearing Impaired in all public mode installations.

   b. Strobes shall meet UL 1971 flash rate.

   c. Visual signals shall incorporate a Xenon flashtube enclosed in a rugged Lexan lens or equivalent with solid state circuitry.

   d. The strobe intensity shall be rated per UL 1971.

   e. The strobes shall be available for semi-flush or surface mounting and in conjunction with audible signals as required.

   f. Strobes shall have field configurable intensity levels.

2. Audible Devices: Audible evacuation signals shall be provided meeting the following requirements:

   a. Audible Notification appliance shall be electronic and use solid state components.

   b. Each electronic signal shall provide four field selectable alarm tones. The tones shall consist of slow hoop, continuous, temporal or interrupted.

   c. The device UL dBA measurement at 10 feet (3 m) shall be a minimum of 84 dBA for separately mounted audible signals.

d. The device shall have provisions for standard reverse polarity type supervision and in/out field wiring using terminals that accept 12 AWG wiring.

e. Horns shall be diode polarized, heavy duty, 24 volt DC operated. Enclosure shall be red with a corrosion resistant epoxy finish suitable for wet, corrosive and /or the Hazardous locations as defined on the Contract Drawings.

f. Combination audiovisual alarm horns shall have a high intensity flashing light and alarm horn as an integral unit. Both audio and visual components shall operate from the 24 volt dc polarized indicating circuits. The audiovisual assembly shall be housed in a red color impregnated plastic enclosure, and the electronic light source shall be protected by a polycarbonate clear lens. The strobe output rating shall be selectable, 15, 30, 75 and 110 cd. Horn output shall have a temporary audible repeat cycle pattern.

P. Power Supply:

1. The power supply for each FACP and fire alarm peripherals shall be integral to the FACP. The power supply shall provide FACP and peripheral power needs.

2. Positive-temperature-coefficient thermistors, circuit breakers, or other over-current protection shall be provided on all power outputs.

3. Input power shall be 120 VAC, 60 Hertz. The power supply shall provide internal batteries and charger. Internal battery capacity shall be sized as required to meet system requirements.

4. The main power supply shall provide a battery charging circuit consisting of a fully automatic standby battery charger, rate compensated, capable of maintaining battery in fully charged state and be capable of recharging batteries to 70 percent of alarm capacity within 12 hours. Provide for normal supervisory operation of entire system for 24 hours followed by full load operation for 15 minutes.

5. Provide charger with the following supervised functions: circuit protection for shorts, open, disconnected, or reversed polarity battery connection, supervision, or protection of high or low voltage, overcharging and charger failure. Automatic load shedding or battery disconnect on deep discharge to prevent battery damage.

6. Batteries shall be 24 volt, rechargeable, gelled electrolyte, totally sealed, fully charged with al interconnections ready for service, maintenance free, long-life.

Q. Wiring within Cabinets, Enclosures, Boxes, Junction Boxes, and Fittings:

1. Provide wiring installed in a neat and workmanlike manner and installed parallel with or at right angles to the sides and back of any box, enclosure, or cabinet.

2. Conductors which are terminated, spliced, or otherwise interrupted in any enclosure, cabinet, mounting, or junction box shall be connected to terminal blocks.

3. Mark each terminal in accordance with the wiring diagrams of the system.

4. Make connections with approved pressure type terminal blocks, which are securely mounted.

5. The use of wire nuts or similar devices shall be prohibited.

R. Terminal Cabinets:

1. Provide a terminal cabinet at the base of any circuit riser were indicated on the Contract Drawings.

2. Terminal size shall be appropriate for the size of the wiring to be connected.

3. Conductor terminations shall be labeled and a drawing containing conductors, their labels, their circuits, and their interconnection shall be permanently mounted in the terminal cabinet.

4. Minimum size is 8 inch (200 mm) high by 8 inch (200 mm).

S. Wiring:

1. Signaling line circuits shall be connected to the FACP with 14 AWG (minimum) twisted shielded pair copper cabling type FPLP NYC certified.

2. Notification appliance circuits shall be connected to the FACP with 12 AWG (minimum) unshielded twisted pair copper cabling type FPLP NYC Certified

3. Wire size shall be increased beyond the minimum specified sizing to prevent voltage drop problems as required or as deemed appropriate by the fire alarm system manufacturer.

4. Power wiring, operating at 208/120 VAC minimum shall be 12 AWG (minimum) solid copper having 600V insulation. Ground wiring shall be 10 AWG (minimum) solid copper.

5. Provide all wiring in rigid galvanized metal conduit, minimum size 3/4" and in accordance with Section 26 05 33 – Raceways and Boxes for Electrical Systems.

6. Outer jacketing for all cables shall be red. Conductor insulation for all pairs shall be red/black.

7. Data communication wiring for the alarm communicator connections shall be 4 pair Ethernet shielded cable, UL listed 2 hour fire rated, NYC approved of a type recommended by the fire alarm system supplier.

T. Conductor Terminations:

1. Labeling of conductors at terminal blocks in terminal cabinets, FACP, and remote fire alarm control units shall be provided at each conductor connection.

2. Each conductor or cable shall have a shrink-wrap label to provide a unique and specific designation.

3. Each terminal cabinet, FACP, and fire alarm control unit shall contain a laminated drawing which indicates each conductor, its label, circuit, and terminal.

4. The laminated drawing shall be neat, using 12 point lettering minimum size, and mounted within each cabinet, panel, or unit so that it does not interfere with the wiring or terminals.

5. Maintain existing color code scheme were connecting to existing equipment.

U. Fire Alarm Communicators:

1. Provide fire alarm communicators as indicated on the Contract Drawings for transmitting alarms from the FACP to the Central Station Monitoring. The fire alarm communicators shall be capable of both primary and backup communication.

2. The fire alarm communicator primary communication method shall be the two telephone landlines. The fire alarm communicator backup communication method shall be an LTE cellular network service.

3. Each FACP alarms shall be transmitted to the central station monitoring via the fire alarm communicator primary telephone communication means. The primary telephone communicator shall transmit alarms using the first primary telephone number. If the primary telephone line number is unsuccessful, the secondary telephone line number shall transmit the alarms. If the two telephone lines are out of service or fails, the fire alarm communicator backup cellular communication means shall instantly transmit the FACP alarms to the Central Station Monitoring.

V. Cellular Antenna:

1. Provide antennas suitable for outdoor installation with high directional gain 2x2 MIMO signal boosting for 2G/3G/4G/5G networks and ground impulse suppressor for each FACP. Antenna shall be manufactured by Panorama Antennas, Parsec Technologies, Taoglas or approved equal.

2. The antennas shall be suitable for a frequency range of 698-960/1710-2700/3400-3800 MHZ with a gain of 6-9 dBi and an impedance of 50 Ohms. Maximum input power rating shall be 20 watts.

3. The antennas shall be equipped with a N-Female type connector and a coax double shielded RG58 cable. Provide cable lengths as required to suit each installation, 25 feet at a minimum

4. Provide antenna mast and mounting hardware. Mast shall be suitable for withstanding 105 mph wind and one-half inch ice. Provide clamps and standoff hardware as recommended by the antenna manufacturer.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used.

3.02 INSTALLATION

A. Install each fire alarm system as indicated on the Contract Drawings, in accordance with the manufacturer's diagrams and printed instructions, except where otherwise indicated.

1. Wiring: Wiring for systems shall be installed in conduit. Provide conduit as specified in Section 26 05 33– Raceways and Boxes for Electrical Systems.
2. Station loops shall be arranged to permit disconnecting and bypassing the system at the base of each riser. External wiring between the control panel and the stations and horns/lights shall connect to terminal strips in accessible locked cabinets. Connections to the terminal strips shall be made with terminal spade lugs or with approved type terminal blocks. Terminal cabinets shall be installed at each point where a station circuit riser originates or any point along a circuit where a tap is made. The conductors for the fire alarm system shall be installed in dedicated conduits, junction boxes, or outlet boxes and keep separate from conductors of other systems.
3. Initiating Devices and Notification Appliances shall be installed in accordance with manufacturer's printed instructions.
4. Provide complete wiring and conduit between all equipment. Devices shall be mounted upon UL listed boxes. Wiring splices and transposing or changing of colors will not be permitted.
5. All power distribution equipment dedicated to the fire alarm system, fused disconnect switches, auto transfer switches, fused cutout shall be painted red and labeled as serving the “Fire Alarm System” with decal or approved markings in accordance with the NYC Building Code and Electrical Code.
6. Review the design drawings and perform a walk-through of all areas with the NYC Fire Department inspector.

3.03 FIELD TESTING / QUALITY CONTROL

A. Provide field service technician and instruments as required to perform for each system the initial system programming and testing. Once the initial system programming and testing is completed the performance and acceptance tests for each system shall be conducted.

B. Notify the NYC Fire Department and the Engineer 30 days before the performance and acceptance tests are to be conducted. The tests shall be performed in the presence of the NYC Fire Department and the Engineer or an authorized representative. Submit detailed test reports for all testing required in this section. Tests shall be conducted to the extent applicable for the following:

1. Verify that the system is free of grounds or open circuits. Wiring runs shall be tested for continuity, short circuits and grounds before system is energized. The FACP shall indicate when a ground or open circuit exists.

2. Alarm initiating devices shall be observed and logged for correct zone and sensitivity. These devices and their bases shall be tagged with adhesive tags located in an area not visible when installed, showing the initials of the installing technician and date.

3. Verify that all strobes, audible devices, pull stations, transmitters, automatic detectors, supervisory devices, and remote alarms are functioning. Submit a field test procedure for testing the following elements to the extent applicable for review and approval by the Engineer.

   a. Strobes shall deliver the correct foot-candle. Audible devices shall deliver the correct sound pressure levels decibels of the specified device.

   b. Stations shall close the circuits specified and deliver specified alarm codes. Verify central station receives alarm.

   c. Automatic detectors shall actuate the specified zones when the appropriate fire or smoke conditions are generated. The detectors shall be exposed to actual smoke and/or heat used to simulate this test on each and every smoke/heat detector as located in the building; no other test will be accepted. The operation of associated control relay modules shall be verified to ensure that the relay module activates upon the appropriate alarm and that the associated equipment being controlled for emergency function (i.e. HVAC units, roll up doors) operates as intended.

   d. Panels and supervisory devices shall display, and control functions as specified. Loss of AC system power shall also be tested.

   e. Close each sprinkler system valve and verify proper supervisory alarm.

   f. Verify activation of all water flow switches.

   g. Verify alarm communication, primary and backup to Central Station Monitoring.

h. Verify monitoring of all points for subsystems including but not limited to the HVAC systems.

i. Verify emergency shutdown/operation of HVAC units is as per submitted and approved sequence of operations. A HVAC shutdown matrix detailing sequence of operations for each applicable unit under various alarm conditions shall be included in the field test procedure.

C. System tests to be performed under the supervision of a qualified representative and the AHJ.

D. Perform all tests to verify the correction of defects found in the initial testing. If testing identifies system modifications are required to accomplish the required operation, perform work at no additional cost to the City and retest the system.

E. Provide training on the system in compliance with Section 01 79 05 – Startup and Training. Schedule training at least forty-five (45) days prior to delivery of training subject to the approval of the Engineer and the City. Provide two separate training sessions, one day each session.

3.04 STARTUP / DEMONSTRATION

A. Not Used.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used.

END OF SECTION

SECTION 26 51 11 – LIGHTING FIXTURES, DEVICES AND SCHEDULES
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Requirements for providing lighting fixtures (luminaires) and devices. Luminaires and devices shall be provided in accordance with the requirements specified under this Section, the Specifications and the Contract Drawings.

B. The lighting system shall be complete and include all equipment, devices and accessories as required for the installation of the luminaires and devices.

C. The following index of this Section is presented for convenience:

D. Section 26 05 53 - Identification for Electrical Systems

1.04 REFERENCES

A. Reference Standards

Luminaires and devices shall comply with the latest applicable provisions and recommendations of the following even if not specifically listed in this Section:

1. ANSI C78.377 - Specifications for the Chromaticity of Solid State Lighting (SSL) Products
2. DLC PR - DesignLights Consortium Premium Technical Requirements
3. EISA 2007 - Energy Independence and Security Act of 2007
4. IES LM-79 - Approved Method: Electrical and Photometric Measurements of Sold State Lighting Products
5. IES LM-80 - Approved Method: Measuring Luminous Flux and Color Maintenance of LED Packages, Arrays and Modules
6. IES TM-21 - Technical Memorandum on Projecting Long Term Lumen Maintenance of LED Light Sources
7. NEMA SSL-1 - Electronic Drivers for LED Devices, Arrays, or Systems.
8. NYCEC - New York City Electrical Code.
9. NYCECC - New York City Energy Conservation Code
10. UL 20 - General Use Snap Switches.
11. UL 1598 - Luminaires
12. UL 8750 - Light Emitting Diode (LED) Equipment for Use in Lighting Products.
13. CBM - Certified Ballast Manufacturers, CBM.

1.05 DESCRIPTION

A. Not Used

1.06 QUALITY ASSURANCE

A. General:

1. Luminaires shall be UL listed, approved for use in the City of New York and comply with NYCECC.
2. The luminaire types are noted within the fixture schedule which is shown on the Contract Drawings. The descriptions and catalog numbers serve to establish the quality, appearance and performance of the specified luminaires.
3. Luminaires and controls shall be as manufactured by the same manufacturer.
4. All luminaires shall be the products of lighting equipment manufacturers who have previously demonstrated, by performance and reputation, the ability to manufacture products of the quality specified and shall have a minimum of 5 years' experience manufacturing the luminaires specified. Such manufacturers must maintain an organization and manufacturing facility capable of actually manufacturing the specified luminaires. For the purpose of inspection, Contractor shall assure the Engineer, free and easy access to the manufacturing facilities and inventories of any manufacturer whose equipment the Contractor proposes to supply.
5. Luminaries over the range of operating voltage and temperature shall comply with the following:
    a. Minimum power factor of 0.95
    b. THD for both current and voltage of less than 10%
6. Luminaries shall have integral UL Listed Class 2 drivers and ballasts.
7. Luminaires shall have integral surge protective devices (SPD) to protect the luminaire from common mode transient peak voltages and transient peak currents.
8. Luminaires shall comply with DLC PR.
9. Luminaires utilizing incandescent sources are not permitted.
10. Luminaires shall utilize electronic or solid state drivers or ballasts where applicable.
11. The Contractor shall be responsible to assure that the exact inscription for exit and stairway signs required by local code is checked against that specified, prior to providing same. The Engineer shall be advised of any changes required to conform to local codes before such changes are effected.
12. The Contractor shall be responsible for reviewing all Contract drawings and coordinating with all trades the installation of luminaires and devices. Luminaire and device finishes and construction shall be compatible with the approved wall and ceiling types which shall be determined by the Contractor's review of all Contract drawings.

13. All luminaires shall be of the highest quality material and construction for their respective types.

14. Lamps for all luminaires shall be in accordance with EISA 2007.

15. Luminaires shall be suitable for connection to concealed or exposed conduit runs as required in each particular location and shall be of sizes suitable for lamp sizes indicated on the Contract Drawings.

16. Luminaires designated for emergency use shall be equipped with UL 924 compliant battery backup with a minimum emergency run time of 90 minutes.

17. Fittings and other materials for special luminaires not definitely shown or specified shall be of approved material, make and quality and shall have a finish that will harmonize with other parts of the luminaires. Where suitable standard materials are not available such parts of the luminaires shall be specially manufactured.

B. Field Testing:

1. Luminaires shall be field tested. The field testing shall be performed in accordance with the requirements specified under this Section.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. A list of proposed manufacturers with the products they produce proposed for the contract.

2. Manufacturer's catalog cuts and drawings showing all technical information, and construction details for luminaires, including dimensions, type of wiring, weight, size, installation methods, provisions for relamping or replacing luminaires from the ground, test information criteria and rated life in hours with corresponding standard.

3. Photometric data, developed for each fixture type.

4. Lamp type and technical information.

5. Ballast type and technical information.

6. Driver type for LED luminaires and technical information including input voltage, power factor, Crest Factor and THD.

7. Scaled Shop drawings showing the locations of all fixtures and devices. The Drawings shall include the proposed routing of the branch circuits.

B. Reports

1. Field test reports shall be submitted.

2. Manufacturer's site visit report shall be submitted.

C. Operations and Maintenance Manuals

1. Operations and Maintenance Manuals shall be submitted in accordance with this Section and the Specifications.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Luminaires and devices shall be delivered, stored and handled in accordance with this Section, the Specifications and the manufacturer's instructions.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall furnish and deliver to the Engineer, at that part of the site and at such time as the Engineer may direct, spare parts for luminaires and devices in accordance with this Section and the Specifications.

B. The spare parts shall be listed in an index and packed in containers suitable for long term storage, bearing labels clearly designating the manufacturer's part number with complete information for use and reordering.

C. The following spare parts shall be furnished:

1. 10 percent lamps, lamp module or array shall be provided of each wattage of each type of lamp, lamp module or array but not less than the requirement for two luminaires.

2. Where the lamp, lamp module or array is an integral part of the luminaire and the lamp, lamp module or array is not normally replaceable provide spare luminaires instead.

3. 5 percent ballasts or drivers shall be provided of each type of type of ballast or driver, but not less than two.

4. 5 percent total fuses for each luminaire type and size but not less than one set for each size.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Lamps shall be as manufactured by:

1. Cree, Durham, NC;

2. Nichia America Corporation, Wixom, WI;

3. GE Lighting, Cleveland, OH;

4. Osram Sylvania, Wilmington, MA;

5. Or approved equal.

B. Drivers and Ballasts shall be as manufactured by:

1. Osram Sylvania, Wilmington, MA;
2. Universal Lighting Technologies Inc., Nashville, TN;
3. Eldo LED, Conyers, GA;
4. Advance Transformer, Rosemont, IL;
5. Or approved equal.

C. General use receptacles shall be as manufactured by:
1. Hubbel Incorporated, Shelton, CT;
2. Arrow-Hart Incorporated, Chicago, IL;
3. Or approved equal.

D. Hazardous location receptacles and 480 volt receptacles shall be as manufactured by:
1. Crouse-Hinds Company, Syracuse, NY;
2. Appleton Electric Company, Rosemont, IL;
3. Or approved equal.

E. General use switches shall be as manufactured by:
1. Hubbel Incorporated, Shelton, CT;
2. Arrow-Hart Incorporated, Chicago, IL;
3. Or approved equal.

F. Hazardous location switches shall be as manufactured by:
1. Crouse-Hinds Company, Syracuse, NY;
2. Appleton Electric Company, Rosemont, IL;
3. Or approved equal.

G. Plates shall be as manufactured by:
1. Hubbel Incorporated, Shelton, CT;
2. Arrow-Hart Incorporated, Chicago, IL;
3. Or approved equal.

H. Covers shall be as manufactured by:
1. Crouse-Hinds Company, Syracuse, NY;
2. Appleton Electric Company, Rosemont, IL;
3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Luminaires

1. A luminaire shall be provided for each luminaire symbol shown on the Contract Drawings.
2. Luminaires shall be provided with all necessary hangers, supports, conduit adaptors, reducers, hooks, brackets and other support hardware. All hardware shall have a protective, non-corrosive finish.
3. Recessed luminaires shall be provided with trim moldings and frames suitable for the types of ceilings.
4. Pendent mounted luminaires shall be suspended by means of an enclosed and gasketed cushion type hanger. The hanger shall be suitable to be mounted directly to the luminaire outlet box and shall provide a minimum of 8 degrees swing from the vertical. Stems shall be threaded rigid metal conduit, 1/2 inch minimum size. In corrosive areas stems shall be PVC coated.
5. Where luminaires are subjected to moisture, or assembled of dissimilar metals, gaskets of approved material and thickness shall be provided.
6. Luminaires shall be completely wired except where they will be directly connected to branch circuit wiring. The conductors shall be not less than No. 12 gauge, stranded, with approved heat resistant covering.
7. Mounting heights of all luminaires shall be as shown on the Contract Drawings. For special types, the height shall be determined at the time of installation.

B. Lamps

1. Lamps in association with their ballasts or drivers shall have voltage ratings suitable for the voltages shown on the Contract Drawings.
2. The color temperature of lamps shall be such that the installed luminaire color temperature is as listed in this Section or shown on the Contract Drawings.
3. LED lamps shall be in accordance with the following:
   a. Comply with UL 8750
   b. CRI of not less than 85
   c. Minimum efficacy of 140 lumens/watt
   d. Lamp L80 life of not less than 100,000 hours at 25 degrees C
   e. Maximum junction temperature of 150 degrees C
   f. Binning per ANSI C78.377 at 85 degrees C
   g. Very low thermal resistance to permit optimum heat transfer from the junction to the operating ambient.

C. Drivers and Ballasts

1. General:

a. Ballasts and Drivers shall be matched for proper operation of lamps and shall meet the requirements for luminaire light output, reliable starting and operation.

b. Ballasts shall be UL listed and certified by approved Nationally Recognized Testing Laboratories (NRTL). Testing Laboratories and shall conform to CBM.

2. LED Drivers

a. LED drivers shall be matched to their lamps such that the luminaire supply voltage and its likely site variations shall produce a level of performance indicated in this Section and as shown on the Contract Drawings

b. LED Drivers in conjunction with the respective luminaire construction shall achieve the following:

1) Specified lumen output with variation from specified voltage of plus or minus 10%.

2) Rated life of not less than 100,000 hours.

3) THD of less than 10% across the specified voltage range and full power.

4) Power factor of not less than 95% and over the full range if dimming specified.

5) Consistent performance over the range of temperatures expected at the installation location either indoors or outdoors.

6) Cooling shall be achieved with static arrangements. Active cooling, thermal foldback or thermal sensing to achieve temperature control are not permitted.

c. Electrical connections between LED Drivers and all components of the luminaire shall be polarized and color coded to permit trouble free connection and reconnection. A connection diagram shall be imprinted on the Driver or the internal of the luminaire.

3. Lighting Contactor Panels

a. Lighting contactor panels shall be provided for the control of luminaires where specifically indicated on the Contract Drawings. The panel control and devices shall be arranged for proper operation in accordance with the control schematics shown on the Contract Drawings.

b. The panel enclosures shall be steel, single door type. Enclosures shall be NEMA 12 for dry, indoor areas and NEMA 4X for wet or corrosive areas. Each enclosure shall be equipped with a control fuse with mounting block and 300 volt screw type terminal blocks.

c. Contactors shall be mechanically held type suitable for 120 volt operation and switching ballast type lighting. Contactor voltage, ampere, number of poles and quantities within each panel shall be as shown on the Contract Drawings.

d. Where indicated on the Contract Drawings, the lighting contactor panels shall be provided with selector switches and control relays. Selector switches and control relays shall be heavy duty industrial type.

4. Receptacle and Switches

a. General:

1) Receptacles and switches shall be provided in accordance with the Detailed Specification and as shown on the Contract Drawings. The receptacles and switches shall be complete and shall include all accessories for proper installation.

2) Outlet boxes for receptacles and switches shall be in accordance with Section 26 05 33 – Raceway and Boxes for Electrical Systems.

5. Receptacles:

a. Receptacles shall be duplex grounding type, two pole, three wire, 125 volt AC, 20 ampere. . Where shown on the Contract Drawings, receptacles shall be ground fault type or surge suppression type.

b. Where shown on the Contract Drawings, other special receptacles with number of poles, voltage and current rating shall be provided. Matching plugs shall be provided for each special receptacle.

c. Receptacles for indoor dry, dusty locations shall be heavy duty, straight blade type, with reinforced polyester base and impact resistant nylon face.

d. Receptacles for wet and corrosive locations shall be marine duty, straight blade type, with heat resistant melamine body, weatherproof while use type. Special receptacles in wet and corrosive locations shall be Type 316 stainless steel.

e. Receptacles for hazardous locations shall be factory sealed and shall be in accordance with the following:

1) Explosion-proof type receptacles shall be of the delayed action type requiring the turning of a plug shell on withdrawal to allow time for extinction of arcs.

2) Surface mounted explosion-proof receptacles shall be provided with cast iron or cast aluminum angle type covers with hinged flaps.

3) Flush mounted explosion-proof receptacles shall be provided with brass, chromium plated, flush plates with double hinged flaps.

4) Plugs shall be provided where required for each type of explosion-proof receptacle. Plugs shall be of explosion-proof construction, and shall have steel bodies with corrosion resistant finish. Plugs shall be fitted with aluminum alloy cable clamps and chloroprene cable bushings.

f. Receptacles for installation in floors shall be in accordance with the following:

1) Floor receptacles shall comprise a watertight unit consisting of a cast iron box with an adjustable top, permitting permanent angular and vertical adjustment, brass cover plate and 3/4 inch brass floor extension. The extension shall be of an approved height and shall be surmounted with a brass head arranged for a duplex receptacle. Exposed metal parts shall be finished to match adjacent metal finish.

2) For low voltage signal and telephone work, floor outlets shall be equal to those specified above for floor installation, except that the interiors shall be designed for cable extension as approved.

g. Fan or clock outlets shall be single receptacles with molded composition or bakelite bodies. Rating shall be 15 amperes, 125 volts. Fan outlets shall be furnished with stud supports. Clock outlets shall be of the recessed type and shall be furnished with yokes for clock support.

h. 480 volt receptacles in non-hazardous areas shall be a mechanically interlocked type with circuit breaker disconnect. The disconnect cannot be closed until the plug is fully inserted and the plug cannot be withdrawn or inserted unless the switch is open. The receptacle enclosure shall be copper - free aluminum with stainless steel parts.

6. Switches:

a. Switches shall be industrial-heavy duty, AC toggle quiet type. Switches shall be rated 120/277 volt, 20 ampere. Poles and switching shall be as shown on the Contract Drawings.

b. Switches for hazardous locations shall be factory sealed tumbler type. The switch body and cover shall be cast gray iron alloy or cast malleable iron with zinc electroplate finish.

7. Plates and Covers:

a. Stainless steel plates shall be furnished for devices in indoor dry, dusty locations. They shall have beveled edges and shall be made of Type 316, stainless steel.

b. Plates shall have satin finish. Attachment screws shall have matching head finish.

c. For wet and corrosive locations neoprene gasketed covers shall be used. Covers shall be 316 stainless steel in wet and corrosive locations. Covers shall be equipped with gasketed spring doors for receptacles and an external operating mechanism for switches.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Luminaires

1. Luminaires shall be installed at locations shown on the Contract Drawings. Luminaire locations shall be adjusted where necessary to clear conflicts and obstructions.

2. All luminaires shall be installed complete with all hardware, and supporting devices necessary to make a safe complete and fully operative installation.

3. The Contractor shall obtain from the manufacturer for each luminaire, diagrams, illustrations and other installation instructions. The Contractor shall install in strict conformance with such instructions and the requirements of NYCEC.

4. Recessed fixtures shall be installed in suspended ceiling openings in conformance with manufacturer's recommendations and to suit the architectural details of the area involved. Independent supports from structural members of the building shall be provided.

5. Every linear luminaire shall have at least two supports, and continuous lines of fluorescent luminaire shall be supported at 4 foot intervals.

6. Pendent mounted fixtures shall be installed with pendants 1/2 inch for stems up to 5 feet and 3/4 inch for longer lengths.

7. All pendant stem hangers shall be furnished with suitable aligner canopies or outlet box covers so that the luminaires hang vertical to the finished floor irrespective of the angle of the surface from which they are suspended.

When luminaires or hanger canopies are mounted flush to the ceiling or wall, and where raceways and outlet boxes serving the luminaires are surface mounted to the ceiling or wall, finishing rings shall be provided to conceal the outlet box. All visible hanging devices and appurtenances shall have the same finish as the luminaire.

8. Reflectors, lenses, diffusers, louvers and decorative elements of luminaires shall not be installed until completion of plastering, ceiling tile work, painting, and general clean-up in the area.

B. Lighting Contactor Panels:

1. Panels shall be mounted rigidly and securely to the building structure or to supporting devices which are rigidly and securely supported to the building structure.

2. Panels shall be fastened with bolts and expansion shields on concrete or brick, with toggle bolts on hollow masonry units and with machine screws or welded studs on metal.

3. All panels shall be mounted parallel or perpendicular to walls, such that panels are installed in a neat and professional manner.

C. Receptacles and Switches:

1. Receptacles and switches shall be installed within outlet boxes at locations indicated on the Contract Drawings and in accordance with code requirements.

2. Receptacles shall be mounted 2 feet above the finished floor, except in hazardous locations where receptacles shall be mounted 4 feet-6 inches above the finished floor.

3. Switches shall be mounted 4 feet 6 inches above the finished floor.

4. Where devices are grouped they shall be mounted under a common plate. Where directed or where space conditions limit gang mounting, tandem or tandem gang arrangement shall be provided.

5. Where four or more switches controlling fixtures that are not visible from the switch location are grouped, the switch plate shall be engraved and filled with colored material or otherwise suitably marked to designate the control of each switch.

3.03 FIELD TESTING / QUALITY CONTROL

A. Field Tests

1. After installation, the completed lighting system and receptacle devices shall be field tested for operation and conformance. The field tests shall be witnessed by the Engineer and certified by the Contractor. The Contractor shall provide testing consisting of the following:

a. Wiring continuity test shall be performed.

b. Branch circuit load balance test shall be performed.

c. Fixture and control operation test shall be performed.

d. Receptacle polarity and grounding.

B. Reports

1. The Contractor shall provide a field test report. The report shall identify the test performed and the results obtained.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Cleaning of Luminaries

1. Luminaires shall be cleaned inside and out to remove construction dust prior to the start of Field Tests and again prior to substantial completion at the direction of the Engineer.

2. Fixtures shall be relamped prior to substantial completion.

END OF SECTION

PART 1 GENERAL

1.01 SUMMARY

A. Requirements for providing outdoor lighting. Outdoor lighting shall be provided in accordance with the requirements under this Section, the Specifications and the Contract Drawings.

B. The outdoor lighting system shall be complete and include all luminaires, poles, pole bases, reinforced concrete foundations and accessories as required for the installation of the outdoor lighting.

C. The Contractor shall perform all excavations, complete all forms, and do backfilling and tamping as required, unless specifically shown otherwise on the Contract Drawings.

D. The following index of this Section is included for convenience:

1.05 DESCRIPTION

A. Not Used

1.06 QUALITY ASSURANCE

A. General

1. Luminaires shall be UL listed and approved for use in the City of New York and comply with NYCEC.
2. The types of luminaires are noted within the fixture schedule which is shown on the Contract Drawings. The descriptions and catalog numbers serve to establish the quality, appearance and performance of the specified luminaires.
3. Luminaires shall comply with DLC PR.
4. All outdoor lighting luminaires, poles and associated equipment shall be the products of lighting equipment manufacturers and manufacturers who have previously demonstrated, by performance and reputation, the ability to manufacture products of the quality specified and shall have a minimum of 5 years' experience manufacturing the specified products. Such manufacturers must maintain an organization and manufacturing facility capable of actually manufacturing the specified luminaires, poles and associated equipment. For the purpose of inspection, Contractor shall assure the Engineer, free and easy access to the manufacturing facilities and inventories of any manufacturer whose equipment the Contractor proposes to supply.
5. Outdoor lighting system shall use stainless steel bolts, nuts, washers and screws.
6. Contractor shall ensure that all metals used for poles, bases, support hardware, bolts, nuts washers and screws are of similar material composition and where different, steps are taken to mitigate the effects of corrosion.

B. Field Testing

1. The outdoor lighting system shall be field tested. The field testing shall be performed in accordance with the requirements specified under this Section.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittal shall include, but not be limited to:

1. A list of proposed manufacturers with the products they produce proposed for the contract.
2. Manufacturer's catalog cuts and drawings showing all technical information, and construction details for luminaires, including dimensions, type of wiring, weight, size, installation methods and provisions for relamping luminaires from the ground.
3. Photometric data developed for each fixture including IES BUG ratings, isolux diagrams and IES lighting classification.
4. Lamp type and technical information.

5. Ballast type and technical information including power factor, input watts and ballast factor.

6. Driver type for LED and technical information including input voltage, power factor, Crest Factor and THD.

7. Pole and base construction details. For poles submit wind loading, complete dimensions and finish, include anchor bolt sizing and circle diameter.

8. Scaled Shop drawings showing the locations of all luminaires and shall include the proposed routing of supply conduits.

9. Bills of material.

B. Reports:

1. Field test reports shall be submitted.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Outdoor lighting equipment shall be delivered, stored and handled in accordance with this Section, the Specifications and the manufacturer's instructions.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Spare Parts

1. The Contractor shall furnish and deliver to the Engineer, at that part of the site and at such time as the Engineer may direct, spare parts for the outdoor lighting in accordance with this section and the Specifications.

2. The spare parts shall be listed in an index and packed in containers suitable for long term storage, bearing labels clearly designating the manufacturer's part number with complete information for use and reordering.

3. The following spare parts shall be furnished, with all fractions rounded up to the next number:

a. 10 percent lamps, lamp module or array shall be provided of each wattage of each type of lamp, lamp module or array but not less than the requirement for two luminaires.

b. Where the lamp, lamp module or array is an integral part of the luminaire and the lamp, lamp module or array is not normally replaceable provide spare luminaires instead.

c. 5 percent ballasts or drivers shall be provided of each type of type ballast or driver, but not less than two.

d. 10 percent fuses shall be provided of each size and type, but not less than two.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Luminaires

1. Manufactures of luminaires shall be in accordance with Section 26 51 11 – Lighting Fixtures, Devices and Schedules.

B. Breakaway In-Line Streetlight connectors shall be as manufactured by:

1. Buchanan, Hackettstown, NJ;
2. Ideal Industries, Sycamore, IL;
3. Ilsco, Cincinnati, OH;
4. Or Approved Equal.

2.02 MATERIALS / EQUIPMENT

A. Luminaires

1. Luminaires shall be provided for each lighting fixture symbol shown on the Contract Drawings and in accordance with the lighting fixture schedule shown on the Contract Drawings.
2. Heights of all outdoor luminaires shall be as shown on the Contract Drawings.
3. Fixtures controlled by photocell shall include an on-off switch to overide the photocell as shown on the Contract Drawings.

B. Poles and Bases

1. Poles and bases shall be provided in accordance with the details shown on the Contract Drawings.
2. Poles shall have a wind load rating of at least 90 mph with a gust factor of 1.3.
3. Where shown on the Contract Drawings, bases shall be provided with plug receptacles, fuses, cut-outs, switches or other devices for protection and ease of maintenance. Devices shall be in accordance with the following:
   a. Receptacles shall be housed in stainless steel boxes and shall be watertight, heavy duty type with screwed caps.
   b. Switches shall be enclosed in stainless steel boxes. Where shown on the Contract Drawings switches shall be provided with fuses.

c. Where shown on the Contract Drawings, fused applications shall be provided with breakaway watertight, in-line fuse kits.

C. Reinforced Concrete

1. Concrete for pole foundations shall be in accordance with Section 03 30 10 – Low Carbon Cast-in-Place Concrete, and the concrete steel reinforcement shall be in accordance with Section 05 12 00 - Structural Steel Framing.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Luminaires shall be installed at locations indicated on the Contract Drawings. Fixture locations shall be adjusted where necessary to clear conflicts and obstructions.

B. Excavation for luminaire poles shall be in accordance with the requirements of Section 31 23 16 - Excavation.

C. Backfilling for fixture poles shall be in accordance with the requirements of Section 31 23 23 - Fill.

D. Luminaire poles shall be installed on reinforced concrete foundations as shown on the Contract Drawings. Poles shall be installed in accordance with standard procedures and as recommended by the manufacturer.

E. Poles shall be wired with strain relief provided. A green grounding conductor shall be installed with each circuit, grounding by conduit method shall not be permitted

3.03 FIELD TESTING / QUALITY CONTROL

A. Field Tests

1. After installation, the completed outdoor lighting system shall be field tested for operation and conformance.

2. The field tests shall be witnessed by the Engineer and certified by the Contractor. The Contractor shall provide testing consisting of the following:

a. Wiring continuity test shall be performed.

b. Branch circuit load balance test shall be performed.

c. Fixture and photo cell operation test shall be performed.

B. Report

1. The Contractor shall provide a field test report.
2. The report shall identify the tests performed and the results obtained.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Cleaning of Outdoor Lighting

1. Luminaires shall be cleaned inside and out to remove construction dust prior to substantial completion.

END OF SECTION

NO TEXT ON THIS PAGE

PART 1 GENERAL

1.01 SUMMARY

A. Contractor shall provide all labor, material, equipment and incidentals as shown, specified and required to furnish, install, test and place into satisfactory operation a Process Monitoring Camera System as specified herein. This system shall be comprised of a Closed Circuit Television (CCTV) Surveillance System.

B. Contractor shall employ the services of a Process Monitoring Camera System Supplier with proven experience in the field. The Process Monitoring Camera Supplier shall assume full responsibility for the selection of equipment and components required. Specifically this shall include defining the required system components, preparing detailed system schematics, interconnecting wiring diagrams, field debugging, calibrating, and configuring the system as well as instructing plant personnel on the care and use of the system.

C. The CCTV systems provided shall be turnkey system solutions, wherein each component is seamlessly integrated with the overall system. The CCTV System shall employ common controls communications protocol and video signal formats throughout.

D. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s), or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

1.05 DESCRIPTION

A. The CCTV system shall provide surveillance of the facilities as shown on the Contract Drawings. The system shall include the following:

1. Power Over Ethernet (PoE) pan-tilt-zoom (PTZ) camera contained in outdoor enclosures at the TI-010 Dechlorination Facility and TI-011 Disinfection Facility with quantities as shown on the Contract Drawings.
2. Power Over Ethernet (PoE) fixed camera contained in environmental enclosure, for installation inside the Chemical Room, and Electrical Room for the TI-011 Dechlorination Facility and TI-011 Disinfection Facility with quantities as shown on the Contract Drawings.

3. Infrared (IR) lights.
4. Monitoring capabilities from existing SCADA computers.
5. Ethernet cable, 24V power supplies, mounting assemblies, and all necessary appurtenances for a fully functional CCTV system.

B. Configuration of the Process Monitoring Camera System shall be coordinated with the DEP and the Engineer. At a minimum, the system shall be configured as follows:

1. For all cameras, video monitoring shall be continuous.
2. IP Addresses and port configurations shall be coordinated with the Engineer and DEP during construction.

C. Control Description: CCTV Surveillance System provided under this project shall be implemented in such a way that live video feeds from the CCTV cameras shall be viewed on the existing SCADA workstations over the DEP's CCFISS network. PoE cameras shall be connected to the ethernet switch in the CCTV-CP-10D at TI-010D Dechlorination Facility, and CCTV-CP-11 at TI-011 Disinfection Facility, with communication to the relevant Programmable Logic Controller (PLC) Panels at the respective sites, as shown in Contract Drawings. Provide support to Systems Integrator, and coordinate work required to integrate the cameras on the CCFISS network.

D. Suitably regulated electrical power shall be provided to all equipment and components furnished under this Section. Contractor shall furnish alternate power supplies, as required, suitable to drive components utilizing different voltages. Surge arrestors shall be provided, as required, to protect all equipment from power surges and voltage spikes.

E. Managed ethernet switches, Network Video Recorders, Uninterruptible Power Supplies, Keyboard-Video-Mouse Switch, control panel enclosures, panel appurtenances, and other required appurtenances for the CCTV Surveillance System.

1.06 QUALITY ASSURANCE

A. In order to ensure standardization, proper interfacing and compatibility, it is required that all equipment offered under this Section be furnished by a single Supplier who shall provide all equipment required for a proper installation and coordinate all Shop Drawings.

B. The Process Monitoring Camera System Supplier shall have a minimum of five years' experience in the production of similar equipment and shall show evidence of at least five installations in satisfactory operation for at least three continuous years.

C. The Process Monitoring Camera System Supplier shall be responsible for providing all components and software for the surveillance control systems.

D. All items of equipment, including wire and cable, shall be compatible.

E. The Process Monitoring Camera System Supplier shall provide on-site manufacturer's representatives to oversee installation and to verify that installation of all equipment is in compliance with manufacturer requirements. Supplier shall provide a written report verifying that the installation is complete, fully functional, and in compliance with all manufacturer requirements.

F. Shall have a UL approved panel shop.

G. The Supplier shall be responsible for providing a panel enclosure for the required equipment and appurtenances to interface with the cameras at the respective sites. Panel build requirements shall be as specified in Section 40 67 16 – PMCS Panels and Enclosures.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

a. Product Data:

1) Manufacturer's literature, illustrations, specifications and engineering data including:

a) General arrangement

b) Outline drawings

c) Dimensions

d) Materials

e) Size

f) Weight

g) Performance data

b. Product information for panels including layout drawings, wiring schematics, logic diagrams, and equipment required to interface with the cameras in accordance with the requirements of Section 40 61 13 – PMCS General Requirements, Section 40 63 53 – PMCS Network Equipment, and Section 40 67 16 – PMCS Panels and Enclosures. Wiring schematics shall show required ethernet communication cable interface with process control panel(s) provided under Division 40.

c. Shop Drawings:

1) Fabrication, assembly, and installation drawings.

2) Complete riser diagrams clearly labeling all conduit and wire.

3) Layout drawings with conduit and equipment numbers.

2. Information Submittals:
   a. Certificates:
      1) Certificates of Compliance/Manufacture.
      2) Experience Certificates.
   b. Supplier Instructions:
      1) Installation Instructions.
   c. Source Quality Control Submittals:
      1) Submit reports for all required shop tests.
   d. Site Quality Control Submittals:
      1) Submit reports for all required field-tests.
      2) Submit reports for all manufacturer's site visits.
3. Closeout Submittals:
   a. Operation and Maintenance Manuals:
      1) Submit complete installation, operation and maintenance manuals including test reports, maintenance data and schedules, description of operation and spare parts information.
      2) Furnish operation and maintenance manuals in conformance with the requirements of Section 01 78 23, Operation and Maintenance Data.
   b. Software:
      1) Software Manuals.
4. Maintenance Materials Submittals:
   a. Spare Parts:
      1) Manufacturer’s recommended spare parts and maintenance materials:
   b. Tools:
      1) List of all special tools required for routine maintenance.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents.
   1. Security and process monitoring equipment shall be inspected by the Contractor for shipping damage or loose parts when received. Evidence of water, which may have entered equipment during transit, shall be checked.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents.

1. Equipment shall be stored in a clean, dry location in which a uniform temperature is maintained. Equipment shall be protected with coverings and maintain air circulation.

2. Where dampness or condensation may be encountered, heaters shall be provided for equipment to prevent moisture damage.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Contractor shall furnish and deliver the spare parts as outlined below, all of which shall be identical and interchangeable with similar parts furnished under this specification.

B. The following shall constitute the minimum spare parts:

1. Five (5) LED light subassemblies / bulbs for the explosion proof camera.

C. Spare parts shall be packed in sturdy containers with clear indelible identification markings and shall be stored in a dry, warm location until transferred to the DEP at the conclusion of the Project.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Provide Weather Proof (Outdoor) PTZ Camera as manufactured by:

1. Pelco Model S7230L-PW

2. No alternate manufacturer or product will be accepted.

B. Provide Environmental Enclosure PTZ (Interior Location) Camera as manufactured by:

1. Pelco Model IMP231-1ES .

2. No alternate manufacturer or product will be accepted.

C. Provide Video Storage Server as manufactured by:

1. Pelco Model VXP-E3-4-J-S.

2. Genetec, Inc. Streamvault.

3. Or approved equal.

D. Provide Keyboard-Video-Mouse Switch as manufactured by:

1. IOGear .

2. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Cameras:

1. General:

a. Provide PTZ Cameras as shown.

b. The Weather Proof PTZ camera system shall consist of an outdoor camera and housing designed specifically for use in moderate to severe climate conditions and shall include l IP 67 water resistant, NEMA 4X enclosure rating for wind-blown dust, water, and corrosion resistance along with any accessories which may be required for a complete Weather Proof camera system.

c. The interior Environmental Enclosure PTZ camera shall consist of an indoor camera and housing designed specifically for use in corrosive environments.

d. The camera system shall be able to transmit/receive video, and data over a single ethernet cable. All mounting hardware shall be furnished with the system. Cameras and mounting hardware type shall be as shown or specified. Manufacturer shall provide system with one 100BASE-TX, RJ45 connector.

2. Weather Proof PTZ Camera Features:

a. Type: High Speed PTZ.

b. Lens: f/1.6~f/4.4, focal length 4.5 mm (wide), ~135.0 mm (tele) .

c. Signal Format: Ethernet, Pelco API, or Onvif Profile.

d. Sensitivity: 0.035 lux for color (33 ms).

e. Iris Control: Auto iris with manual override .

f. Electrical:

1) Powered Over Ethernet (PoE). Contractor to provide CAT 6 ethernet cabling to network switch (which shall be for POE injector) as required.

g. Mounting Brackets:

1) All mounting brackets shall be of aluminum painted, corrosion-resistant construction and shall be load rated to support camera and accessories specified herein. Mounting heads shall be adjustable.

h. Environmental Enclosure:

1) Weather Proof, NEMA 4 and IP67 rated.

2) Material: Aluminum.

3) Operating Temperature: -60° to 140°F (-51° to 60°C).

4) Electrical Ports/Connections: RJ-45 connector for 100 Base-TX and 1000 Base-TX, Auto MDI/MDI-X, Auto negotiate/manual setting

3. Environmental Enclosure PTZ Camera Features:

a. Type: High Speed PTZ.

b. Lens: f/1.4, focal length 2.8 – 12 mm nominal.

c. Signal Format: Ethernet, Pelco API, or Onvif Profile.

d. Sensitivity: 0.0169 lux at 33 ms.

e. Iris Control: Auto iris with DC-Iris.

f. Field of View: Diagonal - 123º-40º, Horizontal - 103º-35º, Vertical - 54º-20º

g. Electrical:

1) Powered Over Ethernet (PoE). Contractor to provide CAT 6 ethernet cabling to network switch (which shall be for POE injector) as required.

h. Mounting Brackets:

1) All mounting brackets shall be of aluminum body, corrosion-resistant construction and shall be load rated to support camera and accessories specified herein. Mounting heads shall be adjustable.

i. Environmental Enclosure:

1) Weather Proof, NEMA 4 and IP66/67 rated.

2) Material: Ruggedized aluminum, anodized.

3) Operating Temperature: -40° to 140°F (-40° to 60°C).

4) Operating Humidity: 5% to 95%, RH condensing

4. Surge Protection:

a. Each camera shall be protected with lightning arrestor at each end of the cable, at the camera site and the head end equipment where the cabling is connected to the fiber-optic backbone.

b. The connections to the surge protection devices shall be made with BNC connectors.

B. Video Storage Server

1. General: The Video Storage Server shall function as a Network Video Recorder (NVR) and shall manage archiving and streaming videos from IP

cameras and encoders over an IP network. Video feeds from all new IP cameras and shall be directly recorded into this Video Storage Server.

2. Features:

   a. Shall support minimum of 32 standard or high definition IP video channels over a 1000/10G Base-T network interface expandable to 128 standard or high definition IP video channels, total system quantity based on a total system recording bandwidth of 250 Mbps.

   b. Shall support video recording of JPEG, MPEG-4, and H.264 streams from CCTV cameras using NTSC or PAL format.

   c. Recording frame rate and resolution shall be configurable independently for each camera.

   d. The system shall support Pelco and third-party H.264 Megapixel (MPx) video streams up to 10 (MPx) resolution with quantities based on a total system recording bandwidth of 280 Mbps.

   e. The system shall have a fully open architecture with support for both IP-specific camera drivers as well as cameras with ONIVIF compliance.

   f. The system shall support automatic detection of Pelco IP cameras. Third-party IP cameras may also be automatically detected dependent on IP driver versions and manufacturers specifications.

   g. The system shall operate on 2nd generation Intel Core i5-9500™ processor or higher with minimum of 8GB RAM.

   h. Operating system: Microsoft Windows 10 IoT Enterprise 64-bit, latest service pack or higher.

   i. Storage: minimum 4 TB internal and expandable up to 32 TB.

   j. The system shall allow archival of video data to computers or SAN storage devices over a network connection with the optional DS Archive Utility. The archival schedule shall be either automatic at user-defined intervals or manual and shall be configurable per connected camera.

      1) Software will be licensed based per archived recorder

      2) Software will require a single archive server for search, playback, clip, and maintenance

      3) Each archive software shall support up to five recorders

      4) Video shall only be copied for archive; existing video will remain on the recorder until over-written

   k. The system shall support network health and monitoring utilizing third-party SNMP monitoring tools.

l. The system shall indicate system performance and operation status utilizing a variety of HTML reports.

m. The system shall display system health monitoring data utilizing front panel LED displays and display pop-ups.

n. The system shall provide the capability of running a client application in additional to the video management system.

o. A client computer with system compatible software shall be the user interface for viewing one or more systems. Live and recorded video and current event video shall be displayed on any client computer using a proper login and password. The client computer shall be able to connect to an unlimited number of recorders simultaneously to display live and recorded video.

p. Client Software shall be provided from the same manufacturer and shall be license-free and available to be installed on as many clients as required by the user.

q. Connectors:

1) Two high-speed USB 3.0 ports, three USB 3.1 Type-C ports.

2) 4x Mini Display Port (DP++) 1.4

3) 1x1Gigabit Ethernet (1000 Base-T),1x10 Gigabit Ethernet (10GBase-T)

4) DisplayPort audio ports

r. Operating environment: 50° to 95°F (10° to 35°C) at 10 to 85 percent non-condensing humidity.

s. Power:

1) Input Voltage 100 to 240 VAC ±10%, 50/60 Hz

2) Power Consumption 550 W maximum

C. CCTV Control Panel(s)

1. Provide Control Panels to house the required network equipment, and recorder devices interfacing with the camera(s) at the respective locations, as noted on the System Architecture drawings. Panels shall be NEMA 12 and built in accordance with the requirements of Section 40 67 16 – PMCS Panels and Enclosures.

2. Provide managed ethernet switch to interface with the network video recorder, Keyboard-Video-Mouse (KVM) Switch and associated cameras. Managed ethernet switch shall be in accordance with the requirements of Section 40 63 53 – PMCS Network Equipment.

3. Provide Uninterruptible Power Supply (UPS) in each CCTV Control Panel in accordance with the requirements of Section 40 78 90 – PMCS Panel Mounted Instruments and Devices.

4. Panel nomenclature shall be in accordance with the list provided in Section 40 67 16 – PMCS Panels and Enclosures. Provide required tagging and nameplates in accordance with the requirements of the same Specification Section.

5. All panel appurtenances shall be provided in accordance with the requirements of Division 40.

D. Keyboard-Video-Mouse Switch

1. General:

a. Provide a UL-certified keyboard-video-mouse (KVM) switch that will enable the operators to access the Video Storage Server from the DEP CCFISS Network.

2. Features:

a. KVM switch shall have capability to communicate over Ethernet network.

b. KVM switch shall be a single port over IP with both USB and PS2 connectors for the server and client connections.

c. KVM shall be equipped with dual 10/100 Ethernet and a local KVM interface for direct access.

d. Power: 1 x AC (110 -240V) input to +12V DC (1 amp) external power adapter (detachable regional plug)

e. Security: AES 256-bit encryption for all transmitted data, RSA 1024-bit encryption for authentication

f. Connectors:

1) 2 x RJ-45 10/100 UTP Ethernet (HUB)

2) 2 x USB Host Connectors (Keyboard, mouse)

3) 1 x HD-15 - for local KVM - 3 in 1 cable 11" (28 cm)

4) 1 x Integrated 3 in 1 KVM cable to host server 22.5" (57 cm)

5) 1 x mini USB device connector (virtual media) and device cable

6) 1 x RJ-45 RS232 Connector (with PC DB-9 adapter cable)

7) 1 x DC Jack for +12V DC input power

8) 1 x Reset Button

9) 1 x Rack Mounting Adapter Plate

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Contractor shall examine the conditions under which the Work is to be installed and notify the Engineer, in writing, of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. Manufacturer's Representative:

1. Contractor shall furnish the services of a qualified manufacturer's service representative to assist in the installation of security system equipment, check the installation before it is placed into operation, assist in the performance of field tests, observe and assist initial operations and train the plant operations and maintenance staff in the care, operation and maintenance of the equipment.

2. Contractor shall arrange with the equipment manufacturer or approved representative to provide direct supervision of all final connections between equipment and the wiring system.

B. Reports: Contractor shall submit a report from the manufacturer of each visit to the Site. Contractor shall provide complete information on time, schedule, tasks performed, persons contacted, problems corrected, test results, training, instruction, and all other pertinent information.

1. The services of the manufacturer's representative shall be furnished for installation supervision for at least the following number of days:

Visit:	Purpose:	Number of Visits:	Person-days per Visit:
No. 1	Installation Supervision	2	1

2. Should additional days of service be necessary for a successful installation, such services shall be provided by the Contractor at no additional cost to the City.

C. Install in conformance with the requirements of National Electrical Code.

D. Install all security equipment at the locations as shown and in accordance with the manufacturer's recommendations.

E. Contractor shall ensure that adequate strain relief is provided in the installation of cameras to prevent premature damage to cables caused by continual flexing in pan/tilt applications.

F. The CCTV System shall be installed and wired completely as shown by Contractor who shall utilize the services of a qualified installer.

3.03 FIELD TESTING / QUALITY CONTROL

A. Integrated System Field Test:

1. After installation of the equipment, controls and all appurtenances, Contractor shall field test the equipment for system operation and conformance to the specified performance parameters.

2. Contractor, under the observation of the Engineer, shall provide the services of factory-trained technicians to perform the following:

a. Check and approve the installation of all components of the CCTV monitoring system and all cable connections between various components prior to placing the components into operation.

b. Conduct a complete system checkout and adjust cameras, check operational functions of all of the equipment supplied under this Contract. All problems encountered shall be promptly corrected to prevent any delays in start-up.

1) Confirm focus is set and image is acceptable.

3. Contractor shall provide all test equipment necessary to perform the testing during system checkout and testing.

4. Contractor shall be responsible for initial system operation and shall make any changes, adjustments or replacements of any or all components, within the warranty period, if required, until the equipment supplied performs satisfactorily as intended.

5. Contractor shall furnish to the Engineer certified copies of set-up and adjustment reports for all specified devices.

6. Contractor shall furnish the Engineer an installation and inspection report certifying that all equipment has been installed correctly and is operating properly. The report shall be signed by the authorized representatives of Contractor and the system supplier.

B. The Contractor shall provide the services of the manufacturer's representative at such times and for such durations of time as are needed to perform the field testing tasks required of the representative:

1. The services of a manufacturer's representative shall be furnished for field testing for at least the following number of days:

Visit	Purpose:	Number of Visits:	Person-days per Visit:

No. 2	Field Testing	2	1

3.04 STARTUP / DEMONSTRATION

A. Operational Availability Demonstration:

1. Operational Availability Demonstration (OAD) shall begin following completion of the Integrated System Field Test as specified above and shall continue until a time frame has been achieved wherein the system hardware, communications and functionality availability meets or exceeds 99.8 percent for 60 consecutive days and no system failures have occurred which result in starting the OAD over again. During the OAD the Security System shall be available for use in normal security operations at the Plant.

2. For the purpose of the Operational Availability Demonstration, the system will be defined as consisting of the following systems and components:

   a. CCTV System.

   b. Integrated functionality, both monitoring and control, with the existing security systems on site.

3. The conditions listed below constitute system failures which are considered critical to the operability and maintainability of the system.

4. The Operational Availability Demonstration shall be terminated if one or more of these conditions occur. Following correction of the problem, a new 60 consecutive day OAD shall begin"

   a. Failure to repair a hardware problem within 120 consecutive hours from the time of notification of a system failure.

   b. Recurrent hardware problems: the same type of problem occurs three times or more.

5. Each of the following conditions constitutes a system failure in determining the system availability:

   a. Failure of hardware.

   b. Loss of communications between devices.

   c. Failure of one or more devices simultaneously.

   d. Failure of five field devices.

   e. Failure of backup power supply or failure of the backup supply to operate properly and maintain supply power shall constitute a system failure.

6. The system availability shall be calculated based on the following equation:

$$A = \frac{TTO}{TTO + TTR} \times 100 \text{ percent}$$

where, A = system availability in percent
TTO = total time in operation
TTR = total time to repair

7. Time to repair shall be the period between the time that Contractor is notified of a system failure and the time that the system has been restored to proper operation in terms of hours with an allowance for the following dead times which shall not be counted as part of the time to repair period

   a. Actual travel time for service personnel to get to the Plant - up to 6 hours per incident from the time Contractor is notified of a system failure.

   b. Time for receipt of spare parts to the Plant once requested up to 24 hours per incident. No work shall be done on the system while waiting for delivery of spare parts.

8. Dead time shall not be counted as part of the system test period. The dead time shall be recorded and the duration of the OAD extended for an amount of time equal to the total dead time.

9. Completion of a 60 consecutive day period without any restarts of the OAD and with system availability in excess of that specified will constitute acceptance of the system by DEP.

10. All parts and maintenance materials required to repair the system prior to completion of the OAD shall be supplied by Contractor at no additional cost to DEP. If parts are obtained from the required plant spare parts inventory, they shall be replaced to provide a full complement of parts as specified.

11. Malfunction/Repair Reporting Form shall be completed by the Plant personnel and Engineer to document system failures, to record Contractor notification, arrival and repair times and Contractor repair actions. Format of the form shall be developed and agreed upon prior to the start of the OAD.

B. Furnish the services of a qualified manufacturer's representative to assist in the start-up of the equipment and train DEP operations and maintenance staff in the care, operation, and maintenance of the equipment in accordance with the requirements of the Contract Documents. In addition:

1. Contractor shall make all adjustments required to place Work in proper operating condition.

2. Contractor shall include in training of DEP personnel instruction on care and maintenance of the materials and equipment.

3. In the event of trouble with the equipment during startup / initial operation, the manufacturer's representative shall revisit the Site as often as required until all troubles are corrected and the installation is entirely satisfactory.

C. At a minimum, the services of the manufacturer's representative shall be provided as indicated, below. The number of visits and person-days per visit indicated, below, shall be understood as referring to the total required services for equipment provided under this Section.

Visit:	Purpose:	Number of Visits:	Person-days per visit:

SECTION 31 09 16.10 - DYNAMIC PILE TESTING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish all equipment, materials and services for driving and removal, if required, of test pile(s) and dynamic pile hammer testing by an independent testing agency employed by the Contractor.

B. Installation of drive-test piles as indicated on the Contract Drawings, specified or approved to complete the Work.

C. Modifying pile driving system or replacing hammer if test results show that the pile driving system does not meet the minimum energy requirements for selected piles.

D. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

B. The cost of providing additional dynamic pile hammer testing due to failure of hammer to meet the minimum transferred energy requirement, or due to a change in pile hammer, shall be borne by the Contractor.

SECTION 31 09 16.10 - DYNAMIC PILE TESTING
CONTRACT CSO-FC-DF

1.03 RELATED SECTIONS

A. Section 31 09 16.20 -Pile Load Tests, Compressive, Lateral and Uplift Loads

1.04 REFERENCES

A. ASTM D4945 - Test Method for High Strain Dynamic Testing of Piles

1.05 DESCRIPTION

A. Performance Requirements

1. The working load of the piles shall be as shown on the Contract Drawings.

2. Tested piles shall be sacrificial; and non-production piles. The Contractor shall obtain the Engineer's approval for each pile so tested and so reset.

3. Piles which do not meet test requirements for the working load of the piles shall be rejected and additional testing shall be performed on other piles at no additional cost to the City.

B. Schedule of Operation

1. Dynamic pile testing shall be scheduled sufficiently in advance of production pile driving to prevent delay in the progress of the Work.

2. No production piles shall be driven until the dynamic pile testing is approved by the Engineer.

C. Vibration Monitoring

1. When driving piling, the Contractor shall monitor vibration using seismograph at locations shown on the Contract Drawings.

D. Dynamic Pile Testing

1. Dynamic pile testing on drive-test piles shall be in accordance with ASTM D4945. The testing shall be performed at locations shown on the Contract Drawings. driving resistance, testing and recording of data shall be under the direct supervision of the registered Professional Engineer engaged by the Contractor. A report shall be submitted as specified in this Section.

1.06 QUALITY ASSURANCE

A. Dynamic pile hammer testing and drive testing shall be performed in the presence of the Engineer.

B. Dynamic pile hammer testing shall be performed by an independent testing agency with a minimum of five years of experience in testing and instrumentation of same type of work.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. Pre-Construction Submittals, submitted no less than three (3) weeks prior to start of work:

a. Experience and qualifications of Dynamic Testing Contractor.

b. Pile Driving Equipment Data:

1) Submit detailed information regarding make and model of pile hammer and driving equipment three weeks prior to commencement of indicator pile driving activities. Submit details of driving helmets, cap-blocks, hammer cushions, and driving heads. Include weight, dimensions, stiffness and coefficient of restitution of cap block assembly (helmet, hammer cushion materials, and driving head).

2) Do not commence pile driving activities until complete pile hammer and driving equipment submittals have been received and accepted by the Engineer.

c. Pile driving layout and sequence plan:

1) Description of installation and dynamic test procedures including locations of tests, anticipated driving resistance and methods including redriving, restriking.

2) Show the location, identification, order and orientation in which piles will be driven, and describe how the sequence will minimize piles from being displaced laterally when driving subsequent piles.

3) Results of Wave Equation Analyses of the piles and pile driving equipment proposed by the Contractor indicating the driving stresses in the pile and confirming the pile set (in blows per inch) and pile hammer energy needed to obtain the required pile capacities at the end of initial drive and upon restrike. Wave Equation Analyses shall also include a drivability analysis. The Wave Equation Analyses and calculations shall be signed and sealed by a Professional Engineer licensed in the State of New York.

d. Manufacturer's or vendor's data on transducers, computers, wiring and schematic drawings for the dynamic testing equipment.

e. Sample of the dynamic testing apparatus output. Output shall include recorded input, reduced data and analysis.

2. Sample of pile driving record/report.

3. Detailed description of testing sequence and procedure, evaluation of results and planned reports.

4. After completion of dynamic pile tests and drive tests, perform a refined wave equation analysis and submit a test report for review and approval by the Engineer. The test report shall include information specified in ASTM D4945 and recommendations for production pile lengths and driving criteria.

5. Submittals pertaining to the piles, pile driving equipment and static load tests shall be as specified in the relevant pile Specification Sections.

B. Construction Submittals:

1. New or modified pile driving system or installation procedures, as applicable.

2. The Contractor shall also submit a complete preliminary report to the Engineer at the completion of each dynamic pile test within 24 hours of the completion of each test. The Contractor shall engage the services of a Professional Engineer, subject to the approval of the Commissioner, licensed in the State of New York, experienced in dynamic pile testing and test analysis for the supervision of dynamic testing procedures and preparation of the report. The report shall include, but not be limited to:

a. Pile identification and location.

b. A description of the pile driving equipment.

c. Driving records for test piles.

d. Complete test data.

e. Available kinetic energy developed by the hammer.

f. Transferred energy (efficiency) from hammer to pile;

g. Predicted ultimate static bearing capacity using three or more methods;

h. Maximum compressive force in pile;

i. Maximum tension force in pile;

j. Maximum impact velocity at pile top;

k. Maximum acceleration at pile top.

l. Analysis of test data.

m. Recommended allowable design loads based on the pile test data.

n. Description of subsurface conditions.

o. Recommended pile installation criteria.

C. Contractor shall submit a summary report prepared by its dynamic testing agency subcontractor. Summary report shall include all finalized data from all piles tested.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. Dynamic monitoring shall be performed using a Pile Driving Analyzer. All equipment necessary for the dynamic monitoring such as sensors, cables, etc., shall be furnished by Dynamic Testing Contractor. The equipment shall conform to the requirements of ASTM D4945.

B. The Pile Driving Analyzer (PDA) instrumentation equipment shall include at least two accelerometers and two strain gauges and the pile driving analyzer. The accelerometers and strain gauges are attached to the test piles with bolts through pre-drilled and threaded holes. Wires from each gauge are collected at a connection box that hangs from the pile hammer using a chain. A single cable runs from the connection box to the Pile Driving Analyzer located on the ground. Wireless technology also may be used.

C. Provide power capable of operating an electric drill to install sensor attachment holes in the test piles. Provide a 12 to 24 volt D.C. power source (e.g. car battery) for operating the Pile Driving Analyzer.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examination of Site

1. Prior to starting operations, an examination of the site shall be performed in accordance with Section 31 62 23.13 - Concrete-filled Steel Piles .

3.02 IMPLEMENTATION

A. Test Pile Program

1. A minimum of twenty-one (21) calendar days prior to installing drive-test piles, the Contractor shall submit its testing agency's initial wave equation analysis for the pile-hammer system to be used and taking into consideration the soils in which the pile will be embedded in accordance with the Section 1.07.A.3.C. The submittal shall include estimated static capacity versus driving resistance and pile stress versus driving resistance.

2. The Contractor shall provide and install test piles where shown on the Contract Drawings or as directed by the Engineer to determine lengths of production piles to be furnished to achieve twice the pile design load. At

each test pile location, the Contractor will provide driving records for the test pile.

3. Piles located at Contract pile locations can become part of the completed structure provided they are approved as conforming to requirements specified for production piles. The Contractor shall assist the Engineer in verifying measurements and driving characteristics, as necessary, to aid in the analysis of the piles.

4. Install all test piles with the same type and model of equipment and methods to be used to install production piles.

5. Redriving of test piles to assess setup may be required as determined by the Engineer. The Contractor shall assume that a redrive will be required at intervals on each test pile within a 24-hour period after completion of driving. Should the driving period fall on the last workday of a week, then the redrive will occur on the next workday.

B. Dynamic Pile Hammer Testing

1. During redriving of the test pile, the pile hammer shall be dynamically tested by the testing agency to verify that the hammer is delivering the minimum specified energy to the pile.

2. During pile driving operations, dynamic measurements shall be taken by the testing agency at the tops of selected piles chosen at random by the Engineer. All Work associated with providing and installing the instrumentation and obtaining the measurements shall be performed by the testing agency.

3. The Engineer shall have access to the test piles. Measurements to be obtained will consist of the following information:

   a. Transferred energy (efficiency) from hammer to pile.

   b. Predicted ultimate static bearing capacity.

   c. Maximum compressive force in pile.

   d. Maximum tension force in pile.

   e. Maximum impact velocity at pile top.

   f. Maximum acceleration at pile top.

4. If dynamic measurements indicate that the pile driving system does not provide the minimum specified transferred energy, the Contractor shall either replace the hammer or make whatever modifications to the pile driving system that are necessary, subject to approval of the Engineer, to provide the minimum energy.

5. The testing agency shall perform the monitoring work and obtain the required analyses.

6. The minimum required transferred energy between the hammer and pile shall be at least 50 percent of the rated energy for each type of hammer used in pile driving operations.

7. Piles which are subjected to static pile load tests will be subject to dynamic testing and analyses during driving and during redriving.

8. Perform dynamic pile testing on drive-test piles in accordance with ASTM D4945 and prepare a written report of the drive test pile program. This report shall utilize the results from the static pile load tests and shall contain a discussion of the pile capacity and driving characteristics. Report shall explain any unusual conditions encountered during driving and explanation and recommendations when established driving criteria cannot be met.

9. Analyses of the dynamic pile testing shall be performed on data obtained from the initial driving and the restrike of the drive test piles.

10. The Contractor's testing agency shall perform refined wave equation analyses using the results of each drive test pile and incorporate the refined wave equation in driving of subsequent drive test piles. Refined wave equation analyses shall be based upon the variations in the subsurface conditions and/or drive system performance observed in the drive test pile program results.

11. The Contractor's testing agency shall use the information to perform a wave equation analysis using a computer program as approved by the Engineer.

12. The Contractor's testing agency shall prepare a summary report of the wave equation results. The report shall include test details, hammer and driving system details, soil conditions, instrumentation, test sequence and observations, discussions of test results (e.g. hammer performance, driving stresses and pile integrity, pile capacity, etc.), conclusions and recommendations.

13. Restrike Criteria: The restrike driving sequence shall be performed using the Dynamic Testing Apparatus with a hammer at normal operating temperature and shall consist of striking the pile for 50 blows or until the pile penetrates an additional three (3) inches, whichever occurs first. In the event the pile movement is less than 0.25 inch after 20 blows during restrike, the restrike may be terminated.

3.03 FIELD TESTING / QUALITY CONTROL

A. Witnessing

1. The test program shall be witnessed by the Engineer designated for controlled inspection.

2. The Engineer designated for controlled inspection shall keep records for confirmation of the test data in accordance with Specification Section 31 09 16.20 – Pile Load Tests, Compressive, Lateral, and Uplift Loads.

3. The agency designated for controlled inspection will be employed by the DEP.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Cleanup

1. Upon completion of the test program, the Contractor shall remove all equipment and remove or cutoff piles not in permanent locations or rejected and restore the site to a condition satisfactory to the Engineer.

2. Test piles and reaction piles which are driven at non-permanent pile locations shall be removed or cutoff at least 18 inches below the bottom of the foundation and abandoned.

END OF SECTION

SECTION 31 09 16.20 - PILE LOAD TESTS, COMPRESSIVE, LATERAL AND UPLIFT LOADS
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all equipment, labor, materials and incidental items necessary to perform the pile load tests as shown on the Contract Drawings, specified or otherwise as approved to complete work.

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

B. Test piles shall be considered sacrificial piles.

1.03 RELATED SECTIONS

A. Section 31 62 23.13 – Concrete Filled Steel Pipe Piles

1.04 REFERENCES

A. ASTM D1143 - Test Method for Piles Under Static Axial Compressive Load

B. ASTM D3966 - Test Method for Piles Under Lateral Loads

C. New York City Building Code (NYCBC)

1.05 DESCRIPTION

A. Performance Requirements

1. Pile load tests shall conform to the New York City Building Code and this specification. Where the requirements of this specification are more rigorous, they shall be adhered to.

2. The working load of the piles shall be as specified herein or shown on the Contract Drawings.

3. Tested piles which pass the load tests and are within tolerance at permanent locations shall be reset for use as permanent piles. The Contractor shall obtain the Engineer's approval for each pile so tested and so reset.

4. Piles which do not meet the requirements for the working load of the piles shall be rejected and additional testing shall be performed on other piles at no additional cost to the City.

B. Vibration Monitoring

1. When driving piling, the Contractor shall monitor vibration using seismograph at locations shown on the Contract Drawings.

C. Compressive Pile Load Test

1. Compressive pile load tests shall be in accordance with ASTM D1143 and NYBC. The load tests at locations shown on the Contract Drawings or specified herein shall be made on test piles placed to the tip elevation and/or driving resistance used for establishing lengths of piles, unless otherwise directed by the Engineer. Loading, testing and recording of data shall be under the direct supervision of the registered Professional Engineer engaged by the Contractor. A report shall be submitted in accordance with Article 1.06., Submittals.

2. Load Tests:

a. The Contractor shall drive test piles of the same size and materials as the permanent piles. Test piles shall be driven with the same equipment and in the same manner as the permanent piles.

b. In cases where test piles will develop resistance during testing by non-bearing materials to be excavated, the test pile shall be cased off in that material(s).

c. Permanent piles may not be used as reaction piles.

3. The Contractor shall provide all equipment, instruments, personnel, accessories and appurtenances required for the tests. The Contractor shall place reaction piles and beams, as required, to transmit load into the test pile. Calibrated pressure gauges shall be used to determine the actual load

placed on the test pile. Calibrations shall have been made within three (3) months of load testing.

a. The Contractor shall prepare complete detailed shop drawings showing how the test will be performed, how the reaction piles will be placed, and how the jacking beams will be anchored to the test piles and the reaction piles.

b. The Contractor's shop drawings shall include date and calibration curves on all instruments and accessories used in the tests.

c. The entire test setup and test procedure shall be subject to the approval of the Engineer.

d. A table of pile loads and test pressures for each test shall be submitted.

e. A foundation stability analysis where dead weights are used for test reactions shall be submitted.

4. Test loads shall be applied by direct weight or by means of a hydraulic jack. The loading platform or box shall be carefully constructed to provide a concentric load on the pile.

a. If direct weight is employed, the loading increments shall be applied without impact or jar. The weight of the loading platform or box shall be obtained prior to the test, and this weight shall be considered as the first increment of load.

b. If a hydraulic jack is employed, equipment for maintaining each increment of desired load constant under increasing settlement shall be provided. The gauge and the jack shall be calibrated as a unit and have a rated capacity to achieve twice the maximum test pile load.

5. The test load shall be as shown on the Contract Drawings. Axial compression load test shall be performed in accordance with ASTM D 1143, Procedure B – Maintained Test and as shown on the Contract Drawings.

6. Under each load increment, settlement observations shall be made and recorded at 1/2 minute, 1 minute, 4 minute, and each 4 minutes thereafter after application of load increment, except in the instance of the total load where, after the 4-minute reading, the time interval shall be successively doubled until the final settlement limitation is reached and the load is removed.

7. The maximum allowable pile load shall be such that 50 percent of the applied load shall not cause a net settlement of the pile of more than 0.01 inch per ton of total applied load or shall be 50 percent of the applied load which causes a gross settlement of 1 inch, whichever is less.

D. Pile Lateral Load Tests

1. Pile lateral load tests shall be in accordance with ASTM D3966 and NYBC. The load tests at locations shown on the Contract Drawings or specified herein shall be made on test piles placed to the tip elevation and/or driving criteria used for establishing lengths of piles, unless otherwise directed by the Engineer. Loading, testing and recording of data shall be under the direct supervision of the registered Professional Engineer engaged by the Contractor. A report shall be submitted in accordance with Article 1.10, Submittals.

2. The proposed testing apparatus and structures to be used in making the pile load tests shall be designed by the Professional Engineer engaged by the Contractor. The Contractor shall prepare complete detailed working drawings showing how the lateral load test will be performed including the layout of reaction, jack, and test pile. The drawings shall include date and calibration curves of all equipment and instruments. The entire test setup and procedure will be subject to the approval of the Engineer.

3. Piles shall be tested as free-head piles. Lateral load tests shall be conducted in accordance with Section 6.1 of ASTM D3966 until either 1 inch of gross lateral movement has occurred or the test load has reached 200 percent of the design load. For both cases, the allowable lateral pile load shall be 50 percent of the test value.

   a. Reaction for the lateral load test may be an adjacent pile.

   b. Movement shall be measured with dial gages to the nearest 0.001 inch referenced to a beam which is supported at least 10 feet away from the test pile and reactions.

   c. For H-piles, the direction of the test shall be as specified herein or shown on the Contract Drawings.

1.06 QUALITY ASSURANCE

A. Qualifications

1. The work shall be performed by the Contractor or a specialty subcontractor employed by the Contractor and having minimum of 5 years of experience in performing pile load tests and installation of the specified piling system under similar subsurface conditions.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Approval by the Engineer shall not relieve the Contractor of his complete responsibility for the adequacy of the pile load test setup. Submittals shall include, but not be limited to:

1. Full description of test method and equipment.

2. Load type and loading equipment.

3. Safety devices.

4. Calibration equipment.

B. The Contractor shall also submit a complete report to the Engineer at the completion of each pile load test. The Contractor shall engage the services of a Professional Engineer, subject to the approval of the Commissioner, licensed in the State of New York, experienced in pile load testing and load test analysis for the supervision of load test procedures and preparation of the report. The report shall include, but not be limited to:

1. Pile identification and location.
2. A description of the pile driving equipment.
3. Driving records for both test piles and reaction piles.
4. Complete test data.
5. Analysis of test data.
6. Recommended allowable design loads based on the pile test reports.
7. Description of subsurface conditions.
8. Recommended pile installation criteria.

2.02 MATERIALS / EQUIPMENT

A. Compressive Load Testing Apparatus: The proposed testing apparatus and structures to be used in making the pile load tests shall be designed by a Professional Engineer licensed in the State of New York engaged by the Contractor.

1. Load tests shall be performed by a method that will maintain constant concentric load under increasing settlement.
2. Settlement observations shall be made by means of dial extensometers. A minimum of three (3) extensometers shall be used. The extensometers shall provide readings to the nearest 0.001 inch. In addition, settlement observations shall be taken using an engineer's level reading to 0.001 feet properly referenced to a well-established benchmark.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examination of the Site

1. Prior to starting operations, an examination of the site shall be performed in accordance with the relevant pile Specification Sections.

B. Schedule of Operation

1. Load tests of piles shall be scheduled sufficiently in advance of production pile driving to prevent delay in the progress of the work.

2. No production piles shall be driven until the load test report is approved by the Engineer.

3.02 IMPLEMENTATION

A. Installation of Production Piles

1. The method of installing the permanent piles shall be the same as that used to install the test piles, except where a change in procedure is ordered by the Engineer.

2. The installation procedure established in the test program shall not be changed without the written approval of the Engineer.

3.03 FIELD TESTING / QUALITY CONTROL

A. Witnessing

1. The pile installation and test program will be witnessed by the Engineer designated for controlled inspection.

2. The Engineer designated for controlled inspection shall keep records for confirmation of the test pile driving. The Contractor shall cooperate with the Engineer so that all necessary data may be obtained. The data will include the following:

a. Type and dimensions of the pile.

b. Location and pile number.

c. Type and size of hammer.

d. Steam or air pressure used to activate hammer.

e. Type and dimensions of the cushion block.

f. Actual number of blows per minute delivered by the hammer.

g. Number of blows required for each foot of penetration, and blows per inch for last six (6) inches.

h. Elevation of ground.

i. Elevation to which the pile penetrated under its own weight and under the weight of the hammer.

j. Final elevation of tip of pile.

k. Length of delays due to splicing or for any other reason and elevation of pile tip at such time.

l. Location of pile splices.

m. Such other information as the Engineer may deem necessary.

3. The agency designated for controlled inspection will be employed by the DEP.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Clean Up

1. Upon completion of the test program, the Contractor shall remove all equipment, and remove or cutoff piles not in permanent locations or rejected and restore the site to a condition satisfactory to the Engineer.

2. Test piles and reaction piles which are driven at non-permanent pile locations shall be removed or cut off at least 18 inches below the bottom of the foundation and abandoned.

END OF SECTION

NO TEXT ON THIS PAGE

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, tools, equipment, materials and incidental items required to perform site clearing of all designated areas within the Contract limits and as shown on the Contract Drawings, including work specified in permits and other agreements, in accordance with the requirements of the Contract Documents

B. If applicable, the Contractor shall develop and implement an Emerald Ash Borer (EAB) Management Plan that provides for compliance with the latest EAB Quarantine Order(s), as applicable to the location of work. Work includes, but is not limited to, the performance of a Site survey by an appropriately qualified professional when the site is located in an EAB Quarantine Zone, and written protocol for the management of EAB Regulated Articles.

C. If applicable, the Contractor shall develop and implement an Asian Longhorned Beetle (ALB) Management Plan that provides for compliance with 7 CFR 301.51 and NYCRR Title 1 Part 139, as applicable to the location of work. Work includes, but is not limited to, the performance of a site survey by an appropriately qualified professional when the Site is located in an ALB Quarantine Zone, and written protocol for the management of ALB Regulated Articles.

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

1.04 REFERENCES

A. Definitions

1. Asian Longhorned Beetle (ALB): The insect known as the Asian Longhorned Beetle (Anoplophora glabripennis) in any stage of development.

2. ALB Compliance Agreement: A written agreement between United States Department of Agriculture (USDA) Animal and Plant Health Inspection Service (APHIS) and a person engaged in growing, handling, or moving regulated articles that are moved within an ALB Quarantine Zone, in which the person agrees to comply with the provisions of 7 CFR 301.51.

3. ALB Limited Permit: A document in which a USDA APHIS inspector affirms that the ALB Regulated Article is eligible for movement only to a specified destination and in accordance with conditions specified on the permit.

4. ALB Regulated Article: The term applies to: (1) Firewood (all hardwood species), and green lumber and other material living, dead, cut or fallen, inclusive of nursery stock, logs, stumps, roots, branches, and debris of half an inch or more in diameter of the following genera: Acer (maple), Aesculus (horse chestnut), Albizia (mimosa), Betula (birch), Celtis (hackberry), Cercidiphyllum (katsura), Fraxinus (ash), Platanus (sycamore), Populus (poplar), Salix (willow), Sorbus (mountain ash), and Ulmus (elm); (2) Any other article, product, or means of conveyance not covered in (1) of this definition if a USDA APHIS inspector determines that it presents a risk of spreading Asian Longhorned Beetle and notifies the person in possession of the article, product, or means of conveyance that it is subject to the restrictions of 7 CFR 301.51. This definition is subject to change and should be verified by consulting 7 CFR 301.51 prior to the start of work.

5. Caliper: An instrument used to measure the diameter of a tree.

6. Clearing: The removal from the ground surface within the designated areas and disposal of trees, brush, shrubs, down timber, decayed wood, other vegetation, rubbish, trash, scrap metal, debris and miscellaneous other structures not covered under other Sections as shown on the Contract Drawings, specified or otherwise required to permit construction of the new Work.

7. Emerald Ash Borer (EAB): The insect known as the Emerald Ash Borer in any stage of development.

8. EAB Compliance Agreement: An approved document, executed by persons or firms, covering the restricted movement, processing, handling or utilization of regulated articles not eligible for certification for intrastate movement. USDA APHIS controls the issuance of EAB Compliance Agreements for movement of regulated articles interstate. For movement of regulated articles intrastate, New York State Department of Agriculture and Markets (NYSDAM) controls the issuance of EAB Compliance Agreements.

9. EAB Regulated Article: The term applies to: (1) entire ash trees of any size, inclusive of nursery stock; (2) any part of ash trees, including leaves, bark, stumps, limbs, branches, and roots (i.e., living, dead, cut or fallen); (3) ash lumber or ash logs of any length; (4) any item made from or containing ash wood; (5) any article, product or means of conveyance determined by the USDA APHIS, NYSDAM or New York State Department of Environmental Conservation (NYSDEC) to present risk of spreading the EAB infestation; (6) firewood from any tree species; and, (7) wood chips and bark mulch from any tree species, larger than 1 inch in two dimensions, whether composted or uncomposted. This definition is subject to change. The relevant EAB Quarantine Order should be consulted for the current definition.

10. Grubbing: The removal and disposal of all stumps, buried logs, roots larger than 2 inches, matted roots and organic materials.

B. Reference Standards

1. Federal regulations, 7 CFR 301.51- Asian Longhorned Beetle

2. NYCRR Title 1 Part 139 – Control of the Asian Long Horned Beetle

3. NYCRR Title 1 Part 141 – Control of the Emerald Ash Borer

4. Federal regulations, 7 CFR 301.53 – Emerald Ash Borer

1.05 DESCRIPTION

A. Project/Site Conditions

1. Streets, roads, adjacent property and other works and structures shall be protected throughout the entire project. Contractor shall return to original

condition, satisfactory to the Engineer, facilities damaged by the Contractor's operations.

2. If the project site is in an Emerald Ash Borer Quarantine Zone established by the NYSDEC and NYSDAM, New York State prohibits the movement of regulated articles beyond the quarantined counties without an EAB Compliance Agreement.

3. If the project site is in an Asian Longhorned Beetle Quarantine Zone, USDA APHIS prohibits the movement of regulated articles beyond the quarantine zone without an ALB Compliance Agreement.

1.06 QUALITY ASSURANCE

A. Codes and Standards: State and local laws and code requirements shall govern the hauling and disposal of trees, shrubs, stumps, roots, rubbish, debris and other matter.

B. The Contractor or subcontractor responsible for work of any kind affecting EAB Regulated Articles within the Emerald Ash Borer Quarantine Zone must have EAB First Detectors training as certified by Cornell Cooperative Extension, or an approved equal. Work includes, but is not limited to planting trees, transplanting trees, pruning trees, fertilizing trees, removing trees and stumps, and Clearing and Grubbing trees or roots.

C. The Contractor or subcontractor responsible for work of any kind affecting ALB Regulated Articles within the Asian Longhorned Beetle Quarantine Zone must have an ALB Compliance Agreement. Work includes, but is not limited to planting trees, transplanting trees, pruning trees, fertilizing trees, removing trees and stumps, and Clearing and Grubbing trees or roots.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings and material specifications for the approval by the Engineer. Shop Drawings shall identify all trees designated for removal and those that shall remain and require protection, as directed by the Engineer.

B. Tree Protection Plan

1. The Contractor shall submit a Tree Protection Plan to the Engineer for approval prior to performing any work on trees or shrubs to be saved or in the vicinity of such trees and shrubs. The Plan must be approved prior to any such work being performed.

a. The Plan shall be prepared in consultation with the Engineer.

1) The Plan should include, but not necessarily be limited to, the location of temporary wooden tree guards, construction fence, temporary snow fence boundary, range fencing, micro tunneling, soil erosion and sediment control, hand and/or pneumatic excavation, soil compaction prevention and mitigation requirements, impact of trenching and/or cut and fill operations and pruning and fertilization schedule. Soil

testing and fertilization schedule, as well as other applicable methods of tree protection shall be as required by Sections 32 90 00 - Planting and 32 90 05 – Soil Mixes.

2) In addition, the Plan should address the Contractor's operations, including designated staging areas, site access and stockpiling of materials.

3) Mandatory provisions of the Plan always include, but are not limited to, the following provisions:

a) The Contractor shall not be permitted to park vehicles or equipment or to stockpile materials of any nature under the drip line of trees and shrubs in order to minimize surface and subsurface root damage and soil compaction. This directive shall apply to all areas within or outside the contract limit line.

C. Emerald Ash Borer Management Plan

1. The Contractor responsible for site clearing and grubbing shall submit an EAB Management Plan to the Engineer for approval prior to removal of any trees or vegetation from the construction site. The Plan shall identify each work site and all transportation routes, haulers, processing and disposal facilities including full contact information. The Plan shall confirm whether any debris will be generated, transported, processed or disposed in an EAB Quarantine Zone. If the construction site, transportation routes, processing and disposal facilities are not within an EAB Quarantine Zone, no further details are required in the Plan.

2. If EAB Regulated Articles are generated at a site that is not located within an EAB Quarantine Zone, but the materials will be transported into or through a Quarantine Zone for processing or disposal, the Plan shall also include:

a. A copy of the EAB Compliance Agreement for the transportation of EAB Regulated Articles into or through an EAB Quarantine Zone.

3. If the site is located within an EAB Quarantine Zone, the Plan shall also include the following:

a. A description of the survey methods to identify any EAB infestation and EAB Regulated Articles. The survey shall be performed by a professional in possession of a Cornell Cooperative Extension EAB First Detectors Certificate, or an approved equal, and shall be performed after felling trees and prior to removing any EAB Regulated Articles from the site. Evidence of certification shall be provided in the Plan. The results of the survey shall be summarized in an EAB survey report and provided to the Engineer prior to removing any EAB Regulated Articles from the site.

b. Provisions for notifying the Engineer and a NYSDAM horticultural inspector immediately upon the discovery of an EAB infestation. If an EAB infestation is confirmed by NYSDAM, the Contractor will be required to enter into an EAB Compliance Agreement. The EAB Compliance Agreement will dictate how the EAB and Regulated Articles must be managed and treated prior to removal from the site.

4. Unless the survey report specifically confirms the absence of ash trees (*Fraxinus* spp.), the Plan shall also include the following:

a. Schedule for conducting activities affected by EAB Regulated Articles

b. Identification and anticipated quantity of EAB Regulated Articles and proposed handling methods

1) If the EAB Regulated Articles are destined for a processing facility, the facility shall identify whether the materials will be recycled for resale or disposed.

2) If the EAB Regulated Articles are to be processed for resale by the Contractor, Subcontractor or processing facility, the Plan shall include a copy of the facility's EAB Compliance Agreement for handling Regulated Articles.

3) If the EAB Regulated Articles are to be transported out of the EAB Quarantine Zone, a copy of the Contractor's EAB Compliance Agreement for transporting Regulated Articles out of an EAB Quarantine Zone shall be included in the Plan.

c. Storage location for EAB Regulated Articles

d. Treatment methods if the Contractor elects to treat EAB Regulated Articles onsite such that they are no longer regulated. Onsite treatment requires that the responsible party be in possession of a Cornell Cooperative Extension EAB First Detectors Certificate, or an approved equal, and requires coordination with NYSDAM for inspection and verification. Evidence of the responsible party's certification shall be provided in the Plan.

e. Protocol for tracking the shipment of EAB Regulated Articles using a bill of lading or manifest that identifies the site, transporter, truck identification number and provides for signature upon receipt at the Processing or Disposal Facility. Payment of the removal of EAB Regulated Articles will not be made until signed copies of the bill of lading or manifest are provided to the Engineer.

D. EAB Survey Report

1. The Contractor responsible for site clearing and grubbing within an EAB Quarantine Zone is required to have the site surveyed for the presence of EAB by a professional in possession of a Cornell Cooperative Extension EAB First Detectors Certificate, or an approved equal. The Contractor shall

submit an EAB Survey Report to the Engineer within two weeks of survey completion. Regulated Articles may not be moved offsite without Engineer approval of the EAB Survey Report. The EAB Survey Report shall be signed by the certified professional and shall include documentation of the surveyor's credentials.

E. Asian Longhorned Beetle Management Plan

1. The Contractor responsible for site clearing and grubbing shall submit an ALB Management Plan to the Engineer for approval prior to removal of any trees or vegetation from the construction site. The Plan shall identify each work site and all transportation routes, haulers, processing and disposal facilities including full contact information. The Plan shall confirm whether any debris will be generated, transported, processed or disposed in an ALB Quarantine Zone. If the construction site, transportation routes, processing and disposal facilities are not within an ALB Quarantine Zone, no further details are required in the Plan.

2. If ALB Regulated Articles are generated at a site that is not located within an ALB Quarantine Zone, but the materials will be transported into or through a quarantine zone for processing or disposal, the Plan shall also include:

   a. For Interstate Movement - A copy of the ALB Limited Permit authorizing such movement or specific procedures for ensuring compliance with 7 CFR 301.51-4 which regulates the movement of Regulated Articles.

   b. For Intrastate Movement - Identification of the origin and destination of the regulated article in accordance with NYCRR Title 1 Part 139.

   c. A copy of the processing or disposal facility's ALB Compliance Agreement.

3. If the site is located within an ALB Quarantine Zone, the Plan shall also include the following:

   a. A copy of the Contractor's ALB Compliance Agreement with USDA APHIS.

   b. A description of the survey methods to identify any ALB infestation and ALB Regulated Articles. The survey shall be performed by a professional in possession of an ALB Compliance Agreement and shall be performed prior to felling trees and removing any ALB Regulated Articles from the site. Evidence of the professional's ALB Compliance Agreement shall be provided in the Plan. The results of the survey shall be summarized in an ALB survey report and provided to the Engineer prior to removing any ALB Regulated Articles from the site.

c. Provisions for notifying the Engineer and a USDA APHIS inspector immediately upon the discovery of an ALB infestation. If an ALB infestation is discovered, the Contractor shall stop all site Clearing and Grubbing until permission to resume work has been given in writing by a USDA APHIS Inspector. A copy of the permission to resume work shall be provided to the Engineer.

4. Unless the survey report specifically confirms the absence of Regulated Articles, the Plan shall also include the following:

a. Schedule for conducting activities affected by ALB Regulated Articles

b. Identification and anticipated quantity of ALB Regulated Articles and proposed handling methods

1) If the ALB Regulated Articles are destined for a processing facility, the facility shall be in possession of an ALB Compliance Agreement. The Plan shall include a copy of the facility's ALB Compliance Agreement for handling Regulated Articles.

2) If the ALB Regulated Articles are to be transported out of the ALB Quarantine Zone, a copy of the Contractor's ALB Compliance Agreement for transporting Regulated Articles out of an ALB Quarantine Zone shall be included in the Plan.

c. Storage location for ALB Regulated Articles

d. Treatment methods if the Contractor elects to treat ALB Regulated Articles onsite such that they are no longer regulated. Onsite treatment requires that the responsible party be in possession of an ALB Compliance Agreement and requires coordination with USDA APHIS or a professional in possession of an ALB Compliance Agreement with USDA APHIS for inspection and verification. A copy of the responsible party's ALB Compliance Agreement shall be provided in the Plan.

e. Protocol for tracking the shipment of ALB Regulated Articles using a bill of lading or manifest that identifies the site, transporter, truck identification number and provides for signature upon receipt at the processing or disposal facility. Payment of the removal of ALB Regulated Articles will not be made until signed copies of the bill of lading or manifest are provided to the Engineer.

F. ALB Survey Report

1. The Contractor responsible for site clearing and grubbing within an ALB Quarantine Zone is required to have the site surveyed for the presence of ALB by a professional in possession of an ALB Compliance Agreement. The Contractor shall submit an ALB Survey Report to the Engineer within two weeks of survey completion. Regulated Articles may not be moved

offsite without Engineer approval of the ALB Survey Report. The ALB Survey Report shall be signed by the professional and shall include a copy of the surveyor's ALB Compliance Agreement.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall guarantee that work performed under this Section will not permanently damage trees, shrubs, turf or plants designated to remain, or other adjacent work or facilities. If damage resulting from Contractor's operations appears during the period up to 12 months after completion of the project, the damaged items shall be replaced as directed by DEP at no expense to the City, to the satisfaction of the DEP.

PART 2 PRODUCTS

2.01 MANUFACTURERS

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Trees and Shrubs to be Saved

1. Protection: The Contractor shall protect from defacement, injury and destruction all trees and shrubs within the construction site that are so delineated or are marked in the field to be saved. Trees, shrubs and grassed areas which are to remain shall be protected by fences, barricades, wrapping or other methods as shown on the Contract Drawings, specified or approved by the Engineer.

a. Within the limits of the area from the tree trunk up to 3 to 4 feet outside of the tree drip line, work shall be performed with extreme care using either hand tools or equipment that will not cause damage to trees.

1) Do not disturb or cut roots unnecessarily. Do not cut roots 2 inches or larger unless approved.

2) Immediately backfill around tree roots after completion of construction in the vicinity of trees.

3) Do not operate any wheeled or tracked equipment within drip line.

b. Vegetation shall be protected from damage caused by emissions from engine-powered equipment.

c. During working operations, the trunk, foliage and root system of all trees to be saved shall be protected with boards or other guards placed as shown on the Contract Drawings and as required to prevent damage, injury and defacement.

1) Excavated materials shall not be piled within the drip line or adjacent to the trunks of trees. Equipment, stockpiles, etc. shall not be permitted within the drip line.

2) Do not allow runoff to accumulate around trunks of trees.

3) Ropes, cables, or guy wires shall not be fastened or attached to trees without permission. When such permission is granted, protect the tree before making fastening or attachments by providing burlap wrapping and softwood cleats.

4) The use of axes or climbing spurs for trimming will not be permitted.

5) Provide climbing ropes during trimming.

d. When directed by the Engineer, shrubs to be saved shall be removed by taking a sufficient earth ball with the roots to maintain the shrub.

1) Temporarily replant, if required, and replace at the completion of construction in a condition equaling that which existed prior to removal.

2) Replace in kind if the transplant fails. Provide transplanting, planting, and watering and guarantee as specified in Section 32 90 00 – Planting.

e. When directed by the Engineer, emergency repair to damaged trees and to trees that pose imminent danger shall be performed within 24 hours.

f. Damage Assessment

1) Tree damage. For trees that are damaged during the course of construction, a monetary credit shall be taken. The monetary assessment shall be the difference between the tree's condition rating, as per the International Society of

Arboriculture appraisal method, before and after the damage. The damage assessment shall be determined by the Engineer.

2) Tree Destruction. Any trees irreparably damaged during the course of construction, as determined by the Engineer shall be removed at the Contractor's sole expense. Restitution shall be made according to the Caliper Area Replacement formula, as determined by the Engineer. Restitution can be met by the Contractor through the following options:

a) Direct planting by the Contractor or its subcontractor of the required equivalent number of replacement trees at locations determined by the Engineer; or

b) A monetary credit for the value of the tree destroyed; or

c) A combination of (1) and (2) above, as determined by the Engineer. If the Contractor plants replacement trees, a monetary credit shall be taken for the difference between the full value of the destroyed tree and the value of the number of replacement trees planted.

3) Tree Removal. Restitution for any prohibited tree removals shall be made according to the Caliper Area Replacement formula, with adjustments for tree condition as per the International Society of Arboriculture appraisal method, as determined by the Engineer.

B. Air pollution caused by dust and dirt shall be controlled, complying with governing regulations. Dust control shall be as specified in Section 31 25 10 – Dust, Soil Erosion and Sediment Control.

C. Stripping Topsoil

1. The Contractor shall strip existing topsoil as described in Section 31 23 16 – Excavation. Heavy growths of grass shall be removed from areas before stripping the topsoil.

3.02 IMPLEMENTATION

A. Removal of Trees and Shrubs

1. Tree Removal within Property Limits:

a. Only those trees designated on the Contract Drawings for removal shall be removed.

b. Tree and shrub removal shall be conducted in a manner so as to avoid damage to those trees and shrubs which will remain.

c. Do not cut or damage trees or shrubs outside of the Contract limit lines. Damage outside the Contract limit lines caused by the Contractor's operations shall be corrected at the Contractor's expense.

d. All trees shall be calipered at four and one-half feet above existing grade prior to removal. All trees shall be "topped" and "limbed" previous to felling unless otherwise directed by the Engineer.

e. In areas of major construction, the stumps and roots of all trees designated for removal shall be grubbed and excavated to a depth of three (3) feet below the ground surface except in areas of fill greater than three (3) feet, where such trees may be cut flush with the ground surface.

B. Emerald Ash Borer Quarantine Zone

1. The EAB is a destructive wood boring insect that solely infests ash (*Fraxinus* spp.) trees and has killed tens of millions of trees across the US. EAB feed upon the cambium and phloem and kill a tree within two years. From a seedling to full grown trees, all parts of an ash tree are subject to infestation. In an effort to control the spread of EAB to other areas, quarantine orders have been imposed on a number of counties within New York State.

a. A current map of the geographic area included in the quarantine zones within New York State is available at the following website: https://www.aphis.usda.gov/aphis/ourfocus/planthealth/plant-pest-and-disease-programs/pests-and-diseases/emerald-ash-borer/emerald-ash-borer.

2. Any Contractor and Subcontractor performing tree work of any kind within the EAB Quarantine Zone shall comply with the relevant NYSDEC Quarantine Order. Tree work includes, but is not limited to planting trees, transplanting trees, pruning and fertilizing trees, removing trees and stumps, and Clearing and Grubbing trees or roots.

a. Additional information is available at the following website: http://www.dec.ny.gov/animals/7253.html

C. Asian Longhorned Beetle Quarantine Zone

1. The Asian Longhorned Beetle (ALB) is a destructive wood boring insect. It can cause serious damage to healthy trees by boring into their heartwood and eventually killing them. Nursery stock, logs, green lumber, firewood, stumps, roots, branches and debris of one-half (½") inch or more in diameter are subject to infestation. In an effort to control the spread of the beetle to other areas, a quarantine has been imposed by USDA APHIS on large portions of the City of New York as per Part 139 of Title 1 NYCRR.

2. Any Contractor or subcontractor performing tree work of any kind within the ALB Quarantine Zone must have an ALB Compliance Agreement and

will be held responsible for compliance with USDA APHIS. Tree work includes, but is not limited to planting trees, transplanting trees, pruning and fertilizing trees, removing trees and stumps, and Clearing and Grubbing trees or roots.

a. A current map of the geographic area included in the ALB Quarantine Zone within New York City is available at the following website: https://www.aphis.usda.gov/aphis/ourfocus/planthealth/plant-pest-and-disease-programs/pests-and-diseases/asian-longhorned-beetle/ct_alb_maps

b. Additional information is available at the following website: http://www.dec.ny.gov/animals/7255.html

D. Clearing and Grubbing

1. Clearing: The Contractor shall clear all items specified to the Contract limit lines shown on the Contract Drawings and shall remove cleared and grubbed materials from the site to an authorized disposal site.

a. Do not start earthwork operations in areas where Clearing and Grubbing is not complete, except that stumps and large roots may be removed concurrent with excavation.

b. Comply with erosion, sediment control and storm management measures as specified in Section 31 25 10 - Dust, Soil Erosion and Sediment Control.

2. Grubbing: The Contractor shall Clear and Grub areas to be excavated, areas receiving less than 3 feet of fill and areas upon which structures are to be constructed.

a. Stumps and root mats in these areas shall be removed to a depth of not less than 1 foot below the subgrade of sloped surfaces.

b. All depressions made by the removal of stumps or roots shall be filled with material suitable for backfill as specified in Section 31 23 23 - Fill.

3. Limited Clearing: The Contractor shall clear areas receiving more than 3 feet of fill by cutting trees and shrubs as close as practical to the existing ground. Grubbing will not be required.

4. Disposal:

a. All disposals off-site shall be in complete accordance with rules and regulations of the authorities having jurisdiction.

b. Burning of cleared and grubbed materials is not allowed within the property limits.

5. Explosives shall not be used.

6. No cleared or grubbed material may be used in backfills or structural embankments.

7. Cleared and grubbed items shall be removed from the site and disposed of in accordance with the applicable regulations and requirements of this Contract.

3.03 FIELD TESTING / QUALITY CONTROL

A. Certified Arborist

1. All tree pruning, tree repair, and tree removal is to be performed by competent workers only, under the supervision of an arborist holding certification from the International Society of Arboriculture (ISA), or registered with the American Society of Consulting Arborists or equivalent education and experience.

3.04 STARTUP / DEMONSTRATION

END OF SECTION

PART 1 GENERAL

1.01 SUMMARY

A. This Section describes excavation Work and reuse or disposal of all material as specified herein, shown on the Contract Drawings or required by the Engineer, for any purpose pertinent to the construction of the Work.

B. Excavation Work includes stripping and stockpiling of topsoil; sheeting and bracing; excavation over the Site; excavation for roads, pipelines and structures; removal and control of water in and around excavations; segregation and stockpiling of excavated material; disposal of unsuitable material and excess excavated material; reuse of suitable material; and trimming, shaping and grading of excavations.

C. This Section includes the excavation of soils, including Support of Excavation (SOE) spoils, classified, in accordance with 6 NYCRR Part 360.13 (f), Table 2, Fill Material Beneficial Reuse, as Fill Type F4, and soils classified as non-hazardous Solid Waste based on the results of the design phase soil sampling, and as described in Section 02 24 20 – Soil Sampling and Analysis.

1. Soils are suitable for off-site beneficial use at out-of-state beneficial use facilities as they meet the New Jersey Non-Residential Soil Cleanup criteria and the Pennsylvania Clean and Regulated Fill Concentration Limits, as per Tables 7 and 8, included in their respective Soil and Groundwater Investigation reports, dated June 2025.

D. The Contractor's Qualified Environmental Professional (QEP) shall oversee the excavation of fill material to ensure that soil sampling data is representative of the final excavation footprints, that fill material with different classifications are not commingled, and that hot spots or suspect soils are segregated for offsite reuse or additional testing, as necessary.

1.04 REFERENCES

A. Definitions:

1. Case-Specific Beneficial Use Determination (BUD): Under 6 NYCRR Part 360, Section 360.12(d), NYSDEC sets forth the requirements for petitioning NYSDEC to obtain a Case-Specific BUD, and the criteria for reviewing, granting, or denying of the BUD. For reuse of a solid waste to be determined

a beneficial use, the petition must satisfy all criteria outlined under 6 NYCRR Part 360, Section 360.12(d).

2. Excavated Material: All material regardless of its nature, except rock or boulders that have been excavated. The requirements for excavation of rock and boulders are set forth in Section 31 23 25 - Rock Excavation.

3. Fill: Soil and similar material excavated or brought to the Project Site for the purposes of construction. All fill material must meet the requirements of Section 31 23 23 – Fill. Material to be excavated and proposed for reuse as fill under Pre-Determined Beneficial Use must meet the requirements of 6 NYCRR Part 360, Section 360.13 (a), Applicability, Section 360.13 (b), Waste Cessation, or Section 360.12(c)(1)(iv)(a), Material ceases to be waste when used as backfill in the same excavation or for grade adjustment on the site of generation. If these criteria cannot be met, such material shall meet Section 360.12(d), Case-specific beneficial use determinations - general. Fill that is imported from another DEP Project Site must specifically meet Fill Type 2 maximum concentration levels. Fill from any other off-site source shall be non-hazardous and shall also meet Fill Type 2 maximum concentration levels.

4. New York City Metropolitan Area Waste Impact Zone: The area encompassing the City of New York and the counties of Nassau, Suffolk, Putnam and Westchester, as per 6 NYCRR Part 360.2 Definitions.

5. Pre-Determined Beneficial Use for fill material: Under 6 NYCRR Part 360, Section 360.13(b) Waste cessation. "Excavated material ceases to be solid waste in accordance with the following:

   a. Fill Type 1 generated outside of the New York City Metropolitan Area Waste Impact Zone (NYCMAWIZ) – once a determination has been made that the material is Fill Type 1;

   b. Fill Type 1 generated within Nassau, Suffolk, Westchester and Putnam Counties – once the material is delivered to the site of reuse;

   c. Fill Type 1 cannot be generated within the City of New York;

   d. Fill Type 2 and Fill Type 3 generated outside of the NYCMAWIZ – once a determination has been made that the material is Fill Type 2 or Fill Type 3;

   e. Fill Type 2 and Fill Type 3 generated within the NYCMAWIZ – once the material is delivered to the site of reuse;

   f. Fill Type 4 and Fill Type 5 – Once the material is delivered to the site of reuse."

   g. Under 6 NYCRR Part 360, Section 360.12(c)(1)(iv)(a), "Excavated material used to backfill the same excavation or as grade adjustment in areas of similar physical characteristics on the site of generation. If the material exhibits visual or historical evidence of contamination (including odors) and will be used in an area with

public access, the material must be covered with pavement, foundation, or with a minimum of 12 inches of soil or fill that meets the criteria to be used as Fill Type 1 and Fill Type 2" as defined in Subdivision 360.13, Special requirements for pre-determined beneficial use of excavated material. Refer to Section 02 24 20 - Soil Sampling and Analysis for sampling requirements, including a list of parameters to be analyzed for soils to be reused on-site, or soils to be reused or disposed off-site.

h. As per 6 NYCRR Part 360, Section 360.13.(c), Notification requirements in the City of New York. For fill types 2 through 5, NYSDEC shall be notified at least five (5) days before the first load greater than ten (10) cubic yards is planned to be transported from the site of excavation directly to a site of reuse within New York State. Notifications shall be made on forms acceptable to NYSDEC and shall include all associated analytical data reports.

i. Notification of fill placement. For Fill Types 4 and 5 generated outside the City of New York, NYSDEC shall be notified at least five days before the first load greater than ten (10) cubic yards is planned to be transported directly from the site of excavation to the site of reuse within New York State. Notifications shall be made on forms acceptable to NYSDEC and shall include all associated analytical data reports.

6. Suitable Material: Any material whose composition is satisfactory for use as fill. Any mineral (inorganic) soil, blasted or broken rock and similar materials of natural or man-made (i.e. recycled) origin, including mixtures thereof, are considered suitable materials. Determinations of whether a specific natural material is suitable shall be made by the Engineer on the above basis.

7. Topsoil: Topsoil shall consist of natural loam, free from subsoil, obtained from an area which has never been stripped. Topsoil is friable clay loam surface soil found in a depth of not less than 4 inches, and is substantially free of subsoil, clay lumps, stones, and other objects over 2 inches in diameter, and without weeds, roots, and other objectionable material. Topsoil shall be as further defined under Section 32 90 05 – Soil Mixes. Topsoil meeting this definition and Section 32 90 05 – Soil Mixes shall be considered suitable for use on-site.

8. Unsuitable Materials: Any material containing vegetable or organic matter such as muck, peat, organic silt, topsoil or sod, that is not satisfactory for the use as fill material.

1.05 DESCRIPTION

A. Design Requirements:

1. In designing the sheeting, take note of the minimum load diagram requirements of the DEP, shown in Attachments A and B (located after the "End of Section" designation), unless otherwise shown on the Contract Drawings. However, when it is anticipated that heavier crane or equipment loads will fall within the influence line of the excavation, increase design loads accordingly.
2. The Contractor's operations shall conform to the requirements of Section 31 25 10 - Dust, Soil Erosion and Sediment Control.
3. Site Conditions:
   a. Actual Conditions: Perform any geotechnical investigations deemed necessary to determine actual Site conditions. Geotechnical data reports, if they are available, will be provided in the Contract Documents.
   b. Underground Utilities: Locate and identify all existing underground utilities prior to the commencement of work.

B. Regulatory Requirements:

1. General: Before proceeding with any excavation, obtain all necessary permits required by agencies having jurisdiction and consents from owners of private property where their interests may be affected by the Work, such

as for temporary or permanent occupation, for disposal or storage of materials, or other encroachment except where temporary easements may have been obtained by the City in connection with permanent easements or otherwise.

2. Excavation operations and related Work shall be performed in strict compliance with the applicable sections of OSHA 1926 Subpart P-Excavations, New York City Department of Buildings Regulations and N.Y.S. Department of Labor, Industrial Board of Appeals, Part 23 Protection in Construction, Demolition and Excavation Operations latest editions.

3. In the period of 2 to 10 days prior to starting excavation, notify all utilities of intended Work locations and have utility locations marked. In NYC locations, the New York City Long Island One Call Center (800-272-4480) is available for this use. Upstate locations are served by Dig Safely NY (800 962-7962 or 811).

4. Recycled materials that the Engineer has evaluated and approved for general use shall be considered to be Suitable Material subject to the conditions for use as determined by the City. In general, the use of recycled materials must be sanctioned by NYSDEC, usually in the form of a BUD. See definition above.

C. Excess soils not reused onsite shall be reused offsite to the extent possible in the following hierarchal locations:

1. Other DEP projects that need available, excess suitable materials;

2. The NYC Clean Soil Bank managed by the Mayor's Office of Environmental Remediation (OER);

3. New York State beneficial use facilities;

4. Or outside of New York State at other applicable out-of-state agency beneficial use facilities.

1.06 QUALITY ASSURANCE

A. Certification of Laboratory Services:

1. For certification of Laboratory Services see Section 02 24 20 - Soil Sampling and Analysis.

1.07 SUBMITTALS

A. Sheeting and Bracing: Before commencing any excavating operations, submit for approval Shop Drawings of all sheeting and bracing, cofferdams, bridging, decking, soldier beams and lagging, and other temporary or permanent supporting structures. Shoring and underpinning submittals shall be as required by Section 31 40 00 – Shoring and Underpinning.

1. Shop Drawings shall show types of materials, dimensions and details of the entire bracing system, including wale splices and corner connections,

stressing/jacking methods, reaction systems, posting and rebracing, if necessary.

2. Provide plans, details and procedures for jacking-in preload at struts.

3. For sheeting and shoring not shown on the Contract Drawings submit engineering calculations and design assumptions for determination of loads and stresses acting in the wall and lateral supports during installation, as well as final conditions. Show locations at which the temporary or permanent supporting structures will be used. The proposed design shall take into account the excavation procedures, dewatering operations, surcharge loading, soil properties, material stresses, temperatures, permanent construction, stages of work and all other conditions which could affect the excavation support system and the permanent structure. These drawings and calculations shall be prepared and stamped by a Professional Engineer licensed in the State of New York.

B. Soil Excavation, Reuse, Transport and Disposal Plan (SERTD Plan): Submit a SERTD Plan to the Engineer for approval at least 30 calendar days prior to the start of excavation. The SERTD Plan shall include two protocols: the Excavation Protocol and the Reuse, Transport and Disposal Protocol.

1. The Excavation Protocol shall include, but not be limited to, the following:

   a. Limits of excavation

   b. Excavation methods

   c. Protection methods:

      1) Sheeting and bracing

      2) Fencing, bridging and decking

2. The Reuse, Transport and Disposal Protocol shall address the following waste classifications defined in Section 02 24 20 – Soil Sampling and Analysis: hazardous solid waste; non-hazardous contaminated waste; non-hazardous petroleum-contaminated waste; non-regulated solid waste, and construction and demolition (C&D) debris. The Protocol shall include the following:

   a. Details on proposed reuse:

      1) Identities of beneficial use facility (ies) with copy (ies) of their regulatory approvals, as applicable. Unless otherwise reused under Pre-Determined Beneficial Use, details shall include all supporting back-up information sent to and received from NYSDEC or other applicable out-of-state agency. See Section 02 24 20 - Soil Sampling and Analysis for on-site reuse criteria. When reusing soils on site, details of temporary (stockpile) storage and the location(s) of reuse shall be identified.

2) As applicable, the requirements of each beneficial use facility / treatment, storage, and disposal facility (TSDF) for sampling, including analytical parameters, frequencies, protocols, and minimum detection limits.

b. Transportation details:

1) Identities of waste transporters; supporting NYSDEC Part 364 Waste Transporter Permit(s) and other out-of-state transporter permits required to transport the wastes to the TSDFs; or for use of public roadways if temporary off-site storage becomes necessary.

c. Disposal details:

1) Identities of TSDFs solicited including names and locations, insurance certificate, permit documentation including the types of materials allowed and not allowed, and chemical and physical material acceptance criteria. If no concentrations are indicated, then the facility must indicate the types of material that it is allowed to accept under its permit. Treatment, storage, or disposal of any waste generated by excavation Work shall be at a facility permitted to accept such waste by an authorized state or local government agency, or the EPA, as applicable.

3. The SERTD Plan shall be coordinated with the Field Sampling Plan (FSP), including beneficial use facilities/TSDF selection, and associated materials acceptance requirements specified in Section 02 24 20 – Soil Sampling and Analysis, as applicable.

4. The SERTD Plan shall be prepared in accordance with all applicable Federal, State and local hauling and disposal codes and regulations

5. Reuse of excavation spoils either on-site or off-site must be prioritized over disposal. TSDFs shall only be approved where reuse options are not available.

6. Under separate cover, additional waste disposal documentation submittals for DEP signature as generator. The Contractor shall provide waste profiles, facility letters of acceptance of DEP waste, advance copies of waste manifest(s), and Land Disposal Restriction (LDR) Notification and Certification Form (if hazardous waste) for the Engineer's review and approval and DEP signature as generator, where applicable.

C. Manifest Requirements and Submittals: Manifests shall include measurements of the volume of all excavated material to be removed from the site prior to transporting to an approved beneficial use facility/ TSDF. The Contractor shall also prepare all vehicles and manifests necessary for transporting all material. The Contractor shall comply with all Federal, State and local regulations regarding the transport of hazardous and non-hazardous waste.

1. Applicable Regulations: All Contract Work that concerns the transport of hazardous and non-hazardous waste shall comply with the appropriate EPA and NYSDEC regulations, and DOT hazardous material transportation regulations.

2. EPA Hazardous Waste Manifest: The Contractor shall obtain an appropriate number of hazardous waste manifest forms (EPA Form 8700-22 (Rev. 3-05) or latest version), sequentially numbered for this Contract based on the quantity of hazardous waste to be removed from site. The name of the generator, transporter and TSDF, and their appropriate EPA identification number, shall be typed on each form. All other pertinent information shall be included on the manifest. A copy of the partially completed manifest including the above information shall be submitted for approval at least 3 weeks prior to commencement of excavation.

    a. Routing: The Contractor shall provide a map and written description of the route which will be taken to the approved TSDF by the hazardous waste transporter.

3. Non-hazardous Waste Manifest: Manifests shall be provided for each truckload of non-hazardous waste removed from the site, including soils destined for reuse. The form of the manifest shall be approved by the Engineer. Non-hazardous waste shall be transported in accordance with all applicable local, State and Federal DOT regulations by properly licensed and permitted waste haulers.

    a. Routing: The Contractor shall provide a map and written description of the route which will be taken to the approved beneficial use facility / TSDF by the non-hazardous waste transporter.

4. The Contractor shall submit written evidence that selected beneficial use facilities / TSDFs have accepted or will accept the materials generated during excavation. The Contractor shall also submit copies of the completed manifest, signed and dated by the initial transporter, in accordance with Federal and State requirements and with associated documentation (e.g., waste profile and Hazardous Waste LDR Notification and Certification Form, as applicable). Copies of completed and signed waste manifests from beneficial use facilities / TSDFs shall be provided to the Engineer within 30 days of waste shipment off-site.

5. Bill of Lading: Bills of Lading shall be provided for all uncontaminated soils destined for reuse off-site. Uncontaminated soil shall be removed by a properly licensed hauler.

6. Notification to the NYSDEC must be made prior to the first load greater than 10 cubic yards is planned to be transported from the site of excavation directly to the site of reuse.

    a. At least five days in advance of transfers of Fill Types 2, 3, 4 and 5 generated in, imported to, or relocated within the City of New York.

b. At least five days in advance of transfers of Fill Type 4 and Fill Type 5 anywhere in the State of New York.

The Notification of Fill Transfer for Reuse form (NYSDEC Division of Materials Management, version 03/24 or latest) will be sent to the NYSDEC Regional Office in which the destination is located. The form must be certified by a Qualified Environmental Professional (QEP). In the event the QEP is not a Professional Engineer or Geologist licensed in New York State, the QEP's basis for credential must be attached to the form.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. Steel for struts, braces, and whalers shall meet the requirements of Section 05 12 00 – Structural Steel Framing and the Contract Drawings.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. General: No excavation Work below the water table shall begin before the Dewatering Plan is approved, as specified in Section 31 23 19 - Dewatering.

B. Clearing and Grubbing: Clear and grub the site of all open cut excavations and all areas shown on the Contract Drawings and specified. The Contractor shall comply with the requirements of Section 31 10 10 - Site Clearing.

C. Stripping: Completely strip all topsoil and earth containing roots away from areas which have been cleared and grubbed. Topsoil which is determined by the Engineer to be suitable for future reuse by the City shall be stripped separately and stockpiled at locations on the Site as directed by the Engineer. Topsoil to be reused on-site shall comply with the requirements of Section 32 90 05 – Soil Mixes. Topsoil to be

reused on-site or off-site may require testing to meet the requirements for NYSDEC Pre-Determined Beneficial Use or a Case-Specific BUD per 6 NYCRR Part 360, or other applicable out-of-state agency's requirements for a Case-Specific BUD. For further discussion on topsoil reuse refer to Section 02 24 20 – Soil Sampling and Analysis and Section 31 23 23 – Fill.

D. Sheeting and Bracing:

1. The Contractor shall provide all labor, equipment, materials and incidental items and services necessary to perform sheeting and bracing as indicated on the Contract Drawings and specified herein. Sheeting and bracing shall include but not limited to:

   a. Furnish, install, preload and maintain a system of wales, struts, kickers and bracing appurtenances to shore portions of the earth support walls as shown on the Contract Drawings.

   b. After support is provided, including installation of base slabs, unload and remove wales, struts, kickers and bracing as required.

   c. The arrangement, construction, testing and maintenance of the lateral bracing system shall be the responsibility of the Contractor.

2. All excavations shall be excavated with vertical sides and properly sheeted and braced for the full depth of the excavations, unless otherwise shown on the Contract Drawings, specified or ordered in writing by the Engineer. All excavation shall be shored and braced in accordance with 29 CFR 1926 Subsection P requirements and New York City Department of Buildings regulations

3. Pilot cuts for excavations shall not exceed 5 feet in depth and shall be made with equipment approved by the Engineer. The equipment to be used and the method to be employed in starting the sheeting operation shall be submitted for approval and must be approved in writing by the Engineer before the start of Work.

4. Exception: Excavation for structures or pipe lines 5 feet in depth or less need not be sheeted and braced except where excavation is in close proximity to existing footings or conduits and where unsupported sides may be unstable.

5. Design and install sheeting and bracing in excavations for pipe lines so that at no time shall sheeting be braced or blocked against the sides of pipe or conduit. Do not drive sheeting for pipelines below the elevation of the bottom of the pipe. If it is necessary to drive the sheeting below that elevation in order to obtain a dry trench or satisfactory working conditions, cut off the sheeting and leave in place below the top of the pipe at no additional cost to the City.

   a. Contractor shall design and provide additional and supplemental sheeting and bracing as needed to perform the excavation.

b. Adjust field locations of wales, rakers, struts and braces as required and approved by the Engineer to avoid interference with new Work and provide sufficient bearing. Block between wales and sheets with steel shims immediately after installing braces.

c. Struts shall be wedged, posted and tied to form a stiff support. Rakers and struts to be preloaded shall be jacked to the loads shown on the Contract Drawings. Rakers and struts shall be preloaded in the presence of the Engineer.

d. Provide web stiffeners, plates or angles as needed to prevent rotation, crimping or buckling of connections and points of bearing between structural steel members and/or jacks occasioned by eccentricities caused by field fabrication, assembly or conditions.

e. Protect bracing members from damage by construction equipment and other causes. Repair any damage promptly and erect temporary barriers to secure area of damage, as required.

6. Where permitted or ordered in writing by the Engineer, slope the sides of the excavation to elevations approved by the Engineer and excavate below such elevations with vertical sides, properly sheeted and braced. Side slopes must be stable. Banks more than 5 feet high shall be shored and sloped to the angle of repose in accordance with current OSHA standards to furnish safe working conditions, to prevent shifting of material, to prevent damage to structures or other work and to avoid delay to the Work, all in compliance with U.S. Department of Labor Safety and Health Regulations for construction promulgated under the Occupational Safety and Health Act of 1970 and under Contract Work Hours and Safety Standards Act, as amended. The minimum shoring, sheeting and bracing for trench excavations shall meet the general trenching requirements of the applicable safety and health regulations. However, in no case shall the sides of trench excavations for pipe or conduit be sloped to elevations lower than 2 feet above the top of the pipe or conduit.

7. Removal of sheeting:

a. When the sheeting and bracing for the vertical sides of such trench excavations is not required to be left in place, such sheeting and bracing shall be removed, and backfill shall be placed and compacted to an elevation at least 1'-6" above the top of the pipe or conduit. This requirement shall be met unless an exception is provided elsewhere in the Contract Documents.

b. Where sheeting and bracing is removed, it shall be done as the excavation is refilled in a manner to avoid the caving in of the bank or disturbance to adjacent areas or structures, except as otherwise shown on the Contract Drawings or directed. Carefully fill voids left by the withdrawal of the sheeting by ramming or otherwise as directed by the Engineer.

c. Obtain permission of the Engineer before the removal of any shoring, sheeting or bracing. Such permission by the Engineer shall not relieve the Contractor of responsibility for injury to structures or to other property or persons resulting from failure to leave such sheeting and bracing in place.

d. Load from rakers, struts and corner braces shall be released in a controlled fashion by cutting kickers and removing wedges and shims, as approved by the Engineer.

8. Credit: Sheeting and bracing required to be provided by the Contract Drawings or the Sections and subsequently allowed or ordered in writing by the Engineer to be omitted shall be subject to suitable credit to the City. Measurement of sheeting and bracing limits subject to suitable credit shall extend from the subgrade to within 18 inches of the ground surface in the case of vertical sides, regardless of stages; and shall extend from the subgrade to 12 inches above the junction of the vertical and sloping sides in the case of excavations with sloped sides above and vertical sides below. Sheeting and bracing indicated to be omitted on the Contract Drawings will not be subject to credit.

9. Width: The width of trenches, between inner faces of sheeting or rock, as the case may be, shall not exceed the width of the structure to be installed by more than 3 feet. Where two or more stages of sheeting are used, the width of trench shall not exceed the width of structure by 3 feet at the lowest stage of sheeting to a point 2 feet above the top of pipe or conduit.

10. In cases where sheeting and bracing will not adequately protect adjacent structures from damage and settlement, the Contractor shall employ other methods, such as underpinning. The Contractor shall hold the City harmless from all claims for damage arising from failure to adequately protect all structures. The Contractor will be presumed to have fully examined and inspected the buildings before estimating the costs and hazards involved.

11. If, in the opinion of the Engineer, any of the approved temporary or permanent supporting structures are inadequate or unsuitable for the actual conditions in the field, the Engineer may direct the Contractor to strengthen the supporting structures at no additional cost to the City. The Contractor shall be responsible for the sufficiency of all temporary and permanent supporting structures whether or not directed by the Engineer to strengthen them.

E. Protection of Plants and Structures: Before starting excavation, clear away all obstructions which are to be removed or relocated. Properly brace and protect trees, shrubs, poles and other structures which are to be preserved. Comply with the requirements of Section 31 10 10 - Site Clearing.

F. Frost Prevention: Protection shall be provided against the penetration of frost into material below the bearing level during work in the winter months. This protection

shall consist of a temporary blanket of straw or salt hay covered with a plastic membrane or other approved means

G. Removal of Water:

1. Conform to the requirements of Sections 31 23 19 - Dewatering and 31 25 10 - Dust, Soil Erosion and Sediment Control.

2. Care of Water: At all times during the Work, including final inspection, provide and maintain ample means and suitable equipment with which to promptly remove and properly dispose of all water entering excavations or other parts of the Work. Keep all excavations dry at all times until the structures to be built therein are completed and backfilled to approximately final grades except where otherwise approved by the Engineer in writing. Do not permit sewage from existing sewers and house connections to flow into excavations.

3. To prevent flotation or uplift of the structure or portions of the structure under construction, provide approved dewatering or freezing methods which shall operate under supervision 24 hours per day, including holidays and weekends. Maintain this dewatering or other system in continuous operation until the structure or portions of the structure are substantially completed to a gravity load 10 percent greater than the upward load caused by the ground water uplift pressure measured and computed from the original ground water level. Place backfill and mechanically compact it to approximately final grade after the structure has achieved the required strength, except where otherwise approved by the Engineer in writing. In addition, provide and have available at the work site suitable standby equipment for prompt replacement during breakdowns of operating equipment.

4. The dewatering system shall be maintained in operation as required in Section 31 23 19 – Dewatering.

5. Obtain written approval from the Engineer before discontinuing the dewatering or other groundwater control system.

6. Where water or sewage has accumulated or is flowing in the completed or partly completed structures, remove and dispose of such water or sewage during the time covered by the Contract, unless otherwise directed by the Engineer.

7. The Contractor shall take care of all sewer drainage interfered with by his operations to the satisfaction of the Engineer. Drainage into trench excavations is expressly prohibited.

3.02 IMPLEMENTATION

A. Structure Excavation:

1. Excavations shall be of sufficient size to permit the Work to be safely and properly constructed in the manner and of the size specified, except where limits of excavation are provided on the Contract Drawings. The bottom of

the excavation in earth and rock shall have the shape and dimensions of the underside of the structure with allowance for the concrete work mat or compacted aggregate base layer.

2. Exercise care to prevent disturbing or loosening of the soil in the excavation. Densify the bearing surface for all structures with an approved type vibratory compactor to 95 percent of the maximum dry density obtainable by ASTM D1557 before the construction of any foundations. Where the depth of disturbed or loosened soils is greater than 12 inches or; as determined by the Engineer, that it will require special compaction; the Contractor shall propose the appropriate method of compaction and submit to the Engineer for approval. All disturbed or loosened soils as determined by the Engineer that should be removed shall be replaced in accordance with the requirements of Paragraph 3.03D "Unauthorized Excavation".

3. Whenever abandoned existing piles are encountered during excavation, they shall be cut off at least 18 inches below the bottom of new footings, unless otherwise indicated on the Contract Drawings, and shall not be pulled.

B. Site Excavation:

1. Excavate over the site within the limits of site grading to conform to finished site grades. Arrange the excavation work to permit continuous surface drainage off the site, eliminate low spots and surface ponding, and prevent runoff from flowing into the surrounding areas.

C. Trench Excavation:

1. Maintain the minimum trench width adequate to place, joint and backfill the pipe or conduit properly. The clear width of the trench at the level of the top of the pipe shall not exceed the sum of the outside diameter of the pipe barrel plus 20 inches for pipe 4 through 24 inches in diameter nor the outside diameter of the pipe barrel plus 2 feet for pipe more than 24 inches in diameter, unless otherwise approved by the Engineer. The banks of pipe trenches shall be as near to vertical as practicable.

2. Length of Excavation: Make excavation for the sewers, drains, ducts, conduits or pipe lines only a reasonable distance in advance of pipe laying, at the discretion of the Engineer, and as may be indicated by the supply of materials on hand.

3. In sheeted trenches, measure the clear width of the trench at the level of the top of the pipe to the inside of the sheeting.

   a. Pipes placed in trenches wider than specified above shall be provided with concrete cradle or encasement as directed by the Engineer. No separate payment will be made for such cradles or encasement.

   b. Do not overexcavate the bottom of the trenches. The bottom of trenches shall be graded accurately to provide uniform bearing and

support for each section of the pipe on undisturbed soil at every point along its entire length (except for the portions of the pipe sections where it is necessary to excavate for bell hole, for the proper sealing of pipe joints, and as hereinafter specified).

c. Dig bell holes and depressions for joints after the trench bottom has been graded. In order that the pipe rests on the prepared bottom for as nearly its full length as practicable, make bell holes and depressions only of such length, depth, and width as required for properly making the particular type of joint. Remove stones as necessary to avoid point bearing. Except as hereinafter specified for wet or otherwise unstable material, backfill overdepths with materials specified for backfilling the lower portion of trenches. Whenever wet or otherwise unstable material that is incapable of properly supporting the pipe is encountered in the bottom of the trench, over excavate such material (a minimum of 2 feet below pipe) to a depth to allow for construction of stable pipe bedding. Backfill the trench to the proper grade with suitable approved materials as per Section 31 23 23 - Fill.

d. If unstable material is exposed at the level of the bottom of the trench excavation, it shall be excavated in accordance with Paragraph 3.03C "Authorized Additional Excavation". When the Engineer judges that the unstable material extends to an excessive depth, he may advise the Contractor, in writing, to stabilize the trench bottom with additional select fill or pipe bedding material or to ensure firm support for the pipe or electrical duct by other suitable methods. Payment for such trench stabilization will be made as described for "Authorized Additional Excavation."

e. The open, excavated trench preceding the pipe laying operation and the unfilled trench with pipe in place shall be kept to a minimum length, causing the least possible disturbance. Means of egress shall be located so as to require no more than 25 feet of lateral travel by employees. Ladders shall extend a minimum of 36 inches above the top of the sheeting or be tied down with a grabrail provided.

f. No water shall be allowed to rise in the trench excavation until sufficient backfill has been placed to prevent pipe flotation.

D. Lines and Grades:

1. Excavate for sewers, drains, conduits, pipe lines, walls, foundations, footings, and other structures, including any excavating indicated on the Contract Drawings or necessary, to the lines and grades shown on the Contract Drawings, specified or required.

2. Demolition: Cut pavements, curbs and sidewalks with non-impact tools or other equipment approved by the Engineer. Breaking of pavements, curbs and sidewalks by impact, such as with the use of a ball, is not permitted.

When removing sections next to sections that are to remain, sawcut the full depth of the concrete and asphalt.

3. Adequate Space: Do all trimming, grading and other incidental work to the grades and slopes shown on the Contract Drawings, specified or required as approved by the Engineer. Perform all excavations of sufficient size for the proper execution and inspection of the work. Keep excavation in good condition at all times and fill all voids which may endanger existing structures to the satisfaction of the Engineer.

3.03 FIELD TESTING / QUALITY CONTROL

A. Subgrade Consolidation:

1. Consolidating Suitable Materials: Materials used in the bottom of excavation to replace boggy and other yielding or unsuitable materials, for providing solid and firm foundations for the structures to be built thereon, where approved in writing, may be either select fill or lean concrete.

B. Explosives: Do not use explosives for any clearing, grubbing or excavation work as per Section 31 10 10 – Site Clearing.

C. Authorized Additional Excavation: In case the materials encountered at the elevations shown on the Contract Drawings are not suitable, or in case it is found desirable or necessary to go to an additional depth or to an additional depth and width, carry the excavation to such additional depth and width as the Engineer may direct in writing. Refill such excavated space with either 2,500 psi concrete or compacted select fill materials, as ordered. Where necessary, compact fill materials to avoid future settlement. Use select fill materials meeting the requirements of Section 31 23 23 – Fill and compact to attain a minimum degree of compaction of 95 percent of the maximum dry density as determined by ASTM D1557. Place backfill in lifts not exceeding 9 inches in loose thickness.

D. Unauthorized Excavation: Wherever the excavation is carried beyond or below the lines and grades shown on the Contract Drawings or given by the Engineer, except as specified in Paragraph 3.03C "Authorized Additional Excavation", refill all such excavated space with such material and in such a manner as may be directed by the Engineer to insure the stability of the various structures. Areas excavated beneath all manholes, structures, pipelines or conduits without authority shall be refilled by the Contractor at its own expense with 2,500 psi concrete or compacted select fill material and properly compacted as ordered by the Engineer.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Fencing, Bridging, and Decking

1. All excavations or openings made under this Contract in any public street, park or place, or in any adjoining property, shall be immediately enclosed by a guard fence constructed in a neat and workmanlike manner in

accordance with the requirements of Section 32 31 15 – Chain Link Fence. Where a tight board fence is specified, no guard fence will be required, provided there is no delay in the erection of the tight board fence.

2. Wherever a driveway occurs, construct a bridge of adequate strength and width and provide with side railings to span the excavation.

3. Wherever the distance between available crossings over the excavation is, in the opinion of the Engineer, excessive, he may order a temporary foot bridge with side rails to be constructed.

4. At all street intersections, excavations made from the surface shall be decked over in a substantial manner so that traffic can be maintained at all times except as herein provided for. The removal of the pavement and the placing of the decking shall be done during the hours of a day or night which will cause the least inconvenience to adjoining property owners and to public traffic in general. During certain designated hours of the day or night, sections of planking not more than 10 feet in length may be temporarily removed for the purpose of removing excavated material, receiving materials of construction or for backfilling.

B. Segregation, Storage, and Disposal of Materials:

1. Segregating:

a. All unsuitable material which may be excavated by the Contractor shall be kept separated from suitable excavated material which may be reused on-site or off-site under NYSDEC Pre-Determined Beneficial Use or a Case-Specific BUD per 6 NYCRR Part 360, or other applicable out-of-state agency's Case-Specific BUD, or disposed off-site.

b. Soil sample results greater than 5 ppm lead by TCLP shall be reported to the Engineer immediately. (See Section 01 35 45 – Hazardous Materials Control for implementation of a Community Air Monitoring Program (CAMP) in the event that hazardous levels of lead are detected in soil.)

2. Stockpiling:

a. Excavated material to be used for backfilling on-site under NYSDEC Pre-Determined Beneficial Use or Case-Specific BUD shall be so piled and placed as not to encumber sidewalks or roadways, or wash away or obstruct the free flow of surface or drainage water. Excavated material shall not be placed closer to the edge of an excavation than a distance equal to 1-1/2 times the depth of the excavation, unless the excavation is in rock or the sides of the excavation have been sloped or sheeted and shored to withstand the lateral forces imposed by such superimposed loads.

b. Stockpile cover and liner material and installation requirements should be as specified in Section 31 25 10 - Dust, Soil Erosion and Sediment Control.

c. Storage before beneficial use shall not exceed 365 days per 6 NYCRR Part 360.12(d)(2)(vii)(a)(2), unless a different time period for storage is approved by NYSDEC.

3. Excess Materials: The Contractor shall make arrangements for transportation and reuse of the soil on-site or off-site under NYSDEC Pre-Determined Beneficial Use or a Case-Specific BUD per 6 NYCRR Part 360, or applicable out-of-state agency's Case-Specific BUD. If reuse is not an option, only then may the Contractor dispose of excess materials.

C. Sheeting and Bracing Left in Place:

1. All sheeting and bracing in excavations for sewer pipelines, including manholes and chambers, shall be left in place except where otherwise shown on the Contract Drawings, specified or ordered in writing by the Engineer. Sheeting left in place shall be cut off at the elevation shown on the Contract Drawings, or at least 18 inches below final grade. Bracing remaining in place shall be driven up tight.

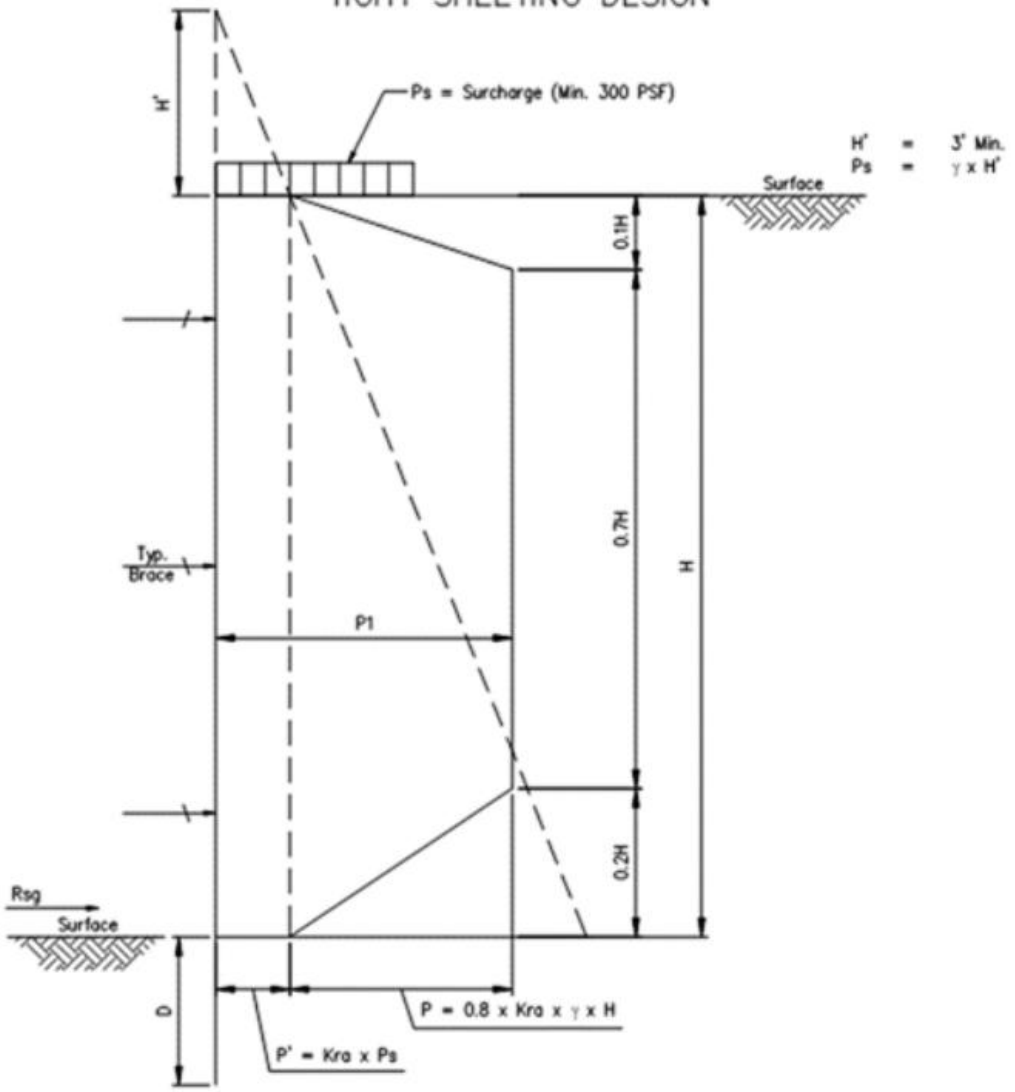
2. Where it is necessary to remove cross braces to make way for sewer pipe, manholes, and chambers, rebrace the sheeting in a manner approved by the Engineer, but in no case shall sheeting be braced against the sides of pipe or structures, unless approved in writing by the Engineer.

3. Leave sheeting and bracing in place in excavations for structures other than pipe lines where shown on the Contract Drawings, specified or ordered in writing by the Engineer to be left in place. Where such sheeting is to be left in place, the original braces shall not be removed and the sheeting shall be rebraced against the structure unless it is approved by the Engineer.

4. Sheeting and bracing to be left in place shall include all elements of the sheeting and bracing regardless of the type used, except such braces required to be removed to make way for the structure or pipeline being constructed. Where lagging and "soldier" beams are used, the "soldier" beams shall also be left in place.

5. In excavations with vertical sides for the full depth, cut off sheeting left in place at the elevations provided in writing by the Engineer, but in general, such cutoffs shall not be less than 18 inches below the existing ground surface. In excavations with sloped sides above and vertical sides below, cut off sheeting at the top of the vertical sides of the excavation. Cut off timber sheeting by sawing, and steel sheeting or "soldier" beams by burning. Breaking off sheeting will not be permitted.

6. Do not remove sheeting and bracing not shown on the Contract Drawings or specified to be left in place without first obtaining a statement in writing from the Engineer that such sheeting may be removed.



7. No separate payment will be made for sheeting and bracing left in place, the cost thereof shall be included in the price or prices bid for the Work under this Contract, except when separate payment for sheeting and bracing ordered in writing by the Engineer to be left in place is provided for in the Contract Documents.

SECTION 31 23 19 – DEWATERING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish, install, operate and maintain dewatering equipment and systems as specified, shown on the Contract Drawings, or required during the Contract.

B. Groundwater sampling results from the Design Phase subsurface investigations are provided in Tables 11, 16, and 21, attached to Section 01 35 45 – Hazardous Materials Control, and in the following reports.

1. Soil and Groundwater Investigation Report for TI-010 Chlorination, June 2025, prepared by Bidwell Environmental, LLC;
2. Soil and Groundwater Investigation Report for TI-010 Dechlorination, June 2025, prepared by Bidwell Environmental, LLC; and
3. Soil and Groundwater Investigation Report for TI-011 Disinfection, June 2025, prepared by Bidwell Environmental, LLC.

C. The Contractor shall provide standby equipment and power supply for maintaining uninterrupted construction dewatering.

D. The Contractor shall install groundwater monitoring wells/piezometers and measure, record and report the levels/hydraulic head of groundwater as required during the project.

E. The Contractor shall obtain and comply with all necessary permits from State and local agencies required for operation of the dewatering system, monitoring groundwater, and disposal of dewatering effluent.

F. The Contractor shall collect samples of the dewatering effluent as required by the applicable State and local permits and provide the services of a laboratory certified under the New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program (ELAP) for the analyses of the samples collected to determine the quality of dewatering effluent prior to disposal.

7. ASTM standards applicable to piping, equipment and other items required for a complete dewatering system

1.05 DESCRIPTION

A. Design Requirements

1. The Contractor shall design, install, operate, maintain and remove the dewatering system as necessary to:

   a. Lower and maintain groundwater levels and hydrostatic pressures to 2 feet below the prevailing excavation level or to a point no higher than 2 feet above the top of an impermeable stratum, if the subgrade is in the impermeable stratum. Groundwater levels shall be lowered for a time period as deemed necessary by the Engineer to ensure adequate factor of safety for the constructed structure.

   b. Maintain stable slopes and subgrade.

   c. Control and remove seepage and surface water into excavations.

   d. Allow subsequent work to be safely performed and not result in damage to adjacent properties, buildings, structures, utilities and other work.

   e. The Contractor shall provide primary and standby power, including all costs for installation, energy and fuel.

   f. The Engineer will perform inspections and witnessing of:

      1) Testing of sand and silt from dewatering wells.

      2) Drawdown and performance testing of Dewatering System.

      3) Performance testing of standby power source and backup Dewatering System.

2. The method of dewatering and control of water both inside and outside the excavation shall be selected by the Contractor who shall be solely responsible for the location, arrangement and depth of any system(s) selected to accomplish the Work. The Contractor shall construct protective works as necessary to dewater, cut off porous zones of fill and direct the flow of water from whatever source away from the excavations and adjacent areas. Protective works shall include slurry methods, grouting, clay seepage plugs, toe drains with appropriate filters, deep wells, well points, sumps, dikes, ditches and all supporting features as required, but not specifically shown on the Contract Drawings.

   a. The dewatering system shall be designed and implemented so as to maintain a minimum factor of safety against the uplift groundwater pressures in any soil strata. The factor of safety shall be calculated by considering the stabilizing pressure to consist of overburden soil weight alone. The dewatering system shall be maintained operational until the dead weight of the overburden soil plus any completed portion of the structure is able to provide the required factor of safety at static (normal) groundwater level / pressure.

3. The dewatering system shall be designed to treat dewatering effluent to comply with all necessary permits and/or applications for disposal of dewatering effluent.

B. Regulatory requirements

1. The Contractor shall manage and dispose of all groundwater removed during dewatering activities in accordance with either New York State Pollutant Discharge Elimination System (SPDES) standards set by the New York State DEC for discharge to surface water, or New York City DEP Sewer Discharge Criteria for discharge to the City wastewater collection system. The Contractor shall acquire, and update as necessary, all permits and/or applications for water withdrawal and disposal of dewatering effluent. It shall be the Contractor's responsibility to update permits to match their final dewatering system design.

2. For discharge to the City wastewater collection system, a comparison of the site groundwater quality data (before and after any treatment proposed by the Contractor) with the NYCDEP Limitations for Effluent to Sanitary or Combined Sewers (latest version issued by the Division of Pollution Control and Monitoring, Bureau of Wastewater Treatment) shall be required prior to and during effluent discharge.

1.06 QUALITY ASSURANCE

A. The dewatering Work shall be performed by an entity specializing in and having experience with installing and operating dewatering systems in similar subsurface conditions for at least 5 years.

B. The dewatering system shall be designed by a Professional Engineer registered in the State of New York having experience in designing a system in similar site conditions.

C. Well drillers shall be licensed in the State of New York.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings and the following for the approval by the Engineer:

1. Pre-construction Submittals: A Dewatering Plan shall be submitted to the Engineer for approval, at least 30 calendar days prior to the scheduled date for commencement of the dewatering Work, and to the NYSDEC, as applicable. Approval of the Dewatering Plan by the Engineer or City shall not in any way relieve the Contractor from full responsibility for the complete and adequate design and performance of the dewatering system to provide the necessary construction dewatering. At a minimum, the Dewatering Plan shall include the following:

a. Design calculations confirming the adequacy of the proposed dewatering system, including depths to groundwater within the excavation limits.

b. Calculations and requisite technical data on well screens and filter materials and gradations to demonstrate the adequacy of proposed systems to prevent the pumping of fines.

c. Shop drawings showing the proposed types and planned locations of surface water control and the dewatering system to be used.

d. Shop drawings shall include the arrangements, locations and depths of the dewatering system, a complete description of equipment and materials to be used and the procedures to be followed in installation, operation and maintenance in relation to the proposed sequence of excavation, foundation construction and backfilling.

e. The standby equipment and standby power supply details.

f. The proposed locations and sizes of effluent treatment equipment, effluent flow equalization tanks and discharge of water.

g. Location and size of sumps, ditches and water discharge lines, including their relation to water disposal points.

h. Submittals shall also include discharge details, metering, and monitoring schedules and the details of the settling tank and oil/water separator.

i. Methods and equipment to be used for drilling, construction, and development of wells and piezometers.

j. Protocols to be followed for the sampling and analysis of dewatering effluent, and the name and qualifications of the laboratory that will be testing the quality of dewatering effluent prior to disposal.

k. Protocols to be followed for treatment of effluent in conformance with the requirements of the applicable permits.

2. As required in Section 02 24 20 - Soil Sampling and Analysis, the Contractor shall submit a completed EH&S Drilling and Boring Checklist for approval to the Engineer

3. As-built Submittals: Prior to the start of construction dewatering, submit as-built conditions of the dewatering system. As-built data are to include but are not limited to:

a. Plans and sections showing as-built locations, and surveyed elevations of the dewatering system and its components.

b. Drawings to indicate changes made to the original shop drawings to accommodate field conditions and to comply with design standards.

c. Details of installation including dimensions and materials used, description and drawings of all installations, all procedures, soil strata encountered and logs with descriptions of soil samples and stratification.

d. Details of each sump, well, well point, observation well, and piezometer installed, including, but not limited to, the diameters of the borehole and the components, screen type, screen opening size, screen top and bottom elevations, details of filter, seal and grout, pump type, and capacity if installed within. These details should be provided to the Engineer within a week of installation of each entity. The details shall be re-submitted if any part of the entity changes during construction.

e. Details of abandoning each sump, well, well point, observation well, and piezometer after its use has been completed.

4. Regulatory Compliance: Prior to the start of construction dewatering, submit a report comparing site groundwater quality data with the water quality standards to be complied with under permit(s) as applicable to the project. The permitting requirements to be considered under the Work of this section include, but may not be limited to:

   a. NYCDEP Dewatering Permit for temporary groundwater discharge into the public sewers of the City.

      1) Wastewater Quality Control Application and Letter of Approval, if applicable, from the Inspection & Permitting Section, Industrial Pollution Prevention (IPP) Program, Division of Pollution Control and Monitoring, Bureau of Wastewater Treatment (BWT).

      2) Letter of Approval from the Division of Connection and Permitting, Bureau of Water & Sewer Operations (BWSO), if applicable.

      3) NYC DEP Bureau of Customer Service Permit

   b. NYSDEC SPDES Discharge Permit(s) - General or Individual Permits - for dewatering effluent or storm water discharges from construction activities at the project site.

   c. Water Withdrawal and Long Island Well Permits, if applicable, in association with construction dewatering.

   d. The Contractor shall be responsible for compliance with all dewatering permit requirements including renewals once construction dewatering begins.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The settling tank shall be concrete or steel as manufactured by Rockford, Belvidere, IL or an approved equal,

B. The oil/water separator shall be concrete or steel as manufactured by Rockford, Belvidere, IL or an approved equal.

2.02 MATERIALS / EQUIPMENT

A. Materials and equipment used in the dewatering system shall adhere to accepted industry standards and be in good operating condition and able to perform satisfactorily over the required duration of construction dewatering.

B. Back up equipment for the dewatering system shall be identical to the primary equipment and shall be available in operating condition at all times.

C. Pipes and well screens shall consist of Schedule 40 PVC or stronger.

D. Sand shall consist of clean, single-size filter sand of adequate gradation.

E. Grout shall consist of cement-bentonite grout of adequate mix proportion and consistency. Seals shall consist of bentonite pellets.

F. Pumps, meters, hoses and controls shall be suitable for the intended purpose and application.

G. Power supply and effluent discharge are included in this Work.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Construction dewatering is required to protect foundation subgrades and to maintain dry and stable conditions for construction. The Contractor shall maintain a continuous and completely effective Dewatering System for the required time as specified in Section 31 23 16 - Excavation.

B. The Contractor shall obtain and pay for all permits, applications and licenses required by law that are associated with the disposal of dewatering effluent, including but not limited to the NYSDEC SPDES Permit, if applicable. The Contractor shall coordinate with the CM and DEP to obtain or modify permit(s), if necessary, sufficiently in advance of dewatering system startup. The Contractor shall also maintain the permits by applying for and following up on the applications for modifying or renewing the permits, if necessary, during the period of performance.

C. The Contractor shall coordinate the operation of the dewatering system with any other Work.

D. The Contractor is responsible for monitoring dewatering efforts to determine if the Contract and related permit requirements are being met. The Contractor shall provide observation wells and other means to monitor the dewatering as detailed in the Dewatering Plan.

E. Surface areas adjacent to the excavation shall be graded and/or curbed to prevent flow of surface water into the excavation.

F. Open pumping with sumps and ditches resulting in boils, loss of fines, softening of the ground or instability of slopes will not be permitted.

G. The Contractor shall select and supply Personal Protective Equipment (PPE) in accordance with the Contractor's Site Health and Safety Plan.

3.02 IMPLEMENTATION

A. The dewatering system shall provide for an uninterrupted flow of pumped water and shall be maintained and pumped as necessary to drawdown and maintain the groundwater levels as

specified. Unless otherwise specified, pumping shall maintain those depressed levels until the permanent under drainage system has been installed, tested, accepted and is operational or until the permanent structure, or a portion thereof, is capable of withstanding hydrostatic pressures as determined by the Engineer.

B. The Contractor shall furnish, operate and maintain sufficient drainage and pumping facilities to dewater the site and its underlying soil. Dewatering operations shall operate in such a manner so that the excavation can proceed while maintaining stable slopes and the designed lateral support for the perimeter support of excavation walls, without disturbing the bearing subgrades for the structure and provide stable conditions. The ground water level as measured in observation wells shall be lowered and maintained at least two feet below the prevailing excavation level, or it shall be lowered to a point no higher than 2 feet above the top of impermeable stratum if the subgrade is in the impermeable stratum.

C. The dewatering system shall be installed and operated in such a manner as to avoid the movement of fines or loss of ground below the bearing level and shall not influence the stability of surrounding areas. Well points and deep wells shall be properly sanded in and sumps shall be sheeted and provided with proper filter material.

D. Any sign of subgrade disturbance due to seepage or unaccountable reduction in effluent flow rate shall be immediately reported to the Engineer and steps immediately taken to correct the condition.

E. The Contractor shall install observation wells / piezometers and monitor groundwater lowering at nearby structures due to construction dewatering. Any damage caused to nearby structures due to construction dewatering shall be repaired by the Contractor at no cost to the City.

F. Surface Water

1. Surface water on and around the site shall be collected into local sumps by means of trenches, pipes, or other means. The Contractor shall discharge the water into the City wastewater collection system. Direct surface water to minimize surface erosion, ponding and softening of slopes and berms, including haul roads and equipment working stations. Slope protection by means of polyethylene sheets, held in place by tires or otherwise, shall be provided locally as required. At the perimeter of the excavation, surface water is to be directed into the storm sewer system and not permitted to enter the excavation. Curbs shall be maintained and, where necessary, extended across intersections, curb cuts and defective curb sections. Surface cracks in the adjacent streets are to be sealed and re-sealed as necessary. Should adjacent settlement occur during the work, curbs shall be raised or water-tight mounds shall be installed as directed by the Engineer to prevent flow into the site. Measures for preventing the pollution of and discharging storm water shall be in accordance with Section 31 25 10 - Dust, Soil Erosion and Sediment Control.

    a. If surface water flows to a point across a potentially contaminated surface (e.g., contaminated or hazardous soils) or otherwise unsuitable/impermeable surface (e.g., mud mat), removal of said water via pumping to storm sewers shall require the appropriate dewatering permits from the NYSDEC or NYCDEP Bureau of Water and Sewer Operations (BWSO) Division of Permitting and Connections. The Contractor shall obtain all necessary permits in a timely manner so as not to delay the Work.

G. Pretreatment of dewatering effluent

1. The Contractor shall provide appropriately sized settling tanks to collect and store dewatering effluent commensurate with dewatering discharge rates to allow for settlement of suspended solids and sampling as required by disposal/discharge criteria. The tanks shall be equipped with an overflow collection system to prevent accidental release of dewatering effluent. Routine inspection of the tanks shall be carried out daily to ensure that tank integrity is being maintained, and that all valves or tank openings are properly locked out to avoid accidental discharge. Settling tanks shall be cleaned frequently to prevent excess deposition of solids which could overflow from the tank. Removed solids shall be classified and disposed of in accordance with the requirements of Section 02 24 20 - Soil Sampling and Analysis. Transportation and Disposal including waste manifests shall be in accordance with Section 31 23 16 - Excavation).

   a. The settling tank shall be sized based upon the maximum groundwater flow times a 1.5 safety factor.

2. The Contractor shall provide appropriately sized oil/water separators to prevent discharge of hydrocarbons, grease and other floatable materials to surface water or the sewer system. Oil/water separators shall be cleaned frequently and collected materials classified and disposed of in accordance with Sections 02 24 20 - Soil Sampling and Analysis and 31 23 16 - Excavation requirements for manifests and material transport and disposal.

   a. The oil/water separator shall be sized based upon the maximum groundwater flow times a 1.5 safety factor.

3. The Contractor shall provide treatment for, or remove from the site to an approved disposal facility, all dewatering effluent or groundwater which exceeds any limit set for surface water or sewer discharge, whichever is applicable. Classification and disposal shall conform to Sections 02 24 20 - Soil Sampling and Analysis and 31 23 16 - Excavation requirements for manifests and material transport and disposal.

H. Disposal of Dewatering Effluent

1. Dewatering effluent may be affected by rainfall. The Contractor shall provide adequate equalization and holding tanks to allow work to proceed in the case of restricted discharge capability during rain events.

2. The Contractor shall provide sufficient clean water to flush all sewers and drains when necessary. If any sewer, drain, catch basin, or inlet becomes filled or partially filled with sediment or debris, the Contractor shall promptly and satisfactorily remove such deposits.

3. The Contractor shall collect dewatering effluent samples as required by the permits and the Dewatering Plan. If pretreatment, other than oil/water separators and settling tanks, is required, the Contractor shall continue to collect effluent samples during dewatering operations, and analyze for all listed parameters at intervals based on dewatering discharge volume as a verification of discharge compliance. Intervals will be as defined in the Dewatering Plan. A copy of all analytical results shall be submitted to the Engineer for review and approval, no later than one day after receipt of such data.

The Contractor shall provide for prompt sampling and turn-around times so as not to delay the project, but in no case shall turn-around time be longer than 5 calendar days.

3.03 FIELD TESTING / QUALITY CONTROL

A. The Contractor shall determine the presence of contaminants in dewatering effluent, including the quantity of fines in the pumped water, by sampling and analyzing in accordance with permit requirements, or once every two weeks, whichever is more frequent.

B. The fines content should be measured in each sump, well or well point being pumped. The permissible maximum fines content is 5 parts per million (ppm) as measured by the Rossum Sand Content tester. If the fines content is exceeded, the Contractor shall modify or re-install the well or wellpoint to satisfy the requirements.

C. The Contractor shall measure water levels periodically in observation wells / piezometers installed adjacent to nearby structures to ensure drawdown outside the excavation is within allowable limits in accordance with applicable permits.

D. A sufficient number of observation wells shall be installed and water levels monitored by the Contractor, at least weekly, to demonstrate that the goals of the Dewatering System are being met. If applicable, the Contractor may make use of existing observation wells as shown on the Contract Drawings.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. The Contractor shall be prepared to modify the dewatering system and methods as required by actual field conditions encountered during construction, at no additional cost to the City. Any component of the dewatering system that malfunctions or is damaged during its operation shall be promptly repaired or replaced by the Contractor at no additional cost to the City.

B. All wells and piezometers shall be abandoned at the completion of the work, except as directed by the Engineer, in accordance with NYSDEC guidelines.

C. All wells shall be abandoned in place and all other portions of the dewatering system shall be removed by the Contractor after completion of dewatering activities and in accordance with NYSDEC requirements.

END OF SECTION

SECTION 31 23 23 - FILL
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Fill Work includes furnishing, placing and compacting all fill material necessary to bring excavations and site work to final grade as shown, specified or required.

B. Clean fill material from an off-site source shall be non-hazardous and shall meet the requirements of this Section.

C. The following index of this Section is presented for convenience:

1.04 REFERENCES

A. Definitions

1. Case-Specific Beneficial Use Determination (BUD): Under 6 NYCRR Part 360, Section 360.12(d), NYSDEC sets forth the requirements for petitioning NYSDEC to obtain a Case-Specific BUD, and the criteria for reviewing, granting, or denying of the BUD. For reuse of a solid waste to be determined a beneficial use, the petition must satisfy all criteria outlined under 6 NYCRR Part 360, Section 360.12(d).

2. Fill: Soil and similar material excavated or brought to the project site for the purposes of construction. All fill material must meet the requirements of this Section. It does not include overburden generated from mining operations.

3. New York City Metropolitan Area Waste Impact Zone: The area encompassing the City of New York and the counties of Nassau, Suffolk, Putnam and Westchester, as per 6 NYCRR Part 360.2 Definitions.

4. Pre-Determined Beneficial Use for fill material: Under 6 NYCRR Part 360, Section 360.13(b) Waste cessation. "Excavated material ceases to be solid waste in accordance with the following:

   a. Fill Type 1 generated outside of the New York City Metropolitan Area Waste Impact Zone (NYCMAWIZ) – once a determination has been made that the material is Fill Type 1;

   b. Fill Type 1 generated within Nassau, Suffolk, Westchester and Putnam Counties – once the material is delivered to the site of reuse;

   c. Fill Type 1 cannot be generated within the City of New York;

   d. Fill Type 2 and Fill Type 3 generated outside of the NYCMAWIZ – once a determination has been made that the material is Fill Type 2 or Fill Type 3;

   e. Fill Type 2 and Fill Type 3 generated within the NYCMAWIZ – once the material is delivered to the site of reuse;

   f. Fill Type 4 and Fill Type 5 – Once the material is delivered to the site of reuse."

   g. Under 6 NYCRR Part 360, Section 360.12(c)(1)(iv)(a), Excavated material used to backfill the same excavation or as grade adjustment in areas of similar physical characteristics on the site of generation. If the material exhibits visual or historical evidence of contamination (including odors) and will be used in an area with public access, the material must be covered with pavement, foundation, or with a minimum of 12 inches of soil or fill that meets

the criteria to be used as Fill Type 1 and Fill Type 2 as defined in Subdivision 360.13, Special requirements for pre-determined beneficial use of excavated material. Refer to Section 02 24 20 - Soil Sampling and Analysis for sampling requirements, including a list of parameters to be analyzed for soils to be reused on-site, or soils to be reused or disposed off-site.

5. Suitable Material: Any material whose composition is satisfactory for use as fill. Any mineral (inorganic) soil, blasted or broken rock and similar materials of natural or man-made (i.e. recycled) origin, including mixtures thereof, are considered suitable materials. Determinations of whether a specific natural material is suitable shall be made by the Engineer on the above basis.

6. Unsuitable Materials: any material containing vegetable or organic matter such as muck, peat, organic silt, topsoil or sod, that is not satisfactory for use as fill material.

B. Reference Standards

1. ASTM C131 - Standard Test Method for Resistance to Degradation of Small-Size Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine

2. ASTM C143 - Standard Test Method for Slump of Hydraulic-Cement Concrete

3. ASTM C330 - Lightweight Aggregates for Structural Concrete

4. ASTM D422 - Standard Test Method for Particle-Size Analysis of Soils

5. ASTM D698 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft^3 (600 kN-m/m^3))

6. ASTM D1556 - Standard Test Method for Density and Unit Weight of Soil in Place by the Sand-Cone Method

7. ASTM D1557 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft (2,700 kN-m/m^3))

8. ASTM D2167 - Standard Test Method for Density and Unit Weight of Soil in Place by the Rubber Balloon Method

9. ASTM D4318 - Standard Test Method for Liquid Limit, Plastic Limit and Plasticity Index of Soils

10. ASTM D4832 - Standard Test Method for Preparation and Testing of Controlled Low Strength Material (CLSM) Cylinders

11. ASTM D6023 - Standard Test Method for Density (Unit Weight), Yield, Cement Content, and Air Content (Gravimetric) of Controlled Low Strength Material (CLSM)

12. ASTM D6024 - Test Method for Ball Drop on Controlled Low Strength Material (CLSM) to Determine Suitability for Load Application
13. ASTM D6938 - Standard Test Methods for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth)
14. NYSDEC regulations, 6 NYCRR Part 375, Environmental Remediation Programs
15. NYSDEC regulations, 6 NYCRR Part 360, Solid Waste Management Facilities General Requirements
16. NYC Building Code

1.05 DESCRIPTION

A. Recycled materials that the Engineer has evaluated and approved for general use shall be considered to be Suitable Material subject to the conditions for use as determined by the City. In general, the use of recycled materials must be sanctioned by NYSDEC, usually in the form of a BUD. See definition above.

B. Suitable fill material from an off-site source shall be non-hazardous and shall come from the following hierarchical sources:

1. Other DEP projects that have available, excess suitable materials;
2. The NYC Clean Soil Bank, located at 830 Forbell Street, Brooklyn, and managed by the Mayor's Office of Environmental Remediation (OER);
3. Beneficial Use Facilities; and
4. Commercial Facilities.

1.06 QUALITY ASSURANCE

A. Testing: The Contractor shall retain the services of an independent materials testing laboratory to perform the following laboratory and field tests.

B. All materials used in construction, whether brought to the site or developed from on-site sources, shall be tested for optimum moisture-maximum density curve, and reports of the test results for each source shall be submitted promptly. The tests shall be as follows:

Test	ASTM Standard	Tests Per Volume Delivered
Gradation	D422	1 per 200 C.Y.
Compaction or Density	D1557	1 per 200 C.Y.

C. Acceptability of completed compaction shall be demonstrated by tests performed by the Contractor and accepted by the Engineer. The minimum number of tests shall be determined by quantity of material placed, and reports of the test results shall be submitted promptly. The Contractor shall perform either of the following tests subject to the approval of the Engineer:

Test	ASTM Standard	Tests Per Volume Placed
In-Place Density	D2167 D6938	1 per 200 cy

D. The Contractor shall engage the services of a testing laboratory, with the qualifications required by Section 03 30 00 - Cast-in-Place Concrete and experienced in design and testing of flowable fill materials and mixes, to perform material evaluation tests and to design mixes for flowable fill. A trial mix shall be performed to verify the flowable fill mix design. The trial mix shall also report slump, air content, yield, cement content, and dry unit weight per ASTM C143 and ASTM D6023.

E. Any fill material being brought to the site that is composed of soil or a mixture of soil (excluding gravel, crushed stone, limestone screenings, other granular materials or flowable fill), as well as any soil being used for drainage fill, common fill and pipe bedding for small piping, must comply with the following protocol:

1. Testing shall be performed on all soil brought on-site (fill and topsoil) and shall demonstrate chemical quality meeting 6 NYCRR Part 360, Section 360.13(f), Table 2: Fill Material Beneficial Use, specifically Fill Type 2 maximum concentration levels.

2. Chemical analyses shall include the 6 NYCRR Part 375-6.8(b) compounds, including volatile organic compounds and asbestos, as detailed in Section 02 24 20 - Soil Sampling and Analysis. All analyses shall be performed by a testing laboratory certified by the New York State Department of Health Environmental Laboratory Accreditation Program (NYSDOH-ELAP). Based on visual observation, the volume of physical contaminants, if present, shall also be recorded

3. The frequency of testing per volume of fill shall be in accordance with 6 NYCRR Part 360.13 (e)(1), Table 1, Minimum Analysis Frequency for Fill purchased from a registered/permitted processing or recycling facility.

4. Notification to the NYSDEC must be made prior to the first load greater than 10 cubic yards is planned to be transported from the site of excavation directly to the site of reuse.

   a. At least five days in advance of transfers of Fill Types 2, 3, 4 and 5 generated in, imported to, or relocated within the City of New York.

   b. At least five days in advance of transfers of Fill Type 4 and Fill Type 5 anywhere in the State of New York.

   c. The Notification of Fill Transfer for Reuse form (NYSDEC Division of Materials Management, version 03/24 or latest) will be sent to the NYSDEC Regional Office in which the destination is located. The form must be certified by a Qualified Environmental Professional (QEP). In the event the QEP is not a Professional Engineer or Geologist licensed in New York State, the QEP's basis for credential must be attached to the form.

F. When testing is required to confirm the reuse of on-site excavation spoils under a Case-Specific BUD, sample the soils in accordance with NYSDEC requirements.

1.07 SUBMITTALS

A. The Contractor shall submit shop drawings for the approval of the Engineer. Submittals shall include, but not be limited to:

1. Name and location of all suppliers.
2. Certificate of compliance with standard specified for each source of material.
3. The Contractor shall submit all laboratory analytical reports, which shall include a Summary Table listing the analytical results with highlighted exceedances as defined in 6 NYCRR Part 360, Section 360.13 (f), Table 2: Fill Material Beneficial Use, as applicable.
4. Prior to stockpiling or placing of select fill materials at the job site, submit for approval approximately 100-pound samples representative of the fill at the proposed borrow source. In addition, submit documentation of the availability of the required fill quantities at any proposed borrow source.
5. Submit optimum moisture – maximum density curves and reports for all fill materials before placement of fill.
6. Results of all compaction tests for fill placement.
7. Mix design for flowable fill, including all materials used and trial mix test results.
8. Certification by the lightweight fill producer of the gradation, dry loose unit weight, dry compacted unit weight and Los Angeles Abrasion Test lost for the proposed lightweight fill source.

B. Prior to the transfer of fill, the Contractor shall submit the Notification of Fill Transfer for Reuse form for review prior to being sent to the NYSDEC. The form must be certified by a Qualified Environmental Professional (QEP). In the event the QEP is not a Professional Engineer or Geologist licensed in New York State, the QEP's basis for credential must be attached to the form. NYSDEC must receive notification at least five days in advance of transfers of Fill Types 2, 3, 4 and 5 generated in, imported to, or relocated within the City of New York and at least five days in advance of transfers of Fill Type 4 and Fill Type 5 anywhere in the State of New York.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Materials delivered to the site shall be stored in a manner to prevent contamination and segregation.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. General

1. Backfill shall be composed of suitable materials as defined in this Section.

a. On-site Materials: Material to be excavated and proposed for reuse as fill under Pre-Determined Beneficial Use must meet the requirements of 6 NYCRR Part 360, Section 360.13 (a), Applicability, Section 360.13 (b), Waste Cessation, or 360.12(c)(1)(iv)(a), Excavated material used to backfill the same excavation or as grade adjustment in areas of similar physical characteristics on the site of generation. If these criteria cannot be met, material shall meet Section 360.12(d), Case-specific beneficial use determinations - general. Fill may require sampling and analyses in accordance with Section 02 24 20 – Soil Sampling and Analysis designed and implemented by or under the direction of a qualified environmental professional (QEP). The Contractor shall maximize reuse of soil on-site for backfilling rather than import soil from other sources.

b. Off-site Imported Materials: Fill that is brought on site to be used as backfill must meet the requirements of 6 NYCRR Part 360, Section 360.13 (f), Table 2: Fill Material Beneficial Use for General Fill.

2. Follow common fill requirements whenever drainage or select fill is not specified. Determine and obtain the approval of the Engineer for the appropriate test method where more than one compaction test method is specified.

3. Do not use wet or frozen material for backfilling.

4. The maximum stone size shall be two-thirds of the thickness of the backfill lift, but in no case shall material containing stones over 10 inches in the largest dimension be used for backfill.

B. Drainage Fill

1. Use clean gravel, crushed stone, or other suitable material conforming to the gradation specified for drainage fill. Clay and fine particles are unacceptable in drainage fill. Provide drainage fill that complies with the following gradation limits:

U.S. Standard Sieve	Percent Passing By Weight
1-1/2 inch	100
1 inch	95-100
1/2 inch	45-65
#4	5-15
#16	0-4

C. Select Fill

1. Use gravel, crushed stone, limestone screenings or other granular or similar materials, as approved, which can be readily and thoroughly compacted to not less than 95 percent of the maximum dry density obtainable by ASTM D1557. Very fine sand, uniformly graded sands and gravels, or other materials that have tendency to flow under pressure when wet are unacceptable as select fill. Provide select fill that complies with the following gradation limits:

U.S. Standard Sieve	Percent Passing By Weight
2 inch	100
1-1/2 inch	90-100
1 inch	75-95
1/2 inch	45-70
#4	25-50
#10	15-40
#200	5-15

D. Common Fill

1. Material from on-site excavation may be used as common fill provided that it can be readily compacted to not less than 90 percent of the maximum dry density obtainable by ASTM D1557, and does not contain unsuitable material as per Article 1.04.A.5 Select fill may be used as common fill at no change in the Contract Price.

2. Granular on-site material that complies with the following gradation limits may be used as granular common fill:

U.S. Standard Sieve	Percent Passing By Weight
3 inch	100
#10	50-100
#60	20-90

U.S. Standard Sieve	Percent Passing By Weight
#200	0-20

3. Cohesive site material may be used as common fill as follows:
   a. The gradation requirements do not apply to cohesive common fill.
   b. Use material having a liquid limit less than or equal to 40 and a plasticity index less than or equal to 20, as determined by ASTM D4318.
4. All material used as common fill is subject to approval by the Engineer. If there is insufficient suitable material on site, import whatever additional material is required which conforms to the sections, at no additional cost to the City.

E. Pipe Bedding

1. Gradation for Small Piping: For pipe 18 inches or less in diameter, use pipe bedding material of which 90 percent will be retained on a No. 8 sieve and 100 percent of which will pass a 1/2-inch sieve and be well graded between those limits.
2. Gradation for Large Piping: For pipe larger than 18 inches in diameter, use the same pipe bedding material as specified for smaller pipe or use a similar well graded material of which 90 percent will be retained on a No. 8 sieve, 100 percent will pass a 1-inch sieve, and will be well graded between those limits.

F. Lightweight Fill

1. Lightweight fill shall be a lightweight aggregate produced by the rotary kiln method and meeting the requirements of ASTM C330. No byproduct slags or cinders are permitted.
2. The material shall meet the grading requirements of ASTM C330, Table 1, Coarse Aggregate: 3/4 inch to No. 4.
3. Dry loose unit weight shall be maximum of 55 pcf. Dry compacted unit weight shall be a maximum of 60 pcf when measured by a one-point test performed in accordance with ASTM D698.
4. Maximum Los Angeles Abrasion Test loss of 50 percent when tested in accordance with ASTM C131 (B grading).

G. Flowable Fill

1. Flowable fill (also known as controlled low strength material) shall be a uniform mixture of sand, Type II Portland cement, fly ash, slag, admixtures, and water. The mix design shall produce a flowable material with little or no bleed water which produces a minimum compressive strength of 50 psi and maximum compressive strength of 100 psi at 56 days. The cured

material shall be excavatable and have a maximum dry unit weight of 100 pounds per cubic foot. Slump shall be from 7 inches to 10 inches.

2. Admixtures specifically designed for flowable fill shall be used to improve flowability, reduce unit weight, control strength development, reduce settlement and reduce bleed water. Admixtures shall be:

   a. Rheocell-Rheofill manufactured by BASF;

   b. DaraFill manufactured by W.R. Grace Construction Products;

   c. Or an approved equal.

3. All other materials shall be as specified in Section 03 30 00 - Cast-in-Place Concrete.

H. Compaction Equipment

1. Equipment and Methods: Perform all compaction with suitable approved equipment and methods.

2. Compact clay and other cohesive material with sheep's-foot rollers or similar equipment where practicable. Use handheld pneumatic tampers elsewhere for compaction of cohesive fill material.

3. Compact low cohesive soils with pneumatic-tire rollers or large vibratory equipment where practicable. Use small vibratory equipment elsewhere for compaction of cohesionless fill material.

4. Do not use heavy compaction equipment over pipelines or other structures, unless the depth of fill is sufficient to adequately distribute the load.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. All stockpiled materials shall be adequately handled as required in Section 31 25 10 – Dust, Soil Erosion and Sediment Control.

B. No material shall be placed until satisfactory test reports for material type and compaction requirements have been approved by the Engineer.

C. Warning tape/ribbon shall be placed and/or restored as required when backfilling new and existing utility lines.

3.02 IMPLEMENTATION

A. Backfill all excavations to the original surface of the ground or to such other grades as may be shown or required. For areas to be covered by lawn mix, leave or stop backfill 12 inches below the finished grade or as otherwise required to provide

adequate depth of lawn mix to satisfy the requirements of Section 32 90 00 – Planting.

B. Remove from all backfill, and from the space being backfilled, any compressible, putrescible, or destructible rubbish and refuse before backfilling is started. Dispose of the rubbish and refuse in accordance with the requirements of Section 01 74 20 – Construction Waste Management.

C. Leave sheeting and bracing in place or remove as the Work progresses, as shown in the Contract Drawings, specified or directed by the Engineer.

D. Do not permit backfilling construction equipment to travel against or over cast-in-place concrete structures until the specified concrete strength has been obtained, as verified by concrete test cylinders. In special cases where conditions warrant, the above restriction may be modified provided the concrete has gained sufficient strength, as determined from test cylinders, to satisfy design requirements for the removal of forms and the application of load.

E. Electrical Duct and Structure Bedding

1. All electrical ducts and precast manhole bases shall be bedded in well graded, compacted, select fill material. Select fill shall be placed in uniform layers not greater than 9 inches in loose thickness and compacted in place with suitable mechanical or pneumatic tools to not less than 95 percent of the maximum dry density as determined by ASTM D1557. Bedding thickness shall be not less than 6 inches after compaction. Bedding below electrical ducts shall extend the full width of the trench.

2. Existing underground structures, tunnels, conduits and pipes crossing the excavation shall be bedded with compacted select fill material. Place bedding material under and around each existing underground structure, tunnel, conduit or pipe and extend underneath and on each side to a distance equal to the depth of the trench below the structure, tunnel, conduit or pipe.

3. Cast-in-place manhole bases and other foundations for structures shall be cast against a concrete work mat in clean and dry excavations, unless otherwise shown, specified or required.

F. Pipe Bedding and Initial Backfill

1. Place select fill by hand for initial pipe backfill from top of bedding to 1 foot over top of pipes in uniform layers not greater than 6 inches in loose thickness. Tamp under pipe haunches and thoroughly compact in place the select fill with suitable mechanical or pneumatic tools to not less than 95 percent of the maximum dry density as determined by ASTM D1557.

2. Do not place stone fragments larger than 2-inch size in the pipe bedding or in the backfill to 1 foot over the top of pipes, nor any stone fragments larger than 3-inch size nearer than 2 feet from any pipe, conduit or concrete wall.

3. Pipe bedding containing very fine sand, uniformly graded sands and gravels, or other materials that have a tendency to flow under pressure when wet is unacceptable.

4. Bed pipelines or electrical ducts placed in short tunnels in select fill, flowable fill, or 2500 psi concrete. Completely fill the remainder of the annular space between the outside of the pipe wall and the tunnel wall with select fill, flowable fill, suitable job-excavated material, or 2500 psi concrete, as approved. Pipes and ducts in short tunnels shall be supported to permit placing and compaction of backfill.

G. Placement of Flowable Fill

1. Flowable fill shall be batched and premixed by an approved producer, dispensed from ready-mix trucks, and placed by approved methods and equipment.

2. Flowable fill shall be placed so as to completely fill the space to receive it with no trapped air pockets or other voids. Positive means of allowing air to escape shall be provided where necessary. Where placed against and around existing structures, lift heights shall be limited so as not to overload the structure. Lift heights shall be as approved by the Engineer.

3. Where flowable fill is placed around piping and other elements subject to floating within the fill, positive means shall be taken to provide temporary balancing loads to prevent uplift, or fill lift heights shall be limited to prevent uplift.

4. Application of loads or placement of other fill materials or concrete on top of flowable fill shall not occur until the flowable fill surface is determined to be suitable for loading per ASTM D6024.

H. Trench Backfill

1. Backfill trenches from 1 foot over the top of the pipe, from the top of electrical duct bedding or as shown to the bottom of pavement base course, subgrade for lawns or lawn replacement, to the top of the existing ground surface or to such other grades as may be shown or required. Backfill trenches as soon as, in the opinion of the Engineer, it can be done without injury to the concrete or pipe lines.

2. Provide select fill, suitable job-excavated material or other material, as specified and as approved for trench backfill.

3. Depth of Placement - General: Except under pavements, walkways, railroad tracks, and street or highway appurtenances, or as otherwise specified, place trench backfill in uniform layers not greater than 9 inches in loose thickness and thoroughly compact in place using suitable mechanical or pneumatic equipment. Compact backfill to not less than 90 percent of the maximum dry density as determined by ASTM D1557.

4. Depth of Placement - Traffic Areas and Under Utilities: Where pavements, walkways, railroad tracks and street or highway appurtenances are to be placed over trenches and under utilities or utility services crossing the trench, provide trench backfill using select fill placed in uniform layers not greater than 9 inches in loose thickness and thoroughly compacted in place

with equipment as specified above. Compact backfill to not less than 95 percent of the maximum dry density as determined by ASTM D1557.

5. Depth of Placement - Undeveloped Areas: In undeveloped areas and where select fill material or hand-placed backfill are not specified or required, place suitable job-excavated material or other approved backfill in lifts not exceeding 12 inches in loose thickness. When the trench is full, consolidate the backfill by jetting, spading, tamping or puddling to ensure complete filling of the excavation. Mound the top of the trench approximately 12 inches to allow for consolidation of backfill.

6. Backfill trenches in such a way as to prevent dropping material directly on top of any conduit or pipe through any great vertical distance. Do not allow backfilling material from a bucket to fall directly on a structure or pipe and, in all cases, lower the bucket so that the shock of falling earth will not cause damage.

7. Break up lumps and distribute any stones, pieces of crushed rock or lumps which cannot readily be broken up, throughout the mass so that all interstices are solidly filled with fine material.

8. Retain backfill in trenches by temporary bulkheads only and remove them as the backfilling progresses. Do not make bulkheads of stone.

9. Do not cover sewers, drains, basin connections, ends of sewers and branches until the Engineer orders or gives permission to backfill.

10. After completion of backfilling in City streets, remove all surplus material, and regrade and leave free, clear, and in good order all roadways and sidewalks. Deposit and compact a temporary surface of asphalt, or other equivalent and suitable material to a depth of six inches on all backfilled areas where ordered by the Engineer in writing. Until areas are restored to their original condition, maintain the surface of the temporary pavement in good and safe condition and promptly fill all depressions caused by settlement of the backfill with the temporary surfacing materials and compact the same. Wet the temporary surface by spraying with water when necessary to prevent a dust nuisance.

I. Structure Backfill

1. Backfill excavations as soon as, in the opinion of the Engineer, it can be done without injury to the concrete or structures.

2. Use select fill underneath all structures, and adjacent to structures where pipes, connections, electrical ducts and structural foundations are to be located within this fill. Use select fill beneath all pavements, walkways, and railroad tracks, and extend to the bottom of pavement base course or ballast.

   a. Place select fill in uniform layers not greater than 8 inches in loose thickness and thoroughly compact in place with suitable approved mechanical or pneumatic equipment.

b. Compact select fill to not less than 95 percent of the maximum dry density as determined by ASTM D1557.

3. When shown on the Contract Drawings, or approved by the Engineer, lightweight fill shall be used to raise the grade in areas that are to support pavements, walkways, railroad tracks and other structures.

   a. Place lightweight fill in uniform horizontal layers not greater than 12 inches in loose thickness.

   b. Lightweight fill shall be compacted by four complete coverages with an approved smooth drum vibratory roller having a minimum static weight of 14,000 pounds, a minimum dynamic force of 23,000 pounds, and a total force not less than 5,500 pounds per foot of compactor drum width.

4. Use of common granular fill adjacent to structures in all areas not specified above, unless otherwise shown or specified. Select fill may be used in place of common granular fill at no additional cost.

   a. Extend such backfill from the bottom of the excavation or top of bedding to the underside of the lawn mix for seeded, sodded or hydroseeded areas, the top of previously existing ground surface or to such other grades as may be shown or required.

   b. Place backfill in uniform layers not greater than 8 inches in loose thickness and thoroughly compact in place with suitable equipment, as specified above.

   c. Compact backfill to not less than 90 percent of the maximum dry density as determined by ASTM D1557.

5. In unpaved areas adjacent to structures, for the top 1 foot of fill directly under the lawn mix, use cohesive backfill conforming to Article 2.02.G.3, placed in 6-inch lifts. The cohesive backfill shall extend to the limits of the excavated area. Compact to not less than 90 percent of the maximum dry density as determined by ASTM D1557.

6. When shown on the Contract Drawings, flowable fill shall be used for backfilling of structures. Backfilling with flowable fill shall be as specified in Article 3.02.G.

7. When sheeting is withdrawn, solidly fill all cavities in or adjoining the trench or other excavation. When sheeting is left in place, solidly fill all cavities behind such sheeting.

J. Drainage Blanket

1. Provide a drainage blanket consisting of drainage fill where shown, specified, or required. Place drainage fill in uniform layers not greater than 8 inches in loose thickness.

2. Where drainage fill is required underneath structures or adjacent to structures where pipes, connections, electrical ducts and structural

foundations will be located within the fill, compact the fill with suitable mechanical or pneumatic equipment to not less than 95 percent of the maximum dry density as determined by ASTM D1557.

3. Where drainage fill is required in areas not specified in Paragraph 3.02.J.2, compact with suitable mechanical or pneumatic equipment to not less than 90 percent of the maximum dry density as determined by ASTM D1557.

K. Earth Embankments

1. Make all earth embankments of approved cohesive common fill material.

2. Place fill in uniform layers not greater than 10 inches in loose thickness. Compact in place with suitable approved mechanical equipment.

3. Compact earth embankments to not less than 90 percent of the maximum dry density as determined by ASTM D1557.

4. Do not use cohesionless, granular material as earth embankment backfill, unless otherwise shown or required.

L. Finish Grading

1. Perform finish grading in accordance with the completed contour elevations and grades shown on the Contract Drawings and blend into conformation with remaining natural ground surfaces.

   a. Leave all finished grading surfaces smooth and firm to drain. Areas shall be finished to the degree obtainable by either blade or scraper operations and suitable for application of topsoil.

   b. Bring finish grades to elevations within plus or minus 0.10 foot of elevations or contours shown.

   c. Areas which are anticipated to be undisturbed for a period of more than 30 days shall receive temporary seeding of rye grass at a rate of three bushels per acre, weather and season permitting. This seeding shall be repeated as necessary to maintain a continuing ground cover.

2. Grade outside of building or structure lines in a manner to prevent accumulation of water within the area. Where necessary or where shown, extend finish grading to ensure that water will be carried to drainage ditches, and the site area left smooth and free from depressions holding water.

3.03 FIELD TESTING / QUALITY CONTROL

A. Sampling and Testing of Select, Common and Lightweight Backfill:

1. Provide sampling, testing, and laboratory methods in accordance with ASTM D1556 or other method as determined by the Engineer for select fill and common fill.

2. Lightweight fill shall be tested as specified herein.

3. Subject all backfill to these tests to the satisfaction of the Engineer. These tests shall be the basis for acceptance or rejection by the Engineer of the compaction. Failure to achieve the specified densities shall require the Contractor to recompact or remove the material as required.

B. Sampling and Testing of Flowable Fill:

1. The Contractor shall provide all facilities as may be necessary for the ready procurement of samples of flowable fill from the Work or truck mixers as required by the Engineer for test purposes.

2. The DEP/QA/QC Consultant will provide personnel and equipment for making periodic determinations in the field of slump, air content, ambient and concrete temperature, unit weight and yield and for the preparation of compressive strength test cylinders as required in compliance with applicable ASTM tests and procedures. In compliance with ASTM D4832, a minimum of two cylinders will be tested at 7 days, two at 28 days, and three at 56 days. Tests shall be made on material at point of discharge into the work. Tests shall be made for each 200 cubic yards of material placed but not less than one test for each day flowable fill is placed.

3. The Contractor shall supply all equipment necessary to perform the required tests including, but not limited to, cylinder molds, tags, capping compound, slump cones, platform scale, two buckets (each 2 cubic feet in size), thermometers, pressure air meter, and roller meter.

C. Correction of Work:

1. Correct any areas of unsatisfactory compaction by removal and replacement, or by scarifying, aerating or sprinkling as needed and recompaction in place prior to placement of a new lift. The Contractor shall, if necessary, increase the compactive effort by increasing the number of passes, using heavier or more suitable compaction equipment, or by reducing the lift thickness. The Contractor shall adjust the moisture content of the soil to bring it to the optimum range by drying or adding water, as required.

2. Correct any depression which may develop from settlement in backfilled areas within one year after the work is fully completed. Provide, as needed, backfill material, pavement base replacement, permanent pavement, sidewalk, curb and driveway repair or replacement, and lawn replacement, and perform the necessary reconditioning and restoration work to bring such depressed areas to proper grade as approved.

SECTION 31 23 64 – PROTECTIVE COATING FOR STEEL PILE
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. This Section specifies requirements for the shop application of protective coating.

B. Piles shall be coated to five (5) feet below the bottom of the fill and or organic clay layer i.e. about thirty feet (30) feet below the pile cut-off elevation for TI-010 foundation piles and no less than fifteen (15) feet below the pile cut-off elevation for TI-011 foundation piles.

C. Refer to Section 31 62 23.13 – Concrete filled Steel Piles for additional pile requirements.

D. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. No Used.

1.04 REFERENCE STANDARDS

A. The following is a listing of the publications referenced in this Section:

American Society for Testing and Materials (ASTM)

ASTM A 972/972M	Standard Specification for Fusion Bonded Epoxy Coated Pipe Piles
ASTM D 3359	Standard Test Methods for Rating Adhesion by Tape Test
ASTM D 4417	Standard Test Methods for Field Measurement of Surface Profile of Blast Cleaned Steel
ASTM D 4541	Standard Test Method for Pull-Off Strength of Coatings Using Portable Adhesion Testers
ASTM D 4285	Standard Test Method for Indicating Oil or Water in Compressed Air

U.S. Army Corps of Engineers (ACOE)

SSPC-SP 1	Solvent Cleaning
SSPC-SP 5	White Metal Blast Cleaning
SSPC-SP 10	Near-White Blast Cleaning
SSPC-SP 11	Power Tool Cleaning to Bare Metal
SSPC-PA 1	Shop, Field and Maintenance Painting
SSPC-PA 2	Measurement of Dry Paint Thickness with Magnetic Gages
SSPC-VIS 1	Visual Standard for Abrasive Blast Cleaned Steel

American Welding Society (AWS)

AWS D 1.1	Structural (Steel) Welding Code

1.05 DESCRIPTION

A. Not Used.

1.06 QUALITY ASSURANCE

A. Not Used.

1.07 SUBMITTALS:

A. Product Data:

1. For specific products listed in 2.2 A., B. and C. of this Section, submit the following for each product:

   a. Manufacturer's printed Technical Data Sheets and Material Safety Data Sheets (MSDS).

   b. Manufacturer's printed product label and application instructions.

2. For products other than those expressly listed in 2.2 A., B. and C. of this Section, submit the following for each product:

   a. Information adequate for Engineer to compare the specified product and the proposed substitution; including, but not limited to, technical specifications, test data, references to product use in existing installations, or any other data required by the Engineer.

B. Surface Preparation/Coating Plan:

1. Written procedures for conducting the Work of this Section including but not limited to, the preparation of surfaces, abrasive "work mix" analysis; coating mixing, application, and repair; recoat times and cleaning between coats; and specific details for the preparation and coating of welds.

2. A comprehensive listing of the equipment that will be used for surface preparation and coating. A description of equipment repair and replacement capability, including the procedures that will be followed in the event of equipment failure so that lost production time is kept to a minimum.

C. Steel Test Panel:

1. Submit one 8" x 8" blasted steel test panel for approval by the Engineer. The panel shall be prepared using the same procedures, equipment, and abrasive "work mix" described in A.2. herein. The approved test panel shall be used by the Engineer as a standard of judgment for approval of production operations.

2. Identify the name and chemical composition of detergents or solutions that will be used if it is necessary to clean the surface of one coat prior to the application of the next. Only detergents which are environmentally safe and which will have no adverse effect are acceptable. Submit the MSD Sheets for the chemicals and detergents. Use chemicals and detergents that are acceptable to the coating manufacturer.

D. Quality Control Inspection Plan - Submit the quality control inspection plan that will be followed to confirm that all work under this Contract complies with the requirements of this Section. The plan shall include the following at a minimum:

1. Inspection organization chart including lines of authority and the experience, training, and qualifications of all quality control personnel.

2. Written inspection procedures for all phases of the Work, including the frequency of inspections that will be performed, and the handling of non-conforming Work.

3. Documentation procedures including samples of the actual inspection forms that will be used for Work of this Section.

4. Written description of equipment to be used for surface preparation and coating application inspection, calibration procedures, frequency of calibration, and the methods for handling equipment that is found to be out of calibration.

E. Inspection Log or Report:

1. Submit one (1) copy of the log or report form package to the Engineer each seven (7) calendar days.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Use nylon slings to handle coated steel piles during handling, shipment and delivery to the construction site.

B. Do not handle or move coated steel piles until the coating has cured.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. ABRASIVES:

1. Abrasives shall be dry and free of oil, grease, corrosion producing chemicals, or other deleterious contaminants. Do not use silica sand.

2. Abrasives shall be shaped and sized to produce a profile that comply with profile requirements specified by the approved coating manufacturer

B. COATINGS

1. Fusion Bonded Epoxies

1) Scotchkote 206N, manufactured by 3M, St. Paul MN

2) Pipe Clad 2000, manufactured by Lilly Industries, Inc. North Kansas City, MO

3) Nap-Gard 72500, manufactured by Dupont Powder Coatings, Houston, TX

2. Coal Tar Epoxies

1) Bitumastic 300 M, manufactured by Carboline, St.Louis, MO

2) Hempel 119US-19990, manufactured by Hempel Coatings (USA), Inc. Houston, TX

3) Coal Tar Epoxy Series 9000, manufactured by Mercury Paint Corp., Brooklyn, NY

4) Sigma 3307 Coal Tar, manufactured by Sigma Coatings, Harvey, LA

3. Touchup coatings for repair of coating defects and damage, as recommended by the approved coating manufacturer.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Surface Preparation

1. Weld Spatter, Sharp Edges, and Holes

a. Remove slag, flux deposits, weld spatter, and surface irregularities such as slivers, tears, fins, and hackles. Grind all resulting burrs smooth, including burrs around holes. Do not remove any weld material that will weaken weld strength.

b. Prior to preparation, break sharp edges such as those created by flame cutting and shearing. The rolled edges of angles, channels, and wide flange beams do not normally require further rounding unless specifically shown on the Contract Drawings.

2. Compressed Air Cleanliness

a. Compressed air shall be free from moisture and oil contamination.

b. Use the white blotter test in accordance with ASTM D-4285 to verify the cleanliness of the compressed air. Conduct the test at the start of each shift for each compressor system.

c. If testing indicates contamination, soiling or discoloration visible on the paper, change filters, clean traps, add moisture separators or filters, or make adjustments as necessary to achieve clean, dry air. Re-inspect surfaces prepared or coated since the last satisfactory test, and reblast such surfaces at no additional cost to the DEP.

3. Prior to dry abrasive blast cleaning, remove all visible oil, grease, soil, drawing and cutting compounds, and other soluble contaminants from bare steel in accordance with SSPC-SP 1 Solvent Cleaning.

4. Abrasive Blasting

a. All steel surfaces to be coated shall have SSPC-SP 10 Near White Blast Cleaning. Blast cleaning shall be accomplished using abrasive as stipulated in 2.1 herein.

b. For all steel surfaces to be coated provide a sharp, angular, uniform anchor pattern with a profile height of 2-3 mils, unless the requirements of the coating manufacturer are more restrictive. Peak counts per square inch shall be eighty (80) or greater, when tested in accordance with ASTM D-4417, Method C.

c. SSPC-VIS 1 shall be used as an aid in determining the quality of cleaning.

3.02 IMPLEMENTATION

A. PAINT STORAGE, MIXING AND HANDLING

1. Store materials not in actual use in tightly covered containers at a minimum ambient temperature of 45 °F in a well-ventilated area. Maintain containers used in storage of coatings in a clean condition, free of foreign materials and residue. Protect from freezing where necessary.

2. Mixing and Thinning of Coal Tar Epoxies

a. Do not use coating materials that have exceeded their shelf life.

b. When required by the approved manufacturer, warm paints stored at less than 50 °F to above 50 °F prior to mixing.

c. Mix all coatings in accordance with the requirements of the approved coating manufacturer using mechanical equipment such as a jiffy mixer.

d. Mix only complete kits of multi-component materials. Mixing of partial kits is not allowed.

e. Do not use two component materials beyond the pot life established by the approved manufacturer's written instructions.

f. Do not thin any coatings unless approved in writing by the manufacturer and the Engineer. If thinning is required and authorized, use only those types, brands, and amounts of thinner stipulated by the coating manufacturer.

B. COATING APPLICATION

1. General:

a. Apply the coatings in accordance with the requirements of this Section, the coating manufacturer, and SSPC-PA 1.

b. In the event of a conflict between the manufacturer's technical data and the requirements of this Section, comply with this Section unless the requirements of the manufacturer are more restrictive. In these cases, advise the Engineer of the discrepancies in writing, and comply with the Engineer's written resolution.

2. Quality of Surface Preparation and Time Restrictions Prior to Painting:

   a. Verify that the surface exhibits the specified degree of cleaning immediately prior to coating. Reclean deficient areas. Do not apply coating unless the prepared surface is inspected and approved by the Engineer.

   b. Apply the first coat within twelve (12) hours of cleaning to bare metal. If the bare substrate is allowed to remain uncoated for more than twelve (12) hours, or rerusting is evident, reclean the surface prior to painting.

3. Surface Cleanliness Prior to Coating and Between Coats:

   a. Do not perform coating application in areas where dust is being generated.

   b. Thoroughly clean the surface of each coat prior to the application of the next to remove spent abrasive, dirt, dust, cement spatter, and other deleterious materials. Pay particular attention to the removal of detrimental residue from surfaces such as corners and pockets. Clean the surfaces by vacuuming or blowing down with compressed air.

   c. If grease or oil have become deposited on the bare steel or on the surface of any of the applied coats, remove by solvent cleaning in accordance with SSPC-SP 1 prior to the application of the next coat. Use a solvent that is acceptable to the coating manufacturer.

4. Ambient Conditions During Coating Application of Coal Tar Epoxies:

   a. Apply coatings under the following conditions unless the requirements of the coating manufacturer are more restrictive:

      1) Surface and Air Temperatures - Between 50°F and 100°F.

      2) Relative Humidity - Less than 90%.

      3) Dew Point - Surface temperature at least 5°F above the dew point temperature of the surrounding air.

      4) Frost/Rain - Do not apply coatings to surfaces containing frost or free-standing water, or during rain, fog, or similar detrimental weather conditions.

   b. Remove and replace any coating that is exposed to unacceptable conditions (e.g. rain or dew) prior to adequate curing.

5. Methods of Application:

   a. For fusion bonded epoxies, coat exposed surfaces of steel piles within limits shown on the Contract Drawings with electrostatically applied, fusion-bonded epoxy to a minimum dry coat thickness of 18 mils, as tested in accordance with SSPC-PA 2. Follow the coating manufacturer's printed instructions regarding handling, mixing, pre-heating, application, post-baking and curing.

   b. For coal tar epoxies, coat exposed surfaces of steel piles within limits shown on the Contract Drawings using spray application to a minimum dry film thickness of 18 mils, as measured in accordance with SSPC-PA 2. Apply one (1) or two (2) coats as recommended by the approved manufacturer to achieve the required dry film thickness.

6. Performance Requirements

   a. The cured coating shall be of uniform gloss and thickness and shall be free of blisters, pinholes, fisheyes, sags, runs and any other irregularities.

   b. Test for continuity of coating with a holiday tester of 100 volts or less and repair all holidays detected to meet such test.

   c. Conduct adhesion tests in accordance with ASTM D-3359 or ASTM D-4541 as directed by the Engineer and repair all test areas. The acceptance criteria for the testing shall be obtained by the Contractor from the coating manufacturer and submitted for approval by the Engineer. Remove all defective coating and reblast and recoat such areas in accordance with this Specification.

   d. Maintain all quality control records on the results of all inspections and submit all results to the Engineer as stipulated in Appendix "A".

7. Repair of Damaged & Unacceptable Coatings Before and After Driving:

   a. Based upon results of the tests stipulated in 3.03 F. herein, repair coating as follows:

      1) Surface preparation of defective area.

         a) Prepare the surface by cleaning in accordance with SSPC-SP 1 Solvent Cleaning followed by SSPC SP-3 Power Tool Cleaning. Use a solvent that is acceptable to the approved coating manufacturer.

         b) If the damage exposes the substrate, remove all loose material and prepare the steel in accordance with SSPC SP 11.

      2) Coating Application in Repair Areas

a) When the bare substrate is exposed in the repair area, reapply all coats of the system to the specified thickness.

b) When the damage does not extend to the bare substrate, reapply to only the affected coats.

c) Maintain the thickness of the system in overlap areas within the specified total thickness tolerances.

d) For field touch-up after driving, use touch-up coatings as recommended by the approved coating manufacturer.

3.03 FIELD TESTING / QUALITY CONTROL

A. Inspection will be performed in accordance with the Section of Division 1 entitled "Quality Control".

3.04 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

END OF SECTION

NO TEXT ON THIS PAGE

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, tools, equipment, and incidentals required to assure adequate environmental protection including implementation of all erosion and sediment control measures and maintenance of storage areas as directed by the Engineer.

B. The Contractor shall provide an Erosion and Sediment Control Plan (E&SCP) that establishes methods and procedures to prevent migration of contaminated stormwater and sediment and to prevent erosion of features of the Work.

C. The Contractor shall minimize erosion and prevent discharge of sediment to surface water features, watercourses, drainage systems, public streets or private property from construction activities. The Contractor shall provide methods to prevent construction activities from generating contaminated stormwater runoff. Methods of constructing berms and dikes to direct clean stormwater runoff around the work area to the local drainage system shall be included.

D. The Contractor shall comply with all Federal, State, or local laws, codes, ordinances, and regulations which govern the control of sediment, erosion, and stormwater during construction activities.

E. The Contractor shall provide Best Management Practices (BMPs), including, but not limited to silt fences, straw bales, diversion dikes, swales, sedimentation basins/traps, truck wash areas/decontamination stations, stabilized construction entrances and/or other means as a temporary structural practice to minimize erosion and sediment runoff.

F. The Contractor shall implement dust, erosion, and sediment control and stormwater pollution prevention in accordance with the requirements of the current NYSDEC SPDES General Permit for Stormwater Discharges from Construction Activity, and, if applicable, in accordance with the approved Stormwater Pollution Prevention Plan (SWPPP) for this contract prepared by the Engineer.

G. If applicable, the approved SWPPP for this contract will be made available to the Contractor upon request during the bidding process. Proposed modifications to the approved SWPPP shall be in accordance with the requirements of this Section.

H. The Contractor shall control dust caused by operation and movement of vehicles and equipment in accordance with the latest DEP and OSHA standards, and all other applicable Federal, State and local regulations.

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 02 24 20 - Soil Sampling and Analysis

B. Section 31 10 10 - Site Clearing

C. Section 31 23 19 - Dewatering

D. Section 31 23 16 - Excavation

1.04 REFERENCES

A. Comply with applicable provisions and recommendations of the following except as otherwise shown or specified.

1. NYSDEC SPDES General Permit for Stormwater Discharges from Construction Activity (GP-0-15-002, or latest version)

2. New York City Watershed Regulations (April 4, 2010, or latest version)

3. New York State Standards and Specifications for Erosion and Sediment Control (aka “Blue Book”) (NYSDEC, Aug 2005, or latest version)

4. New York State Stormwater Management Design Manual (latest version)

1.05 DESCRIPTION

A. Definitions

1. Best Management Practices: Physical, structural, and/or managerial practices that, when used singly or in combination, prevent or reduce pollution of water, and have been approved by DEP or NYSDEC.

2. Commencement of Construction: The initial disturbance of soils associated with clearing, grading or excavation activities; or other construction related activities that disturb or expose soils such as demolition, stockpiling of fill material, and the initial installation of erosion and sediment control practices.

3. Erosion: The wearing away of the land surface by running water, wind, ice, or other geological agents, including such processes as geological creep, detachment, movement of soil or rock fragments by water, wind, ice, or gravity.

4. Erosion/Sediment Control: Any temporary or permanent measures taken to reduce erosion, control siltation and sediment, and ensure that sediment-laden water does not leave the site.

5. Final Stabilization: All soil-disturbing activities at the site have been completed and uniform, perennial vegetative cover with the density of eighty (80) percent has been established or equivalent stabilization measures (such as the use of mulches or geo-textiles) have been employed on all unpaved areas and areas not covered by permanent structures, concrete or pavement.

6. Receiving Waters: Bodies of water or surface water systems receiving water from upstream manmade (or natural) streams

7. Sediment: Fragmented material that originates from weathering and erosion of rocks and unsolicited deposits, and is transported by, suspended in, or deposited in water.

B. Environmental Requirements

1. Soil Stabilization: The stabilization practices to be implemented shall include one or a combination of the following: temporary seeding, mulching, geotextiles, sod stabilization, vegetative buffer strips, erosion control mats, protection of trees and shrubs, preservation of mature vegetation. Protection of trees shall be in accordance with Section 31 10 10 – Site Clearing. Stabilization practices shall be implemented as approved by the Engineer. The Contractor shall record the dates when the major grading activities occur (i.e. clearing and grubbing, excavation, embankment and grading); when construction activities temporarily or permanently cease on a portion of the site; and when stabilization practices are initiated. Except as provided in paragraphs 1.08A.1 and 1.08A.2 below, stabilization practices shall be initiated as soon as practicable, but no more than fourteen (14) days after construction activities have temporarily or permanently ceased.

   a. Unsuitable Conditions: Where the initiation of stabilization measures by the fourteenth day after construction activity

temporarily or permanently ceases is precluded by unsuitable conditions caused by the weather. Stabilization practices shall be initiated as soon as practicable after conditions become suitable.

b. Temporary Inactivity Less than 14 Days: Where construction activity will resume on a portion of the site within 14 days after it temporarily ceases, no stabilization practices will be required.

2. Erosion and Sediment Control: Erosion and Sediment control BMPs shall be operational at all times during the Work, specifically during excavation, backfilling and restoration, and decontamination operations. The sediment and erosion control system shall be capable of handling stormwater during construction. Damage to excavation slopes and the migration of contaminated soil to downstream areas resulting from storm events shall be repaired or remediated by the Contractor, at the Contractor's expense.

3. Stormwater: At no time shall the Contractor allow stormwater runoff from soil excavation/stockpiling operations, or effluent from decontamination operations to migrate off to contaminate soils in other areas or percolate into the groundwater. The Engineer will monitor any overflow or leakage that occurs, and may at his discretion require the Contractor to perform soil sampling within all areas affected by such overflow. Any soils that have been contaminated by such overflow shall be removed, treated and disposed of by the Contractor at no additional cost to the City. All sampling and analyses of soils required to determine the contamination or remediation of these soils shall be performed in accordance with Section 02 24 20 – Soil Sampling and Analysis.

4. Disposal of Water: Water collected from decontamination areas and dewatering operations shall be handled in accordance with Section 31 23 19 - Dewatering.

C. Project Conditions

1. Existing Work: All BMPS (e.g., silt fences, straw bales, swales, sumps, pumps, piping) and other sediment/stormwater controls shall be installed such that other aspects of the Work are not adversely impacted or endangered. All installations shall be subject to the approval of the Engineer.

2. Dust Control: The Contractor shall be responsible for controlling visible dust caused by Work operations and the moving of vehicles and equipment. Dust control shall be implemented when soils are exposed, before, during and after Work activity ceases. Dust control will also be required on the weekends. The Contractor shall utilize the application of water or other methods, subject to the Engineer's approval, when visible dust is present on-site, in accordance with the Health and Safety Plan. The use of chemicals for dust control, including calcium chloride, will not be permitted.

a. All excavation, loading and transport of materials shall minimize the formation of dust and shall conform to Section 31 23 16 - Excavation. To prevent dust generation, application of water to roadways and active work areas shall be utilized as required. The Contractor's operations shall include air monitoring and dust minimization measures, consistent with the Health and Safety Plan (HASP) Specifications.

3. Silt and Sediment Disposal: All silt and sediment which accumulates behind any BMPs used on the site (i.e., straw bale berms or silt fences) shall be removed and disposed of off-site in accordance with all applicable Federal, State and local regulations.

D. Materials

1. All components/controls must be designed in conformance with the most current version of the technical standard, New York State Standards and Specifications for Erosion and Sediment Control, and the New York State Stormwater Management Design Manual. Where erosion and sediment control practices are not designed in conformance with these technical standards, the Contractor must demonstrate equivalence to the technical standard.

E. Installation and Maintenance

1. All installation of erosion and sediment control BMPs must be consistent with the most current version of the technical standard, New York State Standards and Specifications for Erosion and Sediment Control, and the New York State Stormwater Management Design Manual. Where erosion and sediment control practices are not designed in conformance with these technical standards, the Contractor must demonstrate equivalence to the technical standard.

2. Maintenance: The Contractor shall maintain the temporary and permanent vegetation, erosion and sediment control measures, and other protective measures in good and effective operating condition at all times consistent with the most current version of the technical standard, New York State Standards and Specifications for Erosion and Sediment Control, and the New York State Stormwater Management Design Manual.

1.06 QUALITY ASSURANCE

A. Permits and Regulations:

1. The Contractor shall obtain all necessary permits and be responsible for implementing the terms and requirements of these permits as needed and for payment of all fees.

2. The Contractor shall handle all material in compliance with applicable requirements of OSHA and other governing authorities having jurisdiction.

3. Certifications. The Contractor must sign a copy of the certification statements below, as provided in GP-0-15-002 (or certifications in latest

version), before undertaking any construction activity at the site identified in the SWPPP. All certifications must be included in the SWPPP.

a. "I hereby certify that I understand and agree to comply with the terms and conditions of the SWPPP and agree to implement any corrective actions identified by the qualified inspector during a site inspection. I also understand that the NYCDEP must comply with the terms and conditions of the New York State Pollutant Discharge Elimination System ("SPDES") General Permit for Stormwater Discharges from Construction Activity (GP-0-15-002, or latest version) and that it is unlawful for any person to cause or contribute to a violation of water quality standards. Furthermore, I understand that certifying false, incorrect or inaccurate information is a violation of the referenced permit and the laws of the State of New York and could subject me to criminal, civil and/or administrative proceedings."

b. The certification statements must include the name and title of the person providing the signature, address and telephone number of the contracting firm, the address of the site, and the date the certification is made. The certification must be signed by an authorized representative of the firm.

4. Inspections. The Contractor must have a qualified inspector conduct an assessment of the site prior to the commencement of construction and certify in an inspection report that the appropriate erosion and sediment controls described in the SWPPP have been adequately installed or implemented to ensure overall preparedness of the site for the commencement of construction. Following commencement of construction, site inspections shall be conducted at least once every seven (7) calendar days and twice a week for sites with soil disturbance greater than 5 acres. The two (2) inspections shall be separated by a minimum of two (2) full calendar days. The inspection reports must be kept on file at the construction site with the SWPPP, if applicable, for review by a NYSDEC inspector.

5. Stabilization. The contractor shall initiate stabilization measures as soon as practicable in portions of the site where construction activities have temporarily or permanently ceased.

6. If a SWPPP is required, it shall be kept current on file at the construction site for review by a NYSDEC inspector. If there is a significant change in construction which may have a significant effect on the potential for the discharge of pollutants to surface waters of the State and which has not otherwise been addressed in the SWPPP, it would require that the SWPPP be updated to reflect those required changes. The SWPPP would also require an amendment if the SWPPP proves to be ineffective in eliminating or significantly minimizing pollutants from sources identified in the SWPPP or achieving the general objectives of controlling pollutants in

stormwater discharges from permitted construction activity. Additionally, the SWPPP shall be amended to identify any new subcontractor and their associated responsibilities.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings and other documentation, required to show conformance to the requirements of the Contract Drawings, for the approval to the Engineer. Shop Drawings shall show details of the Sediment and Stormwater Control System. The Submittals shall include, but not limited to the following:

1. Plan locations of all components of the Sediment/Stormwater Control System.
2. Details of all applicable BMPs (e.g., silt fence, diversion dike, straw bale berm, decontamination stations, etc.).
3. All of the planned components of the Erosion and Sediment Control Plan, as detailed below in Paragraph B.
4. All components of the SWPPP to be constructed on site, as detailed in Paragraph C below.
5. The Contractor shall submit manufacturer's descriptive literature and installation instructions for stockpile liner and cover material as specified in Paragraph 2.01.B and Part 3.02.

B. Erosion and Sediment Control Plan (E&SCP): The Contractor shall develop and submit to the Engineer for approval, prior to commencement of construction activities, an E&SCP. The E&SCP shall address schedules and measures that will be taken to prevent migration of contaminated stormwater/sediment, and to prevent erosion of features of the Work. The E&SCP shall include the following at a minimum:

1. Measures to capture and mitigate stormwater runoff from active, disturbed areas.
2. Provisions for silt fences and other measures to limit migration of sediments.
3. Provisions for straw bale berms and silt fences or other measures to prevent contaminant and sediment migration.
4. Diversion of stormwater: The Contractor shall include provisions for controlling stormwater runoff in and around excavation areas.
5. Soil Storage Area: All details of temporary soil storage to be implemented as specified in this section.
6. Soil Stabilization Practices: All details of soil stabilization practices to be implemented, as specified in this section.
7. Provisions for all other applicable Best Management Practices.

C. The Contractor shall adopt the approved SWPPP prepared by the Engineer for this Contract, if applicable. If the Contractor proposes to modify the approved SWPPP,

the Contractor shall develop and submit to the Engineer for approval the modified SWPPP in accordance with the requirements of the current NYSDEC SPDES General Permit for Stormwater Discharges from Construction Activity. The modified SWPPP shall be developed and submitted to the Engineer for approval prior to the initiation of construction activities. The modified SWPPP must be in compliance with the requirements of this Section in all respects. The Contractor shall bear sole responsibility for all permitting requirements of, and coordination with, the governing authorities having jurisdiction, as well as for any costs and delays resulting from the modification(s).

D. The SWPPP shall include the following at a minimum:

1. Provide background information about the scope of the project, including the location, type and size of project;

2. Provide a site map for the project, including a general location map. The site map should show the total site area; all improvements; areas of disturbance; areas that will not be disturbed; existing vegetation; on-site and adjacent off-site surface water(s), wetlands and drainage patterns that could be affected by the construction activity; existing and final slopes; locations of off-site material, waste, borrow or equipment storage areas; and location(s) of the stormwater discharge(s);

3. Provide a map and a description of the soil(s) present at the site;

4. Provide a Construction Phasing Plan describing the intended sequence of construction activities, including clearing and grubbing, excavation and grading, utility and infrastructure installation and any other activity at the site that results in soil disturbance. Consistent with the NYSDEC SPDES General Permit for Stormwater Discharges from Construction Activity (GP-0-15-002 or latest version), there shall not be more than five (5) acres of disturbed soil at any one time without prior written approval from the NYSDEC;

5. Provide a description of the pollution prevention measures that will be used to control litter, construction chemicals and construction debris from becoming a pollutant source in the stormwater discharges;

6. Provide a description of construction and waste materials expected to be stored on-site with updates as appropriate, and a description of controls to reduce pollutants from these materials including storage practices to minimize exposure of the materials to stormwater, and spill prevention response;

7. Describe the temporary and permanent structural and vegetative measures to be used for soil stabilization, runoff control and sediment control for each stage of the project from initial land clearing and grubbing to project closeout;

8. Identify and show on a site map the specific location(s), size(s), and length(s) of each erosion and sediment control practice;

9. Provide the dimensions, material specifications, and installation details for all erosion and sediment control practices, including the siting and sizing of any temporary sediment basins;
10. Identify temporary practices that will be converted to permanent control measures;
11. Provide an implementation schedule for staging temporary erosion and sediment control practices, including the timing of initial placement and the placement and the duration that each practice should remain in place;
12. Provide a maintenance schedule to ensure continuous and effective operation of the erosion and sediment control practices;
13. Provide the name(s) of the receiving water(s);
14. Provide a delineation of SWPPP implementation responsibilities for each part of the site;
15. Provide a description of structural practices to divert flows from exposed soils, store flows, or otherwise limit runoff and the discharge of pollutants from exposed areas of the site to the degree attainable; and
16. Provide any existing data that describes the stormwater runoff characteristics at the site.

E. Inspection Reports: The Contractor shall conduct inspections and submit inspection reports consistent with requirements of the NYSDEC SPDES General Permit for Stormwater Discharges from Construction Activity (GP-0-15-002 or latest version) including:

1. Site inspections shall be conducted by the Qualified Inspector.
2. Site inspections are conducted a minimum of once every seven (7) calendar days and twice every seven (7) calendar days for sites with greater than 5 acres of soil disturbance. The two (2) inspections shall be separated by a minimum of two (2) full calendar days.
3. Inspection reports shall be maintained in a logbook at the site with SWPPP and other required documentation.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall store, handle, and remove material and equipment consistent with requirements of the SWPPP and NYSDEC SPDES General Permit for Stormwater Discharges from Construction Activity (Permit No. GP-0-15-002) or latest version.

B. Removal of all waste shall be in accordance with the requirements of Section 01 74 20 – Construction Waste Management.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. Materials

1. Stockpile cover and liner fabric shall be a composite structure of fiber-reinforced polyethylene (RPE) fabric (minimum 20-mils). The fabric shall be inert to biological degradation and naturally encountered chemicals, alkalis and acids. Its permeability coefficient shall be less than 10^{-3} cm/sec.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 IMPLEMENTATION

A. Stockpiling

1. Cover and Liner Requirements

a. Soil Stockpiles: Stockpiles of excavated soil to be used for backfilling on-site under the NYSDEC Pre-Determined or Case-Specific BUD, or stockpiles of other soil mixes being brought onsite for landscaping purposes, shall be stored as follows:

1) Contaminated Soil: Stockpiles of excavated soil that are known to be or potentially could be contaminated (pending analysis), shall be lined on the bottom and covered with an impermeable, RPE fabric, as specified in 2.02.A above.

2) Uncontaminated Soil: Stockpiles of excavated uncontaminated soil shall have a cover only; a bottom liner is not required. The cover fabric shall be as specified in 2.01.B above.

b. Demolition Waste Stockpiles: Stockpiles of demolition waste that are to be recycled (on-site or off-site) or disposed of at a sanitary landfill shall be stored as follows:

1) Contaminated Demolition Waste: Stockpiles of demolition waste that are known to be or potentially could be contaminated (pending analysis), shall be lined on the bottom and covered with an impermeable, RFP fabric, as specified in 2.01.B above.

2) Uncontaminated Demolition Waste: Stockpiles of uncontaminated demolition waste shall have a cover only; a bottom liner is not required. The cover fabric shall be as specified in 2.01.B above.

c. Stockpiles of materials classified as contaminated, hazardous waste shall be stored with a cover and liner as specified above for contaminated soil or contaminated demolition waste, and transported off-site promptly in DOT-approved hazardous waste shipping containers. Temporary hazardous waste storage areas shall comply with and the requirements of the Contract and applicable Federal, State and local regulations.

d. All stockpiles shall be covered during non-working hours and during periods of no construction activity. The terminal edges of the fabric cover panels shall be secured to prevent uplift by wind.

2. Stockpile Areas and Placement

a. Stockpiling of excavated materials will be permitted on-site within areas as designated on the Contract Drawings for construction staging, or as directed by the Engineer. All stockpiling areas on-site must be approved by the Engineer in advance.

b. The Contractor shall make his or her own arrangements to provide additional stockpiling area on-site or off-site, if required, for excavated material at no additional cost to the City. Additional stockpiling areas whether on-site or off-site shall be approved by the Engineer.

c. Stockpiles of excavated material to be used for backfilling on-site under the NYSDEC Pre-Determined or Case-Specific BUD shall be so piled and placed as not to encumber sidewalks or roadways, or wash away or obstruct the free flow of surface or drainage water. Stockpiles shall be suitably bermed for run-off containment of any water that drains from the soils.

d. Stockpiles shall not be placed closer to the edge of an excavation than a distance equal to 1-1/2 times the depth of the excavation, unless the excavation is in rock or the sides of the excavation have been sloped or sheeted and shored to withstand the lateral forces imposed by such superimposed loads.

3.03 FIELD TESTING / QUALITY CONTROL

A. Inspections: Site Inspections shall be conducted consistent with the requirements of the SWPPP and the current NYSDEC SPDES General Permit for Stormwater Discharges from Construction Activity (GP-0-15-002 or latest version). The Qualified Inspector shall inspect disturbed areas of the construction site, areas used for storage of materials that are exposed to precipitation that have not been finally stabilized, stabilization practices, structural practices, other controls, areas where vehicles exit the site daily and all other requirements listed in the most current NYSDEC SPDES General Permit for Stormwater Discharges from Construction Activity (GP-0-15-002 or latest version).

B. Inspection of soil and material stockpiles shall be done daily to ensure the integrity of the cover and liner is maintained.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. The Contractor shall clean the site and equipment consistent with requirements of the SWPPP and the current New York State Standards and Specifications for Erosion and Sediment Control. Where appropriate, truck washes/decontamination stations should be installed to minimize the migration of sediment off-site as specified herein**.**

END OF SECTION

SECTION 31 62 16.13 – STEEL SHEET PILES
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish all labor, equipment and material required to handle, store and install all steel sheet piling and bracing systems as specified herein and shown on the Contract Drawings.

B. Steel sheet piling and all necessary structural shapes, bracing, bolts, washers, nuts, connections and miscellaneous appurtenances shall be of the form, weights, shapes and lengths as specified herein and shown on the Contract Drawings.

C. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

B. No payment will be made for steel sheet piling which the Contractor uses for its own purposes or for steel sheet piling required to complete the Work under another

item of the Contract, except where such piling is left in place on written order of the Engineer.

1.05 DESCRIPTION

A. Schedule of Procedures and Operations

1. Before commencing any steel sheet pile installation, the Contractor shall submit to the Engineer for approval, a schedule of the procedures he intends to use.

2. The schedule shall show in detail his proposed method, sequence and timing of all steel sheet piling driving operations, catalog data and manufacturer's specification for all hammers and anvils to be used, method of lifting, handling, driving and cutting off of steel sheet piles.

B. Seismic Monitoring

1. When driving steel sheet piling, the Contractor shall provide the monitoring stations at locations as specified herein or shown on the Contract Drawings.

2. All pile driving, removal of piling, demolition and related sheet piling activities shall be performed in a manner so that the following criteria shall not be exceeded; peak resultant particle velocity of one-inch per second at location of sensitive instruments and two-inches per second at concrete structures.

3. The Engineer reserves the right to change the locations of the monitoring stations, as required during construction. The Contractor shall engage the services of an approved geotechnical consultant (who shall be a registered Professional Engineer in the State of New York) experienced in the monitoring of vibrations, to install, maintain and monitor an approved seismic monitoring system.

4. Particle velocity shall be measured by using seismographs capable of measuring peak component particle velocities in the range of 0.2 to 0.4 in/sec. All pile driving vibrations shall be monitored for the duration of pile driving unless otherwise ordered to be discontinued by the Engineer. In the event that the monitoring is ordered to be discontinued a suitable credit shall be due the City.

5. All vibration monitoring of specified locations shall be implemented in such a manner that peak component particle velocity can be determined shortly after instances where the vibrations exceed the above criteria. Both the Contractor and the Engineer shall be notified within 30 minutes after any such occurrence and the actual peak particle velocity identified.

6. Permanent vibrations monitoring records of each day's work shall be maintained until the completion of the work or until such time when monitoring is ordered to be discontinued. Such records shall be turned over to the Engineer upon completion of all seismic monitoring work. Monthly reports shall include a tabulation of all instances of vibration levels in excess of the seismic criteria noted above.

7. The cost of the work specified under this section shall be included in the lump sum price bid for the Contract unless otherwise specified in the Contract.

C. Job Conditions

1. The excavation support system must retain the adjacent soil, water, structures, utilities, streets and other features and must protect them from damage due to settlement, lateral movements, loss-of-ground or any other causes related to this construction. The Contractor shall be responsible for taking all precaution necessary to prevent such damage. An important function of the sheeting is to act as a ground water cutoff so as to prevent disturbance of subgrade at bearing level due to groundwater inflow into the excavation.

2. The Contractor shall be fully responsible for installing and maintaining the rakers, and corner bracing as necessary to minimize movements of the wall during all stages of construction.

3. Expose active utilities by hand, where they lie within work areas. All existing utilities affected by construction shall be temporarily supported and protected from harm.

4. If existing utilities interfere with the method of excavation support shown on the Contract Drawings, relocate the utilities as approved by the Engineer.

5. Use continuous members for the excavation support system unless otherwise approved by the Engineer.

1.06 QUALITY ASSURANCE

A. Not Used

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. Details of pile driving equipment

2. Certification that materials meet ASTM requirements

3. Detail drawings of steel sheet piling, shoring and bracing

4. Details of all connections and brackets, including corner details

5. Schedule of procedures and operations

6. Sample of driving record forms

7. Sheet piling installation sequence

8. Sheet piling location survey (project record documents).

B. After locations of utilities and other underground obstructions have been confirmed, provide drawings showing the actual locations of existing utilities, structures or other interferences in relation to the proposed locations of steel sheet piling and bracing.

C. Any variations proposed by the Contractor between the Contract Drawings and requirements in this Section shall be submitted for review and approval to the Engineer and shall also require approval by the City. For all proposed variations or alternatives, the Contractor shall submit engineering calculations and design assumptions for determinations of loads and stresses acting in the wall and lateral supports during installation, as well as final conditions. The redesign shall take into account the excavation procedures, dewatering operations, surcharge loading, soil properties, material stresses, temperatures, permanent construction, stages of work and all other conditions which could affect the excavation support system. These calculations must be prepared and stamped by a Professional Engineer licensed in the State of New York.

D. After installation, prepare dimensioned as-built CAD drawings of the complete support system and of the portion of the system left in place.

E. Sustainability Submittals:

1. Environmental Product Declarations

a. The Contractor shall provide product-specific type III Environmental Product Declaration (EPD) conforming to ISO 14025, 14044.

2. Envision Submittals

a. The Contractor shall report information pertaining to the sustainable procurement, regional sourcing, and/or recycled content of new materials to be procured during the Work, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall coordinate with its vendor on sustainable product requirements as stipulated by the Contractor's approved New Materials Sustainable Implementation Plan, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall submit vendor shop drawings for review by the Engineer that clearly illustrate the vendor is meeting the requirements as approved in the Contractor's New Materials Sustainable Implementation Plan.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Storage of sheet piling and other excavation support materials shall be such that sagging which would produce permanent deformation shall be prevented.

Concentrated loads which occur during stacking or lifting shall be kept below the level which would produce permanent deformation of the material.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. Steel sheet piling shall conform to the requirements of ASTM A328 or ASTM A572. Sheet piles shall be new and shall consist of rolled sections of the continuous interlocking type of the section, length, weight and ASTM as specified herein or shown on the Contract Drawings.

1. Sheet piling utilized for temporary construction shall conform to ASTM A328.

2. Sheet piling installed as permanent construction shall conform to ASTM A572.

a. Each heat shall meet the Charpy V-notch impact test requirements of ASTM A370. Samples shall be machined in a set of three and tested at the following minimum requirements for temperature and test value:

Temperature	Test Value
30°F	25 ft-lb
0°F	15 ft-lb

b. When using subsize samples, that is thickness of less than one-half inch as specified in ASTM A673, the following minimum requirements shall be met:

Temperature	Test Value
30°F	19 ft-lb
0°F	11 ft-lb

c. In the event that the average ft-lbs of the three samples does not meet the above requirements when tested at both temperatures, all the material manufactured from that sheet shall be rejected.

B. All structural shapes, plates and similar members shall conform to the requirements of ASTM A6 and A36, and Sections 05 12 00 – Structural Steel Framing and 05 50 00 – Metal Fabrications.

C. C. Bolts, nuts and washers shall conform to the requirements of ASTM A325 or A307. All hardware for permanent construction shall be galvanized in accordance with Section 05 05 13.01 - Galvanizing.

D. D. Minimum web and flange thickness of the steel sheet piling shall be 3/8 inch unless otherwise shown on the Contract Drawings or specified herein.

E. E. Opening of socket at interlock shall be checked with manufacturer supplied tolerance gages.

F. Pile Hammer

1. Pile hammers shall have a sufficient reserve capacity for driving the sheet piles to the design requirements, including any contingencies occurring during driving. The minimum hammer energy and maximum hammer energy in foot-pounds per blow shall be as specified herein or shown on the Contract Drawings, and in accordance with NYBC.

2. The lower end of the hammer shall be fitted with an anvil base that is built to fit the top of the steel sheet piling and to hold the sheet piling under the center of the hammer during driving.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Welding

1. Welding shall be performed in accordance with the requirements of:

2. ANSI/AWS D1.1 Structural Welding Code.

a. Relevant sections of the NYBC.

b. Latest rules of the BS&A.

3. All shop and field welding shall be performed by certificated welders under the immediate supervision of a representative of a standard testing agency or an inspection agency reporting directly to and under the control of the Department of Environmental Protection. The Contractor shall submit the name of such agency to the Commissioner for approval before starting work. The costs of all welding inspections shall be borne by the Contractor.

B. Fabrication

1. Steel sheet piling shall be new and so fabricated that when driven in place, it will form a continuously interlocked wall to the extent shown on the Contract Drawings. Steel sheet piles with bends or springs, or with damaged interlocks shall not be used.

2. Steel sheet piling shall be full length; no splices will be permitted.

3. Walers and braces may be prefabricated or fabricated in place. All welding shall conform to the requirements of Article 2.02, Welding.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examination of the Site

1. Prior to starting steel sheet piling driving operations, the Contractor, the City and the Engineer shall make a joint inspection of the accessible existing structures, pavement and improvements adjacent to the pile driving site to examine and document their present condition.

2. Photographs and measurements shall be taken by the Contractor to record any conditions that may become the subject of possible damage claims.

3. The Contractor shall prepare a report of such conditions, verified by the photographs, and signed by the personnel of the Contractor, the City and the Engineer participating in the investigation.

3.02 IMPLEMENTATION

A. Driving

1. Steel sheet piling shall be carefully positioned at the locations shown on the Contract Drawings and driven in a plumb position, to the minimum tip elevations as specified herein or shown on the Contract Drawings.

2. Sheet piling shall penetrate to approved depth in firm subsurface material and each sheet pile shall interlock with the adjacent sheet pile so as to form a single continuous wall. Piling shall be driven in vertical increments limited in such a manner so that driving proceeds without erratic advance of individual sheets.

3. Sheet piles shall be driven in such a manner as to insure continuous interlocking throughout the length of the sheet piles. Sheet piles shall be driven in pairs with ball end leading.

4. Steel sheet piling shall be framed with and connected to other structural members and shapes as specified herein or shown on the Contract Drawings.

5. In the event the sheet piling cannot be driven to the minimum tip elevation, the Contractor shall immediately notify the Engineer for corrective measures.

B. Excavation

1. Excavation shall conform to Section 31 23 16 – (Soil) Excavation (and Disposal) and shall not be carried in advance of or below the bottom of the steel sheet piling.

2. Excavation within the sheet piling shall not be performed until the bracing system, if required by the Contract Drawings or this Section, has been installed at the stage and in the sequence as approved by the Engineer.

C. Jetting

1. Steel sheet piling shall be jetted only when written permission is given by the Engineer. Sufficient jets and adequate water pressure shall be used to erode the material adjacent to the pile without impairing the penetration of steel sheet piling already in place.

2. Before the desired penetration is reached, the jets shall be withdrawn and the steel sheet piling shall be driven with the hammer alone to obtain the required penetration in the subsurface material.

D. Obstructions

1. Any obstructions encountered in driving the steel sheet piling shall be removed or otherwise disposed of by the Contractor so as to permit the proper installation of the sheet piling.

2. After the removal of the obstructions, the steel sheet piling shall be redriven to the required penetration. It is essential that the Contractor familiarize himself with the site conditions and the subsurface conditions at the site so as to be prepared for removal of obstructions.

3. The Contractor shall have on hand suitable equipment for removing obstructions, and shall employ this equipment, in a manner satisfactory to the Engineer.

E. Tolerance

1. Steel sheet piling shall be driven plumb to the lines, grades and depths shown on the Contract Drawings or specified herein with secure interlocking for the entire length of the sheet piling.

2. Driving shall be done with fixed leads to hold the sheet piling firmly in position and alignment and in axial alignment with the hammer.

3. Sheet Piling Cutoff

4. The Contractor shall cutoff sheet piling left in place to the grades established on the Contract Drawings or specified herein.

5. Cutoffs are the property of the Contractor and shall be disposed of off-site.

F. Survey Work

1. The Contractor shall engage the services of a licensed surveyor, approved by the Commissioner, for the performance of the survey work.

2. Before starting work, the Contractor shall survey adjacent structures and improvements, establishing exact elevations at fixed points to act as benchmarks. He shall clearly identify benchmarks and record existing elevations. Datum level used to establish benchmark elevations shall be

located at a sufficient distance so as not to be affected by movement resulting from excavation or construction operations.

3. During excavation, the Contractor shall resurvey benchmarks as required by the Contract. The Contractor shall maintain an accurate log of surveyed elevations for comparison with original elevations, and shall promptly notify the Engineer if changes occur or if cracks, sags or other damage is evident.

4. The installed location of the sheet piling shall be established by survey and shown on drawings prepared for this purpose as project record documents. Upon completion of the sheet piling installation, the Contractor shall submit to the City, drawings showing installed location of the sheet piling as related to column lines, center of footings or other reference points and lines, the cutoff elevation, and length below cutoff for each pile.

G. Painting

1. Structural steel braces and supports attached to the steel sheet piling and exposed in the finished work and indicated to remain shall be thoroughly cleaned, prepared for painting and painted in accordance with the requirements of Section 09 91 00 - Painting.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Damaged Sheet Piling

1. Any sheet piling, which at any time becomes damaged, displaced, separated from adjacent sheets or otherwise injured, shall be withdrawn and replaced with new sheet piling at the expense of the Contractor.

2. All damaged sheet piling shall be removed from the site by the Contractor.

END OF SECTION

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish, install, drive and cutoff concrete filled steel pipe piling as specified herein and shown on the Contract Drawings.

B. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

B. No Separate Payment:

1. No separate payment will be made for pile tips, splices, concrete, test piles, removing damaged or misdriven piles, piles driven for the temporary use or for the convenience of the Contractor, jetting if permitted, pile surveys and related drawings, pile cut-offs and their disposal off-site. The costs thereof shall be included in the unit prices bid for piling.

2. No separate payment will be made for excavating for pile driving, replacing unsuitable materials or for furnishing, placing and compacting fill and

backfill material; the costs thereof shall be included in the unit prices bid for piling.

9. New York City Building Code (NYCBC).

1.05 DESCRIPTION

A. Performance Requirements

1. Furnishing and installation of the pipe piles shall conform to the New York City Building Code and as specified herein. Where the requirements as specified herein are more rigorous, they shall be adhered to.

2. Pile design loadings, concrete strengths, diameters and wall thicknesses of steel pipe shall be as specified herein or shown on the Contract Drawings. The ends of each pipe shall be perpendicular to its axis. Metal to metal bearing joints shall be machine cut. Other joints may be flame cut.

3. Pipe piles with open ends driven to rock in accordance with NYBC will not require load tests. The Contractor shall drive test piles as specified in Article titled "Test Piles" in this Section.

4. Dynamic pile testing, when required by the Contract, shall be performed in accordance with Section 31 09 16.10 – Dynamic Pile Testing.

5. Pipe piles to be driven to material other than rock shall be driven with closed ends or shoes and load tests, when required by the Contract, shall be performed in accordance with Section 31 09 16.20 – Pile Load Tests, Compressive, Lateral and Uplift Load.

B. Test Piles

1. The Contractor shall be responsible for the proper length of piles required to develop the specified loads.

2. All available samples and information relating to boring records and subsurface conditions are expressly excluded from and are not a part of the Contract and are available for information purposes only. It shall be the Contractor's responsibility:

   a. To make application for inspection and review of these data in order to select the proper length of piles.

   b. To obtain any additional subsurface data he may desire.

3. The Contractor shall determine the lengths of the piles required to develop the specified loads by driving test piles. The allowable load of the test piles shall be determined using the following driving formula:

$$P = \frac{2E}{S + 0.1}$$

   P - Allowable pile load, in pounds
   E - Rated energy delivered by the hammer per blow in foot pounds
   S - Penetration of pile per blow, in inches, after the pile has been driven to a depth where successive blows produce approximately equal net penetration.

4. The location and number of test piles shall be as specified herein or shown on the Contract Drawings The test piles shall be of the same material and construction as the permanent piles.

5. The Engineer shall be notified at least forty-eight (48) hours in advance so that he may be present at the commencement of driving the test pile(s).

6. Load tested piles are considered to be sacrificial piles and cannot be considered part of permanent foundation piles. Sacrificial piles including reaction piles are to be abandoned upon the completion of load test program..

C. Seismic Monitoring

1. When driving piles, the Contractor shall provide the monitoring stations at locations as specified herein or shown on the Contract Drawings.

2. All pile driving, removal of piling, spudding and related pile driving activities shall be performed in a manner so that the following criteria shall not be exceeded; peak resultant particle velocity of one-inch per second at location of sensitive instruments and two-inches per second at concrete structures.

3. The Engineer reserves the right to change the locations of the monitoring stations, as required during construction. The Contractor shall engage the services of an approved geotechnical consultant (who shall be a registered Professional Engineer in the State of New York) experienced in the monitoring of vibrations, to install, maintain and monitor an approved seismic monitoring system.

4. Particle velocity shall be measured by using seismographs capable of measuring peak particle velocities in the range of 0.2 to 0.4 in/sec. All pile driving vibrations shall be monitored for the duration of pile driving unless otherwise ordered to be discontinued by the Engineer. In the event that the monitoring is ordered to be discontinued a suitable credit shall be due the City.

5. All vibration monitoring of specified locations shall be implemented in such a manner that peak component particle velocity can be determined shortly after instances where the vibrations exceed the above criteria. Both the Contractor and the Engineer shall be notified within 30 minutes after any such occurrence and the actual peak particle velocity identified.

6. Permanent vibrations monitoring records of each day's work shall be maintained until the completion of the work or until such time when monitoring is ordered to be discontinued. Such records shall be turned over to the Engineer upon completion of all seismic monitoring work. Monthly reports shall include a tabulation of all instances of vibration levels in excess of the seismic criteria noted above.

7. The cost of the work specified under this Section is deemed to be included in the unit prices bid for piling.

1.06 QUALITY ASSURANCE

A. Qualifications

1. The work shall be performed by a General Contractor or a specialty Subcontractor specializing in the specified foundation system and having experience installing the specified foundation system under similar subsurface conditions.

B. Quality Assurance Inspections

1. Quality Assurance inspections may be made by NYC DEP Bureau of Engineering Design and Construction, Quality Assurance Section or its representative at the manufacturer's facility.

2. Quality Assurance inspections shall be in accordance with the requirements of the Contract Documents.

3. The Contract shall give ample notice to the Engineer prior to the beginning of any fabrication, so that Quality Assurance inspection may be made.

4. Quality Assurance inspections shall include (but are not limited to) the following activities:

   a. Obtain copies of Certified Materials Test Reports (both chemical and physical) and Manufacturer Certificates of Conformance.

   b. Perform visual inspection of welding, as per applicable welding code.

   c. Perform visual and dimensional inspection of completed work.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. Pile location plan, size and numbering system
2. Pile location survey during installation
3. Additional pile locations
4. Final pile location survey
5. Sample of pile record form
6. Pile installation sequence.

B. The Contractor shall also submit the following:

1. Details of proposed pile driving equipment
2. Material certification for piling (mill test reports)
3. Detailed welding drawings and material specifications
4. Test pile report
5. Concrete mix report.

C. Project Record Documents

1. Upon completion of installation of all piles, the Contractor shall submit to the City, drawings showing types and installed location of all piles, including obstructed, damaged and additional piles, as related to their column lines, center of footings or other reference points and lines, percentage out of plumb, the cutoff elevation, and length below cutoff for each pile.

D. Sustainability Submittals:

1. Environmental Product Declarations

a. The Contractor shall provide product-specific type III Environmental Product Declaration (EPD) conforming to ISO 14025, 14044.

2. Envision Submittals

a. The Contractor shall report information pertaining to the sustainable procurement, regional sourcing, and/or recycled content of new materials to be procured during the Work, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall coordinate with its vendor on sustainable product requirements as stipulated by the Contractor's approved New Materials Sustainable Implementation Plan, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall submit vendor shop drawings for review by the Engineer that clearly illustrate the vendor is meeting the requirements as approved in the Contractor's New Materials Sustainable Implementation Plan.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. Steel pipe piles

1. Steel pipe piles shall be new, electric-fusion buttwelded and shall conform to the requirements of ASTM A252, Grade 3, having a minimum yield point of 45,000 psi.

B. Concrete for Steel Pipe Piles

1. Concrete shall be as shown on the Contract Drawings and as specified in Section 03 30 10 - Low Carbon Cast in Place Concrete.

C. Cushion Block and Hammer

1. The cushion block used for pile driving shall be a solid block of hardwood with the grain parallel to the pile and encased in a tight fitting housing or of laminated micarta and steel or aluminum plates. The details of the proposed cushion block shall be submitted for the Engineer's approval.

2. Pile hammers shall have a sufficient reserve capacity for driving the piles to the design requirements, including any contingencies occurring during driving. The piles shall be driven with a single-acting steam or compressed-air hammer and the minimum hammer energy and maximum hammer energy in foot-pounds per blow shall be as specified herein or shown on the Contract Drawings and in accordance with the NYBC.

D. Reinforcing Bars

1. Reinforcing bars shall be as specified in Section 03 21 00 - Reinforcing Steel.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Steel pipe piles

1. All pipe welds shall be performed in accordance with the requirements of this Article.

2. The Contractor shall submit detailed welding drawings and material specifications to the Engineer for approval.

B. Splices

1. For piles less than 50 feet in length, splices below the upper splice shall be at least 20 feet apart. For piles exceeding 50 feet in length, splices below the upper splice shall be at least 30 feet apart.

2. Splices shall be made using heavy, close fitting, cast-steel, internal sleeves (tapered at top and bottom).

a. Splice sleeves shall have a minimum thickness of 3/8 inch (or not less than pipe pile thickness), the minimum length of shoulder shall be 5/8 inch and the minimum overall length of sleeve shall be equal to the diameter of the pipe pile.

b. Splices shall develop full strength of the member.

c. Length of pile to be spliced shall be secured in proper alignment so that no eccentricity results.

d. Details of the splices shall be submitted by the Contractor for the Engineer's approval.

3. Welding of joints shall be performed in accordance with the requirements of:

a. AWS D1.1 Structural Welding Code.

b. Relevant sections of the NYBC.

4. All shop and field welding shall be performed by certificated welders under the immediate supervision of a representative of a standard testing agency or an inspection agency reporting directly to and under the control of the Department of Environmental Protection. The Contractor shall submit the

name of such agency to the Commissioner for approval before starting work. The costs of all welding inspections shall be borne by the Contractor.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examination of the Site

1. Prior to starting pile driving operations, the Contractor, the City and the Engineer shall make a joint inspection of the accessible existing structures, pavement and improvements adjacent to the pile driving site to examine and document their present condition.

2. Photographs and measurements shall be taken by the Contractor to record any conditions that may become the subject of possible damage claims.

3. The Contractor shall prepare a report of such conditions, verified by the photographs, and signed by the personnel of the Contractor, the City and the Engineer participating in the investigation.

3.02 IMPLEMENTATION

A. Driving

1. Piles shall be located and driven as shown on the Contract Drawings, unless otherwise directed by the Engineer. The final driving resistance will be determined based on the specific equipment proposed and the results of driving test piles or the pile load tests, as specified in the Contract.

2. The Contractor shall cooperate with the Engineer in determining the resistance to penetration and length of pile and shall mark each pile at one-foot intervals before driving or as required by the Engineer.

3. Spudding, jetting, predrilling, or other methods utilized to maintain alignment or allow easier penetration are subject to the approval of the Engineer.

4. Permanent pile casings shall be driven without interruption to the calculated tip elevation to reach a driving resistance in accordance with the test pile or pile load test driving data. The pile hammer used for driving shall be the same type and operated at the same rate and in the same manner as that used for driving the test piles or in the pile load test.

5. When driving is interrupted before final penetration is reached, the record of penetration shall not be taken until at least a 12-inch penetration has been obtained on resumption of driving.

6. When driving piles in groups or clusters, or under any conditions of relatively close spacing with other new piles, survey reference marks shall be placed on each pile immediately after installation and reference levels

recorded. The Contractor shall resurvey the levels of all piles in a group after the group has been driven and while the piles are accessible. Piles heaving or subsiding by more than 1/4 of an inch shall be reported to the Engineer and redriven if so directed.

B. Jetting

1. Piles shall be jetted only when written permission is given by the Engineer. Sufficient jets and adequate water pressure shall be used to freely erode the material adjacent to the pile without impairing the bearing capacity of piles already in place.

2. Before the desired penetration is reached, the jets shall be withdrawn and the piles shall be driven with the hammer alone for the last 4 feet, or more if necessary, to obtain the required bearing value.

C. Predrilling

1. The Contractor shall predrill holes to the depth and diameter as specified herein or shown on the Contract Drawings, Predrilling shall be done with continuous flight auger drilling equipment. Piles shall be installed in predrilled holes within 30 minutes of drilling the hole, unless otherwise approved by the Engineer.

2. After installation of the pile, the length of the hole remaining open shall be backfilled with clean granular material.

D. Obstructions

1. When the pile meets obstructions of any kind including concrete, piling, boulders, riprap, rockfill, or timbers within the upper ten (10) feet of driving, the obstructions shall be removed by whatever means necessary including spudding, drilling, augering, jetting and churning. After the removal of the obstructions, the pile shall be redriven to the required penetration. It is essential that the Contractor familiarize himself with the site conditions and the subsurface conditions at the site so as to be prepared for removal of obstructions. If obstructions are encountered below ten (10) feet such as to damage or prevent driving piles, piles shall be abandoned as directed by the Engineer.

2. The actual driven or installed footage of piles abandoned by order of the Engineer because of obstructions encountered, shall be added to the aggregate pay length of piling. Holes left by withdrawn piles shall be filled with clean granular fill.

3. The Contractor shall have on hand suitable equipment for spudding through buried timbers, cribbing and similar obstructions, and shall employ this equipment, when directed, in a manner satisfactory to the Engineer.

4. When spudding or predrilling is ordered by the Engineer, measurement for payment will be made in accordance with Article 1.02 included in this Section.

E. Tolerance

1. Hammer and piles shall be supported in rigid leads designed to hold the pile firmly in position and in alignment with the hammer.

2. Piles shall not be out of alignment by more than 2 percent of their length. The center of each pile at the level of cutoff shall not vary from its designated center by more than such distance that the stress in any pile group is more than 10 percent greater than its designated stress as determined by the Engineer.

3. A tolerance of 3 inches from the design location will be permitted in the installation of the piles, without reduction in load capacity, provided that such variation does not produce a load on any pile more than 10 percent greater than its design load bearing capacity as determined by the Engineer.

4. In general, driving shall be a continuous operation, when driving is interrupted before final penetration is reached, the record of penetration shall not be taken until at least a 12-inch penetration has been obtained on resumption of driving. Piles, which in the opinion of the Engineer are so damaged as to destroy their usefulness, shall be removed or abandoned and replaced with new piles.

F. Placement of Concrete in Steel Pipe

1. No concrete shall be placed in a pile until all piles within a radius of thirty (30) feet have been driven and the pile has been inspected and approved for concrete placement by the Engineer. The inspection will verify the integrity of the steel pipe throughout its length and the absence of distortion and reduction in area, and that all mud, water and other extraneous material has been removed from the interior. The Engineer shall be present when the piles are filled with concrete.

2. Pipe piles driven with open ends shall be cleaned out by means of air or water under pressure or both. The bottom of the piles shall be inspected with an electric lamp and if found satisfactory, the piles shall be driven further to ascertain their bearing capacities before concreting. Where water prevents inspection, the ends shall be sealed with tremie concrete, the piles driven to satisfactory bearing, the water pumped out, and the piles concreted in the dry.

3. Concrete shall be deposited in the pile through a funnel or vertical chute having spacers at the neck to permit air escape during the filling operation and with baffles to prevent segregation of the concrete. Placing of concrete in each pile shall be continuous, and the filling of any pile shall not be commenced unless there is sufficient concrete on hand to fill it. Piles shall be filled with concrete to the elevations as specified herein or shown on the Contract Drawings

4. Concrete shall not be placed through water unless tremie placement methods specifically approved by the Engineer are used. No more than 1

inch of standing water shall be permitted in any pile at the time of placing concrete.

5. Top 5 feet of concrete shall be rodded during placement.

6. The Contractor shall calculate the theoretical volume of each pile and compare to actual volume of concrete placed in each pile.

G. Pile Cutoff

1. All piles shall be cutoff to true planes at the elevation as specified herein or shown on the Contract Drawings

2. Pipe piles requiring a final cutoff elevation below the existing or excavated ground surface shall be filled with concrete to the cutoff elevations.

3. Cutoffs are the property of the Contractor and shall be disposed of off-site.

H. Pile Survey

1. The Contractor shall engage the services of a licensed surveyor, approved by the Commissioner, for the performance of the survey work. The Contractor shall, at such times so as not to interfere with the progress of the installation, make surveys of the installed piles. The installed location of each pile shall be established by survey and shown on drawings prepared for this purpose.

2. Copies of the drawings shall be submitted by the Contractor in accordance with the provisions as hereinafter specified in this Article and in Article titled "Analysis and Corrective Measures" in this Section. Survey information may be submitted on several drawings, each covering a partial area only, as the job progresses, in order to expedite the approval of the work.

3. Upon completion of all pile installation, the Contractor shall submit to the City, mylars of drawings showing installed location of all piles as related to their column lines, center of footings or other reference points and lines, percentage out of plumb, the cutoff elevation, and length below cutoff for each pile. Mylars shall be the same size as the Contract Drawings.

I. Analysis and Corrective Measures

1. The analysis and redesign work called for herein shall be performed by the Engineer.

2. The Engineer will analyze the conditions at each pile to determine whether corrective measures are required. If corrective measures are not required, approval will be given for proceeding with the work.

3. The Engineer will determine the corrective measures required to keep pile loads within the allowable limits. Corrective measures, for any piles installed more than 3 inches from the plan location, will be determined by the Engineer. If the corrective measures are not deemed feasible, the pile

shall be removed in its entirety and replaced by another pile installed in the design location.

4. If corrective measures involve the installation of additional piles, the Engineer will prepare supplemental drawings showing the details of the required corrective work.

   a. The Engineer will then obtain the approval of the supplemental drawing(s) by the Commissioner. The Department of Environmental Protection will obtain the signature of the Engineer of Record required on the Amendment from which the drawing showing corrective measures is to be submitted for approval.

   b. After the approval of the Commissioner has been obtained for the supplemental drawing(s), a copy of the approved Amendment and/or print of the drawing(s) stamped "Inspector's Copy," together with the original tracing of the drawing, will be filed by the Department of Environmental Protection as part of the permanent records of the Contract.

   c. After approval, copies of the drawing(s) will be issued to the Contractor and the work shall be installed in accordance with the drawings.

5. Cost of Additional Work:

   a. The cost of installing additional piles (as called for on the supplemental drawings for the corrective measures), shall be borne by the Contractor in the case of rejected, defective, damaged or misdriven piles.

   b. The cost will be borne by the City in the case of obstructed piles ordered by the Engineer abandoned or in the case of modifications required because of the presence of obstructions.

   c. Payment for corrective work necessitated by obstructed piles will be made in accordance with the applicable unit prices.

J. Rejected Piles

1. A sudden decrease in driving resistance which cannot be correlated with subsurface data or pile driving event may be a cause for rejection, unless pile is removed for inspection and found to be undamaged.

2. When any pile exceeds the installation tolerances specified in Article 3.02E, it may be rejected.

3. When any driven pile has been so injured in driving (due to causes other than obstructions encountered) as to be, in the opinion of the Engineer, unsuitable, or otherwise does not conform to the requirements of the Contract, such piles shall be rejected.

4. Rejected piles shall be cutoff at an elevation as directed by the Engineer or removed from the site by the Contractor.

K. Additional Piles

1. Additional piles shall be installed in locations designated by the Engineer to replace rejected piles, at no additional cost to the City

L. Withdrawn Piles

1. Piles driven in locations, other than in the permanent work, shall be removed, with the approval of the Engineer, after completion of driving. Such piles, if undamaged, may be reused.

2. The Contractor shall also remove piles driven in the permanent work for inspection of tips, if so ordered by the Engineer.

3. If the Contractor removes any piles driven in the permanent work for his convenience, for the prosecution of the work, or for any other reason, except at the direction of the Engineer, he shall replace such piles at no additional cost to the City.

4. Where piles are withdrawn, the pile hole shall be backfilled with clean granular fill.

M. Foundation Piles

1. All piles, within the area of uniform subsurface conditions pertaining to a given load-tested pile of satisfactory performance, shall be installed to the same or greater penetration resistance (or static load) as the successful load -tested pile, and shall bear in or on the same bearing stratum as the load tested pile.

2. The same equipment (or heavier equipment of the same type) that was used to install the load tested pile shall be used to install all other building piles, and the equipment shall be operated identically.

3. All piles shall be of the same type, shape, external dimension, and equal or greater cross-section as the load tested pile.

3.03 FIELD TESTING / QUALITY CONTROL

A. Inspection

1. All inspections will be performed by the Engineer designated for controlled inspection.

2. The driving of each pile is a mandatory hold point for which prior notification of the Engineer is required, and driving of each pile shall be performed in the presence of the Engineer. Driving records will be kept by the Engineer.

3. The Contractor shall cooperate with the Engineer in determining the resistance to penetration and shall mark each pile before driving as required by the Engineer.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Damaged or Misplaced Piles

B. All damaged or misplaced piles shall be removed or abandoned, and new piles shall be driven as directed by the Engineer at no cost to the City. Voids remaining from pulled piles shall be filled with clean granular fill at the Contractor's expense.

C. Abandoned piles shall be cut off one foot below cutoff elevation as specified herein or as shown on the Contract Drawings

D. All damaged piles and cutoff sections shall be removed from the site by the Contractor.

END OF SECTION

SECTION 32 12 16 - ASPHALT PAVING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide asphaltic concrete pavement roads and walks constructed on properly prepared subgrades and in conformance to the required lines, grades and cross sections shown on the Contract Drawings.

B. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. Not used

1.06 QUALITY ASSURANCE

A. The paving mix manufacturer shall be registered with and approved by NYSDOT.

B. Sub-base materials shall comply with the testing and certification requirements of Section 31 23 23 – Fill.

C. Recycled Portland Cement Concrete Aggregate shall comply with the procedures contained in the Geotechnical Control Procedure (GCP-17) "Procedure for the Control and Quality Assurance of Granular Materials: as per NYSDOT Standards and Specifications section 733-07.

D. Geotextile fabric manufacturer shall be approved by NYSDOT.

E. Manufacturers shall comply with ASTM D3666.

1.07 SUBMITTALS

A. The Contractor shall submit shop drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. Geotextile

a. Manufacturer's literature including physical, mechanical and chemical properties of the geotextile.

b. Certification of geotextile's minimum MARVs and tests used to determine those properties.

c. Certificate of Compliance stating that the geotextile conforms to the Specifications and the manufacturer is aware of and agrees with its intended use.

d. Geotextile manufacturer's qualifications: ISO 9001 certified or equivalent.

e. Manufacturing quality control test results on geotextiles.

2. Asphalt Concrete

a. The bituminous mix design for both the binder course and the top course, which shall include the sources of all ingredient materials, Recycled Asphalt Pavement (RAP) content by weight, the penetration of the asphaltic cement and the percentages by weight and the number of pounds of each of the materials making up one batch.

1) The laboratory analysis of the bituminous mix and the laboratory compacted density.

3. Recycled Portland Cement Concrete Aggregate (RCA) Material

a. Name of location of all suppliers.

b. Certificate of compliance with standard specified for each source of material.

c. Prior to stockpiling or placing of materials at the job site, submit for approval samples representative of the material at the proposed

borrow source. In addition, submit documentation of the availability of the required material quantities at any proposed borrow source.

d. Certification by the material borrow source of the gradation as per ASTM D 422 for the gravel, RCA and any other materials being used. The minimum number of tests shall be determined by quantity of material placed, and reports of the test results shall be submitted promptly.

e. RCA shall also comply with the testing and certification requirements of Section 31 23 23 – Fill.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Materials delivered to the site shall be stored in a manner to prevent contamination and segregation.

B. Geotextile

1. Geotextile delivery, storage, and handling shall comply with the requirements of NYSDOT Standard Specifications Section 207-3.01.

2. Wrap geotextile in black protective wrap.

3. The geotextile rolls shall be labeled as per ASTM D4873.

4. Deliver, store and handle rolls in manner to prevent damage.

5. After unloading, inspect rolls for defects and damage.

6. Protective wrapping should not be removed until ready for installation. Do not leave covered rolls exposed to elements for more than 30 days unless additional heavy-duty waterproof cover is provided. At no time shall the geotextile be exposed to ultraviolet light for a period exceeding 14 days.

7. Store rolls off ground, protected from precipitation, ultraviolet radiation, strong chemicals, sparks and flames, temperatures in excess of 160 °F and other environmental conditions that could cause damage to geotextile.

8. Prevent damage to wrappings and geotextile.

9. Rolls should be deployed as closely as possible to the designated location to avoid dragging. Excessive stress and movement should be kept to a minimum.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer’s standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Geotextiles shall be as manufactured by:

1. Propex Fabrics, Chattanooga, TN;
2. TenCate Geosynthetics, Pendergrass, GA;
3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Geotextile: Provide geotextile fabric conforming to the requirements specified in this Section:

1. Woven high-performance/high-strength slit film polypropylene geotextile; individual slit films woven together in manner to provide dimensional stability relative to each other.
2. Resistant to ultraviolet degradation and biological and chemical environments normally found in soils.
3. Minimum Average Roll Values:

Property	Test Method	Units	Results
Wide Width Tensile Strength	ASTM D4595	kN/m (lbs/in)	31x30.6 (175 x 175)
Grab Tensile Strength	ASTM D4632	N (lbs)	1335 x 1335
Grab Elongation	ASTM D4632	Percent	15 x 15
Puncture Strength	ASTM D4833	N (lbs)	555 (125)
Mullen Burst	ASTM D3786	KPa (psi)	4475 (650)
Trapezoidal Tear	ASTM D4533	N (lbs)	530 x 530
Apparent Opening Size	ASTM D4751	mm	0.212
Permittivity	ASTM D4491	sec-1	0.06
Water Flow Rate	ASTM D4491	1/min/m^2 (gpm/ft^2)	200 (5)
UV Resistance (percent retained at 500 hours)	ASTM D4355	Percent	90

B. Provide asphaltic concrete pavement for roadways conforming to the requirements specified in this Section and to the following standards:

1. Sub-base Course of Recycled Concrete Aggregate as follows:

a. Sub-base material shall have a maximum particle size of 3-in. in any directions and a nominal size of 2-in.

b. Use materials with not more than 30 percent by weight of glass. May use a blend of at least 95 percent, by weight, of RCA, and free from organic and other deleterious material. This material shall not contain asphalt or brick.

c. If RCA is used, provide documentation showing that the material was obtained from a NYSDEC registered or permitted construction and demolition (C&D) debris processing facility as specified in Section 360-16.1 of 6NYCRR Part 360 "Solid Waste Management Facilities" and complying with the regulatory requirements and regulations of Section 31 23 23 – Fill. This material shall be procured from a NYSDOT approved source.

d. Sub-base material shall meet the specification material requirement and must be able to be placed and fine graded to the required tolerances. Should the sub-base course become unstable at any time prior to the placement of the overlying course, correct the unstable condition to the satisfaction of the Engineer at no additional cost to the City. Perform any required modification prior to placing the material on the grade.

e. A Geotextile shall be used to separate the sub-grade layer from the sub-base course.

2. Tack Coat: Asphalt emulsion per NYSDOT Standard Specifications, Sections 407 and 702.

3. Binder Course: Binder mixture as specified in the Contract Drawings per NYSDOT Standard Specifications, Sections 401, 402 and 702.

4. Top Course: Asphaltic concrete mixture as specified in the contract drawings per NYSDOT Standard Specifications, Sections 401, 402 and 702.

C. Walks: Provide asphaltic pavement for walks conforming to the requirements specified in this section and to the following standards:

1. Bottom Course: Asphaltic concrete mixture, NYSDOT Standard Specifications, Subsections 401-2.01 through 401-2.05, Table 401-1, Type 3

2. Wearing Course: NYSDOT Standard Specifications, Subsections 401-2.01 through 401-2.05, Table 401-1, Type 6F

3. Tack Coat: Asphalt emulsion, NYSDOT Standard Specifications, material designation 702-90

D. Asphaltic concrete shall contain not less than 30 percent reclaimed asphaltic pavement, as measured by weight, in accordance with New York City Local Law 71 of 2011.

E. Traffic and Parking Markings:

1. Colors: As shown on the Contract Drawings and in accordance with the MUTCD.

2. Conform to NYSDOT Standard Specifications Section 727 – Pavement Marking Materials.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Quality Control of Geotextile

1. Manufacturing Quality Control: Testing shall be performed at a laboratory accredited by GAI-LAP for tests required for the geotextile, at frequency exceeding ASTM D4354, with following minimum acceptable testing frequency:

Property	Test Method	Test Frequency sq m (sq ft)
Grab Tensile Strength	ASTM D4632	1/10,000 (100,000)
Grab Elongation	ASTM D4632	1/10,000 (100,000)
Trapezoidal Tear	ASTM D4533	1/10,000 (100,000)
Mullen Burst	ASTM D3786	1/10,000 (100,000)

2. Conformance Testing:

a. Upon delivery to site, Engineer will remove samples of geotextile and send to laboratory for testing.

b. Testing will be performed at a laboratory accredited by GAI-LAP in accordance with ASTM D4759, Practice A.

B. RCA Material

1. General: Provide materials for sub-base course that consist of sand, gravel, approved blast furnace slag, RCA, or stone that meet the requirements of this specification. Provide materials well graded from coarse to fine, and free from organic or other deleterious material. Any gravel material will be rejected if it is determined to contain any unsound or deleterious materials.

2. Testing: The Contractor shall retain the services of an independent materials testing laboratory to perform the following laboratory and field tests:

a. Gradation: Perform sieve analysis in accordance with ASTM/AASHTO procedures C136/T 27, T 88, T 311, T 89 or D 4318/ T 90. Report the following sieves for all tests: #200, #40, ¼ in., ½ in., ¾ in., 1 in., 1 ½ in., 2 in., 3 in.

b. Soundness: Provide material that complies with the soundness limits specified in the NYSDOT Standard Specifications. Material will be accepted on the basis of Magnesium Sulfate Soundness Loss after four (4) cycles performed according to NYSDOT Standard Specifications.

c. Plasticity: Determine plasticity using either of the following methods:

1. Plasticity Index: The Plasticity Index of the material passing the #40 mesh sieve shall meet the values of the Table 1. Determine the plasticity using AASHTO T 89 and ASTM D4318/AASHTO T 90.
2. Sand Equivalent: The sand equivalence of the granular material shall meet the values in Table 1. Determine sand equivalence using ASTM D2419 or AASHTO T 176.

d. Elongated Particles: Not more than 30 percent, by weight, of the particles retained on a ½-in. sieve shall consist of flat or elongated particles. A flat or elongated particle is defined as one which hast it greatest dimension more than 3 times its least dimension. Acceptance for this requirement will normally be based on a visual inspection. When the Engineer elects to test for this requirement, material with a percentage greater than 30 will be rejected.

e. Fractured Faces: When the Engineer elects to test for this requirement, Surface material shall have at least two fractured faces on 50 percent of the stone particles larger than ½ in. Base material shall have at least one fractured face on 50 percent of the stone particles larger than ½-in.

3. All materials used in construction, whether brought to the site or developed from on-site sources, shall be tested for gradation, optimum moisture-maximum density curve, and reports of the test results for each source shall be submitted promptly. The tests will be performed in conformance with the procedures contained in the appropriate NYSDOT publications and ASTMs listed in Section 1.04 - References.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 IMPLEMENTATION

A. The Resident Engineer shall conduct a pre-pave meeting in accordance with NYSDOT Standards and Specifications Section 402-3.

B. Full Depth Asphaltic Concrete Pavement

1. General: Asphaltic concrete pavement roads shall consist of

a. A layer of woven geotextile fabric,

b. A sub-base course,

c. A base course

d. A tack coat of asphalt emulsion,

e. An intermediate binder course of asphaltic concrete (close binder type),

f. A tack coat of asphalt emulsion, and

g. A top course of fine surface mix asphaltic concrete (top course).

2. Preparation of Subgrade:

a. Per Section 31 23 16 – Excavation, remove to a depth of 24 inches, top soil, boulders, muck, soft clay, spongy material and any other objectionable material and replace them with broken stone, sand and gravel or other approved fill to promote positive drainage.

b. On sites where it appears that there may be some areas containing objectionable materials, proof roll to locate the unsuitable materials.

c. Exercise care during stripping operations to prevent excessive disturbance to subgrade. Use lightweight dozers or grade-alls for low strength, saturated, noncohesive and low cohesive soils.

d. For extremely soft ground such as peat bog areas, do not over excavate surface materials to take advantage of root mat strength.

e. If vegetation is present, cut at ground surface and place sawdust or sand over stumps and roots extending above ground surface.

f. Scrape and fill subgrades, as necessary, and thoroughly consolidate them to the required lines and grades. Consolidate subgrades for pavements by means of a smooth steel-wheel roller having a nominal gross weight of not less than 10 tons, and exerting a minimum force of not less than 300 lbs/in of width on the compression roll faces, or approved equivalent.

g. Compact subgrade to not less than 75 percent relative density as determined by ASTM D4253, or not less than 95 percent of the maximum dry density as determined by ASTM D1557, as applicable.

h. In places where the use of a roller is impractical, compact subgrades with hand tampers weighing not less than 40 lbs. and having a face not exceeding 80 sq.in. in area.

i. Subgrade shall be prepared not less than 100 ft. in advance of the pavement to be immediately constructed.

3. Installation of Geotextile:

a. After subgrade has been prepared, place geotextile in same direction as the new roadway aggregate is being laid down.

b. Do not drag geotextile across subgrade. Place entire roll on subgrade surface and roll out smoothly. Remove wrinkles and folds by stretching and holding down with sandbags as required.

c. Join parallel rolls of geotextile as follows:

California Bearing Ratio (CBR)	Method of Joining
Over 2	300-450 mm (12-18 in) overlap
1-2	600-900 mm (24-36 in) overlap
0.5-1	900 mm (36 in) overlap or sewn
Less than 0.5	Sewn
All roll ends	900 mm (36 in) overlap or sewn

d. If the CBR of the subgrade is not known, join parallel rolls by sewing them together.

e. For subgrades with CBR less than or equal to 1, where the geotextile is to provide reinforcement, the geotextile shall be pretensioned in the following manner:

1) Proofroll with heavily loaded, rubber-tired vehicle. Wheel load of truck shall be equivalent to maximum expected for site. Vehicle to make at least four passes over first lift in each area of site.

2) Once design aggregate has been placed, use roadway prior to paving to prestress geotextile-aggregate system.

f. If required, the geotextile may be held in place prior to subbase placement with sandbags. The use of pins to anchor the geotextile will not be permitted, except at edges of existing pavement as specified below.

g. Do not place overlaps along anticipated primary wheel path locations. Place overlaps at end of rolls in direction of aggregate placement with previous roll on top.

h. When sewn seams are required, strength of seams shall be greater than or equal to 80 percent of tensile strength of unseamed geotextile as determined by same testing methods.

i. When placing woven geotextile on curves, fold or cut geotextile and overlap in direction of turn with previous fabric on top. Staple or pin folds in geotextile approximately 2 ft on center.

j. When geotextile intersects an existing pavement area, extend geotextile to edge of old system and anchor it by trenching and covering the edge of the fabric with stone, or staple or pin the fabric to the ground. For widening or intersecting existing roads where geotextiles have been used, excavate edge of roadway down to existing geotextile and sew the new geotextile to the existing geotextile, or overlap and staple or pin the new fabric to the old and into the ground.

k. Prior to covering, inspect geotextile for excessive damage, including holes, rips and tears.

1) If excessive defects are observed, repair affected area by placing new layer of geotextile over damaged area.

2) Extend new layer beyond damaged area the same distance as required for overlap of adjacent rolls.

l. End-dump base aggregate on previously placed aggregate. End dumping or tail-gate dumping of the aggregate directly on the geotextile will not be permitted.

1) For subgrades with CBR less than or equal to 1, limit pile heights to prevent possible subgrade failure.

2) Maximum placement thickness for subgrades with CBR less than or equal to 1 shall not exceed design thickness of road.

m. Spread and grade first lift of aggregate to 12 in. or to design thickness if less than 12 in. prior to compaction. Do not allow traffic on soft roadway with less than 8 in. of aggregate over geotextile, except 6 in. for CBR greater than or equal to 3.

n. Compact the sub-base course as specified in Paragraph D.2. Vibratory compaction shall not be used on the initial lift over the geotextile.

o. Perform construction parallel to road alignment.

p. Fill ruts formed during construction to maintain adequate cover over geotextile. Do not blade ruts down.

q. Place remaining base aggregate in lifts not exceeding 250 mm (10 in) in loose thickness and compact to specified density.

r. Equipment may operate on roadway without aggregate for geotextile installation under permeable bases if subgrade is of sufficient strength.

1) For soils with CBR less than or equal to 0.5, use lightweight construction vehicles for access on first lift.

2) Limit construction vehicles in size and weight to limit rutting in initial lift to 3 in.

3) If rut depths exceed 3 in, decrease construction vehicle size or weight or increase lift thickness.

s. Turning will not be permitted on first lift of base aggregate. Construct turn-outs at roadway edge to facilitate construction.

4. Sub-Base Course:

a. Spreading

1) Spread the No. 1 and No. 2 stone or RCA uniformly on the geotextile with shovels from piles along the side of the roadway or from dumping boards or by means of vehicles of approved design constructed especially for this purpose, but in no case dump the material directly on the geotextile.

2) The loose lift thickness shall be a minimum of 1.5 times the maximum particle size. The Contractor shall control the lift thickness, provided that the thickness shall not exceed the thickness limitations specified herein, for installation of aggregate over geotextile, and shall not exceed the maximum allowed according to the equipment classifications in Subparagraph 2, *Compaction Equipment* of Subsection 203-3.03.C, Compaction, of New York State Department of Transportation Standard Specifications, and the equipment meets all specified class criteria of that Standard.

3) Spread broken stone or RCA in sufficient quantity to provide the required thickness after rolling. The depth of stone shall be gauged by the use of cubical concrete blocks of the required thickness, or other approved means.

4) Remove all segregated fine or coarse stone and replace it with well graded stone.

5) Do not spread the broken stone or RCA over wet geotextile.

6) Do not place broken stone or RCA adjacent to manhole heads or other structures until such structures have been set to the required lines and grades.

b. Rolling and Filling

1) After the No. 1 and No. 2 stone or RCA mixture has been laid loose, thoroughly roll it with an approved smooth steel-wheel roller having a nominal gross weight of not less than 10 tons and exerting a minimum force of 300 lbs/in of width on the compression roll faces.

2) Start rolling longitudinally at the sides and proceed toward the center, overlapping on successive trips by at least one-half the width of a rear wheel. A minimum of 8 passes shall

be applied over each lift with the roller operating at a speed not exceeding 6 feet per second. Rolling shall be continued until there is no movement of the stone ahead of the roller.

3) After the sub-base is thoroughly compacted, as measured by the method described in Paragraph f, below, uniformly spread No. 4 stone over the compacted area from piles along the side of the roadway or from dumping boards. Broom the filler in and roll it dry until no more filler can be forced into the voids. Remove excess filler.

4) Do not lay over 500 lineal feet of the sub-base without it being rolled and thoroughly filled.

5) The maximum layer thickness prior to compaction shall be 12 in., and the final compacted thickness shall be as shown on the Contract Drawings. In confined areas as defined by the Engineer the maximum compacted layer thickness shall be 6 in.

6) Do not allow the surface of the completed sub-base to deviate more than ¼ inch in 5ft from the nearest point of contact nor more than 3/8-in in 18ft when tested by means of an 18ft straight-edge placed parallel to the centerline of the roadway.

7) If any irregularities develop in the surface during or after rolling of the sub-base, remedy them by loosening the surface and removing or adding broken stone or RCA as may be required, and follow by rolling the entire area, including the surrounding surface, applying filler and continuing rolling until the course is compacted satisfactorily to a uniform surface.

5. Base and Binder Courses:

a. Preparation: Clean the binder course of all dirt and loose material, thoroughly dry it and obtain the Resident Engineer's approval before laying the binder course.

b. Weather Limitations: Bituminous material or mixture shall not be applied on any soft surfaces, when the surface is wet, when the temperature of the surface on which the mixture is to be placed is below 45°F, or when other weather conditions would prevent proper construction of the pavement.

c. Forms: When side forms are required, accurately set them to line and grade and securely stake and brace them in place sufficiently to withstand all construction operations. Thoroughly clean and oil forms before use.

d. Spreading:

1) Dump the binder course into the hopper of the spreader. Spread and screed it immediately to the full width required for the pavement and to such a depth that, when rolled, the required thickness is obtained. The maximum allowable compacted thickness for binder shall be 4 in. The maximum allowable compacted thickness for base shall be 6in.

2) When the mixture is to be spread by hand, dump it on approved steel dump sheets outside of the area on which it is to be spread and immediately distribute it into place and spread it in a uniformly loose layer.

3) Remove material from areas which show an excess or lack of bituminous material or an inconsistent mix and fill with new material. Re-spread or otherwise rectify areas which show segregation to obtain a uniform mixture in the course.

4) Do not use mixture which has been over 45 minutes out of the mixer, or if longer, the mixture must be over 250^{o}F when spread.

5) Do not lay over 500 lineal feet of binder material without it being rolled and properly compacted.

e. Compacting:

1) 50 Series Compaction Method: Contractor shall compact HMA according to NYSDOT Standard Specifications Section 402-3.07A.

2) 60 Series Compaction Method: Contractor shall compact HMA according to NYSDOT Standard Specifications Section 402-3.07B.

3) 70 Series Compaction Method: Contractor shall compact HMA according to NYSDOT Standard Specifications Section 402-3.07C.

4) 80 Series Compaction Method: Contractor shall compact HMA according to NYSDOT Standard Specifications Section 402-3.07D.

6. Tack Coat:

a. Before spreading the binder course, spray the sub-base with an asphalt emulsion tack coat in the amount of 0.25 gallon per square yard. Allow the tack coat to cure until sticky or tacky. Renew and repair or replace damaged coating.

b. Tack coat shall be applied evenly by means of a truck having appropriate spray nozzles. All nozzles shall be kept free of clogs.

c. Paint contact surfaces of all curbing, gutters, manholes and adjacent pavement edges with the tack coat material.

d. Tack coat shall not be applied on a wet pavement surface or when the temperature is below 45° F.

7. Top Course:

a. Preparation:

1) Thoroughly clean the binder course of all loose and foreign material before the top mixture is delivered.

2) Apply a tack coat at a rate of 0.03 to 0.07 gallon per square yard as approved by the Engineer.

3) Do not lay mixture until the Engineer approves the binder course and determines in all cases whether the weather conditions are suitable to permit laying.

b. Weather Limitations: Bituminous material or mixture shall not be applied on any soft surfaces, when the surface is wet, when the temperature of the surface on which the mixture is to be placed is below 45° F, or when other weather conditions would prevent proper construction of the pavement

c. Forms: If at the time of laying the mixture, permanent side supports such as curbs, edgings or gutters have not been constructed, firmly fasten in place suitable side forms of wood or steel, true to line and grade. In all cases adequately support the sides of roadways until final compaction has been obtained and the mixture has hardened by cooling.

d. Spreading and Compacting:

1) Spread and compact the top course until it meets the compaction and surface requirements specified above for the binder course.

2) The Contractor shall have the same options for achieving the required compaction as given for the compaction of the binder course.

3) Do not lay over 500 lineal feet of top course material without it being rolled and properly compacted.

4) Do not use mixture which has been over 45 minutes out of the mixer, or if longer, the mixture must be over 250° F when spread.

e. Joints: Perform construction as near continuously as possible. Carefully make joints between old and new pavements, or between successive days' work, in a manner which will insure a thorough and continuous bond, as follows:

1) Cut back the edge of the old surface before recommencing the operation of laying, in order to present a fresh, clean surface for contact with the newly placed material.

2) Carefully employ hot smoothing irons to heat the old pavement sufficiently (without burning) to insure a proper bond.

f. Shoulders: If temporary forms are used, protect the edges of the finished roadway by placing and thoroughly compacting approved material to form shoulders along the roadway as shown on the Contract Drawings. Construct finished shoulders 1/4 inch above the elevation of the finished roadway edges.

g. If weather conditions necessitate delaying the installation of the top course for more than two days, the tack coat shall be reapplied to the binder course at the rate of 0.03 to 0.07 gallon per square yard as approved by the Engineer.

C. Mill and Overlay

1. Conform to NYSDOT Standard Highway Specifications, Section 490 for cold milling of existing pavement.

2. Milling shall conform to Section 02 41 10 – Demolition and Removals.

3. Conform to NYSDOT Standard Highway Specifications, Section 401, 402 and 702 for new top course.

4. Mill to the thickness shown in the Contract Drawings or as directed by the Engineer.

5. Follow requirements for Top Course as specified herein.

D. Walks

1. General: Asphaltic concrete pavement walks shall consist of

a. A binder course of asphaltic concrete (close binder type),

b. A tack coat of asphalt emulsion, and

c. A top course of fine surface mix asphaltic concrete.

2. Binder Course:

a. Before the binder course is laid:

1) Compact the subgrade thoroughly, so that the binder course, after compaction, will be found satisfactory when field tested.

2) Clean subgrade of all loose and foreign material, dry it, and obtain the Resident Engineer’s approval.

b. Paint contact surfaces of all curbing, gutters, manholes and adjacent pavement edges with an asphalt emulsion tack coat at the rate of

0.03 to 0.07 gallon per square yard as approved by the Resident Engineer.

c. Set forms, spread and compact the binder course as specified above for the binder course for roads.

d. Provide a binder course surface free from depressions exceeding 3/8-inch when tested with a 10-foot straight edge placed parallel with the center line of the walk.

3. Top Course:

a. Clean the binder course of all loose and foreign material before the top course mixture is delivered. Do not lay mixture until the Resident Engineer approves the binder course and determines in all cases whether the weather conditions are suitable to permit laying.

b. If at the time of laying the mixture, permanent side supports such as curbs, edging or gutters have not been constructed, fasten in place suitable side forms of wood or steel, true to line and grade. In all cases, adequately support the sides of walks until final compaction is obtained and until the mixture hardens.

c. Spread and compact the top course as specified for the binder course.

d. Provide a walk surface free from depressions exceeding 1/8-inch when measured with a 10-foot straight edge placed parallel with the centerline of the walk.

e. Perform construction as near continuously as possible. Carefully make joints between old and new pavements, or between successive days' work, in a manner which will insure a thorough and continuous bond, as follows:

1) Cut back the edge of the old surface before recommencing the operation of laying, in order to present a fresh, clean surface for contact with the newly placed material.

2) Carefully employ hot smoothing irons to heat the old pavement sufficiently (without burning) to insure a proper bond.

f. Paving procedure, including compaction requirements, shall be the same as specified above for the top course for roads.

E. Patching

1. As directed by Resident Engineer, remove and replace defective areas. Cut such areas and replace with fresh asphaltic concrete and compact to required density.

F. Pavement Marking

1. Clean with power and hand brooms.

2. Mark edges straight and uniform. Use two coats and comply with manufacturer's recommendations.

3.03 FIELD TESTING / QUALITY CONTROL

A. Pavement Density Testing/Monitoring

1. Contractor shall conduct the following pavement density monitoring operations depending on the pavement design compaction series indicated in the Contract Drawings:

a. 50 Series Compaction: Contractor shall extract pavement cores, in accordance with NYSDOT Section 402-3.08A, and deliver to the Regional Materials Laboratory in accordance with NYSDOT standard specifications Section 402-3.08E, for density testing.

b. 60 Series Compaction: Contractor shall monitor pavement density using density gauges in accordance with NYSDOT Standard Specifications Section 402-3.07B. The density gauges used to monitor pavement density shall follow the requirements specified in NYSDOT Standard Specification Section 402-3.07E. In addition to density gauge measurements, contractor shall extract pavement cores, in accordance with NYSDOT Standard Specifications Section 402-3.08A, and deliver to the Regional Materials Laboratory in accordance with NYSDOT Standard Specifications Section 402-3.08E, for density testing.

c. 70 Series Compaction: Contractor shall monitor pavement density using density gauges in accordance with NYSDOT Standard Specifications Section 402-3.07C. The density gauges used to monitor pavement density shall follow the requirements specified in NYSDOT standard specification section 402-3.07E.

d. 80 Series Compaction: Density testing is not required. Contractor shall place and compact HMA as per NYSDOT Standard Specifications Section 402-3.07D.

2. When required by the Engineer, furnish 4-inch diameter test samples cored from the binder course and from the completed pavement. The Engineer will choose the number of cores and the locations at which the cores shall be taken. Sample cores, when required, shall be taken for every 10,000 square feet of pavement and patch. Density test shall show that the sample is within 90 percent of the laboratory specimen. Replace with new mixture and refinish the areas of pavement so removed without additional compensation.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Cleaning and Protection

1. After paving, clear surfaces of excess asphaltic concrete and all foreign matter.
2. Protect new pavement until fully hardened.
3. Cover openings of drainage structures until permanent covers are placed.

END OF SECTION

SECTION 32 12 16.01 - ASPHALT PAVING FOR NYCDOT ROW
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide asphaltic concrete pavement roads and walks constructed on properly prepared subgrades and in conformance to the required lines, grades and cross sections shown on the Contract Drawings.

B. The following index of this Section is presented for convenience:

Article	Title	Section Page

1.05 DESCRIPTION

A. Not used.

1.06 QUALITY ASSURANCE

A. Paving mix manufacturer

1. Shall be registered with and approved by NYSDOT.
2. Shall meet the NYCDDC QA Mix Design, Laboratory, and Plant Acceptance Protocol, and shall maintain the required accreditations for NYCDDC Plant Acceptance.

B. Sub-base materials shall comply with the testing and certification requirements of Section 31 23 23 – Fill.

C. Manufacturers shall comply with ASTM D3666 - Standard Specification for Minimum Requirements for Agencies testing and inspecting road and paving materials.

1.07 SUBMITTALS

A. The Contractor shall submit shop drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. Asphalt Concrete

a. The bituminous mix design for both the binder course and the wearing course, which shall include the sources of all ingredient materials, Recycled Asphalt Pavement (RAP) content by weight, the penetration of the asphaltic cement and the percentages by weight and the number of pounds of each of the materials making up one batch.

b. The laboratory analysis of the bituminous mix and the laboratory compacted density.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Materials delivered to the Site shall be stored in a manner to prevent contamination and segregation.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not used

2.02 MATERIALS / EQUIPMENT

A. Provide asphaltic concrete pavement for roadways conforming to the requirements specified in this Section and to the following standards:

1. Concrete Base for Pavement per NYCDOT Standard Highway Specifications, Section 4.04.

2. Tack Coat: Asphalt emulsion, NYCDOT Standard Highway Specifications, Section 6.58.

3. Binder Course: Binder mixture Type 3, NYCDOT Standard Highway Specifications, Section 4.02.

4. Wearing Course: NYCDOT Standard Highway Specifications, Section 4.02.

B. Walks: Provide asphaltic pavement for walks conforming to the requirements specified in this Section and to the following standards:

1. Tack Coat: Asphalt emulsion, NYCDOT Standard Highway Specifications, Section 6.58.
2. Binder Course: Binder mixture Type 3, NYCDOT Standard Highway Specifications, Section 4.02.

C. Wearing Course: NYCDOT Standard Highway Specifications, Section 4.02. Asphaltic concrete shall contain not less than 30 percent reclaimed asphaltic pavement, as measured by weight, in accordance with New York City Local Law 71 of 2011.

D. Traffic and Parking Markings:

1. Colors: As shown on the Contract Drawings and in accordance with the MUTCD.
2. Conform to NYCDOT Standard Highway Specifications, Section 6.44 and NYCDOT Standard Typical Markings Specifications.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 IMPLEMENTATION

A. The Resident Engineer shall conduct a pre-pave meeting in accordance with NYSDOT Standards and Specifications Section 402-3.

B. Full Depth Asphaltic Concrete Pavement

1. General: Asphaltic concrete pavement roads shall consist of
   a. A concrete base for pavement,
   b. A tack coat of asphalt emulsion,
   c. An intermediate binder course of asphaltic concrete (close binder type),
   d. A tack coat of asphalt emulsion, and
   e. A wearing course of fine surface mix asphaltic concrete (top course).
2. Preparation of Subgrade:
   a. Per Section 31 23 16 – Excavation remove to a depth of 24 inches, top soil, boulders, muck, soft clay, spongy material and any other

objectionable material and replace them with broken stone, sand and gravel or other approved fill to promote positive drainage.

b. On sites where it appears that there may be some areas containing objectionable materials, proof roll to locate the unsuitable materials.

c. Exercise care during stripping operations to prevent excessive disturbance to subgrade. Use lightweight dozers or grade-alls for low strength, saturated, noncohesive and low cohesive soils.

d. For extremely soft ground such as peat bog areas, do not over excavate surface materials to take advantage of root mat strength.

e. If vegetation is present, cut at ground surface and place sawdust or sand over stumps and roots extending above ground surface.

f. Scrape and fill subgrades, as necessary, and thoroughly consolidate them to the required lines and grades. Consolidate subgrades for pavements by means of a smooth steel-wheel roller having a nominal gross weight of not less than 10 tons, and exerting a minimum force of not less than 300 lbs/in of width on the compression roll faces, or approved equivalent.

g. Compact subgrade to not less than 75 percent relative density as determined by ASTM D4253, or not less than 95 percent of the maximum dry density as determined by ASTM D1557, as applicable.

h. In places where the use of a roller is impractical, compact subgrades with hand tampers weighing not less than 40 lbs and having a face not exceeding 80 sq.in. in area.

i. Subgrade shall be prepared not less than 100 ft in advance of the pavement to be immediately constructed.

3. Installation of Concrete Base for Pavement

a. Concrete base for pavement shall meet the requirements of spec section 03 30 00 – Cast-In-Place Concrete and NYCDOT Standard Highway Specifications Section 4.04.

b. Concrete shall be placed, spread, internally vibrated, consolidated and struck off using methods and equipment approved by the Resident Engineer. Spreading by shovels will be permitted.

c. Concrete shall be deposited before the initial set has taken place, crosswise of the street, in as nearly a continuous operation as practicable, and with approved tools which will prevent segregation. It shall not be deposited in standing water and shall be thoroughly compacted to the required depth and against rails and structures.

d. Concrete shall have its top surface parallel to and at the required depth below the finished pavement surface.

e. The Contractor shall be required to furnish a minimum of three (3) hand operated immersion type vibrators to the job site, one of which shall be used as a backup for the other two. Immediately after concrete has been placed, the Contractor shall use the hand operated immersion type vibrators to thoroughly consolidate the concrete in areas against and along the face of forms, when used, and along curbs, street hardware, and other structures. Vibrators shall not come in contact with forms, shall not be used for moving concrete in the work, and in no case shall any vibrator be operated longer than 4 seconds in any one location.

f. Where a block pavement is to be laid on the concrete base it shall be finished to a surface that is not rough and where an asphalt pavement is to be laid the surface of the concrete shall be left roughened by transverse brooming, except within one (1') foot of joints which shall be finished smooth for the application of a reflective cracking membrane.

g. Concrete base in roadways shall be finished three (3) inches below the surface of the new asphaltic concrete wearing course and shall conform to the profile and cross section of finished asphaltic concrete wearing course within a tolerance of +1/4 inch throughout. Hand screeding and finishing of the concrete base will be permitted. The finished surface shall be struck uniformly and be free of ruts, depressions, bumps and unevenness, suitable for temporary use as a vehicular riding surface.

h. For the application of reflective cracking membrane under Item NYCDOT Standard Highway Specifications Section 6.91, the surface of the concrete base within one (1) foot of joints shall be finished smooth. No other hand finishing of the pavement will be required except to correct surface irregularities.

i. Transverse and construction joints shall be constructed as per the New York City Department of Transportation's Standard Details of Construction Standard Drawing Nos. H-1040 and H-1034. Construction joints will be required at paving stops and at other locations as directed by the Resident Engineer.

j. No traffic of any kind will be allowed on the concrete base until permitted by the Resident Engineer. Normally that shall be at least seven (7) days or at least seventy-two (72) hours for High Early Strength Concrete.

4. Tack Coat:

a. Before spreading the binder course, spray the bottom course with an asphalt emulsion tack coat in the amount of 0.25 gallon per square yard. Allow the tack coat to cure until sticky or tacky. Renew and repair or replace damaged coating.

b. Tack coat shall be applied evenly by means of a truck having appropriate spray nozzles. All nozzles shall be kept free of clogs.

c. Paint contact surfaces of all curbing, gutters, manholes and adjacent pavement edges with the tack coat material.

d. Tack coat shall not be applied on a wet pavement surface or when the temperature is below 45° F.

5. Binder Course:

a. Preparation: Clean the bottom course of all dirt and loose material, thoroughly dry it and obtain the Resident Engineer's approval before laying the binder course.

b. Weather Limitations: Bituminous material or mixture shall not be applied on any soft surfaces, when the surface is wet, when the temperature of the surface on which the mixture is to be placed is below 45°F, or when other weather conditions would prevent proper construction of the pavement.

c. Forms: When side forms are required, accurately set them to line and grade and securely stake and brace them in place sufficiently to withstand all construction operations. Thoroughly clean and oil forms before use.

d. Spreading:

1) Dump the binder course into the hopper of the spreader. Spread and screed it immediately to the full width required for the pavement and to such a depth that, when rolled, the required thickness is obtained. The maximum allowable compacted thickness for binder shall be 4 in.

2) When the mixture is to be spread by hand, dump it on approved steel dump sheets outside of the area on which it is to be spread and immediately distribute it into place and spread it in a uniformly loose layer.

3) Remove material from areas which show an excess or lack of bituminous material or an inconsistent mix and fill with new material. Re-spread or otherwise rectify areas which show segregation to obtain a uniform mixture in the course.

4) Do not use mixture which has been over 45 minutes out of the mixer, or if longer, the mixture must be over 250° F when spread.

5) Do not lay over 500 lineal feet of binder material without it being rolled and properly compacted.

e. Compacting:

1) Rake the mixture after spreading and immediately compress it thoroughly and uniformly by either of the following methods:

   a) Option A - Three-roller Compaction Train: Under this option, the binder course shall be initially rolled with an approved steel-wheel roller. The roller shall overlap the previous roller pass by one-half the width of the roller.

      (1) Immediately following the initial rolling, the course shall be rolled with an approved pneumatic rubber-tired roller. A minimum of three passes of the rubber-tired roller shall be made. One pass is defined as one movement of the roller over any point of the pavement in either direction.

      (2) Immediately following the intermediate rolling, the course shall be finish rolled with a steel-wheel tandem roller. This final rolling shall be both longitudinal and diagonal as directed by the Engineer and shall remove all shallow ruts and ridges and other irregularities from the surface. Rolling shall be continued until all roller marks are eliminated.

      (3) Under this option, the binder course shall not be compacted to a thickness in excess of 4 in. No rollers shall move at speeds in excess of 3 miles per hour unless otherwise approved.

   b) Option B - Vibratory Compaction: Under this option, the Contractor shall use vibratory compaction equipment appearing on the current Approved List - Bituminous Concrete Vibratory Compaction Equipment in the NYSDOT Standard Specifications. The Contractor may substitute one vibratory roller in lieu of the initial roller and the pneumatic roller in the conventional three-roller compaction train stipulated under Option A. Under this option, the course shall be finish rolled with a steel-wheel tandem roller having a minimum weight of 8 tons. This finish roller shall add a minimum of two passes closely following the vibratory roller or as directed by the Engineer.

(1) One vibratory roller and one steel-wheel tandem roller shall be provided for each nominal 12-foot width of paving. Dual vibrating drum rollers meeting the requirements of a steel- wheel tandem roller and operating in the static mode may be used as the finish roller. However, this single vibratory roller shall not be used as both the initial roller and the finish roller.

2) To prevent adhesion of the mixture to the roller, keep the drum properly moistened with water. Drums must have working water spray nozzles to keep drums moistened.

3) Compact material thoroughly with hot irons or damp vibratory tampers along curbs, headers, manholes and similar structures and at all places not accessible to the roller.

4) Remedy depressions which develop before the completion of the rolling by loosening the laid mixture and adding new mixture to bring such depressions to a true surface. Should any depressions remain after the final compaction has been obtained, remove the full depth of the mixture, replace it with new mixture, and reroll it to form a true and even surface. Correct all high spots, waves, bunches and honeycombing, to the satisfaction of the Engineer.

5) Remove and replace with new material areas that are unbonded after rolling, areas containing drippings, areas that are fat or lean, and areas evidencing defective construction of any description.

6) Do not allow the surface of the completed binder course to deviate more than 1/16 in/ft from the nearest point of contact nor more than 1/4 in. maximum when tested longitudinally with an 18-foot straight edge placed parallel to the centerline of the roadway.

7) After final compression, the finished course shall at no point have a density less than 95 percent, as measured by a nuclear density meter, of the laboratory compacted density.

6. Wearing Course:

a. Preparation:

1) Thoroughly clean the binder course of all loose and foreign material before the top mixture is delivered.

2) Apply a tack coat at a rate of 0.03 to 0.07 gallon per square yard as approved by the Engineer.

3) Do not lay mixture until the Engineer approves the binder course and determines in all cases whether the weather conditions are suitable to permit laying.

b. Weather Limitations: Bituminous material or mixture shall not be applied on any soft surfaces, when the surface is wet, when the temperature of the surface on which the mixture is to be placed is below 45°F, or when other weather conditions would prevent proper construction of the pavement

c. Forms: If at the time of laying the mixture, permanent side supports such as curbs, edgings or gutters have not been constructed, firmly fasten in place suitable side forms of wood or steel, true to line and grade. In all cases adequately support the sides of roadways until final compaction has been obtained and the mixture has hardened by cooling.

d. Spreading and Compacting:

1) Spread and compact the wearing course until it meets the compaction and surface requirements specified above for the binder course.

2) The Contractor shall have the same options for achieving the required compaction as given for the compaction of the binder course.

3) Do not lay over 500 lineal feet of wearing course material without it being rolled and properly compacted.

4) Do not use mixture which has been over 45 minutes out of the mixer, or if longer, the mixture must be over 250°F when spread.

e. Joints: Perform construction as near continuously as possible. Carefully make joints between old and new pavements, or between successive days' work, in a manner which will insure a thorough and continuous bond, as follows:

1) Cut back the edge of the old surface before recommencing the operation of laying, in order to present a fresh, clean surface for contact with the newly placed material.

2) Carefully employ hot smoothing irons to heat the old pavement sufficiently (without burning) to insure a proper bond.

f. Shoulders: If temporary forms are used, protect the edges of the finished roadway by placing and thoroughly compacting approved material to form shoulders along the roadway as shown on the Contract Drawings. Construct finished shoulders 1/4 inch above the elevation of the finished roadway edges.

g. If weather conditions necessitate delaying the installation of the wearing course for more than two days, the tack coat shall be reapplied to the binder course at the rate of 0.03 to 0.07 gallon per square yard as approved by the Engineer.

C. Mill and Overlay

1. Conform to NYCDOT Standard Highway Specifications, Section 6.75.
2. Mill to the thickness shown in the Contract Drawings or as directed by the Engineer.
3. Follow requirements for Wearing Course as specified herein.
4. Milling shall conform to Section 02 41 10 – Demolition and Removals.

D. Walks

1. General: Asphaltic concrete pavement walks shall consist of
   a. A bottom course of asphaltic concrete (close binder type),
   b. A tack coat of asphalt emulsion, and
   c. A wearing course of fine surface mix asphaltic concrete.
2. Bottom Course:
   a. Before the bottom course is laid:
      1) Compact the subgrade thoroughly, so that the bottom course, after compaction, will be found satisfactory when field tested.
      2) Clean subgrade of all loose and foreign material, dry it, and obtain the Resident Engineer's approval.
   b. Paint contact surfaces of all curbing, gutters, manholes and adjacent pavement edges with an asphalt emulsion tack coat at the rate of 0.03 to 0.07 gallon per square yard as approved by the Resident Engineer.
   c. Set forms, spread and compact the bottom course as specified above for the binder course for roads.
   d. Provide a bottom course surface free from depressions exceeding 3/8-inch when tested with a 10-foot straight edge placed parallel with the center line of the walk.
3. Wearing Course:
   a. Clean the bottom course of all loose and foreign material before the wearing course mixture is delivered. Do not lay mixture until the Engineer approves the bottom course and determines in all cases whether the weather conditions are suitable to permit laying.

b. If at the time of laying the mixture, permanent side supports such as curbs, edging or gutters have not been constructed, fasten in place suitable side forms of wood or steel, true to line and grade. In all cases, adequately support the sides of walks until final compaction is obtained and until the mixture hardens.

c. Spread and compact the wearing course as specified for the bottom course.

d. Provide a walk surface free from depressions exceeding 1/8-inch when measured with a 10-foot straight edge placed parallel with the centerline of the walk.

e. Perform construction as near continuously as possible. Carefully make joints between old and new pavements, or between successive days' work, in a manner which will insure a thorough and continuous bond, as follows:

1) Cut back the edge of the old surface before recommencing the operation of laying, in order to present a fresh, clean surface for contact with the newly placed material.

2) Carefully employ hot smoothing irons to heat the old pavement sufficiently (without burning) to insure a proper bond.

f. Paving procedure, including compaction requirements, shall be the same as specified above for the wearing course for roads.

E. Patching

1. As directed by Engineer, remove and replace defective areas. Cut such areas and replace with fresh asphaltic concrete and compact to required density.

F. Pavement Marking

1. Clean with power and hand brooms.

2. Mark edges straight and uniform. Use two coats and comply with manufacturer's recommendations.

3.03 FIELD TESTING / QUALITY CONTROL

A. Pavement Samples

1. When required by the Engineer, furnish 4-inch diameter test samples cored from the binder course and from the completed pavement. The Engineer will choose the number of cores and the locations at which the cores shall be taken. Sample cores, when required, shall be taken for every 10,000 square feet of pavement and patch. Density test shall show that the sample is within 90 percent of the laboratory specimen. Replace with new mixture and refinish the areas of pavement so removed without additional compensation.

B. The Contractor shall meet the sample coring requirements of the New York City Department of Transportation (NYCDOT) Highway Rules, Title 34 Chapter 2, Rules of the City of New York.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Cleaning and Protection

1. After paving, clear surfaces of excess asphaltic concrete and all foreign matter.
2. Protect new pavement until fully hardened.
3. Cover openings of drainage structures until permanent covers are placed.

SECTION 32 14 13 – PRECAST POROUS CONCRETE PANEL
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified, and required to furnish, install, and test all Precast Porous Concrete Panels (PPCPs) complete.

B. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. Not Used.

1.06 QUALITY ASSURANCE

A. The precast porous concrete panels must be supplied by a manufacturer having at least five (5) years of experience in the production and sale of porous concrete panels.

B. Quality Control Plan must be furnished by the Contractor and must receive approval from the Engineer at least five (5) working days prior to commencing any work.

1. The plan must include, but is not limited to, horizontal and vertical layout of the work, methods for the installation of the edge restraints, the methods for placing of the broken stone leveling course (base) and the placing of the panels.

2. A review of the Contractor's Quality Control installation plan will be done at a pre-construction meeting with the Contractor, the Contractor's panel installer mechanic/subcontractor, the panel manufacturer's representative (if present on the site) and the Engineer.

C. The Contractor shall review and comply with the manufacturer's handling and installation requirements including any required training, if applicable.

1.07 SUBMITTALS

A. The Contractor shall submit shop drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. Action Submittals (submitted prior to the Pre-Construction Meeting):

a. Installation plan showing layout of each precast porous concrete panel with identification mark intended for installation.

b. Individual slab drawings detailing lifting points in surface, reinforcing, finishes, and all dimensions.

c. Narrative of shipping, handling, and protection procedures.

B. Test results performed by an independent AASHTO Materials Reference Laboratory (AMRL) accredited testing laboratory of the following:

1. Density and void content results in accordance with ASTM C1688 Standard Test Method for Density and Void Content of Freshly Mixed Pervious Concrete, and

2. Flexural strength test results in accordance with ASTM C78 Flexural Strength of Concrete. Three (3) saw-cut concrete beams prepared specifically for testing purposes as per ASTM C78, with the same concrete mix and reinforcing characteristics would be representative of a full-size panel. Changes in reinforcement configuration for testing purposes will

not be permitted. The Contractor must submit a drawing for approval of the concrete beams intended for testing with all the reinforcing and lifting hook placements indicated. No end caps on the beams intended for testing will be permitted. One percent (1%) of the total number of panels intended for the entire project will be tested for compliance with the specifications.

3. Infiltration rate of Precast Porous Concrete Paving Panels in accordance with ASTM C1701 Standard Test Method for Infiltration Rate of In-Place Pervious Concrete. One percent (1%) of the total number of panels intended for the entire project will be tested for compliance with the specifications.

C. Particle size analysis in accordance with ASTM C136 for the open-graded stone leveling course with approved source(s) of supply noted.

D. Test method procedures to conduct percolation rate testing after installation in accordance with ASTM C1701 Test Method for Infiltration Rate of In-Place Pervious Concrete. The submittal must include information related to the testing apparatus being used (infiltration rings) for approval by the City.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery of the precast porous concrete panels must be coordinated so as not to interfere with other construction in the project to avoid delays.

B. Precast porous concrete panels must be handled per manufacturer recommendations which were included in the approved submittal.

C. Offloading of panels must be performed by trained and experienced equipment operators. Extra care must be taken while offloading the panels due to their unique structural characteristics. A forklift or similar machine with forks must be used to offload. Chains, cables, or slings must not be wrapped around slabs and only the lifting points must be utilized.

D. Precast porous concrete panels must be visually inspected for completeness, texture, and consistency with the approved shop drawings and the installation drawings. Minor spalls and cracks will be the basis for rejection. Defective panels will be inspected by the Engineer and the decision will be made at his sole discretion.

E. Panels must be stored such that they are kept free from mud, dirt, grass cuttings, accumulation of foliage and debris at all times.

F. Panels must not be exposed unsecured to vehicular and pedestrian traffic. Skid steer and forklift equipment must be kept off unsecured paving panels.

G. Geogrid, geofabrics, crushed stone, and liner materials must be kept clean and prepared for installation.

H. Stored panels must be placed on a level or nearly level paved surface. In dusty environment, panels must be covered to prevent dust and debris from settling on panel surfaces.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. Precast Porous Concrete Panel

1. Concrete average unit weight shall be 120 lb./ft.3 (+/- 4%). The average core compressive strength of the precast porous concrete panels must be a minimum of 2,000 psi at 28 days per ASTM C42. The manufacturer must cure the precast porous concrete panels. The precast porous concrete panels shall have a minimum infiltration rate of 250 inch/hr when tested in accordance with ASTM D1701.

2. Refer to the Contract Drawings for precast porous concrete panel dimensions, thickness, and reinforcing requirements. The precast porous concrete panels supplied shall be of the type(s) shown in the Contract Drawings.

3. Fiber reinforcement shall be utilized to achieve the panel design load requirements. Reinforcing shall be a product on the New York State Department of Transportation Approved Materials, Equipment, Methods and Procedures List, Material Code 711-01.

4. Minor adjustments of the limits of work will be considered by the Engineer to reduce the number of panels less than full length to eliminate cutting. Smaller lengths shall only be used where necessary and appropriate to accommodate utilities and overall alignment or as shown on the Contract Drawings.

5. Installation of precast porous concrete panels shall be in strict accordance with the manufacturer's recommendations, all information contained in this specification, and related contract drawings.

6. Permanent lifting points shall be embedded in the panel surface for unloading, handling, installation, maintenance, removal, and reinstallation purposes. Refer to Contract Drawings for lifting point locations. Shop drawings are required. All panels shall be provided with lifting point protection caps and approved lifting swivels for use in covering the embedded lifting points. Any altered unit shall include a minimum of two

(2) permanent lifting points.

7. Precast porous concrete panels shall have a minimum average Flexural Strength of 400 psi when tested in accordance with ASTM C78. Panels shall not be shipped until they have achieved 85% of the minimum flexural strength or higher as determined by the lab test results submitted. The void content shall be from 15% to 25%, conforming to ASTM C1688.

8. Each individual precast porous concrete panel shall be weighed, and the unit shall be labelled with the weight, size, and date of manufacture.

9. All panels shall be provided with spacers preventing slab to slab contact, as required by the manufacturer.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Use

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. General:

1. Before panels are installed, the Contractor shall ensure that all materials and preparation for subbase and edge restraints are installed in accordance with Contract Drawings and specifications and accepted by the Engineer.

2. Do not damage drainpipes, underdrains, observation wells, roadway boxes, manholes, or any other utilities during installation. Report any damage immediately to the Engineer. All damage shall be replaced or repaired as part of the bid price of this item by the Contractor at no additional cost to the city.

B. Subgrade Preparation:

1. The subgrade under the clean open graded stone course (subbase) shall not be compacted.

2. Prepared subgrades under all infiltration areas shall not be compacted and shall not be subjected to construction equipment traffic. Where erosion has caused accumulation of sediment or ponding on the subgrade, remove sediment with light equipment and/or manually. Scarify the underlying soils to a minimum depth of six-inches (6”) with a York-type rake or equivalent equipment to the satisfaction of the Engineer.

3. Restore any subgrade areas damaged by erosion, ponding, or traffic compaction to design line and grades prior to installation of geogrid and clean open graded stone.

4. Any excess thickness of material placed over the soil subgrade to trap

sediment transported by runoff from adjacent construction areas shall be removed before placement of geogrid and storage reservoir layer. Keep area where precast porous concrete panels are to be installed free of sediment during the entire construction period. Any materials that are contaminated with sediment shall be removed and replaced with clean materials.

C. Low Carbon Cast-in-Place Concrete Header

1. Low Carbon Cast-in-place concrete header shall comply with Section GI-PPCP-CH and shall be placed prior to the placement of the geogrid or open graded stone base.

D. Microgrid:

1. Microgrid shall comply with Section GI-PPCP-MG.

E. Stacked Drainage Cells:

1. Stacked drainage cells shall comply with Section GI-PPCP-DC.

F. Biaxial Geogrid:

1. Biaxial Geogrid shall comply with Section GI-PPCP-BXG.

G. Clean Open-Graded Stone Base:

1. Clean open-graded stone base shall comply with Section GI-2.07.

2. Clean open-graded stone base shall be compacted to at least 95% Modified Proctor relative compaction per ASTM D1557. A minimum 200-pound walk- behind plate compactor shall be used on each lift of six-inches (6”). Compaction using the plate compactor shall include four (4) passes in each direction longitudinally along length of the trench.

3. The surface tolerance of the compacted clean open-graded stone base shall be a maximum of +/- three-quarter inch (¾") under a ten (10) foot straightedge in all directions.

4. Verify that the open-graded stone base, as shown on the Contract Drawings, has been properly placed within the trench and compacted as approved and accepted by the Engineer before the leveling course is placed.

5. Place and spread leveling course stone evenly over screed rails to achieve a thickness of two inches (2”) minimum. Level the surface of leveling course stone with a screed, it shall not be compacted.

6. The surface tolerance of the screed leveling course shall be a maximum of a +/- one-quarter inch (¼") under a ten (10) foot straightedge in all directions. The cost of any additional stone beyond the limits shall be borne by the Contractor at no additional cost to the city.

7. Once installed, Contractor shall not disturb screeded leveling course.

3.02 INSTALLATION

A. PPCP Placement

1. Precast porous concrete panels shall not be placed in heavy rain or snow or on a saturated or frozen base.

2. Precast porous concrete panels shall only be lifted and placed using swivels and spreader chains. Chains, cables, or slings should never be wrapped around the panel for lifting under any circumstances. Swivels shall be securely bolted snug but not over-tightened to avoid damage to the surface of the panel.

3. Contractor shall keep skid steer, forklift, and all other heavy equipment off all unrestrained panels.

4. Lay panels in pattern(s) shown on approved shop drawings layout plan. Cut panels to complete installed length and pattern on approved shop drawings.

5. Contractor is responsible for installing precast porous concrete panels according to the manufacturer's requirements for proper handling and installation.

6. To prevent any damage to panel edges, Contractor shall place panels with the joint size specified without using metal hammers, pry bars or drift pins. Horizontal adjustments to the placement of laid slabs shall be made with wood wedges and levers, and rubber mallets as needed. Joint widths and lines shall be continually evaluated and straightened as necessary as paving proceeds to the satisfaction of the Engineer.

7. Panels shall be placed parallel to the adjacent low carbon cast-in-place header as per approved shop drawings. Any adjustments shall be made at the curb for irregular alignment.

8. Unless otherwise directed, adjacent slabs shall be separated from each other by one-eighth inch (1/8") to provide open joints between panel slabs of one- eighth inch (1/8") wide using spacers provided by the manufacturer of the panels to ensure proper joint spacing. No joints shall exceed one-eighth inch (1/8") in width unless otherwise directed by the Engineer in writing.

9. Panel to panel joints shall be left open. No stone or sand is to be placed in joints.

10. Horizontal joint lines along header shall not deviate more than ± one-half inch (½") over 50 feet from reference string lines.

11. The precast porous concrete panels shall be installed so that there is no lippage or surface unevenness greater than one-eighth inch (1/8") difference in height between panels and adjacent surfaces.

12. Contractor shall complete any gaps at the edges of the paved area with

panels cut according to manufacturer's requirements for minimum panel dimensions. Cut panels to meet installation dimensions as indicated on the approved panel layout shop drawings. End panels to be placed along the edge or corners shall be cut with a masonry saw. Cut units shall be no shorter than one-quarter (1/4) of a whole panel length and shall still retain the minimum number of lifting points required.

13. Contractor shall protect adjacent panels' surfaces from dust infiltration when cutting panels.

14. Contractor shall finish outside edge joints as indicated on the approved installation plan with approved joint filler material.

15. After an area is completely paved, Contractor shall complete a final setting of the precast porous concrete panels into the screed leveling course layer by trafficking with light-weight rubber-tired equipment approved by the Engineer.

16. Contractor shall remove and replace any panels cracked or damaged during installation with equivalent replacement panels. Contractor shall all reset panels not in conformance with specified installation tolerances to the satisfaction of the Engineer.

    a. Hairline cracks (1/8" or smaller) with no vertical or horizontal displacement of panels shall be considered as to not interfere with the proper functioning or performance of the system and are acceptable when immediately repaired upon observation per manufacturers recommendation. Where approved by the Engineer, larger cracks (1/8" or larger) with no vertical displacement may be repaired under the direction of the manufacturer. Any cracked panels with horizontal displacement of greater than 1/4" or a vertical displacement of any size shall be replaced.

    b. The repairs shall be properly finished and cured. The color of the repair area shall match as closely as possible with the rest of the panel color. Repairs shall be made with a mixture of self-leveling polyurethane sealant for horizontal applications and cement, as directed by the manufacturer.

17. Contractor shall warranty as noted in Schedule A of the Contract from the date of the initial acceptance of the installation that all installed panels are free of rocking or pumping as evidenced by visible vertical movement. Any panels observed to be moving or displacing shall be removed, the screeding leveling course re-screeded, and the panels reset and/or replaced if cracked.

18. Contractor shall verify and report to the Engineer in writing that the final surface elevations of the set panels are in conformance with the Contract Drawings. The final surface tolerance from grade elevations shall not deviate more than ± one-eighth inch (1/8") under a ten-foot (10')

straightedge.

19. The surface elevation of set panels shall be flush with all manholes and the top of utility structures.

B. Edge Restraint

1. Edge restraints installed at exterior sides of precast porous concrete panels pavement shall be as follows:

2. Edge restraints shall be furnished and installed under the following concrete items: Concrete Header, Section GI-PPCP-CH, Concrete Curb, Section GI- PPCP-CC, or GI Concrete Elements, Section GI-4.06, and as shown on the Contract Drawings.

3. Expansion joint material shall be placed per Contract Drawing details between edge restraints and panels. Cost to be included in the cost of the panels.

4. Manufacturer: Expansion Joint Material shall be from a manufacturer listed in the current New York State Department of Transportation's approved list of Pre-Molded Resilient Joint Fillers.

5. Material Standards for Expansion Joint Material shall comply with the requirements of Section 2.15, Type IV, in the New York City, Department of Transportation, Standard Highway Specification, current edition, and shall be either one-quarter inch (¼") or one-half inch (½") thick, as directed by the Engineer.

6. Backer rods and polyurethane joint filler shall be provided on the curb side. Joint filler consisting of closed cell foam backer rod and polyurethane non- sag elastomeric sealant such as Sikaflex –2c NS TG, Akonaflex Expansion joint filler, or approved equal shall be used.

3.03 FIELD TESTING / QUALITY CONTROL

A. Acceptance

1. Prior to acceptance by the City for Substantial Completion, the Contractor shall conduct percolation rate testing every hundred (100) linear feet of gutter but no less than three (3) per section of gutter in accordance with ASTM C1701. All testing shall be done in coordination with and in the presence of the Engineer.

2. Testing locations will be chosen at the Engineer's discretion and in accordance with the ASTM requirements.

3. Contractor shall submit testing results within seven (7) days after the completion of testing. The Contractor shall review testing results with the City of New York. Precast porous concrete panels with infiltration rates below the minimum infiltration rate of 150 inches per hour prior to Substantial Completion shall undergo corrective action (such as cleaning the failed panel, or cleaning the entire gutter run, or replacement of the

failed panel) prior to the City issuing Substantial Completion.

4. After corrective action has taken place, then one other panel in the same contiguous length of porous gutter will be randomly selected by the Engineer and tested to ensure that the gutter meets the specified infiltration rate. If the selected panel fails to meet that rate, then the whole length of the gutter shall be cleaned again, and the testing process repeated until passing results are obtained.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. PROTECTION

1. Immediately after precast porous concrete panels have been placed, insert plastic caps in lifter holes as provided.

2. After work in this section is complete, the Contractor will be responsible for protecting the precast porous concrete panel system from damage and/or contamination during the remainder of work on site. The surface of the precast porous concrete panels shall be completely covered during the placement of adjacent soils or paving materials in a manner approved by the Engineer.

B. Maintenance:

1. The Contractor shall conduct periodic maintenance and cleaning for the duration of the guarantee period after Substantial Completion.

2. Frequency of cleaning: At a minimum, during the guarantee period the Contractor shall conduct cleaning as described below:

a. Towards the end of the Spring pollen season (typically June-July)

b. Towards the end of the Fall leaf falling season (typically December-mid January)

c. Just prior to end of the guarantee period, unless the porous concrete panels were last cleaned within 120 calendar days.

C. Infiltration rate testing, in lieu of cleaning and maintenance, during the guarantee period will not be acceptable.

1. Procedures for Maintenance and Cleaning:

a. The Contractor shall remove all visible sediment deposits. Where sediment has accumulated in areas surrounding and/or upstream of the precast porous concrete panel system and may enter the porous concrete, the Contractor shall also remove such visible sediment deposits.

b. The Contractor shall use vacuum cleaning, regenerative air machines

equipped with a specialized vacuum head that includes high pressure water nozzles. Walk behind and handheld equipment are not acceptable for use. This maintenance shall remove sediment and debris that has clogged or blocked voids in the precast porous concrete panel.

c. Sediment and debris shall be sufficiently removed after cleaning to allow the porous pavement to infiltrate stormwater runoff. This may require multiple passes of cleaning to meet the desired post-cleaning infiltration rate, as discussed below.

d. After cleaning of the precast porous concrete panel system and no later than three calendar (3) days after cleaning, the Contractor shall conduct percolation rate testing every hundred (100) linear feet of gutter but no less than three (3) per section of gutter in accordance with ASTM C1701. All testing shall be done in coordination with and in the presence of the Engineer.

e. Testing locations will be chosen at the Engineer's discretion and in accordance with the ASTM requirements.

f. The Contractor shall provide testing results to the City of New York within seven (7) days after the completion of testing. The Contractor shall review testing results with the City. Precast porous concrete panels with infiltration rates below the minimum infiltration rate of 150 inches per hour specified shall undergo corrective action (such as further cleaning or replacement).

g. After corrective action has taken place, then one other panel in the same contiguous length of porous gutter will be randomly selected by the Engineer and tested to ensure that the gutter meets the specified infiltration rate. If the selected panel fails to meet that rate, then the whole length of the gutter shall be cleaned again, and the testing process repeated until passing results are obtained.

h. Cleaning will be deemed sufficient only if the minimum of 150 inch/hr infiltration rate required by the city has been met. The City will conduct field inspections to ensure the proper condition and performance of the precast porous concrete paving panel system. Visual inspections and infiltration tests will be used to determine the performance of porous concrete. If based on visual inspections and/or the test results reviewed by the Engineer, the City determines that the Contractor's performance of maintenance work is insufficient, the Contractor will submit a revised method or schedule for the maintenance of precast porous concrete paving panels. The Contractor shall perform subsequent corrective maintenance work at no additional cost to the City.

i. The Contractor shall responsibly decant dirty water in accordance

with DEP regulations.

j. The equipment information, operating procedures including disposal, and schedule for maintenance work shall be submitted to the City at least 45 calendar days prior to start of maintenance and cleaning. Maintenance and cleaning cannot begin until approved by the Engineer.

END OF SECTION

NO TEXT ON THIS PAGE

SECTION 32 14 13 PRECAST POROUS CONCRETE PANEL
EXHIBIT A
REF. SECTION GI-2.07 — CLEAN OPEN GRADED STONE

GI-2.07.1 INTENT

This section describes the types of clean open graded stone also described as stone cover or open-graded stone base in the NYC DEP Standard Design and Guidelines for Green Infrastructure Practices drawings.

All materials for this work must comply with the latest New York State Department of Transportation, Standard Specifications, Coarse Aggregate, Section 703-02. The stone must be washed and 3/4", 3/8", 1 1/2" and 2" to 5" in sizes.

The thicknesses and locations of the clean open-graded stone must be as shown on the Contract Drawing Details, the NYC DEP Standard Designs and Guidelines for GI or as determined by field conditions and ordered by the Engineer.

GI-2.07.2 MATERIALS

Use of screened rounded gravel is prohibited.

All clean open graded stone material acceptable under this section must be sound, hard, durable, unweathered stone freshly broken. All open graded stone must be double-washed and clean and free of all fines and debris, not contaminated with clay, and free from any organic or other deleterious material.

Table GI-2.07-1 – Sizes of Open Graded Stone

Size	Nominal Size	US Standard Sieve Sizes (Percent Passing)													
		5 in	4 in	3½ in	3 in	2½ in	2 in	1½ in	1 in	¾ in	½ in	3/8 in	No. 4	No. 8	No. 16
A	3/8 in. to No. 8	-	-	-	-	-	-	-	-	-	100	85 to 100	10 to 30	0 to 10	0 to 5
B1	¾ in.	-	-	-	-	-	-	-	100	0 to15	-	-	-	-	-
B2	¾ in. to 3/8 in.	-	-	-	-	-	-	-	100	90 to 100	20 To 55	0 to15	0 to 5	-	-
C	1½ in.	-	-	-	-	-	100	0 to 15	-	-	-	-	-	-	-
D1*	2 in. to 5 in.	100	85 to 100	80 to100	0 to 90	0 to 35	0 to 25	0 to 10	0 to 5		-	-	-	-	-

*Type D Stone requires 50% minimum porosity

Clean open graded stone of all types must be aggregate size per **Table GI-2.07-1**. Thickness, widths and all dimensions must be as shown on the standard details and Contract Drawings or as otherwise directed by the Engineer. All open graded stone must be properly compacted. The types of aggregate used for each Green Infrastructure Asset will be as per the following **Table GI-2.07-2**:

Table GI-2.07-2 - Types of default clean open graded stone choices unless otherwise specified on drawings or as directed by the Engineer:

GI Use	Course	Stone Type
Porous Concrete Panels	Screed / Leveling	A
	Base	B1
Permeable Pavers	Screed / Leveling	B2
	Base	C
Porous Asphalt	Screed / Leveling	C
	Reservoir/Asphalt Sub–Base	B1
Bio Swales, & Infiltration Basins	Base	D1
	Leveling	B1
Rain Gardens & Green Strips	Base	D1
	Leveling	B1
	Stone Strip Bed	B2
Bio Filter Inlet	Broken Stone Berm	C
Stone Column	Infill	Match GI asset-type base material

GI-2.07.3 SUBMITTALS

(A) The Contractor, prior to the start of work, must submit to the Engineer for approval samples of the clean open graded stone that have been sampled in accordance with the requirements of ASTM D 75. The minimum size of sample must be in accordance with the requirements of ASTM D 75 – TABLE 1 Minimum size of Field Samples.

Certified material test reports showing that the clean open graded stones meet the specified requirements must be submitted for each shipment and identified with specific lots prior to installing materials. Clean open graded stones used in the work must conform to the approved samples.

(B) The manufacturer must submit certified test date to cover each shipment of the material.

(C) Results of the coarse aggregate gradation analyses, with full reporting of all information in AASHTO sieve sizes, in accordance with the ASTM C 136.

(D) Results of the porosity analyses, with full reporting of all information, in accordance with the ASTM C 29.

(1) The "% voids" calculation result of ASTM C29 denotes the volume of voids over the total volume of aggregate, which is porosity, and must be reported and illustrated as such in the respective submittals

(2) A minimum 50% porosity is required.

GI-2.07.4 CONSTRUCTION METHODS

(A) Weather Consideration

(1) Do not place and/or compact clean open graded stone subbase in rain or snow, or on saturated or frozen subgrade.

(2) Do not place and/or screed clean open graded stone base in rain or snow, or on saturated or frozen subbase.

(B) Stockpiling and Sampling of clean open graded stone Reservoir and Leveling Course Aggregate

(1) All material must be stockpiled, unless otherwise directed. Stockpile construction requirements, sampling, testing and acceptance/rejection procedures must be as stipulated in the New York State Department of Transportation Section 703-02 – Coarse Aggregate.

(2) No material must be added to a stockpile after the stockpile has been sampled for approval. Only material from approved stockpiles must be placed on the subgrade for this section. The presence of any oversize particles in the stockpile will be cause for rejection of the entire stockpile. No material must be removed for use from any stockpile until the stockpile has been sampled, tested, and approved in writing, by the Engineer, for placement on the subgrade. Contractor must furnish suitable and approved excavating equipment for such sampling. Approval of a stockpile for placement on the subgrade must not relieve, in any degree, the full responsibility of the Contractor to furnish, in its compacted position, a subbase course of select granular materials, the final condition of which conforms to all the requirements of the specifications for this section. In the event the Contractor must have a plant or procedure resulting in subbase course material of uniform quality, at a rate satisfactory to the Engineer, and such that satisfactory samples for tests can be obtained, the requirement for stockpiling may be waived. Prior approval of the Engineer must be obtained and the work must be done in accordance with such conditions as may be imposed in the approval. Such waiver must remain in force only so long as a satisfactory material is produced.

(C) Subgrade Preparation

(1) The Subgrade under the clean open graded reservoir course (subbase) must not be compacted or permanently covered with geotextile, unless otherwise shown on the Contract Drawings or directed by the Engineer.

(2) Prepared subgrades must not be subject to construction equipment traffic.

(3) Where erosion has caused accumulation of sediment or ponding on the subgrade, remove sediment with light equipment and/or manually. Scarify the underlying soils to a minimum depth of 6 inches with a York type rake, or equivalent equipment.

(4) Restore any subgrade areas damaged by erosion, ponding, or traffic compaction to design line and grades prior to installation of storage reservoir course (layer).

(D) Installation of Reservoir Course (Subbase)

(1) The Reservoir Course Subbase will be installed per specification to the thicknesses and width shown on the contract drawings and as directed by Engineer.

(2) Place 1-1/2" (nominal) size open graded stone, over the prepared subgrade and spread and level evenly by raking to the dimensions shown on the Contract Drawing details. Do not disturb prepared subgrade or shift, wrinkle or fold the geotextile fabric and/or impermeable liner, and place as shown on the Contract Drawings.

(3) The open graded stone reservoir course material must be spread in equal thickness layers. The spreading of any layer of this material must be done with spreader equipment approved by the Engineer, and to such thickness that the maximum depth of the layer, after compaction, will be 6 inches. Spreading from piles dumped on the roadway will not be permitted. No segregation of large or fine particles will be allowed, but the material, as spread, must be well graded, with no pockets of fine material. Water must be added in such amounts as the Engineer may consider necessary to obtain satisfactory compaction.

(4) Compact layers with an approved vibrating plate compactors or impact rammers until there is no visible movement, weaving or deflection in the surface of the clean open graded stone reservoir course. All the equipment must be approved by Engineer with regards to adjacent structures.

(5) The surface tolerance of the compacted clean open graded stone reservoir course must be + 3/4 in. under a 10-ft straightedge.

(6) The Contractor must assume full responsibility for any contamination and/or degradation of any part of this base during construction and must, at the Contractor's own expense, remove any and all portions of this base which do not conform to the requirements of these specifications and replace these portions with specified material.

(E) Installation of Open Graded Stone Base

(1) The Open Graded Stone Base will be installed per specification to the thicknesses and width shown on the Contract Drawings and as directed by Engineer.

(2) The Open Graded Stone Base must be placed in equal thickness layers. Prior to backfilling with Open Graded Stone Base the subgrade of the Green Infrastructure Asset must be scarified to ensure no compaction. The placing of any layer of this material must be done so by gravity with no additional compaction to ensure the required porosity, or void content, is maintained. No segregation of large or fine particles will be allowed, but the material, as placed, must be well graded, with no pockets of fine material.

(3) The Contractor must assume full responsibility for any contamination and/or degradation of any part of this base during construction and must, at the Contractor's own expense, remove any and all portions of this base which do

not conform to the requirements of these specifications and replace these portions with specified material.

(F) Installation of Leveling Course (Screed Base Course)

Installation of all screed leveling courses with material specified above will be installed to the thicknesses and widths shown on contract drawings and Standard DEP GI Details.

Before installation of leveling course verify that the open graded stone base, as shown on the Contract Drawings, has been properly placed within the trench and compacted as approved and accepted by the Engineer.

In no case must a leveling course be less than two (2”) inches thick for Precast Porous Panels and six (6”) inches thick for pavers used in the roadway.

The cost of all leveling courses must be paid per the unit price herein.

SECTION 32 14 13 PRECAST POROUS CONCRETE PANEL
EXHIBIT A
REF. SECTION GI-4.06 – GI CONCRETE ELEMENTS

GI-4.06.1 INTENT

This section describes the concrete elements associated with Green Infrastructure Practice. The Contractor must install concrete as shown on the NYC DEP Standard Design and Guidelines for Green Infrastructure Practices drawings. The GI Concrete Elements may be either Precast or Poured In Place.

GI-4.06.2 PHYSICAL REQUIREMENTS

(A) Concrete elements must comply with the requirements of NYC Department of Transportation Standard Highway Specifications, Subsections 4.05.3, 4.05.4. and 4.05.5, and Section 4.14.

(B) Unless otherwise specified grout must be Cement Grout composed of neat cement and water and must comply with the requirements of Section 3.06 of the NYC Department of Transportation Standard Highway Specifications.

(C) The minimum acceptable average compressive strength of three samples is 4000 psi, with no individual less than 4000 psi. The maximum acceptable average freeze/thaw loss of five- block samples, subjected to 42 freeze/thaw cycles in a 3% NaCl solution, must not exceed 1.0%, with no individual sample exceeding 1.5%.

(D) Batching, mixing and placing of concrete must conform to ASTM C94 “Specification for Ready-Mix Concrete” and ACI 304 “Guide for Measuring, Mixing, Transporting and Placing Concrete”. All materials must be pre-weighed prior to mixing. Concrete must obtain a minimum compressive strength of 4,000 psi at 28 days of age. Concrete must contain 6% entrained air by volume (plus or minus 1%).

(E) Fabrication and placement must conform to ACI-318 “Building Code Requirements for Structural Concrete and Commentary”.

GI-4.06.3 METHODS

(A) All concrete elements must be furnished and installed as per the NYC DEP Standard Design and Guidelines for Green Infrastructure Practices drawings. It must be designed and constructed to fit as shown in the plans and to conform to site conditions, so that no gaps or hazards exist once the concrete is installed.

(B) All equipment and methods of construction must comply with the requirements of the NYC Department of Standard Highway Specifications, Subsections 4.05.4. and 4.05.5, and Section 4.14 with the following modifications and additions:

(1) For installations in existing pavement, the Contractor must be required to first full- depth saw cut and remove the pavement to the dimensions of the concrete elements shown on the Contract Drawings and directed by the Engineer. The Contractor must then backfill the excavated area to ensure that the concrete element will be placed to its proper elevation with foundation material which must comply with the requirements of Subsection 4.05.2(A) of the NYC Department of Transportation Standard Highway Specifications.

The earth subgrade, immediately before foundation material is placed on it, must be compacted to a minimum of 95 percent of Standard Proctor Maximum Density, smooth, parallel to and at the required depth below the finished concrete element surface and be dampened with water sufficient only to be absorbed by the subgrade. The subgrade must not be in a muddy or frozen condition and unsuitable material must be removed and replaced with acceptable material thoroughly compacted.
The foundation material must be placed on the prepared subgrade, in a manner to minimize segregation, using equipment and procedures approved by the Engineer. Uncontrolled spreading from piles dumped on the grade resulting in segregation will not be permitted. Foundation material must then be wetted to the optimum moisture content, based on a laboratory Proctor density test, and thoroughly compacted using an approved plate compactor. Compaction of foundation material must range between 90% and 95% of the Standard Proctor Maximum Density, as directed by the Engineer, depending upon material used.
Unsatisfactory subgrade material must be removed and replaced with acceptable material thoroughly compacted to a minimum of 95% of Standard Proctor Maximum Density. The top surface of the foundation material must be parallel to the finished grade and at a distance below the grade equal to the specified thickness of concrete.

(2) Following the placing and spreading of concrete, it must be struck-off and finished to conform to the cross-sections shown on the Contract Drawings. The final finish must be made by brooming after the water sheen has disappeared as per the requirements for Bus Stop Pavements, Section 4.05.5(K)(2) of the NYC Department of Transportation's Standard Highway Specifications.

(3) Contractor must furnish and install a welded wire fabric as per the NYC Department of Environmental Protection's Standard Design and Guidelines for Green Infrastructure Practices. The welded steel wire fabric must be laid in sheets which are straight and true to form and must be securely held in position by approved methods so that they will be in their prescribed position after the concrete has been placed.

(C) Dimensions must be as required in the contract documents. Dimensions must not vary by more than 1/4 inch from those specified. Concrete elements must be sound and free from cracks or other defects that would interfere with their proper placement or performance.

(D) Prior to installation, the subgrade must be compacted and carefully graded such that the concrete element will be seated flush on the subgrade, at the proper elevation and slope as shown on the Contract Drawings.

(E) Joint filler must comply with Section 2.15 of the NYC Department of Transportation Standard Highway Specifications.

GI-4.06.4 PRECAST CONCRETE ELEMENTS

Where shown in the NYC DEP Standard Design and Guidelines for Green Infrastructure, the precast concrete must be constructed in accordance with the

following requirements:

(A) Fabrication

(1) Precast concrete elements must be fabricated to conform to the shapes and sizes shown on the Contract Drawings.

(2) The Contractor must provide the Engineer with shop drawings and detailed construction procedures for the concrete element. Shop drawings must show the form dimensions and location and type of reinforcement in the precast concrete elements. The drawings must be delivered to the Engineer for approval ten (10) working days before fabrication is to begin. No work must begin until the drawings are approved.

(3) The tolerance on placement of welded steel wire fabric in the concrete element must be ± 1 inch. The chairs, spacers or other devices used to maintain the welded steel wire fabric in position must have rust resistant tips. The cost of any welded steel wire fabric required to transport the precast concrete elements must be deemed included in the cost of these items.

(4) Concrete must be consolidated in the forms by internal vibrators. Exposed surfaces must be free from objectionable imperfections, such as honeycomb and air voids as determined by the Engineer. If air voids collect at the interface of the concrete and forms, the forms must be tapped on the outside with rubber mallets or similar devices to displace the entrapped air.

(B) Curing

(1) The precast concrete elements may be cured as per the requirements for cast in place concrete.

(2) If the concrete elements are steam cured, the elements must be cured in an enclosure free from outside drafts, and cured in a moist atmosphere. The temperature must be maintained at a temperature between 125 degrees and 160 degrees F. by the injection of steam for a period of not less than 12 hours. Steam curing must not begin less than 2 hours from the time that the last concrete was placed. Care must be taken by the Contractor to prevent localized “hot spots” caused by the steam lines. A continuous temperature time recorder is required for each enclosure. The temperature of the curing atmosphere for any method must not be increased or decreased at a greater rate than 40 degrees F. per hour.

(C) Repair

(1) Where approved by the Engineer, occasional imperfections in manufacture or those caused by mishandling may be repaired. The repairs must be properly finished and cured. The color of the repaired area must match as closely as possible with the rest of the element color. Repairs may be made with a mixture of sand and cement, and must be made to the satisfaction of the Engineer.

(D) Basis of Acceptance

The precast concrete element must be accepted at the job site based on all of the following:

(1) The manufacturer's name must appear on the NYS Department of Transportation's Approved List of "Precast Concrete Manufacturers Approved for QC/QA Production" for either Product Group 1, 2, or 4.

(2) A manufacturer's certification.

(3) An acceptable product evaluation made by the Engineer.

GI-4.06.5 SUBMITTALS

(A) Manufacturer must have experience in design and fabrication of similar products and with facilities for fabricating the concrete elements with the quality specified herein and without delay to the specified schedule.

For Precast Concrete Elements, the Contractor must furnish: Shop drawings, in accordance with the requirements of Subsection 1.06.13. of the NYC Department of Transportation Standard Highway Specifications. Engineering layout drawings will be provided for approval and to assist field installation. The drawings will include dimensions, identification and location of each trench part in the trench layout along with a bill of material.

SECTION 32 14 13 PRECAST POROUS CONCRETE PANEL
EXHIBIT A
REF. SECTION GI-PPCP-BXG — BIAXIAL GEOGRID

GI-PPCP-BXG.1 INTENT

This section describes the installation of the BIAXIAL GEOGRID. The purpose of the biaxial geogrid is to improve the structural integrity of the precast porous concrete panels. This is accomplished by confining and distributing load forces by providing soil base reinforcement.

GI-PPCP-BXG.2 DESCRIPTION

Under this section, the Contractor must furnish and install the biaxial geogrid in accordance with the Contract Drawings, the specifications, the NYC DEP Standard Design and Guidelines for Green Infrastructure Practices, current edition, and as directed by the Engineer.

GI-PPCP-BXG.3 SUBMITTALS

(A) The contractor, prior to the start of work, must submit to the Engineer for approval two
(2) labeled samples of the biaxial geogrid in accordance with the requirements of Sections 1.06.13 and 1.06.31 of the NYC DOT Standard Highway Specifications, current edition. The label must include the manufacturer's product name, the type of fabric, and the weight of grade of the material. Biaxial geogrid used in the work must conform to the approved samples.

(B) Certified material test reports showing that the biaxial geogrid meet the specified requirements must be submitted for each shipment and identified with specific lots prior to installing materials. Material test reports must meet the requirements of the criteria outlined herein.

(C) The manufacturer must submit certified test date to cover each shipment of material.

GI-PPCP-BXG.4 MATERIALS

(A) References

(1) American Society for Testing and Materials (ASTM) and other testing standards, in any case the Current Edition will be the reference:

a. ASTM D4355 Standard Test Method for Deterioration of Geotextiles by Exposure to Light, Moisture, and Heat in a Xenon Arc-Type Apparatus

b. ASTM D4759-11 Standard Practice for Determining the Specification Conformance of Geosynthetics

c. ASTM D5818-11 Standard Practice for Exposure and Retrieval of

Samples to Evaluate Installation Damage of Geosynthetics

d. ASTM D6637 Standard Test Method for Determining Tensile Properties of Geogrids by the Single or Multi-Rib Tensile Method
e. ASTM D7748 Test Method for Flexural Rigidity of Geogrids, Geotextiles and Related Products
f. ASTM D7864 Standard Test Method for Determining the Aperture Stability Modulus of Geogrids

(B) Chemical and Physical Requirements

(1) The biaxial geogrid must be defined as a system that allows for long-term, adequate liquid flow normal through the biaxial geogrid with limited flow loss across the plane of the grid. The biaxial geogrid must exhibit high tensile strength in both longitudinal and transverse directions.

(2) The biaxial geogrid must have a Mid-Rib Width of 0.14 inches and a minimum Radial Stiffness @ 0.5% Strain of 321 kN/m (22,000 lb./ft.) when tested in accordance with ASTM D6637 and a Flexural Rigidity of 2,100,000 mg-cm when tested in accordance with ASTM D7748.

(3) The biaxial geogrid must have an Ultraviolet Degradation of 100% when tested in accordance with ASTM D4355. Biaxial Geogrid must be manufactured using an extrusion process resulting in a polypropylene sheet that is specifically shaped to create a triplanar reinforcing structure that produces a large, concave-shape rib. High profile ribs and junctions must be so configured to interlock and distribute stress of the loads above the grid onto the base below.

(4) Minimum Average Roll Value (MARV): Property value calculated as typical minus two (2) standard deviations. Statistically, it yields a 97.7 percent degree of confidence that any sample taken during quality assurance testing will exceed value reported. Typical Roll Value is represented by (TRV).

(5) The biaxial geogrid must have no tears or defects which adversely alter its physical properties. The biaxial geogrid must be inert to biological degradation and must be resistant to naturally encountered chemicals, alkalis, and acids.

Table GI-PPCP-BXG – Biaxial Geogrid Technical Characteristic Requirements

Technical Characteristics	**Units**	**MD Values[1]**	**XMD Values[1]**
Rib Pitch[2]	mm (in)	32 (1.26)	32 (1.26)
Minimum Rib Thickness	mm (in)	2.5 (0.1)	2.1 (0.08)
Rib Shape		Inverted T Beam	Rectangular

Table GI-PPCP-BXG – Structural Integrity Requirements of Biaxial Geogrid

Description	Units	MD Values
Aperture Stability[3]	N-m/deg	0.45
Overall Flexural Rigidity[4]	mg-cm	2,100,000
Radial Stiffness at low stain @ 0.5% Strain[5]	kN/m (lb./ft.)	321 (22,000)

Table GI-PPCP-BXG – Durability Requirements of Biaxial Geogrid

Description	Units	MD Values
Resistance to Installation Damage[6]	%SC / %SW / %GP	95 / 96 / 90
Resistance to Long Term Degradation[7]	%	100
Resistance to UV Degradation[8]	%	100

Table Notes:

1. Unless indicated otherwise, values shown are minimum average roll values determined in accordance with ASTM D4759-11. Machine direction is presented as (MD). Cross machine direction is presented as (XMD).

2. Nominal dimensions.

3. Resistance to in-plane rotational movement measured by applying a 20 kg- cm (2 m-N) movement to the central junction of a 9-IN x 9-IN specimen restrained at its perimeter in accordance with ASTM S7864-15.

4. Resistance to bending force determined in accordance with ASTM D7748, using specimens of width two (2) ribs wide, with transverse ribs cut flush with exterior edges of longitudinal ribs, and of length sufficiently long to enable measurement of the overhang dimension.

5. Radial stiffness is determined from tensile stiffness measured in any in-plane axis from testing in accordance with ASTM D6637/D6637M-15, tolerance +/- 2%.

6. Resistance to loss of load capacity or structural integrity when subjected to mechanical installation stress in clayey sand (SC), well graded sand

(SM), and crushed stone classified as poorly graded gravel (GP). The geogrid shall be sampled in accordance with ASTM D5818-11 and load capacity shall be determined in accordance with ASTM D6637.

7. Resistance to loss of load capacity or structural integrity when subjected to chemically aggressive environments.

8. Resistance to loss of load capacity or structural integrity when subjected to ultraviolet light and aggressive weathering.

GI-PPCP-BXG.5 CONSTRUCTION METHODS

(A) Each biaxial geogrid roll must be wrapped with an overlaying material that will protect the material, including the ends of the roll, from damage due to shipment, water, sunlight, and contaminants. The protective wrapping must be maintained during periods of shipment and storage. During storage, rolls must be elevated off the ground and adequately covered to protect them from the following: site construction damage, precipitation, extended ultraviolet radiation including sunlight, chemicals that are strong acids or strong bases, and any environmental condition that may damage the physical property values of the geogrid.

(B) Excavation must be made to dimensions enough to accommodate placement of the biaxial geogrid, clean open graded stone, drainage cells, microgrid geotextile and leveling course with precast porous concrete panels. Any overcut underlying soil must be removed from the excavation and the bottom must be compacted **only** as specified and required elsewhere. The extra depth will be filled with clean open graded stone materials as required after installation of geogrid. No additional payment will be made for extra clean open graded stone used to compensate for overcut subbase. Where applicable, temporary support must be provided for trench walls to prevent it collapse when directed by the Engineer. The contractor must protect the pavement section at the saw cut line along the roadside.

(C) Prior to installation of biaxial geogrid, the drainage cells must be set in their final configuration as approved by the Engineer. If the biaxial geogrid is damaged during installation, the damaged section(s) must be removed, and the damaged area must be covered with a patch of new fabric which will overlap the undamaged fabric with twelve
(12) inches in all directions. The Contractor must make such repair work as directed by the Engineer at no extra cost to the city. Overlaying material must be placed within the same work shift whether the fabric is subject to damage from sunlight or not.

SECTION 32 14 13 PRECAST POROUS CONCRETE PANEL
EXHIBIT A
REF. SECTION GI-PPCP-CH — CAST-IN-PLACE CONCRETE HEADER

GI-PPCP-CH.1 INTENT

This section describes construction of a flared CAST-IN-PLACE CONCRETE HEADER. The purpose of the concrete header is to contain the precast porous concrete panel system.

GI-PPCP-CH.2 DESCRIPTION

Under this section, the Contractor must install the flared cast-in-place concrete header in accordance with the Contract Drawings, the specifications, the New York City Department of Environmental Protection Standard Designs and Guidelines for Green Infrastructure Practices, current edition, and as directed by the Engineer.

(A) Cast-in-place concrete header must be:

(1) Dimensioned in accordance with specifications, Contract Drawings, and directions of the Engineer.

(2) Constructed to the lines and grades as shown on the NYC Department of Environmental Protection Standard Design and Guidelines for Green Infrastructure.

(3) Installed over a well-compacted subgrade unless otherwise noted.

(4) Installed vertically and horizontally level with 0” reveal from the final finished adjacent asphalt grade. The top of the cast-in-place concrete header must be a medium broom finish as directed.

(B) Cast-in-place concrete header expansion joints must be spaced at fifteen (15) feet maximum spacing.

GI-PPCP-CH.3 MATERIALS AND METHODS

All materials and methods must comply with the requirements of Sections 6.09.3 and 6.09.4, as appropriate, in the NYC Department of Transportation Standard Highway Specifications, current edition, except as follows:

(A) Header dimensions as per Contract Drawings

(B) Depth as shown on the Contract Drawings

SECTION 32 14 13 PRECAST POROUS CONCRETE PANEL
EXHIBIT A
REF. SECTION GI-PPCP-DC — STACKED DRAINAGE CELLS

GI-PPCP-DC.1 INTENT

This section describes the installation of the polyethylene STACKED DRAINAGE CELLS. The purpose of the STACKED DRAINAGE CELLS is to provide subsurface storage for stormwater management.

GI-PPCP-DC.2 DESCRIPTION

Under this section, the Contactor must furnish and install all STACKED DRAINAGE CELLS in accordance with the Contract Drawings, the specifications, the New York City Department of Environmental Protection Standard Designs and Guidelines for Green Infrastructure Practices, current edition, and as directed by the Engineer.

GI-PPCP-DC.3 REFERENCES

(A) STACKED DRAINAGE CELLS must conform to the latest standards of the American National Standards Institute (ANSI), the American Society for Testing and Materials (ASTM), and the American Water Works Association (AWWA) as applicable.

(B) STACKED DRAINAGE CELLS must conform to the following ASTM standards:

(1) ASTM D1248 Standard Specification for Polyethylene Plastics Extrusion Materials for Wire and Cable

(2) ASTM D2321 Standard Practice for Underground Installation of Thermoplastic Pipe for Sewers and Other Gravity-Flow Applications

(3) ASTM D2412 Standard Test Method for Determination of External Loading Characteristics of Plastic Pipe by Parallel-Plate Loading

(4) ASTM D6088 Standard Practice for Installation of Geocomposite Pavement Drains.

(5) ASTM D7001 Standard Specification for Geocomposites for Pavement Edge Drains and other High-Flow Applications

(6) ASTM F2418 Standard Specification for Polypropylene (PP) Corrugated Wall Stormwater Collection Chambers

GI-PPCP-DC.4 QUALITY CONTROL

(A) Contractor must have manufacturer's representative available for site review if requested by the Engineer.

GI-PPCP-DC.5 DELIVERY, STORAGE, AND HANDLING

(A) Protect STACKED DRAINAGE CELLS and other materials from damage during delivery, and store UV sensitive materials under tarp to protect from sunlight when time from delivery to installation exceeds two weeks. Storage of materials should be on smooth surfaces, free from dirt, mud, and debris.

(B) Handling is to be performed with equipment appropriate to the materials and site conditions, and may include hand, handcart, forklifts, and extension lifts.

(C) Cold weather:

(1) Care must be taken when handling plastics when air temperature is 40 degrees or below, as plastic becomes brittle.

(2) Contractor must not use frozen materials or materials mixed or coated with ice or frost.

(3) Contractor must not build on frozen ground or wet, saturated, or muddy subgrade.

GI-PPCP-DC.6 PRE-INSTALLATION CONFERENCE

(A) Prior to the start of the installation, a pre-installation conference must occur with the representatives of the Engineer, the Contractor, the excavation contractor, the STACKED DRAINAGE CELLS installation contractor, and the manufacturer's representative.

GI-PPCP-DC.7 PROJECT CONDITIONS

(A) Contractor must coordinate installation of the STACKED DRAINAGE CELLS with other on-site activities to eliminate all non-installation related construction traffic over the completed stacked drainage cell system. In no case at any time must loads heavier than the design loads of the panel type being installed be allowed over the system.

(B) Contractor must protect adjacent work from damage during the installation of the STACKED DRAINAGE CELLS.

(C) Contractor is responsible for any damage to the system during construction.

GI-PPCP-DC.8 SUBMITTALS

(A) All submittals must be submitted prior to purchase and must be made in accordance with the requirements of the NYC Department of Transportation Standard Highway Specifications, General Conditions, Subsections 1.06.13 and 1.06.31, current edition.

(B) Contractor must submit catalog data for STACKED DRAINAGE CELLS and other appurtenances.

(C) Drawings must include typical section details as well as the minimum cover requirements and STACKED DRAINAGE CELLS configuration.

(D) Contractor must submit manufacturer's product data, including compressive strength and unit weight.

(E) Contractor must submit the manufacturer's protection recommendations and installation instructions.

(F) Contractor must submit product sample for review. Reviewed and accepted samples will be kept on site for comparison purposes and will not be returned to the Contractor.

GI-PPCP-DC.9 CHEMICAL AND PHYSICAL REQUIREMENTS

(A) Drainage cell units must be injection molded plastic cells stacked to form a 90% void modular structure of predesigned height. The STACKED DRAINAGE CELLS must be as uniform as commercially practicable in color, capacity, density, and other physical properties.

Table GI-PPCP-DC – Stacked Drainage Cell Requirements

Property	Description	Value
Void Area	Volume available for water storage	90%
Surface Void Area	Percentage of exterior available for infiltration	90%
Compressive Strength	ASTM S2421 and ASTM F2418	240.2 psi
HS-20 Min. Cover	Min. cover required to support HS-20 loads	6 inches
Maximum Cover	Max. allowable cover depth	< 16.7 feet
Unit Weight	Weight of plastic per cubic foot	7.55 lb./cf
Service Temperature	Safe temperature range for use	-14ºF to 185ºF

(B) Visible defects, such as cracks, creases, crazing, non-uniformly pigmented areas, or undispersed raw materials must not be acceptable and will result in rejection of the STACKED DRAINAGE CELLS by the Engineer.

(C) Any fittings necessary must be manufactured to the requirements of ASTM D 3212 and this Specification.

GI-PPCP-DC.10 CONSTRUCTION METHODS

(A) Excavation

1. Base of the excavation for the STACKED DRAINAGE CELLS must be uniform, level, and free of lumps, debris, or soft yielding subgrade areas.

2. Unsuitable soils or conditions: All questions about the base of excavation shall be directed to the Engineer, who shall approve the subgrade conditions prior to placement of stone.

   a. If unsuitable soils are encountered at the subgrade, or if the subgrade is pumping or appears excessively soft, repair the area in accordance with the contract drawings and as directed by the Engineer.

   b. If indications of the water table are observed during excavation, the Engineer must be contacted to provide recommendations.

   c. Do not begin installation of STACKED DRAINAGE CELLS until unsatisfactory subgrade conditions are accepted by the Engineer.

(B) Base Preparation

1. Place a thin layer (3” unless otherwise specified) of clean open-graded stone base, over the subgrade to establish a level working platform for the STACKED DRAINAGE CELLS. Level to within ½” (+/- ¼”) or as shown on the plans. Bedding materials must be prepared in accordance with the contract documents.

(C) Installation

1. Geogrid must be in accordance with specification GI-PPCP-BXG Biaxial Geogrid.

2. Install STACKED DRAINAGE CELLS in layers in accordance with the contract drawings. STACKED DRAINAGE CELL components must be connected to all other components for each layer. Layers must stack on top of each preceding layer evenly. No vertical connection between layers is required. The panels are to be oriented and at the required depth as per the contract drawings.

3. Wrap the STACKED DRAINAGE CELLS top and sides in specified microgrid material in accordance with specification GI-PPCP-MG Microgrid. Use special care to avoid any damage to microgrid during installation.

(D) Backfilling

1. Backfill and fill with recommended materials as follows:

a. Place clean open graded stone base around the perimeter of STACKED DRAINAGE CELLS in lifts with a maximum thickness of 6". Each lift must be placed around the entire perimeter such that each lift is no more than 24" higher than the side backfill along any other location on the perimeter of the STACKED DRAINAGE CELLS.

b. Open graded stone base shall be carefully placed and compacted in the perimeter spaces around the STACKED DRAINAGE CELLS. No fill shall be placed over top of STACKED DRAINAGE CELLS until the perimeter backfill has been completed.

c. Each lift must be compacted at the specified moisture content to a minimum of 95% of the Standard Proctor Density or until no further densification is observed. The side lifts must be compacted by walk plate compactor.

d. Use special care to ensure the compaction process does not allow machinery to come into contact with the STACKED DRAINAGE CELLS due to the potential for damage to the Microgrid and STACKED DRAINAGE CELLS.

e. No compaction equipment is permissible to operate directly on STACKED DRAINAGE CELLS.

f. During construction, keep the STACKED DRAINAGE CELLS free from foreign matter. The cells must be left thoroughly clean to the satisfaction of the Engineer.

SECTION 32 14 13 PRECAST POROUS CONCRETE PANEL
EXHIBIT A
REF. SECTION GI-PPCP-MG — MICROGRID

GI-PPCP-MG.1 INTENT

This section describes the MICROGRID. The purpose of the microgrid is to prevent the clean open graded stone base from entering the stacked drainage cells, while allowing for the free flow of water within the system.

GI-PPCP-MG.2 DESCRIPTION

Under this section, the Contractor must furnish and install the microgrid in accordance with the Contract Drawings, the specifications, the NYC DEP Standard Design and Guidelines for Green Infrastructure Practices, current edition, and as directed by the Engineer.

GI-PPCP-MG.3 SUBMITTALS

(A) The contractor, prior to the start of work, must submit to the Engineer for approval two (2) labeled samples of the microgrid in accordance with the requirements of Sections 1.06.13 and 1.06.31 of the NYC DOT Standard Highway Specifications, current edition. The label must include the manufacturer's product name, the type of fabric, and the weight of grade of the material. Microgrid used in the work must conform to the approved samples.

(B) Certified material test reports showing that the microgrid meet the specified requirements must be submitted for each shipment and identified with specific lots prior to installing materials. Material test reports must meet the requirements of the criteria outlined herein.

(C) The manufacturer must submit certified test date to cover each shipment of material.

GI-PPCP-MG.4 MATERIALS

(A) Chemical and Physical Requirements

(1) The microgrid must be defined as a system that allows for long-term, adequate liquid flow normal through the microgrid with limited flow loss across the plane of the geotextile. The microgrid must be composed of high molecular weight, high tenacity multifilament polyester yarns woven into a stable network placed under tension. The high strength polyester yarns must be coated with polyvinyl chloride (PVC) material that retain their dimensional stability relative to each other, including selvages. The microgrid must have no tears or defects which adversely alter its physical properties. The microgrid must be inert to biological degradation and must be resistant to naturally encountered chemicals, alkalis, and acids.

(2) Minimum Average Roll Value (MARV): Property value calculated as typical minus two standard deviations. Statistically, it yields a 97.7 percent degree of confidence that any sample taken during quality assurance testing will exceed value reported. Typical Roll Value is represented by (TRV).

Table GI-PPCP-MG– Microgrid Requirements

Tensile Properties	**Test Method**	**MARV (lbs./s.f.)**
Ultimate Strength – Machine Direction (MD)	ASTM 4595	1,700
Ultimate Strength – Cross Machine Direction (XMD)	ASTM 4595	1,400
Creep Limited Strength - MD	ASTM 5262	1,100
Creep Limited Strength - MD	ASTM 5262	1,100
T_{al} = Long Term Design Strength - MD	NCMA 97	912 +/- 5%
T_{al} = Long Term Design Strength - XMD	NCMA 97	826 +/- 5%
Aperture Size (inches)	Measured (inches)	0.08 +/- 5%
Ultraviolet Resistance (500 hours)	ASTM D4355	78%

GI-PPCP-MG.5 METHODS

(A) Each microgrid roll must be wrapped with an overlaying material that will protect the material, including the ends of the roll, from damage due to shipment, water, sunlight, and contaminants. The protective wrapping must be maintained during periods of shipment and storage. During storage, rolls must be elevated off the ground and adequately covered to protect them from the following: site construction damage, precipitation, extended ultraviolet radiation including sunlight, chemicals that are strong acids or strong bases, and any environmental condition that may damage the physical property values of the microgrid.

(B) Excavation must be made to dimensions enough to accommodate placement of the microgrid, clean open graded stone, stacked drainage cells, microgrid and pavement leveling course with precast porous concrete panels. Any overcut underlying soil must be removed from the excavation and the bottom must be compacted **only** as specified and required elsewhere. The extra depth will be filled with clean open graded stone materials as required after installation of geo-grid. No additional payment will be made for extra clean open graded stone used to compensate for overcut subbase. Where applicable, Temporary Support must be provided for trench walls to prevent it collapse when directed by the Engineer. The contractor must protect the pavement section at the saw cut line along the road side.

Prior to installation of microgrid, the stacked drainage cells must be set in their final configuration as approved by the Engineer. If the microgrid is damaged during installation, the damaged section(s) must be removed, and the damaged area must be covered with a patch of new fabric which will overlap the undamaged fabric with twelve (12”) inches in all directions. The Contractor must make such repair work as directed by Engineer at no extra cost to the city. Overlaying material must be placed within the same work shift whether the fabric is subject to damage from

sunlight or not.

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, and equipment required to provide concrete curbs, headers, and sidewalks, as shown, specified and required.

1.05 DESCRIPTION

A. Design Requirements

1. Concrete curbs, headers, and sidewalks which are outside the building line of the site and under jurisdiction of other City agencies, even though constructed as part of this Contract, shall be constructed in accordance with the Rules and Regulations, Standard Details and Standard Specifications of the governing agency in effect at the time of the award of this Contract and as specified and defined in the Contract Drawings.

2. Unless otherwise specified and defined in the Contract Drawings, concrete for curbs, headers, and sidewalks which are inside the building line of the site and not under the jurisdiction of other City agencies shall meet the following requirements:

a. 3500 psi minimum 28-day compressive strength.

b. Utilize type II Cement and contain aggregate conforming to ASTM #57.

c. Water-cement ratio not exceeding 0.44 for normal weight structural concrete.

d. Slump values of 1-1/2 inch minimum to 4 inch maximum.

e. Desired air-entrainment of 6.5%, with an allowable range of +/- 1.5%.

f. Concrete shall be proportioned, mixed, placed, cured and protected in accordance with the requirements of Section 03 30 10 Low Carbon Cast-in-Place Concrete.

1.06 QUALITY ASSURANCE

A. Not Used

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. Those required in Section 03 30 10 – Low Carbon Cast-in-Place Concrete.

2. Marked-up drawings and shop drawings including shop and field test reports of concrete samples tested in an approved laboratory.

3. Concrete sidewalk and curb layouts showing scoring and joint layouts, including joint and sealant materials to be incorporated.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. Coarse aggregate, unless otherwise specified, shall conform to the requirements of Section 03 30 10 – Low Carbon Cast-in-Place Concrete.

B. Concrete shall be air-entrained in accordance with Section 03 30 10 – Low Carbon Cast-in-Place Concrete.

C. Material for foundation of curbs, headers, and sidewalks shall consist Size No. 3 broken stone or gravel complying with the requirements of Section 2.02, NYCDOT Specifications, 100 percent of which passes a 2-1/2-inch square sieve; or other approved broken concrete, 100 percent of which passes a 2-1/2-inch square sieve; or other approved granular material containing not more than 5 percent material passing a No. 200 mesh sieve and not more than 5 percent retained on a 2-inch square sieve.

D. Unless otherwise specified and defined in the Contract Drawings preformed expansion joint filler shall be Type IV as described in Section 2.15 of the NYCDOT Specifications.

E. Joint sealing compound for horizontal joints shall be Type 2 cold application sealer as described in Section 2.22 of the NYCDOT Specifications.

F. Structural steel shall be ASTM A36 and Section 05 50 00 – Metal Fabrications.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Concrete shall be tested and evaluated for strength and acceptance in accordance with the requirements of Section 03 30 00 Cast-in-Place Concrete.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 IMPLEMENTATION

A. Sidewalk Installation

1. Concrete sidewalk shall be of the width shown or otherwise specified and shall be laid on 6 inches thick compacted broken stone base, unless otherwise specified or shown on the Contract Drawings.

2. Sidewalk shall consist of a single course of concrete 4 inches thick, unless otherwise shown on the Contract Drawings.

3. Concrete shall be pigmented when specified and defined in the Contract Drawings.

4. Excavation and subgrade preparation shall be in accordance with the requirements of Section 31 23 16 - Excavation. All existing material within the required 6 inches of foundation shall be removed in its entirety. Additional depth of foundation material for special conditions shall be placed as required by the Engineer.

5. Materials: Foundation material shall be placed on the prepared subgrade and thoroughly compacted into a course not less than 6 inches thick. The top surface shall be parallel to the finished grade and at a distance below the grade equal to the specified thickness of concrete.

6. Forms: Forms shall be in accordance with Section 03 10 00 – Concrete Forming and Accessories.

7. Slabs: Concrete sidewalk shall be built in approximately 20-foot lengths between expansion joints. The sidewalk shall be separated from adjoining structures by expansion joints. When directed, these joints shall be filled with dry sand. Expansion joints in sidewalk shall coincide with expansion joints in curb. Tooled control joints not less than 1/2 inch in depth shall be provided where at four-foot intervals unless otherwise shown on the Contract Drawings.

8. Expansion Joints: Transverse expansion joints shall be 1/2 inch in width and shall be filled with preformed joint filler to within 1 inch of the sidewalk surface. The top 1 inch shall be sealed with Type 2 cold application sealer complying with the requirements of Section 2.22 of the NYCDOT Specifications.

9. The foundation material shall be wetted immediately before concrete is placed. The concrete shall be placed within the forms and thoroughly tamped until the surface is at the finished grade.

10. When specified and defined in the Contract Drawings, the concrete sidewalk shall be pigmented with a minimum of 2 pounds of dispersed

carbon black per bag of cement to produce a bluestone color. Either the coloring pigment shall be treated so as not to cause an increase or decrease of the entrained air content in cement mortar or in the concrete of more than 10 percent, or the amount of air-entrainment agent added to the concrete shall be adjusted to meet the specified requirements. All cement used for concrete work specified herein shall be of uniform color. Requirements for other colors are specified and defined in the Contract Drawings.

11. The top surfaces shall be finished in accordance with Section 03 35 00 – Concrete Finishing. Each rectangular slab shall have all edges neatly rounded with proper tools and be bounded on all sides by a troweled border about 1 inch in width. Surface texture of pedestrian ramps shall be transverse grooves, 1/2 inch wide by 1/4 inch deep on 2-inch centers.

12. Backfilling shall follow the removal of forms as soon as practicable and, unless otherwise permitted, shall be of clean earth, satisfactorily compacted. Backfilling shall conforming to the requirements of Section 31 23 23 - Fill.

13. Concrete sidewalk shall be cured according to Section 03 30 00 Cast-in-Place Concrete.

14. All material types of sidewalk, such as unpigmented, pigmented, bluestone or pavers, and details are outlined in the NYCDOT Street Design Manual.

B. Curb and Header Installation

1. Concrete curbs, headers, and steel faced concrete curbs, except as otherwise detailed and specified, shall be constructed in accordance with the applicable provisions of Sections 4.08 and 4.09, NYCDOT Standard Highway Specifications, except that concrete strength shall conform to Class 45 as indicated in Section 03 30 00 Cast-in-Place Concrete. Depressed curbs shall be provided where specified or shown on the Contract Drawings.

2. Steel street curbs shall conform to ASTM A36 of the size indicated on the Contract Drawings. The length of straight runs shall be not less than 10 feet nor more than 20 feet. Curved curb angles shall be bent to the radius indicated, and provided with a straight tangent at each end, 3 feet in length. Special steel curb angles of approved type shall be provided at drop curbs. Where the length of the special drop curb exceeds 20 feet, it shall be spliced with an approved type butt welded joint. Anchors shall be welded to all steel curbing. The steel curbs shall be placed within the forms, upon suitable chairs, to the proper lines and grades. The joints between units of curbing shall be 1/8 inch. All surfaces of steel curbing, including anchors, shall be thoroughly cleaned of all rust, oil, grease, scale or other foreign matter before concrete is placed. All surfaces of steel curbing which are to remain exposed in the finished work shall be painted in the shop in accordance with Section 09 91 00 - Painting. Finish coats shall be gray in color.

3. Granite and bluestone street curbs and headers shall be Class A dressed curbs and headers conforming to the requirements of Section 2.12 of the NYCDOT Standard Highway Specifications. When specified, a concrete cradle shall be used conforming to the provisions of Section 4.07 of the NYCDOT Standard Highway Specifications, except that concrete strength shall conform to Class 45 as indicated in Section 03 30 10 Low Carbon Cast-in-Place Concrete.

END OF SECTION

SECTION 32 31 19 – DECORATIVE METAL FENCES AND GATES
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. This Section describes the general requirements for decorative fences and gates. Decorative fences and gates shall conform to the requirements specified herein, and in the Contract; and as shown on the Contract Drawings. Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install all decorative fences and gates Work.

1.05 DESCRIPTION

A. Maintain the visual design concept shown, and the technical requirements specified, including modules, profiles, alignment of components and requirements for finish.

B. Thermal Control: Provide adequate expansion joints within the fabricated system which allows for all thermal expansion and contraction caused by a material temperature range of 140 degrees F to -20 degrees F without warp or bow of system components. Distance between expansion joints shall be based on providing a 1/4 inch wide joint at 70º F which accommodates a movement of 150 percent of the calculated amount of movement for the specified temperature range.

C. Certifications:

1. Cantilever Slide Gate and Operator System manufacturer shall submit test results stating that the gate panel and operator have been tested as a system for 200,000 cycles.

2. Gate manufacturer shall certify gate is manufactured in compliance with ASTM F 2200, Standard Specification for Automated Vehicular Gate Construction and the operators are UL 325 listed.

3. Gate operator shall be in compliance with UL 325 as evidenced by UL listing label attached to gate operator.

D. Provide expansion joints in decorative fencing Work where systems cross expansion joints in structure.

E. Configuration of all decorative fences and gates shall be as shown on the Contract Drawings. All details shown on the Contract Drawings are typical; similar details apply to similar conditions, unless specifically noted otherwise on the Contract Drawings. Verify dimensions at the site without causing delay in the work.

F. Fasteners and Supports:

1. When the size, length or load carrying capacity of an anchor bolt, concrete anchor or concrete insert is not shown on the Contract Drawings, provide

the size, length and capacity required to carry the design load times a minimum safety factor of four.

2. Sizes shown on the Contract Drawings shall be considered minimum. Increase size to comply with design loadings and minimum safety factor specified.

1.06 QUALITY ASSURANCE

A. Manufacturer Qualifications:

1. Engage a single fabricator, with undivided responsibility for detailing and performance of the decorative l fences and gates.

2. Engage a firm which can show five years previous successful experience in detailing and fabrication of decorative fences and gates of scope and type similar to the required work.

3. Materials and fabrication procedures shall be subject to inspection and tests in the mill, shop, and field, conducted by a qualified inspection agency. Such inspections and tests shall not relieve the Contractor of responsibility for providing materials and fabrication procedures in compliance with specified requirements.

4. Manufacturer shall provide a list of three recommended gate and operator maintenance companies within 150 miles of project site. List may include the installer or manufacturer.

a. Provide letter from manufacturer for each listed maintenance company indicating recommendations and maintenance company's qualifications matching installer qualifications.

B. Installer Qualifications:

1. Engage a single installer skilled, trained and with documented successful experience in the installation of decorative fences and gates and with specific skill and successful experience in the erection of the types of materials required; and who agrees to employ only tradesmen with specific skill and successful experience in this type of Work. Submit names and qualification to Engineer along with the following information on a minimum of three successful projects:

a. Names and telephone numbers of owner, architects or engineers responsible for projects.

b. Approximate contract cost of the decorative fences and gates.

c. Amount of area installed.

C. Source Quality Control:

1. Obtain all ornamental fences and gates components and accessories from the same manufacturer.

2. Provide qualified welding processes and welding operators in accordance with AWS "Structural Welding Code" D1.1, Section 5, Qualification.

3. Provide certification that all welders employed on, or to be employed for, the fabrication of the ornamental fences and gates have satisfactorily passed AWS qualification tests within the previous twelve months. Contractor shall ensure that all certifications are kept current.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittal shall include, but not limited to:

1. Full size fence section mockup and gate section with all associated connections, and mounting brackets all with specified controlled uniform finish.

2. Samples will be reviewed by Engineer for color, finish, joinery appearance and workmanship only. Compliance with all other requirements is the responsibility of Contractor.

3. Recommended maintenance schedule for gates and operators.

a. Provide gate and operator diagram or layout of items to be adjusted.

b. Provide schedule of maintenance to be performed.

c. Identify special tools and fluids necessary for maintenance.

B. Shop Drawings:

1. Drawings for the fabrication and erection of decorative fences and gates with sizes of members, components and anchorage devices, all based on specified requirements. Include copies of manufacturer's specifications, standard and custom detail drawings and installation instructions for decorative fences and gates. Include all plans and elevations identifying the location of all decorative fences and gates, and all expansion joints.

2. Profiles of decorative fences and gates components, and the details of forming, jointing, sections, connection, internal supports, trim, and accessories. Show details drawn at 1-1/2 inch scale.

3. All calculations for complete structural analysis of the systems including calculations showing compliance with the performance criteria specified.

4. Manufacturer's catalogs showing complete selection of standard and custom components and miscellaneous accessories for selection by Engineer.

C. Certificates:

1. Copies of material purchase receipts, for this job, signed by a certified and licensed Notary Public, verifying that material purchased for the Work complies with material designations specified as confirmed by approved

Shop Drawing Certification of welders and welding procedures shall be submitted as specified.

2. UL 325 certification.

3. ASTM F 2200 certification.

4. Installer qualifications.

5. Maintenance company list and qualification letter from manufacturer.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery of Materials:

1. Deliver decorative fences and gates and all accessories dry and undamaged, with manufacturer's protective coating intact, bearing original intact factory labels.

2. Decorative fences and gates which are damaged during delivery or while being unloaded shall not be stored on site. Remove such units from site and replace panels with new, undamaged material.

B. Storage of Materials:

1. Store decorative fences and gates and accessory materials under tarpaulin covers and in an area protected from dirt, damage, weather and from the construction activities of all Contractors. Do not store outside or allow items to become wet or soiled in any way while on site.

2. Do not store in contact with concrete, earth or other materials that might cause corrosion, staining, scratching or damage to finish. Do not install system components which become dented, scratched or damaged in any way. Remove such components from site and replace with new, undamaged material.

C. Handling of Materials:

1. Do not subject decorative fences and gates and accessory materials to bending or stress. Do not carry or transport panels in the horizontal (flat) position. Hold panels upright on edge when handling.

2. Do not damage edges or handle material in a manner that will cause scratches, warps or dents.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer’s standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. A. Product and Manufacturer - provide one of the following for decorative steel bar style fences:

1. Grotto by Ametco Manufacturing Corporation, Willoughby, Ohio;
2. Grigliato (spacing to match Ametco Groto) by Metalco – MFR manufacturing Inc., Aurora, IL;
3. Or approved equal

B. Product and Manufacturer - provide one of the following for cantilever sliding gate system (TI-10):

1. Fortress Structural Cantilever Slide Gate system by Tymetal Corp, Greenwich, NY
2. Or approved equal.

C. Product and Manufacturer - provide one of the following for bi-fold gate system (TI-11):

1. Speedmaster Cantilever Bi-Fold Gate CR40 System by CLD Fencing Systems, Cova Security Gates LTD, Parsippany, NJ
2. B-70 Securfold-Trackless Cantilever Bi-Fold Gate System by Tymetal Corp, Greenwich, NY
3. Or approved equal.

D. Product and Manufacturer - provide one of the following for grout:

1. Euco N-S as manufactured by The Euclid Chemical Company, East Brunswick, NJ;
2. Masterflow 713 as manufactured by Master Builders Company, Cleveland, OH;
3. Or approved equal.

E. Product and Manufacturer - provide one of the following for Anti-graffiti coating:

1. Clear Coat 1K Siloxane as per Sherwin Williams, Cleveland, OH
2. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Materials:

1. Rectangular steel bars, angles and other shapes: ASTM A36 or ASTM A1011.
2. Steel Tubing: ASTM A513 and ASTM A500, Grade B.
3. Round steel cross rods: ASTM A510 carbon steel.

4. Steel Sheets: Steel sheets of commercial quality, complying with ASTM A1011 hot-rolled steel sheets.
5. Aluminum, General: Provide alloys and tempers with not less than the strength and durability properties of alloy and temper designated in paragraphs below for each aluminum form required.
6. Extrusions: ASTM B 221, Alloy 6063-T5.
7. Tubing: ASTM B 429, Alloy 6063-T6.
8. Plate and Sheet: ASTM B 209, Alloy 6061-T6.
9. Die and Hand Forgings: ASTM B 247, Alloy 6061-T6.
10. Castings: ASTM B 26, Alloy A356.0-T6.
11. Grout: Non-shrink type, premixed compound consisting of non-metallic aggregate, cement, and water reducing amd plasticizing additives. See Section 03 60 00, Grouting.

B. Decorative Steel Bar Fence: Fences made from bars and shapes.

1. Posts: Square steel bars and tubing.
   a. Line (Intermediate) Post / Bar: 3-1/2 by 5/16 inches .
   b. End and Corner Posts: 4 by 4 inches with 0.250-inch wall thickness.
   c. Swing Gate Posts (man gate): 2 by 2 inches with 0.125-inch wall thickness.
   d. Swing Gate Posts (vehicular): 4 by 4 inches with 0.250-inch wall thickness.
   e. Double Swing Gate Posts: 4 by 4 inches with 0.250-inch wall thickness.
   f. Horizontal-Slide Gate Post, Openings up to 12 Feet: 4 by 4 inches with 0.125-inch wall thickness.
   g. Horizontal-Slide Gate Post, Openings Wider Than 12 Feet: 4 by 4 inches with 0.125-inch wall thickness.
   h. Guide Posts for Class 1 Horizontal-Slide Gates: 4 by 4 inches with 0.125-inch wall thickness; installed adjacent to gate post to permit gate to slide in space between.
2. Post Caps: Steel castings with flat cap.
3. Fence panels:
   a. Vertical main bars: 1 by 5/64-inch flat bars spaced at 1-21/32 inches maximum.
   b. Horizontal cross rods: 3/16-inch diameter rods spaced at 5-3/16 inches maximum.

c. Top and bottom perimeter bars: 1 by 1/8-inch flat bars.

d. Panel height: 96 inches.

e. Panel width: 69 inches maximum.

4. Fasteners: Stainless-steel carriage bolts and tamperproof nuts.

C. Concrete and Masonry Anchors: Concrete and masonry anchors shall be as specified in Section 05 05 23.02 – Miscellaneous Metal Fastenings.

1. Anchors shall be of stainless steel Type 316 and a minimum size of 1/2 inch diameter.

D. Non-Shrink, Non-Metallic Grout: Pre-mixed non-staining cementitious grout requiring only the addition of water.

E. Bolting Materials: As specified in Section 05 05 23.02 – Miscellaneous Metal Fastenings.

F. Swing Gates (Man Gate):

1. Gate Configuration: Single leaf, self closing.

2. Gate Frame Height: As shown on Contract Drawing.

3. Gate Opening: As shown on Contract Drawings.

4. Frame and Bracing: Fabricate members from square steel tubes 1-1/2 by 1-1/2-inches to 2 by 2-inches with 0.140-inch wall thickness and as indicated.

5. Frame corner Construction: Welded.

6. Panel Size: Match fence panel sixe and align vertical and horizontal bars and rods.

G. Hardware for Swinging Gates: Latches permitting operation from both sides of gate, hinges, and keepers for each gate leaf more than 5 feet wide. Fabricate latches with integral eye openings for mortise lock, padlocking; padlock accessible from both sides of gate.

1. Operation: all swing gates shall be manually operated.

2. Hinges: all hinges shall be bolted through gate post. Top and bottom hinges are to be reverses: one (1) hinge faced downwards and one (1) hinge faced upwards to ensure gates cannot be removed. Hinges' size and material shall suit gate size and material. All swing gates to allow for 180 degrees opening. All single swing gates shall be self-closing.

a. BHMA A156.1, Grade 1, suitable for exterior use.

b. Function: 39 - Full surface, triple weight, antifriction bearing.

c. Material: Wrought steel, forged steel, cast steel, or malleable iron; galvanized.

3. Mortise Locks: BHMA A156.13, Grade 1, suitable for exterior use.

a. Function: F09 - Apartment, exit lock and F17 - Deadlock.

b. Material: Brass or bronze.

c. Levers: Cast, forged, or extruded brass or bronze.

d. Mounting Box: Configuration necessary to enclose locks. Fabricate from 1/8-inch-thick, aluminum plate.

4. Ground sleeves: shall be galvanized for security drop bolt with the gate in opened and closed position. Sleeves be installed in concrete so no tripping hazard is present.

5. Strike strap: shall be continuous, welded to gate post

H. Slide and Cantilever Gate (TI10):

1. Automated vehicular gates shall comply with ASTM F 2200, Class III.

2. Gate Frame: The gate frame shall be fabricated from 6063-T6 aluminum alloy extrusions. Manufacturer's assemble shall be a minimum of the following:

a. The top member shall be a 3" x 5" aluminum structural channel/tube extrusion weighing not less than 2.6 lb/lf for external picket designs. To maintain structural integrity this frame member shall be "keyed" to interlock with the "keyed" track member. If fabricated as a single horizontal piece, the bottom member shall be a 2" x 5" aluminum structural tube weighing not less than 2.0 lb/lf. If fabricated in two horizontal pieces, the bottom member shall be a 5" aluminum structural channel weighing not less than 2.6 lb/lf. When the gate frame is manufactured in two horizontal pieces or sections, they shall be spliced in the field.

1) The overhang shall be a minimum of 50% of opening size.

a) Size: Opening – 11'-0" through 14'-0"

(1) Support overhang: 7'-6".

b) Size: Opening – 14'-1" through 22'-0"

(1) Support overhang: 10'-0".

c) Size: Opening – 22'-1" through 30'-0"

(1) Support overhang: 12'-0".

2) TI-10 Gate sizes:

a) Entry Opening – 26'-0" long by 8'-0" high.

b) Exit Opening – 26'-0" long by 8'-0" high.

b. Splicing: A galvanized steel splice plate shall be used to secure the two bottom channel members together utilizing eight plated carriage bolts with lock nuts. The top members will be spliced together using

an aluminum splice plate secured with six drive rivets on one side and welded to the top member on the other side. The track is overlapped onto the opposing section in an alternating fashion, interlocking with the top primary member.

c. Gate Track: The gate shall have a separate semi-enclosed "keyed" track, extruded from 6005A-T61 or 6105 T5 aluminum alloy, weighing not less than 2.9 lb/lf. Track members are to be located on each side of the top member. When interlocked and welded to the "keyed" top member, it forms a composite structure with the top of the gate frame. Welds are to be placed alternately along the top and side of the track at 9" centers with welds being a minimum of 2" long.

3. Gate Configuration: Single leaf. See Contract Drawings for fence/gate design to be replicated.

4. Gate Frame Height: 9'-0" minimum (align top with fixed picket panels) or as indicated.

5. Gate Opening: As shown on Contract Drawing.

6. Gate Mounting:

a. The gate frame is to be supported from the track by four swivel type, self-aligning, 4 wheeled, sealed lubricant, ball-bearing truck assemblies.

b. The bottom of each support post shall have a bracket equipped with a pair of 3" UHMW guide wheels Wheel cover protectors shall be included with bottom guides to comply with UL325.

c. Gap protectors shall be provided and installed, compliant with ASTM F 2200.

7. Diagonal Bracing: Diagonal "X" bracing of 3/16" or ¼" diameter stainless cable shall be installed throughout the entire gate frame.

8. The gate shall be completed by installation of approved filler as specified.

a. Overlay fence panel in sliding gate frame. Provide additional panel support within sliding gate framing. Where a motorized gate operator is specified to be applied to the gate and the specified picket spacing allows for openings in the gate frame that exceed 2¼", a secondary gate filler shall be secured at each end of the gate frame and tied at each 1" x 2" or 2" x 2" vertical member. The secondary gate filler shall extend to a minimum height of 72" above grade and shall be sized to prevent a 2¼" diameter sphere from passing through openings anywhere along the length of the gate frame, and in that portion of the adjacent fence that the gate covers in the open position.

9. Posts:

a. Double sets of support posts shall be minimum 4" x 4" x 3/16" wall square steel tubing, grade 500. Gate posts shall be galvanized or coated and supported in concrete footings as specified by the design team.

10. Finish:

a. Gate to be color coated with polyester powder as specified. If powder coated, the gate (including track member) and all accessories shall be pretreated chemically by sand blasting or other acceptable method to ensure proper coating adherence.

11. Gate Lock:

a. Gate system shall be furnished with a secure gate catcher. The catcher shall prevent the gate panel from being pried open while the gate is in the closed and locked position.

I. Slide Gate Operators (TI-10):

1. System Functions:

a. Operation:

1) System shall be designed so that gate movement from the closed position is impossible except by electric or mechanical means.

b. Variable Speed-Rate of Travel:

1) The gate operator shall have the ability to achieve a maximum gate speed of 2.0 feet per second, and shall be equipped with soft start and soft stop function to prevent shock load to the gate panel and operator.

c. Cycle Testing:

1) The cantilever slide gate and operator system shall be cycle tested a minimum of 200,000 cycles.

2. Provide factory-assembled automatic operating system designed for gate size, type, weight, and operation frequency. Provide operation control system with characteristics suitable for Project conditions, with remote-control stations, safety devices, and weatherproof enclosures; coordinate electrical requirements with building electrical system.

a. Provide operator designed so motor may be removed without disturbing limit-switch adjustment and without affecting auxiliary emergency operator.

b. Provide operator with UL approval.

c. Provide electronic components with built-in troubleshooting diagnostic feature.

d. Provide unit designed and wired for both right-hand/left-hand opening, permitting universal installation.

3. Provide operators and electric accessories compliant with NFPA 70, exterior wet environment.

4. UL Standard: Manufacturer and label gate operators to comply with UL 325. The gate operator shall be UL 325 compliant for Class III and IV.

5. Operator system shall be provided so that motor can be removed without disturbing limit switch adjustment and without affecting emergency auxiliary operator.

6. Emergency Access Requirements: Comply with requirements of authorities having jurisdiction for automatic gate operators on gates that must provide emergency access.

7. Motor Characteristics: Sufficient to start, accelerate, and operate connected loads at designated speeds, within installed environment, with indicated operating sequence, and without exceeding nameplate rating or considering service factor. Motor box is 10 gauge galvanized steel with detention grade hinges and mogul lock. Comply with NEMA MG 1 and the following:

   a. Voltage: 208/230VAC, Three Phase.

      1) Phase: Polyphase

   b. Horsepower: 1 HP.

   c. Enclosure: Totally enclosed.

   d. Duty: Continuous duty at ambient temperature of 105 deg F and at altitude of 3300 feet above sea level.

   e. Service Factor: 1.15 for open drip-proof motors; 1.0 for totally enclosed motors.

   f. AC Drive:

      1) The variable frequency drive unit shall allow for programmable speeds and programmable soft-start and soft-stop features.

   g. Overload Protection:

      1) Motor shall be protected against overload by either a thermal or a current sensing overload device.

   h. Gear (Box) Reducer:

      1) The self-enclosed gear-head gearbox shall be manufactured as a single unit, and shall consist of a hardened steel, machine cut worm and mating bronze gear running in oil bath. Oil shall be a #634 specialty oil with a fluid pour point

of –44 degrees F. The gearbox shall perform the following functions:

a) Adjustable Clutching Device.

b) Manual disconnect by crank handle.

i. Gear Box Heater

1) Operator shall include internal gearbox heater and a heater strip for the control box.

j. Drive – Chain:

1) A #50 roller chain shall be utilized. All chain brackets and required attachment hardware shall be supplied.

k. Manual Operation:

1) Emergency Release Mechanism: Quick-disconnect release of operator drive system of the following type, permitting manual operation if operator fails. Design system so control-circuit power is disconnected during manual operation.

2) Type: Integral fail-safe release, allowing gate to be pushed open without mechanical devices, keys, cranks, or special knowledge.

l. Limits:

1) The operator shall be equipped with an integral limit system, providing accurate settings to control the open and close positions of the gate, and shall not be affected by manual operation or motor removal.

m. Control Circuit:

1) U.L. listed operator shall have 5vdc controls.

8. Gate Operators: Post mounted and as follows:

a. Mechanical Slide Gate Operators:

1) Duty: Heavy duty, commercial/industrial.

2) Gate Speed: Maximum 2 feet per second.

3) Maximum Gate Weight: 4500 lb.

4) Frequency of Use: 25 cycles per hour.

5) Operating Type: Roller chain, with manual release.

6) Drive Type: Enclosed worm gear and chain-and-sprocket reducers, roller-chain drive.

J. Bi-Fold Gate (TI-11):

1. Automated vehicular gates shall comply with ASTM F 2200, Class III.

2. Gate Frame: The gate frame shall be fabricated from rectangular hollow steel tubes and plate steel members. Manufacturer's assemble shall be a minimum of the following:

   a. The gate shall custom designed, fabricated from tube and plate steel members. Bi-fold gate assembly components shall be welded to maintain structural integrity of frame members.

   b. All frames and framing members shall be true to dimension and square in all directions, and no gate shall be bowed, warped, or out of line, in the vertical or horizontal plane of the door opening by more than 1/8 inch in 20 feet. Exposed welds and welds which interfere with the installation of various parts shall be ground smooth and flush

   c. Provide infill panels in gate leafs matching fencing panel design and spacing. Infill panel shall be centered within gate leafs. Bolted connection shall be with stainless steel bolts and shall be tampered proof, vandal resistant.

   d. Bi-fold gates shall operate without tracks at bottom or overhead.

   e. Provide two bi-folding two-panel gates.

      1) Clear Opening Width.

         a) College Point Entry: Opening – 26'-0" wide by 8'-0" high.

         b) Service Road Exit: Opening – 26'-0" wide by 8'-0" high.

   f. Gates in closed position shall be held in place and align by use of floor receptor / keeper.

   g. Gate hinge operators shall be electromechanical actuators. Hydraulic operation is not allowed.

   h. Sequence of gate operators shall allow movement of both gate panels simultaneously and fold with minimum project into site.

   i. Gate threshold gap shall be less than 4-inches.

3. Hardware: Not less than four pairs of jamb and fold hinges per opening, and all bolts, nuts, fasteners, etc. necessary for complete installation and operation. Jamb hinges shall be dual shear and have two thrust bearings and two needle bearings. Jamb hinges shall be gusseted. Fold hinges shall be dual shear with two thrust bearings. All bearings shall be completely concealed within the hinge barrel. All hinge pins shall be minimum ¾" diameter hardened steel.

4. Gate Support: The gate support column shall be fabricated from RHS steel tube members of a minimum dimension of 10" x 10".Manufacturer's assemble shall be a minimum of the following:

a. The gate support column base plate shall be recessed 6-inches below finish grade. Finish grade material shall be isolated by expansion joint around base plate.

b. All electrical wiring shall be routed though columns. Exposed conduit shall be solid metal conduit, finished to match gate.

c. Gate panel operators and electrical panel shall be mounted to gate support column on secure side.

d. Gate manufacturer shall provide concrete foundation reaction loads to general contractor and Engineer during foundation or site work shop drawing review.

5. Gate Operator and Access Control:

a. Each half of the opening shall be operated by an electro-mechanical drive unit designed for high cycle operation. Operator consists of an electric motor, dual stage gear reducer, and rotating drive arm. The gate shall be operated with connecting rods attached to the rotating drive arm on the operator and to control arms attached to the gate post section and to the gate panel. The connecting rods shall be positive drive, keeping the gate under firm control at all times. The connecting rods shall be fitted with spherical bearings and control arms shall be equipped with oil impregnated bronze bearings on polished shafts.

1) Provide operators and electric accessories compliant with NFPA 70, exterior wet environment.

b. Provide power and control panels shall be remote. One power and controls panel shall operate both gates. See contract drawing for location.

1) Electric motor shall be of sufficient size to operate gates under normal operating conditions at no more than 75 percent of rated capacity.

2) Provide operator and electrical accessories capable of using 208-3 phase power supply.

3) Panel enclosures mounted to support columns shall be finished same as gate. Remote panel enclosures shall be Type 316 stainless steel, #4 finish.

c. Operator shall open and close rapidly and start and stop gradually. Operator shall be adjustable to allow gate to fully clear the opening. Operator shall automatically lock the gate in the closed position.

1) Manual Release: The manual release shall allow the gate to be disengaged and moved manually from any position. Columns shall have an access cover to access the manual release lever. Access cover shall have the option of being

secured with a heavy duty or detention grade lock. Release lever shall be accessible from floor level and allow for easy release and engagement without the use of tools.

2) Limit switches shall be provided at each operator to stop the travel of the gate in its fully open or fully closed position.

d. Access Control:

1) Gate shall operated via access control options:

a) Remote infrared access control.

b) Keypad access control or HID access control or control station as noted in this section.

2) Provide keypad access control panel mounted on left column from unsecure side. On secure side provide control station on freestanding post adjacent to left column.

3) Provide infrared and keypad access control for exiting gate.

e. Detection Loops:

1) Provide (1) safety and (1) Auxiliary (free exit) loop detector at each gate.

2) Entry Gate: Provide vehicle detection loop on secure side and unsecure side of gate.

a) Unsecure side detection loop shall be installed beyond gate operation area, a minimum of 3’-0” from gate in closed position.

b) Secure side detection loop shall be installed beyond gate operation area, a minimum of 1’-3” from gate end in opening position.

c) Gate shall not open until vehicle is on unsecure side detection loop via radio or infrared controls. Control station entry shall be required to open gate with or without vehicle detection.

d) Gate shall not close automatically until vehicle has completely passed over detection loop on both side of gate. Control station entry shall be required to close gate without vehicle detection.

3) Existing Gate: Provide vehicle detection loop on secure side and unsecure side of gates.

a) Secure side detection loop shall be installed beyond gate operation area, a minimum of 1’-3” from gate end in opening position.

b) Unsecure side detection loop shall be installed beyond gate operation area, a minimum of 3’-0” from gate in closed position.

c) Gate shall not open until vehicle is on secure side detection loop. Control station, radio or infrared signal shall be required to open gate. Control station entry shall be required to open gate without vehicle detection.

d) Gate shall not close automatically until vehicle has completely passed over unsecure detection loop. Infrared signal shall close gate.

4) Safety edge and photo eye detection shall override gate operations.

6. UL Standard: Manufacturer and label gate operators to comply with UL 325. The gate operator shall be UL 325 compliant for Class III and IV.

a. Provide safe edges on all hinged and meeting edges.

b. Integrate photo eye sensors into the gate support columns. Photo eye sensor assembly shall not project into clear opening.

1) Provide (2) thru-beam type photo eyes integrated into the gate column and mounted at 6” and 24” above the finished floor, NEMA 4 rated.

c. Obstruction detection devices shall operate gates as noted in this section.

7. Finish:

a. Baked-Enamel or Powder-Coat Finish: AAMA 2603 except with a minimum dry film thickness of 2 mils. Comply with coating manufacturer's written instructions for cleaning, conversion coating, and applying and baking finish.

1) Color and Gloss: As indicated by manufacturer's designations.

2) Basis of Design Color: RAL 7016 Anthracite Grey.

b. Contractor shall test and apply anti-graffiti coating to fencing assembly. Application shall not void any finish warranty.

1) Applied an anti-graffiti coating on all members of the fence and gates. The anti-graffiti coating shall be Protective Marine Coating type. Color shall be Clear Coat 1K Siloxane as per Sherwin Williams or approved equal.

K. Remote Controls: Electric controls separated from gate and motor and drive mechanism, with NEMA ICS 6, Type 4 enclosure for pedestal mounting, and with

space for additional optional equipment. Provide the following remote-control device(s):

1. Control Station: Momentary-contact, three-button-operated with open, stop, and close function; located remotely from gate. Key switch to lock out open and close buttons.

L. Obstruction Detection Devices: Provide each motorized gate with automatic safety sensors. Activation of sensor causes operator to immediately function as follows:

1. Action: Reverse gate in both opening and closing cycles, and hold until clear of obstruction.

2. Internal Sensor: Built-in torque or current monitor senses gate is obstructed.

3. Sensor Edge: Contact-pressure-sensitive safety edge, profile, and sensitivity designed for type of gate and component indicated, in locations as follows. Connect to control circuit using take-up cable reel or self-coiling cable.

a. Along entire gate leaf leading edge.

b. Along entire gate leaf trailing edge.

c. Along entire length of gate posts, both side.

M. Photoelectric/Infrared Sensor System: Designed to detect an obstruction in gate's path when infrared beam in the zone pattern is interrupted.

N. Leading Edge Gate Sensor: Contact-pressure-sensitive safety edge.

O. Accessories:

1. Warning Module: Audio, strobe-light alarm sounding three to five seconds in advance of gate operation and continuing until gate stops moving; compliant with the U.S. Architectural & Transportation Barriers Compliance Board's ADA-ABA Accessibility Guidelines.

2. External electric-powered solenoid or magnetic lock with delay timer allowing time for lock to release before gate operates.

3. Fire box.

4. Instructional, Safety, and Warning Labels and Signs: According to UL 325.

5. Equipment Bases/Pads: Precast concrete, depth not less than 12 inches, dimensioned and reinforced according to gate operator component manufacturer's written instructions and as indicated on Drawings.

P. Accessory and Miscellaneous Materials: Provide all accessory items and system components of ASTM A666, Type 316 stainless steel, finished to match decorative fences and gates.

Q. Concrete and Masonry Anchors: Concrete and masonry anchors shall be as specified in Section 05 05 23.02 – Miscellaneous Metal Fastenings.

1. Anchors shall be of stainless steel Type 316 and a minimum size of 1/2 inch diameter.

R. Non-Shrink, Non-Metallic Grout: Pre-mixed non-staining cementitious grout requiring only the addition of water.

S. Bolting Materials: As specified in Section 05 05 23.02 – Miscellaneous Metal Fastenings.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Fabrication

1. Provide decorative fences and gates completely factory fabricated using fabrication techniques recommended for stainless steel.

2. Field Measurement: Take field measurements where required, prior to the preparation of Shop Drawings and fabrication, to ensure proper fitting of the Work.

3. Preassemble items in the shop to the greatest extent possible, so as to minimize field splicing and assembly of units at the site. Disassemble units only to the extent necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.

4. Welding

a. Welding shall comply with the requirements of AWS, NYBC and BSA.

b. Field welding shall not be permitted unless approved by Engineer.

B. Decorative Steel Bar Fence Fabrication:

1. Assemble fences into sections by welding bar and rods.

a. Fabricate sections with clips welded to rails for field fastening to posts.

b. Drill posts and clips for fasteners before finishing to maximum extent possible.

2. Finish exposed welds to comply with NOMMA Guideline 1, Finish #2 - completely sanded joint, some undercutting and pinholes okay.

C. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.

1. For aluminum, provide type and alloy as recommended by producer of metal to be welded and as required for strength and compatibility in fabricated items. .

D. Assembling

1. Fencing shall be assembled as indicated in the Contract Drawings or as per Manufacturer's written instructions and recommendations.

E. Final Coating (Anti-Graffiti)

1. Baked-Enamel or Powder-Coat Finish: AAMA 2605 except with a minimum dry film thickness of 2 mils. Comply with coating manufacturer's written instructions for cleaning, conversion coating, and applying and baking finish.

2. Color and Gloss: As indicated by manufacturer's designations

a. Basis of Design Color: RAL 7016 Anthracite Grey.

3. Contractor shall test and apply anti-graffiti coating to fencing assembly. Application shall not void any finish warranty.

a. Applied an anti-graffiti coating on all members of the fence and gates. The anti-graffiti coating shall be Protective Marine Coating type. Color shall be Clear Coat 1K Siloxane as per Sherwin Williams or approved equal.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

1. Obtain all ornamental fences and gates components and accessories from the same manufacturer.

2. Provide qualified welding processes and welding operators in accordance with AWS "Structural Welding Code" D1.1, Section 5, Qualification.

3. Provide certification that all welders employed on, or to be employed for, the fabrication of the ornamental fences and gates have satisfactorily passed AWS qualification tests within the previous twelve months. Contractor shall ensure that all certifications are kept current.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examination

1. The Contractor shall examine the alignment of the substrate and conditions under which the decorative fences and gates work is to be performed and notify Engineer in writing of unsatisfactory conditions. Do not proceed with the work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

3.02 INSTALLATION

A. All cutting, drilling, fitting, and welding shall be done in shop, not in field. If it is found that there needs to be any cutting, drilling, fitting, and welding on site then it is the Contractors responsibility to provide a written explanation to the Engineer as to why this activity needs to be done in field, and wait for the Engineers approval of such activity.

B. Upon written approval by the Engineer, all such work shall be as follows:

1. Perform cutting, drilling and fitting required for installation. Set the work accurately in location, alignment and elevation, plumb, level, true and free of rack, measured from established lines and levels.

2. Fit exposed connections accurately together to form tight hairline joints. Do not cut or abrade the surface of units, which have not been finished after fabrication, and are intended for field connections.

3. See 3.05 for Adjusting, Protecting, and Cleanup procedures and responsibilities.

C. BI-FOLD GATE and slide-gate and operators installation

D. General: Install gates and operators according to manufacturer's written instructions, aligned and true to fence line and grade.

E. The slide gate and installation shall conform to ASTM F 1184 standards for aluminum cantilever slide gates, Type II, Class 1 and Class2. Slide gate and bi-fold gate installation shall conform to ASTM F2200 Class III.

F. Excavation for Support Posts and Concrete Bases: Hand-excavate holes for bases in firm, undisturbed soil to dimensions and depths and at locations as required by gate operator component manufacturer's written instructions and as indicated.

G. Concrete Bases: Cast-in-place or precast concrete, depth not less than 36 inches, dimensioned and reinforced according to gate operator component manufacturer's written instructions and as indicated on Drawings.

H. Comply with NFPA 70 and manufacturer's written instructions for grounding of electric-powered motors, controls, and other devices.

3.03 FIELD TESTING / QUALITY CONTROL

A. The Contractor and Manufacture shall field test all gates and motors to ensure that all gate assembly systems are working together correctly.

B. Any malfunctions, and or design flaws that are witnessed during test shall be fixed immediately.

C. Any minor adjustments may be addressed in field with the approval of the Engineer.

D. All major adjustments that include dismantling and welding shall be done in the shop to prevent damaging the finished materials and to recoat materials that have been stripped of their coating.

3.04 STARTUP / DEMONSTRATION

A. Structural Cantilever Gate System:

1. The complete system shall be adjusted to assure it is performing properly.

2. The system shall be operated for a sufficient period of time to determine that the system is in proper working order.

a. Contractor shall operator slide gate for a minimum of 15 cycles per day for two weeks. Contractor shall submit daily log of the operation and outcome including any adjustment made during test period.

3. Test and Explain Safety Features: Contractor shall hold a minimum of two four-hour instruction sessions with Owner and Engineer. Each session shall be recorded and provide to owner as part of Operations and Maintenance Manual.

a. Each system feature and device is a separate component of the gate system.

b. Read and follow all instructions for each component.

c. Ensure that all instructions for mechanical components, safety devices and the gate operator are available for everyone who will be using the gate system.

d. The warning signs shipped with the gate operator must be installed in prominent position on both sides of the gate.

4. Ensure the owner is clear with regard to the safety points concerning the basic operational guidelines of the safety features of the gate operator system. These safety points are listed in the operator manual and must be read prior to system use.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjusting

1. Adjust fencing and gates prior to securing in place to ensure proper matching at butting joints and correct alignment throughout their length. Plumb posts in each direction.

2. Gates: Adjust gates to operate smoothly, easily, and quietly, free of binding, warp, excessive deflection, distortion, nonalignment, misplacement, disruption, or malfunction, throughout entire operational range. Confirm that latches and locks engage accurately and securely without forcing or binding.

3. Automatic Gate Operators: Energize circuits to electrical equipment and devices. Adjust operators, controls, safety devices, alarms, and limit switches.

a. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.

b. Test and adjust controls, alarms, and safeties. Replace damaged and malfunctioning controls and equipment.

4. Lubricate hardware, gate operators, and other moving parts.

B. Demonstration: Engage a factory-authorized service representative to train DEP's personnel to adjust, operate, and maintain gates. Two one-day training sessions shall be provided.

C. Protection

1. Protect cast-in-place sleeves and field-drilled holes from debris and water intrusion by use of temporary covers or removable foam inserts.

D. Cleanup

1. All material that has been affected by cutting, drilling, fitting, and welding, shall also comply with the below requirements.

2. Clean exposed surfaces of decorative fences and gates before leaving the site after completion of installation. Do not use abrasives or non-approved solvent cleaners. Test cleaning techniques on an un-used section of decorative fence or gate before employing cleaning technique in the work.

   a. Remove all stains, dirt, grease and other substances by washing the decorative fences and gates thoroughly using clean water and soap. Rinse with clean water.

   b. Do not use acid cleaning solutions, steel wool or other harsh abrasives. If stains remain after washing, remove finish and restore in accordance with recommendations of the manufacturer.

3. Leave fencing system and gates, free from dents, burrs, scratches, holes and other blemishes. Refinish minor scratches to be indistinguishable from adjacent un-scarred areas. If, after refinishing and the Engineers inspection, damage remains visible when viewed from five feet away, or if finish of work has been altered to the point where it appears different from adjacent work, Contractor shall replace damaged work with new undamaged material at no additional expense to the City.

4. At the completion of the work, clean or replace adjacent work, marred by the work of this Section.

5. Remove all materials and debris and leave the site in clean condition.

END OF SECTION

SECTION 32 90 00 - PLANTING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Planting as specified herein includes, but is not limited to, the following:

1. Furnishing and installing new trees, shrubs, grasses, and all other plant materials.

2. Staking and guying of trees, only where shown on the Contract Drawings or as directed.

3. Furnishing and installing mulch.

4. Protection and maintenance of all plant materials and the replacement of plantings as required until Substantial Completion.

5. Plant replacements during guarantee period.

B. The Contractor shall implement practices and procedures to meet the Project's sustainability goals as identified in the Contract Documents. The Contractor shall ensure that the sustainability requirements of this Section are implemented to the fullest extent.

C. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 31 23 23 - Fill

B. Section 31 25 10 - Dust, Soil Erosion and Sediment Control

C. Section 32 90 05 - Soil Mixes

1.04 REFERENCES

A. AmericanHort

1. American Standard for Nursery Stock (ASNS), ANSI Z60.1, current edition

B. New York Flora Atlas (http://newyork.plantatlas.usf.edu/Default.aspx)

C. USDA Plant Database (http://plants.usda.gov/java/) & USDA Plant Hardiness Zone Map (http://planthardiness.ars.usda.gov/PHZMWeb/)

1.05 DESCRIPTION

A. Contractor shall locate all required plant materials and be present for their inspection, as directed by the Engineer, at the nursery prior to transport or upon delivery of the materials on Site. Notify the Engineer at least 14 days in advance of the Contractor's desired inspection dates and locations. The Engineer may designate a DEP Bureau of Water Supply Restoration Specialist as the Engineer's representative.

B. Inspection at Nursery: All plants may be inspected and selected by the Engineer at the nursery for conformity to the requirements of the Contract. Whether plant materials are inspected or not at the nursery, the Contractor shall make all preselection arrangements required by the Engineer to ensure an efficient selection procedure. Approval of plant materials at the nursery shall not affect the rights to inspect or reject the materials upon delivery or later.

C. Inspection at Delivery On-Site: Notify the Engineer at least five (5) working days in advance of delivery of plants to the Site.

1. The Engineer will inspect all plants upon delivery to the Site.

2. Contractor shall schedule a time for on-site inspection prior to planting, and shall arrange for adequate labor and equipment on-site at the time of inspection to unload, open, and handle plants during inspection.

3. The Engineer may reject any plant material prior to or upon delivery to the Site.

a. All plant material that is dead, dying or appears unhealthy will be rejected.

b. All plant material that has been improperly maintained, dug, transported or handled in such a way as to impair its appearance or health will be rejected.

c. All substitutions are subject to approval by the City.

D. The Engineer will be the sole judge of the condition of the plants.

1. All material that is rejected on site shall be removed immediately from the Site, and replaced with new material selected or approved by the Engineer, at no additional cost to the City.

E. Sustainable Design Requirements:

1. Regional Materials: Provide plant materials that were grown and harvested, or extracted, within 250 miles of the Site unless otherwise required in the Contract.

1.06 QUALITY ASSURANCE

A. Comply with all rules, regulations, laws and ordinances of local, state and federal authorities having jurisdiction. Provide labor, materials, equipment and services necessary for work to comply with such requirements at no additional cost to City.

B. Procure and pay for all permits and licenses required. Obtain all required permits in a timely manner to avoid delays to the Work.

C. Plant Quality

1. Provide plant material to meet or exceed applicable standards defined by American Standard for Nursery Stock (ANSI Z60.1, latest edition). including plant names, size and grading standards.

a. Plants shall be typical of their species or variety with normal habits of growth, in accordance with ANSI Z60.1; sound, healthy and vigorous, well-branched and densely foliated when in leaf, with healthy well developed root systems; and free from disease, abrasions of the bark, insect pests, eggs or larvae.

b. Plant species native to the Eastern United States shall be provided. Non-native species shall not be considered as substitutes for native species.

c. Plants shall be true to species and, if as a variety or cultivar, said cultivar or variety shall be listed in The New York Flora Atlas (http://newyork.plantatlas.usf.edu/Default.aspx) to determine nativity.

d. Native plant material shall be derived from the local genotypes of the native plants specified to the greatest extent practicable. No plant material shall be collected or harvested from non-nursery areas.

e. Plants that have escaped cultivation, or have accidentally been introduced or naturalized into native habitats, shall not be considered native to the Eastern United States. Refer to USDA Plants Database (http://plants.usda.gov/java) for taxonomy and New York Flora Atlas to determine nativity.

D. Landscape Subcontractor

1. The Contractor shall provide evidence to the Engineer that the landscape subcontractor has experience in landscape work similar to the type and scale of work to be provided in this Project.

1.07 SUBMITTALS

A. Submit a Statement of Qualifications for the landscape subcontractor that consists of the following information:

1. Company name and address
2. Number of years in business under this name
3. Number of current full-time, part-time, and seasonal employees
4. Estimated number of employees intended for this Project
5. Current workload:
   a. Name and address of current projects
   b. Types and dollar amounts of work for which landscape subcontractor is responsible in each current project
   c. Estimated completion date for each current project
6. References for three (3) projects completed within the last six (6) years, which are similar in scope to this Project, including the following information for each project:
   a. Name and address of project
   b. General description of work
   c. Dollar amount of landscape work performed
   d. Dates of commencement and completion of the landscape work
   e. Verified contact information for at least one (1) representative of the owner or prime construction contractors in each project:
      1) Name,
      2) Mailing address,
      3) E-mail address, and
      4) Telephone numbers (Office and Direct).
7. Contact information similar to above for at least one (1) representative of the architect, engineer, landscape architect, or other representative of the designer or construction manager for each project given as reference.

B. Samples: Submit samples of the following items:

1. Mulch: One (1) pound bag with manufacturer's certification of content

C. Growers/Nurseries: Contractor shall submit a list of proposed growers/nurseries prior to the commencement of any landscaping Work, with sufficient advance notice of at least 60 days or as stated in the Contract.

D. For nurseries, a copy of state inspection certificate for current year shall be submitted.

E. Materials/Certificates: Contractor shall submit a list of all materials and certificates specified in this Section prior to the commencement of any landscaping Work, with sufficient advance notice of at least 30 days or as stated in the Contract.

F. All necessary state, federal and other inspection certificates as may be required by law.

G. Product Data - Where applicable, the following product data shall be submitted:

1. Manufacturers' product information for filter fabric, showing conformance with the specified requirements.

2. Analysis of each seed or hydroseed mix to be used, showing percentage of each species, percentage of purity, weed content and germination of seed.

3. Identification of sod source and certification that all sod material is true to name, type, purity and other criteria in conformance with these specifications.

4. Certified analysis for each treatment, amendment, and fertilizer material specified and as used, including weight for packaged material.

5. Manufacturers' product information for erosion control blankets or mats, including documentation that products are 100% biodegradable.

H. Documentation: The Contractor shall submit written documentation at least 30 days prior to scheduled start of planting that all plant material has been ordered.

I. Submit written schedule of maintenance operations proposed for the guarantee period. Schedule shall be in the form of a list of all proposed maintenance tasks, with dates showing when each maintenance task will be performed and its frequency of occurrence.

J. Sustainable Design Submittals:

1. Environmental Materials Reporting Form (EMRF) Regional Materials. Provide the following information:

a. Name of Product and Manufacturer.

b. Material cost breakdowns. Cost breakdowns must include total material-only cost (excluding installation, labor and equipment).

K. Indicate the location and distance from Project of material manufacturer and point of extraction, harvest, or recovery for each raw material. For assemblies, include the percentage by weight that is considered regional.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Deliver packaged materials in unopened bags or containers, each clearly bearing the name of the producer, the material composition, manufacturers' certified analysis, and the weight of the material.

B. Handle all plant material to prevent injury to trunks, branches and roots.

1. Do not bend or bind-tie trees in such manner as to damage bark, break branches or destroy natural shape.

2. Do not drop or throw plant material during delivery. Unloading shall be performed with appropriate equipment.

C. Pack and ship all plant material to ensure arrival at site in good condition. Provide protective covering during transport and delivery.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. All new plant material shall be guaranteed for a period of 1 year after the date of Substantial Completion, unless otherwise required in the Contract.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Acceptable suppliers of planting materials shall be as indicated below.

1. Hardscrabble Farms Nursery, North Salem, NY (www.hardscrabblefarms.com);

2. Pinelands Nursery, Columbus, NJ (www.pinelandsnursery.com);

3. New England Wetland Plants, Inc., Amherst, MA (www.newp.com);

4. One Nature Nursery, Bloomingburg, NY (www.onenaturellc.com);

5. Ernst Conservation Seed, Meadville, PA (www.ernstseed.com);

6. Sylva Native Nursery & Seed Company, Glen Rock, PA (www.sylvanative.com);

7. Octoraro Native Plant Nursery, Kirkwood, PA (www.octoraro.com);

8. Northcreek Nurseries, Oxford, PA (http://www.northcreeknurseries.com);

9. Or approved equal.

B. All nurseries supplying plant material shall have a registration certificate from the Department of Agriculture and Markets, Division of Plant Industry, New York (or similar organization in the state from which plant material is obtained) certifying

that the plant material is apparently free of injurious insects, diseases and invasive plant material.

2.02 MATERIALS / EQUIPMENT

A. Trees and Shrubs

1. All woody plant material shall be nursery grown in accordance with good horticultural practice, for at least two (2) years under climatic conditions and soils similar to those at the Site. All plants shall be of specimen quality. All trees are to be uniform and matched. All trees shall have straight trunks with leader intact, undamaged and uncut. Trees with damaged or crooked leaders, bark or abrasions, sunscald, disfiguring knots, or insect damage will not be accepted.

2. All trees shall be freshly dug for this Project. Depth of planting shall be checked on all trees being tagged at the nursery. Remove all soil or other fill material above the natural point where the tree trunk begins to spread, (the flare), prior to digging and ball and burlap operations.

3. Size:

a. Caliper measurement shall be taken on the trunk at 6 inches above the natural ground line for trees up to and including 4 inches in caliper, and 12 inches above the ground for trees greater than 4 inches in caliper.

b. Height and spread dimensions refer to the main body of plant, and not from branch tip to tip.

c. If a range of size is given, no plant shall be less than the minimum size and not less than 50 percent of the plants shall be as large as the maximum size specified.

d. Plants that meet measurements but do not possess a normal balance between height and spread shall be rejected.

e. Plants larger than specified may be used only if approved by Engineer. Use of such plants shall not increase the Contract price. If larger plants are approved, the root ball shall be increased in proportion to the size of the plant. The Contractor shall verify that the size of the root ball will fit in prepared planting pits.

4. All trees shall be either container-grown or balled and burlapped stock (B&B), with a compact natural ball of earth, firmly wrapped and tied in burlap fabric, as appropriate for the size of the plant material.

a. Root ball sizes shall be in accordance with standards specified in ASNI Z60.1

b. Plants with cracked or broken rootballs will not be accepted.

c. Only natural burlap fabric shall be acceptable for balling. Plastic and other non-biodegradable fabrics will not be accepted.

5. Staking and Guying Materials

a. Stakes (where specified only): 3-inch diameter cedar, fir, or hemlock stakes, with pointed ends. Stakes shall be straight, sound, and free from defects that may impair strength.

b. Tree tie: ¾-inch thick polypropylene woven tree tie

B. Drainage Gravel

1. Drainage fill shall conform to the requirements of Section 31 23 23 – Fill, and shall be clean, free from silt and organic materials.

C. Mulch

1. Mulch shall be a double-shredded natural forest product of a uniform grade, partially decomposed, undyed, free from sawdust, with no additives or any other treatment. Size of bark shall be from 5/8 inch to one and 1/4 inch.

2. Mulch sources shall be free of weed seeds, diseases or pest infestations including but not limited to the Emerald Ash Borer, Asian Longhorned Beetle and Spotted Lanternfly. Use of material from any areas that have been designated for quarantine of wood products by any state or federal agency is strictly prohibited.

D. Filter Fabric

1. Filter fabric shall be non-woven type conforming to the requirements of Section 31 25 10 - Dust, Soil Erosion and Sediment Control.

E. Water

The Contractor shall be supply all required water to the Site at no additional cost to the City.

a. The Contractor shall correct all Work injured or damaged because of the lack of water, or the use of too much water, or the use of contaminated water.

b. Water shall be free from impurities injurious to vegetation.

F. Tree Irrigation Bags

1. Unless otherwise shown on the Contract Drawings, required in the Contract, or directed by the Engineer, the Contractor shall furnish tree irrigation bags for all trees over 1-1/2 inch caliper. The irrigation bags shall be 100% reinforced UV stable polyethylene, at least 10 mils. thick with a polyester scrim lining, such as Tree-Gator, as manufactured by Spectrum Products, Raleigh, NC, or approved equal. The irrigation bags shall have a minimum 20-gallon capacity.

G. Erosion Control Mats

1. Erosion control blankets or mats shall be 100% biodegradable and free of any plastic.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examination

1. Approximately one (1) month prior to the expiration of the guarantee period, the Contractor shall arrange a site inspection by the Engineer.
2. At this time, the Engineer will prepare a list of all remedial Work required, including plant replacement and maintenance.
3. This Work shall be carried out before the end of the guarantee period, unless weather conditions cause delays, in which case such Work shall be carried out as soon as is practical, as determined by DEP.
4. The Contractor shall coordinate its Work with that of other Contractors. Such coordination shall include, but not be limited to:
    a. Location of all underground utility lines and structures
    b. Scheduling of planting operations
    c. Scheduling of maintenance operations
5. Drainage at tree pits: If directed by the Engineer, check drainage at tree pits prior to planting, by performing percolation tests (in dry weather) as follows:
    a. Dig out planting hole to required depth and fill hole half full of water. Monitor decrease in water level to determine if drainage is appropriate for soil type. Soils in wetter areas will drain more slowly that soils in dryer areas.
    b. If water does not drain adequately from plant pits, amend conditions at tree pits and planting beds as required for satisfactory drainage. If topsoil or subgrade has been over-compacted by the Contractor’s operations, such as by compaction equipment or by allowing vehicles or equipment to pass over the area, the Contractor shall remove and replace over-compacted materials at its own expense.
    c. Obtain approval of Engineer for proposed amendments.
    d. Do not place trees in pits until approval of drainage conditions by the Engineer.

6. The Contractor shall be liable for all damage to surrounding areas caused by planting operations and shall be required to restore or replace the damaged areas to their original condition.

7. Contractor is responsible for determining the location of all utilities, by contacting the appropriate utility company prior to any planting activities.

   a. Verify that underground utilities and irrigation systems in landscape areas are in place, at the proper location, tested (except final irrigation testing) and ready for use.

      1) Take proper precautions so as not to disturb or damage sub-surface elements.

   b. Coordinate with other trades.

8. The Contractor is liable for any damage to such utilities during the course of construction and is responsible for making necessary repairs to damaged utilities at its own expense.

B. Preparation

1. Planting

   a. Install filter fabric under planted areas, in areas shown on the Drawings.

      1) Fabric shall be overlapped by a minimum of six (6) inches.

      2) Fabric shall be held in place with wire staples of adequate quantities to prevent movement of fabric during planting operations.

      3) Fabric ends shall be secured in trenches as shown on the Drawings.

      4) No fabric shall be visible following completion of planting and seeding operations.

   b. Planting soil mix materials and installation shall be as specified in Section 32 90 05 – Soil Mixes.

   c. Exercise extreme caution during excavation to avoid damaging or interrupting existing underground utilities. Use appropriate detection equipment to locate utilities during excavation for planting.

   d. Erect barricades, warning signs, or other protective devices as may be required by local, state, or federal laws and regulations to protect open excavations.

3.02 INSTALLATION

A. For projects within New York City, plant only within the following dates, weather permitting. Do not plant in times of high wind, rain, sleet, or snow when the ground is frozen or excessively wet; or when the soil is otherwise in an

unsatisfactory condition for planting. Planting at times other than those specified will be at the Contractor's own risk, and will not invalidate any guarantees.

1. B & B Deciduous trees and shrubs:
   a. Spring: March 15 to May 15
   b. Fall: October 15 to December 15
2. The following trees shall be planted during the spring season only:
   a. Acer rubrum and A. saccharum
   b. Betula lenta, B. allegheniensis and B. populifolia
   c. Carpinus caroliniana
   d. Carya spp.
   e. Castanea dentata
   f. Cornus alternifolia and C. florida
   g. Liriodendron tulipifera
   h. Nyssa sylvatica
   i. Ostrya virginiana
   j. Pinus rigida and P. strobus
   k. Quercus spp.,except Q. palustris or Q bicolor
   l. Salix amygdaloides
   m. Sorbus americana
   n. Tilia americana
   o. Tsuga canadensis
   p. Viburnum lentago and V. prunifolium
   q. Betula sp.
   r. Crataegus sp.
   s. Liquidambar styraciflua
   t. Liriodendron tulipifera
   u. Platanus acerifolia
   v. Prunus sp.
   w. Quercus sp.
   x. Salix babylonica
   y. Tilia tomentosa
   z. Zelkova sp.
3. B & B Evergreen trees and shrubs

a. Spring: March 15 to May 15

b. Fall: September 1 to December 1

4. Container-grown perennials, vines, and ground cover plants:

a. Spring: March 15 to July 1

b. Fall: September 1 to November 1

B. Do not plant until plant material has been approved by the Resident Engineer at the Site.

C. If planting is delayed more than 6 hours after delivery, provide adequate means of protection from freezing and from the drying effects of wind and sun.

1. Protect root balls with soil, wet mulch, or other acceptable material.

2. Provide shade structures or other covering as required to protect from sunscald.

3. Water as necessary until planted. Do not allow plant material to wilt or show signs of stress from lack of water. Provide all water and equipment for water distribution at no additional cost to the City.

4. Do not remove container-grown stock from containers prior to planting.

D. Placement of Plants

1. Plants shall be set in the center of pits, plumb and straight, in accordance with the planting details, and faced to give best appearance and relationship to adjacent plants and structures.

2. Plant to such depth that the finished grade level of plant, after settlement, will be the same as that at which the plant was grown.

3. Trees must be planted at the depth of the flare, where roots spread from the trunk. The flare must be located and placed at the correct level before continuing planting operations.

E. Planting Balled and Burlapped Trees and Shrubs

1. Excavate plant pits to minimum dimensions shown on the Contract Drawings. If plant pits are mechanically dug, the sides of the pit shall be broken down or roughened with a shovel or other hand tool to eliminate surface glazing.

2. Remove any platforms, wire, and surplus binding from top and sides of ball.

3. Position plants in center of pit, using gentle handling to avoid damage to any part of the plant.

4. Set plants on a bed of compacted soil mix, to position at the correct depth, as shown on the Drawings.

5. Cut and remove burlap, rope ties, and wire baskets from the root ball, backfilling and gently removing burlap and wire basket in sections as needed to support the root ball.

6. If wire baskets are used to contain the root ball, these shall be entirely removed before planting.

7. Fully remove all burlap, non-biodegradable twine and other materials.

8. Cleanly cut off all visible broken or frayed roots.

9. Add mycorrhizal fungi inoculant, if specified, to each tree planting as per the approved manufacturer's or supplier's instructions.

10. Apply water retention additive as per approved manufacturer's or supplier's instructions.

11. Backfilling: Fill plant pit with soil mix by hand, in layers not more than six (6) inches deep, and with each layer thoroughly settled by hand tamping and with water, and free of all voids before next layer is put in place.

12. Install tree irrigation bags and fill with water, unless otherwise specified or directed by the Engineer.

F. Planting Perennials, Vines, and Container Grown Shrubs

1. Excavate plant holes to depth of container and twice the container diameter.

2. Carefully remove plant from container using gentle handling to avoid damage to any part of plant.

3. If roots are loose, spread roots out evenly over a mound of soil mix. If roots are tight and compact, loosen by pulling gently apart. If plant roots will not separate, use a sharp tool to make vertical slits in the root ball, approximately 1/2-inch deep at three or four locations around root mass.

4. Set plants on a bed of compacted soil mix, so that the root ball is level with the surface of the soil.

5. Backfilling: Fill plant pit with soil mix by hand, pushing the mix around and just over the surface of the root ball. Add soil mix in layers not more than four inches (4") deep, and with each layer thoroughly settled by hand tamping and with water, and free of all voids before next layer is put in place.

G. Saucering

1. After backfilling is completed, a saucer shall be made for the retention of water around each plant, unless impracticable because of placement of tree gratings or other paving material over planted area.

2. The saucer shall be of the same diameter as that of the hole dug.

3. The lip shall be level all around and shall be at least 4 inches high for trees, and 2 inches high for shrubs.

H. Watering

1. Immediately after installation of each plant, the soil around it shall be thoroughly saturated with water.

   a. Apply water slowly so as to penetrate the entire root system.

   b. Watering shall continue throughout the maintenance and guarantee period, as frequently as seasonal conditions require, until Final Acceptance of the Work.

   c. Contractor shall be responsible for adequate water both before and after installation of irrigation system.

I. Mulching

1. After planting operations are complete all plant bed areas shall be covered with approved mulch.

   a. Unless otherwise specified on the Contract Drawings, mulch shall be installed at an even depth of three (3) inches over tree pit and shrub areas and two (2) inches over groundcover beds.

   b. Mulch shall be contained within the plant bed areas and shall not be permitted to spread onto paved areas. Mulch shall not cover plants.

   c. Mulch shall not be placed in direct contact with tree trunks. The area of the root flare shall be left free of mulch.

J. Staking

1. Trees shall be staked only if shown on the Contract Drawings, required in the Contract, or directed by the Engineer.

   a. Trees shall stand plumb after staking.

   b. Do not use tree wrap.

K. Pruning

1. Perform pruning following planting only as shown on the Contract Drawings, required in the Contract, or directed by the Engineer and approved by the City.

   a. Excessive pruning at the time of transplanting shall be avoided.

   b. Pruning shall be performed by a Certified Arborist in accordance with current best practices of the International Society of Arboriculture.

   c. All deadwood and broken or damaged branches shall be removed. Plants exhibiting suckers should be rejected.

   d. Pruning shall be done with clean, sharp tools.

e. No leaders shall be cut. Each cut shall be made carefully, at the correct location, leaving a smooth surface with no jagged edges or torn bark. The correct anatomical location is just beyond the branch collar.

f. Large or heavy limbs shall not be removed.

L. Antidesiccant Spraying

1. Use antidesiccant only as approved by Engineer. Approval is required for each condition of use.

3.03 FIELD TESTING / QUALITY CONTROL

A. Protection and Maintenance

1. At least 30 days prior to the date of the written request for Substantial Completion, the Contractor shall submit a written protection and maintenance program and schedule to the Engineer for approval.

2. Protection and Maintenance program shall be revised and resubmitted as required until approved by Engineer.

3. During the guarantee period, the Contractor shall maintain all plant materials as specified herein, and as noted in the approved maintenance schedule, and shall replace, at no additional cost to the City, any and all plant material that has died or, in the opinion of the Engineer or Engineer's designated representative, is in unhealthy or unsightly condition.

4. The Contractor is responsible for providing and maintaining adequate protection measures for all planted areas throughout the guarantee period in order to protect plantings from any subsequent construction operations or other types of physical damage.

a. Protection measures may include, but not be limited to, approved temporary fencing, tree guards, signage and other measures as determined to be necessary during the guarantee period.

b. Local fence ordinances and guidelines may also apply to the work, requiring the Contractor to submit design drawings or other documents for obtaining the necessary local permits or approvals at no additional cost to the City.

B. Replacements

1. There will be no limit to the number of times replacements are made of individual plants, unless conditions causing the failure can be proved to be beyond the control of the Contractor.

2. The Contractor is responsible for replacing any and all plant material and any associated compacted soils that are damaged by the Contractor's own operations or the operations of any of its subcontractors, or due to other

damage resulting from a lack of adequate protective measures, at no additional cost to the City.

3. All replacements shall be in accordance with original specification or, if it is determined that specified plants are inappropriate for as-built conditions, they may be replaced with the approval of Engineer to more appropriate species as identified by a DEP Restoration Specialist, Landscape Architect or other qualified professional.

4. Cost of all replacements shall be included in the Contract price. No additional payment will be made therefor.

5. Replace unacceptable plant material no later than the next succeeding planting season.

6. Guarantee all replaced material for a period of 18 months after the date of replacement, unless otherwise required in the Contract.

7. All areas damaged or soiled by replacement planting operations are to be fully restored to their original condition at no additional cost to the City.

C. Substantial Completion

1. Contractor shall submit a written request to the Engineer, for a formal inspection of the planting Work for Substantial Completion.

2. To be accepted at the time of formal inspection of planting Work, all plant material must be alive, healthy, and installed as specified.

a. If plants are dead, dying, or unhealthy, or if landscaping does not serve its visual or soil stabilization functions, or if workmanship is unacceptable to the Engineer or Engineer's Representative for other reasons, written notice will be given to the Contractor in the form of a punch list that itemizes all remedial Work required for Substantial Completion.

b. This Work may include plant replacement or maintenance which must be carried out prior to issuance of the Certificate of Substantial Completion.

c. The Certificate of Substantial Completion will not be issued until a written maintenance program, as described herein, has been approved by the Engineer.

D. Final Acceptance

1. Following the completion of all remedial work and replacement plantings, the Contractor shall request the Engineer in writing for a formal inspection of the landscape Work for Final Acceptance.

If replacement plantings are required, Acceptance will be provisional upon a final inspection at the end of the guarantee period for the plant replacements.

3.04 STARTUP / DEMONSTRATION

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjusting

1. Maintenance of all plant material shall begin immediately after planting, and continue until the end of the guarantee period, unless otherwise noted.

2. Defective Work shall be corrected as soon as possible after it becomes apparent and when weather season permits. The Engineer shall be the sole judge of the condition of the plants.

3. Maintenance shall include:

   a. Watering, replanting, repair of ruts and erosion, repair of protection devices, weeding and continuous control of invasive species, fertilizing and mowing of lawn areas.

   b. The removal of all dead, dying or unhealthy plant material, and replacement of such material with new plants or seeding to meet all specifications of the original plantings.

   c. Protection from insects, disease, and invasive species to maintain optimum health. Infection or infestation may require removal and disposal off-site followed by replacement with plants free of infection at the discretion of the Engineer's designated representative.

   d. The repeating of any or all phases of planting as specified herein, or that may be required to obtain healthy plantings and a uniform, thick, and well developed stand of grass.

4. Specific Maintenance Tasks: Maintenance shall include, but not be limited to the following:

5. Watering: Water planted areas as required. Do not permit plant material to wilt or to show signs of stress from lack of water. Contractor shall supply and distribute water to all plantings during the full time of their establishment at the Site and provide all equipment for water distribution at no additional cost to the City. Plants shall be inspected by the Contractor for watering needs at least once each week, and watered as necessary to promote plant growth and vitality.

6. Fertilizers: If applicable, apply any approved fertilizers, herbicides, pesticides or fungicides as required, or as directed by the Engineer, to keep all plantings healthy and pest-free throughout the guarantee period. Any fertilizers, herbicides or pesticides must be approved in advance by DEP.

7. Rodents: Protect against and exterminate rodents, and repair of any damage caused by rodent activities.

8. Weeding: Weed to keep all planted areas weed-free throughout the guarantee period.

9. Mulching: Add mulch material as required to maintain mulch at specified depth.

10. Resetting: Reset plant material that has settled, to proper grade and position.

11. Pruning: Prune trees and shrubs to remove all dead or broken branches, throughout the guarantee period. Prune flowering shrubs as necessary to ensure flowering.

12. Trimming: Cut back dead stalks, flowers and foliage from perennials in fall after the first frost. Trim or dead-head spent flower blossoms throughout the guarantee period.

13. Anchoring: Maintain any approved tree stakes, ties and other tree anchoring systems, including tightening, repair or replacement as required, and removal at the end of the guarantee period, or as directed by the Engineer.

14. Irrigation: If applicable, coordinate with irrigation system installer for all adjustments to irrigation as required.

15. Instruct City's maintenance personnel in all maintenance procedures.

16. Maintenance Program

    a. Prior to Substantial Completion, the Contractor shall arrange a meeting with the Engineer and with the City's designated maintenance personnel to review together the submitted maintenance program and any modifications required for the duration of the guarantee period.

    b. The Contractor shall make periodic inspections, at no extra cost, during the guarantee period to determine what changes, if any, should be made in the maintenance program.

    c. Any recommended changes shall be submitted in writing to the Engineer.

    d. Additional remedial work not included in the maintenance program shall be carried out by the Contractor as deficiencies are identified and reported by the Engineer or designated maintenance personnel.

17. Replacements

    a. In accordance with the requirements for Warranty (Guarantee Period) under this Section, the Contractor shall replace, as soon as weather conditions permit, and within a specified planting period, all plants determined dead and/or dying by the Engineer or the City's designated personnel during and at the end of the guarantee period. Replacements shall be made at no additional cost to the City. Labor and all materials needed for installation of replacements shall be included in the warranty.

b. Plants shall be free of dead or dying branches and shall bear foliage of normal density, size, and color.

c. Trees having lost their central leader or exhibit crown dieback at the end of the guarantee shall be replaced.

d. Replacements shall match adjacent specimens of the same species. Replacements shall be subject to all requirements stated in this Section.

B. Plant Protection

1. The Contractor shall provide at its own expense all protection that is deemed necessary for all plants and lawn areas against damage prior to Final Acceptance.

2. Removal of Temporary Protection Measures: All temporary protection measures employed during the construction period shall be removed prior to Substantial Completion unless otherwise directed by the Engineer. All stakes and ties used for temporary bracing of trees shall be removed and disposed of by the Contractor off site at its own expense at the end of the guarantee period, or earlier at the direction of the Engineer.

C. Clean Up

1. At the end of each work day the Contractor shall broom-clean the site, to remove all trash, debris, and loose soil materials. Store materials and equipment where directed.

2. Immediately following the completion of planting operations, the Contractor shall remove all excess materials, stockpiles, waste materials, tools, and equipment, and leave the Site in a clear and clean condition.

3. Immediately remove all rejected materials from the Site. All rejected materials and other waste or debris shall become the property of the Contractor, who shall legally dispose of same off-site.

END OF SECTION

SECTION 32 90 05 - SOIL MIXES
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The work of this Section includes but is not limited to the following:

1. Supply of component materials and soil amendments for soil mixes or supply of blended soil mixes from approved off-site sources.

2. Reuse of existing topsoil stripped from site.

3. Preparation of soil mixes on site.

4. Installation, placement, spreading, and fine grading of soil mixes.

5. Testing of all soil component materials, soil amendments, and soil mixes.

B. The Contractor shall implement practices and procedures to meet the project's sustainability goals as identified in the Contract Documents. The Contractor shall ensure that the sustainability requirements of this Section are implemented to the fullest extent.

C. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. System Design Requirements

1. All soil mix components shall be tested and approved prior to incorporation into blended soil mixes.
2. Provide adequate quantities of all soil mix materials to attain, after compaction and natural settlement, all design-finished grades.
3. Sustainable Design Requirements
   a. Regional Materials: Soil shall be extracted within 250 miles of the project site.

1.06 QUALITY ASSURANCE

A. Contractor shall submit written test reports as required in this Section.

1. Testing shall be carried out by an independent testing laboratory.
2. Engineer's approval of the testing laboratory shall be obtained by the Contractor before it is given any work of this Section.
3. Contractor shall be responsible for timely submittal of samples to the testing laboratory.

B. Each test shall be carried out using the categories and sieve sizes as specified herein. Failure to include any of the required criteria will be sufficient cause for rejection of the test.

C. Each test report shall include the following information:

1. Project title
2. Name of Contractor
3. Name of material supplier or location where material is extracted from
4. Testing laboratory name, address and telephone number
5. Type of test
6. Date of test
7. Test results, including identification of deviations from acceptable ranges.

D. Each sample shall be tested, as applicable, for the following:

1. Mechanical analysis: Sieve method, using sieve sizes specified.
2. pH should be measured according to Recommended Soil Testing Procedures for the Northeastern United States (NEC-1012). Where soil will

be used to support plant growth, lab analysis results must include corrective recommendations.

3. Organic matter content: Percentage of oven-dry weight of soil, determined by loss on ignition of moisture-free sample, in accordance with Method A of ASTM F1647.

4. Electrical conductivity (soluble salts): Test by saturated paste method in deciSiemens per meter (dS/m).

5. Soil Fertility Analysis: Analysis for available macronutrients including, at a minimum, phosphorus and potassium in parts per million according to methods as specified in NEC-1012. Test methods and fertility recommendations must be included with results.

6. Chemical Analyses shall include the 6 NYCRR Part 375-6 compounds detailed in Specification 02 24 20 - Soil Sampling and Analysis. All analyses shall be performed by a testing laboratory certified by the New York State Department of Health Environmental Laboratory Accreditation Program (NYSDOH-ELAP). The frequency of testing per volume of fill shall be in accordance with 6 NYCRR Part 360.13 (e)(1), Table 1, Minimum Analysis Frequency for Fill.

E. The Engineer may take and analyze at any time, such additional samples of materials as deemed necessary for verification of conformance to specification requirements. Contractor shall furnish samples for this purpose upon request and shall perform testing as requested at no additional cost to the City.

F. No component bulk material for soil mix shall be used or blended into a mix, until test reports have been received and approved by the Engineer. As necessary, make any and all soil mix amendments and resubmit test reports indicating amendments, until approved.

G. Comply with all rules, regulations, laws and ordinances of local, state and federal authorities having jurisdiction. Provide labor, materials, equipment and services necessary for work to comply with such requirements at no additional cost to City.

H. Procure and pay for all permits and licenses required for the Work of this Section.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. Manufacturer’s technical information, including application instructions where relevant, for all soil amendment materials required.

a. Fertilizers

b. Soil Inoculants

c. Herbicides

d. Water-absorbent Polymer

2. Samples of Soil Mix Components (1-pound package each):
   a. Topsoil -- offsite imported material
   b. Topsoil -- stripped from site
   c. Compost
3. Samples of Blended Soil Mixes (1-pound package each):
   a. Planting Mix
   b. Lawn Mix
   c. Aquatic/Marginal Mix
4. Test Results for Soil Mix Components (written report for each bulk component):
   a. Topsoil -- offsite imported material
   b. Topsoil -- stripped from site
   c. Sand
   d. Compost
5. Test Results for Blended Soil Mixes (written report for each blended soil mix):
   a. Planting Mix
   b. Lawn Mix
   c. Aquatic/Marginal Mix
6. Sources and Manufacturers List: Submit a full list of sources and manufacturers of soil mixes, including component materials and soil amendments.

B. Sustainable Design Submittals:
1. Regional Materials: Provide the following information:
   a. Names of product and manufacturer
   b. Material cost breakdowns. Cost breakdowns must include total material-only cost (excluding installation, labor and equipment).
   c. Indicate the location and distance from the Project of material manufacturer and point of extraction, harvest, or recovery for each raw material. (For assemblies, include the percentage by weight that is considered regional.)

1.08 DELIVERY, STORAGE, AND HANDLING

A. Conform to all governmental regulations in regard to the transportation of materials to, from, and at the job site, and secure in advance such permits as may be necessary.

B. Packaged Materials: Deliver packaged materials to the location where planting soil mixes are to be blended, in unopened bags or containers, each bearing the name and trademark of the producer, material composition, manufacturers' certified analysis, and the weight of the material.

1. All bags shall be protected from water and contamination with other materials.

2. Retain packages for inspection by Engineer.

3. All packaged materials shall be stored, handled and applied in strict accordance with manufacturer's instructions.

C. Stockpiles

1. Contractor shall employ all means necessary for stockpile maintenance to prevent unstable, noxious or anaerobic conditions including, but not exclusive to, temperature monitoring, planting, stockpile repacking, and runoff control.

2. All stockpiled materials shall be adequately handled as required in Section 31 25 10 – Dust, Soil Erosion and Sediment Control.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Fertilizer shall be as manufactured by:

1. Osmocote®, The Scotts Company, Marysville, OH;

2. Meister®, The Scotts Company, Marysville, OH;

3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Topsoil - Offsite Imported Material

1. Imported topsoil or soil blends may not be mined from soils defined by the Natural Resources Conservation Service as prime farmland, unique farmland, or farmland of statewide importance. Imported topsoil shall be:

a. Of uniform quality, free from hard clods, stiff clay, hardpan, sods, roots, chips, sticks, partially disintegrated stone, cement, ashes, slag, concrete, tar residues, tarred paper, boards, or any other undesirable

material. No topsoil shall be delivered in a frozen or muddy condition.

b. Free from refuse, material toxic or otherwise deleterious to plant growth, seeds, or other viable propagules of invasive plants. Construction and demolition debris as classified under 6 NYCRR Part 360, other than uncontaminated land clearing debris, shall not be used to amend topsoil.

c. Free of stones over 1 ½ inches in diameter, and will have less than 10 percent gravel.

2. Topsoil shall conform to the following requirements:

a. pH 5.5 to 7.0

b. Organic content 4 - 6%

3. Topsoil shall conform to the following mechanical analysis:

Sieve Size	Percent Passing
1"	100
1/4"	90 - 99
# 10	80 - 100
# 40	40 - 60
# 60	40 - 60
# 100	10 - 30
# 200	10 - 20

4. When the topsoil otherwise complies with the requirements of the specification but shows a deficiency of not more than one percent (1%) organic matter content; then humus, compost, or other approved organic matter may be incorporated when or as permitted by the Engineer.

5. Topsoil shall not contain hazardous waste, petroleum spills or other chemical releases, or industrial waste. Any shipment of topsoil that does not meet this requirement will be rejected by the Engineer and shall not be brought on site.

6. Topsoil being brought on site shall be sampled and must meet the definition of Fill Type 2 as defined in NYSDEC 6 NYCRR Part 360.13 (f), Table 2: Fill Beneficial Use, unless otherwise approved by the Engineer. Topsoil to be used in ecologically sensitive sites (e.g., wetlands) shall meet the SCOs for the protection of Ecological Resources, unless otherwise approved. See Section 31 23 23 – Fill.

B. Topsoil - Stripped from Site

1. Reuse of topsoil stripped from site shall be used for this work when feasible, provided it meets:
   a. All the requirements of physical properties for imported topsoil as specified hereinbefore; and
   b. The requirements for beneficial use of excavated soil as specified under 6 NYCRR Part 360, Section 360.13(b) Waste Cessation. See Section 31 23 23 - Fill.

C. Compost
1. Shall conform to the following requirements:
   a. Material shall be capable of sustaining the growth of vegetation, with no admixture of refuse or material toxic to plant growth.
   b. Material shall be derived from organic wastes such as food and agriculture residues, composted cow or other animal manures, sewage sludge or other materials that meet the specified requirements.
   c. Material shall be screened, and shall be free of any stones, branches, roots, brush, weeds, or wood chips, and all debris such as plastic fragments, glass, and metal fragments.
   d. Organic content: 50% minimum.
   e. pH: 5.5 to 8.0.
   f. Carbon/nitrogen ratio: 25:1 to 35:1.
   g. 100% passing 1/2" screen .
2. Compost shall meet the requirements for “Monthly Average Concentration” pollutant limits, except where the Engineer specifically allows the use of the “Maximum Concentration” pollutant limits, as stated in the current version of 6 NYCRR Part 360.
3. No compost shall be delivered until the approval of samples by the Engineer, but such approval does not constitute final acceptance. The Engineer reserves the right to reject, on or after delivery, any material which does not, in their opinion, meet these specifications. When compost is stored on the job, it shall be done as directed by the Engineer.
4. Certification: Only facilities permitted to compost biosolids under 6 NYCRR Part 360, will be allowed to furnish finished compost for use in topsoil. The certification shall be supplied by the Contractor prior to the delivery of any composted biosolids, topsoil containing sewage sludge, or other such regulated material to the site.

D. Soil Amendment Materials: Within the watershed, fertilizers shall not be used unless a soil test indicating a need for soil amendment is provided. Recommended materials below may not be used except where they fulfill amendment

requirements. Where authorized for use in the Contract Documents, or by written direction of the Engineer, Soil Amendment Materials shall have the following compositions:

1. Soil Fertility Analysis: Available macronutrients including Phosphorus and Potassium should be adequate to support the intended plant community. Available macronutrients shall not be at excessive levels that could potentially impair plant growth or impact water quality. The determination as to whether available nutrients are low, optimum, or excessive shall be made and reported by the soil testing laboratory based on extraction and test methods used.

    a. Only when soil analysis indicates a need and if approved in advance by the Engineer, apply commercial fertilizer and uniformly work in to top one inch of seedbed. The rate of application shall be determined by soil analysis.

    b. Do not apply superphosphate except where specifically indicated and as approved by the Engineer. Where required, uniformly work in to top one inch of seedbed. The rate of application shall be determined by soil analysis.

2. In addition to obtaining the Engineer's approval of the type(s) and N-P-K (Nitrogen-Phosphorus-Potassium) analyses of soil amendment materials, proposed based on soil test results, the Contractor shall meet the following requirements:

    a. Bonemeal: Shall be finely ground.

    b. Commercial Fertilizer: A minimum of 50% of the nitrogen shall be derived from organic sources.

    c. Controlled-release Fertilizer: Shall be in granular form.

3. Limestone: Shall be granular limestone, produced from Dolomitic limestone specifically for use in planting, with a minimum of 88% of calcium and magnesium carbonates, conforming to the following requirements:

Sieve Size	Percent Passing
# 10	100
# 20	90 minimum
# 100	60 minimum

4. Only when chemical analysis indicates a need and where approved by the Engineer, apply ground limestone and uniformly work in to top one inch of seedbed. The rate of limestone application shall be dependent on the pH of the soil, as determined by chemical analysis, and shall be as follows:

pH of Soil	Rate: Pounds/1000 Square Feet
5.0 to 5.5	100
5.5 to 6.0	50
6.0 to 6.8	25
over 6.8	0

5. Sulfur: Lower pH if required, by use of elemental sulfur product.
   a. Peat moss or copper sulfate may not be used to lower pH.
6. Mycorrhizal Fungi Inoculant
   a. For tree plantings, the Contractor shall supply Mycorrhizal Fungi Inoculant, if specified, in granular form such as by means of a three ounce (3 oz.) premeasured dry formulation packet, such as Mycor Tree Saver Transplant®, as manufactured by Plant Health Care, Inc., Pittsburgh, PA, or approved equal.
7. Water Retention Additive
   a. Water Retention Additives for tree plantings shall be a granular polyacrylamide polymer of a potassium base and not a sodium base that slowly releases moisture into the root zone such as Terra Sorb, as manufactured by Plant Health Care, Inc., 440 William Pitt Way, Pittsburgh, Pa., or approved equal.

E. Herbicides and Pesticides shall be in compliance with NYC Local Law 37 of 2005 and in conformance with the guidelines of NYC Department of Health for determining whether a pesticide or herbicide is prohibited by the Law.

F. Planting Soil Mix
1. Planting Mix shall conform to the following requirements:
   a. Organic Matter: 4.5 % minimum
   b. pH: 6.0 to 7.0
   c. Electrical Conductivity (soluble salts): 0.7 to 2.0 dS/m
2. Mix shall consist of the following proportions by volume:
   a. Six parts topsoil
   b. Two parts compost
3. The following items shall be added to the above mix if specified in contract drawings or approved in writing by the Engineer:
   a. Five pounds bonemeal per cubic yard of soil mixture
   b. One pound commercial fertilizer per cubic yard of soil mixture

c. One pound controlled release fertilizer per cubic yard of soil mixture

d. Two pounds water absorbent polymer per cubic yard of soil mixture, or as recommended by manufacturer

e. Ground limestone as required for specified pH

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examination

1. Prior to soil mix placement, the Contractor shall examine the site to determine the status of construction and existing condition in and near the areas to be planted.

2. The Contractor shall ascertain the location of all existing and proposed electric cables, conduits, irrigation, under-drainage systems and all other underground or at grade utilities, by contacting the appropriate utility company. The Contractor shall comply with the requirements of Section 31 23 16 - Excavation prior to any excavation work.

a. Contractor shall take proper precautions so as not to disturb or damage any sub-surface elements.

b. Contractor shall be liable for any and all damage to such utilities during the course of construction, and shall be responsible for making requisite repairs to damaged utilities at Contractor's own expense.

c. Contractor shall be liable for any and all damage to surrounding areas caused by planting operations and shall be required to restore or replace damaged areas to original conditions, to the satisfaction of the Engineer.

3. The Contractor shall comply with the requirements of Section 31 25 10 - Dust, Soil Erosion and Sediment Control.

4. The Contractor shall coordinate, adjust, and relate together, work of this Section with other work of the Project and with work of other Contractors. Such coordination shall include but not be limited to the following:

a. Scheduling of planting operations

b. Scheduling of maintenance operations

5. The Contractor shall also:

   a. Verify that all work requiring access through or adjacent to areas where soil mixes are to be placed has been completed and no further access (other than landscape installation) will be required. In the event that access will be required, this must be coordinated with the Engineer.

   b. Perform soil mix blending and site soil work only during suitable weather conditions. Do not handle, haul, place, work, disc or rototill soil when frozen, excessively wet, or in otherwise unsatisfactory condition.

B. Preparation of Soil Mixes

1. Excavation of subgrade shall conform to the applicable requirements of Section 31 23 16 - Excavation.

2. Uniformly blend all ingredients as required for each soil mix type, by wind rowing and/or tilling on a hard surfaced area.

   a. The components of all soil mixes shall be blended so that ingredients are thoroughly incorporated into the mixture to assure uniform distribution.

   b. Do not over-mix, mix shall remain friable and well aerated.

   c. Organic matter shall be maintained moist, not wet, during blending.

   d. Delay mixing of any approved fertilizers if planting will not follow within a few days.

   e. Add mycorrhizal fungi inoculant, if specified, to each tree planting at rate specified by approved manufacturer.

   f. Apply water retention additive as per approved manufacturer's instructions.

C. Preparation of Sub-Grade

1. Verify as-constructed or existing sub-grade elevation and perform additional grading operations as necessary to bring the sub-grade to a true, smooth, slope parallel to the finished grade, at all areas to receive soil mixes.

2. Any sub-grades or soils polluted by gasoline, oil, plaster, construction debris, unacceptable soils, or other substances which would render material unsuitable for plant growth, shall be removed from the premises, at no additional cost to the City, whether or not such pollution occurred or existed prior to or during the Contract period. In the event that such material is placed, this material shall be removed and replaced with approved material. All remedial operations associated with soil mixes require the approval of the Engineer.

3. Clean sub-grade and dispose of all debris prior to placement of soil mixes.

a. Remove all large clods, lumps, brush, roots, stumps, litter, trash, and other foreign material and stones one-half inch in diameter or larger.

b. Dispose of removed material legally off-site in accordance with the applicable laws and regulations and the requirements for waste disposal under the Contract.

4. Where specified in contract drawings or approved in writing by the Engineer, spray all vegetation on sub-grade with a pre-emergent weed killer at the rate of application recommended by the manufacturer.

5. Protect adjacent pavements, walls, utilities and other construction from damage or staining by any soil mix placement operations.

3.02 IMPLEMENTATION

A. Placement of Soil Mixes

1. Do not place any muddy or wet Soil Mixes.

2. Place and spread soil mix over sub-grade, to a depth sufficiently greater than the depth required for planting areas so that after settlement the completed work will conform to the lines, grades, and elevations shown or otherwise indicated.

3. Place and spread soil mix over the approved sub-grade, in 6-inch lifts, or as directed by Engineer, and settle to eliminate air pockets and minimize settlement. Lightly scarify previously placed surfaces prior to placing subsequent lifts.

4. Compact gently with a light or medium weight roller, unless otherwise specified in the Contract Documents.

a. Fills shall not be so compacted as to restrict the flow of air or water through the soil.

5. After completion of compaction operations, protect the installation from additional compaction from vehicular traffic, contamination by toxic materials or trash, and from water containing cement, clay, silt or any other materials.

6. Any soils that are over-compacted or contaminated after placement or otherwise made unsuitable for plant growth shall be removed from the premises and replaced with approved material or satisfactorily remediated at no additional cost to the City.

7. The Contractor shall also meet the applicable requirements on placement of soil mixes for different planting operations in Section 32 90 00 – Planting.

B. Grading of Soil Mixes

1. After settlement has occurred, add soil to maintain finished grades. If for any reason soil is left exposed for a long duration prior to planting, add soil and regrade as required.
2. Protect placed soil mixes against construction activity with snow fencing or by other acceptable methods.
3. Protect from the eroding effects of wind and rain with filter fabric, as necessary.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Clean up

1. At the end of each work day the Contractor shall broom-clean the site, to remove all trash, debris, and loose soil materials.
2. Immediately following the completion of soil mix installation operations, the Contractor shall remove all excess materials, stock piles, waste material, tools and equipment, and leave the site in a clear and clean condition.
3. All waste materials shall be disposed offsite by the Contractor in accordance with the applicable laws and regulations and the requirements for waste disposal under the Contract.

END OF SECTION

SECTION 33 01 10.60 – DISINFECTION OF PIPING, TANKS, STRUCTURES, AND EQUIPMENT
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials (including sodium hypochlorite and other chemicals), equipment (including taps, corporation stops, temporary pumps, hoses, and miscellaneous piping), and incidentals necessary to perform disinfection of all pipelines, conduits, pumps, tanks, structures, and equipment which are to store, handle, or carry potable water. The Contractor shall remove said materials and equipment after completion of the disinfection procedure. Water for the initial disinfection procedure shall be furnished by the City.

3.02 IMPLEMENTATION

A. Pipelines:

1. Pumps, hydrants, and other water handling equipment items that are part of the potable water distribution system shall be disinfected in the same manner as described herein for the pipelines.

2. Pipelines shall first be flushed with clean water. Disinfection shall be accomplished by the Continuous Feed Method, as specified in AWWA C651, using sodium hypochlorite solution.

3. Water-chlorine solution with a concentration not less than 50 mg/l of available chlorine shall then be added at one end of the section being disinfected and discharged at the far end. The water-chlorine solution shall be added until the water coming from each downstream blowoff has a residual of not less than 25 mg/l of chlorine.

4. The pipelines shall then be closed and the solution allowed to remain in the lines for at least 24 hs. The chlorine residual in the pipeline shall then be rechecked. If the free chlorine residual is less than 10 mg/l after 24 hrs, the procedure shall be repeated until the free chlorine residual after 24 hrs is 10 mg/l or greater.

5. After the 24-hr holding period, the pipelines and equipment shall be thoroughly flushed and filled with clean water. Flushing water shall not be permitted to enter existing water mains.

6. Flushing water shall not be discharged to sanitary or storm sewers without permission of the NYCDEP. Where necessary, Federal, State and local regulatory agencies shall be contacted to determine special provisions for the disposal of heavily chlorinated water.

7. When new potable water pipelines are to be connected to an existing water distribution system, the connecting piping shall be disinfected and tested in accordance with the procedure set forth in Section 9.1 or Section 9.2, as applicable, of AWWA C651.

B. Water Supply:

1. Water for the first filling, disinfection and flushing procedure of each pipeline, tank and piece of equipment will be furnished by the City, at no cost to the Contractor, from the nearest hydrant or other source. The Contractor shall provide all necessary apparatus to convey the water to the point of use and perform the disinfection procedure. If the water in the pipelines or storage facility fails the bacteriological tests, water for subsequent disinfection procedures shall be provided by the Contractor. If agreeable to the City, water for the subsequent disinfection procedures may

be furnished by the City but shall be metered, and the Contractor shall credit the City for the cost of water used for the subsequent procedures.

3.03 FIELD TESTING / QUALITY CONTROL

A. After the completion of disinfection, bacteriological samples shall be taken by the Contractor and tested at a certified laboratory. Samples shall be taken as required by the New York City Department of Health. The test reports shall be submitted to the Engineer for review and approval. If the samples are not satisfactory, the entire disinfection procedure shall be repeated at the expense of the Contractor until satisfactory samples are obtained.

1.05 DESCRIPTION

A. This scope of this Section includes the requirements for the installation of buried piping, except where installation requirements for buried piping are shown or specified elsewhere in the Contract Documents. In addition:

1. The scope of this Section includes requirements for:

a. The jointing of buried piping

b. The installation of gasket materials, specials, flexible couplings, mechanical couplings, harnessed and flanged adapters, sleeves, and tie rods.

c. Modifications and/or adjustments to existing buried piping.

d. The installation of supports, restraints, and thrust blocks.

e. The cleaning, disinfecting, and field testing of all buried piping.

2. The extent of buried process piping is shown on the Contract Drawings. The Contractor shall provide additional buried pipe as necessary and/or required to complete the Work as shown and specified. Buried pipe service, pipe diameter, coating, lining, pressure rating, joint type, and testing requirements are specified in the following section(s):

a. Section 33 06 01, Schedule for Buried Piping.

3. Where shown on the Contract Drawings, the Contractor shall provide all labor and materials for making connections between buried piping and existing lines(s) installed under other contracts, including all specials required to connect buried pipe to pipe of dissimilar material(s).

1.06 QUALITY ASSURANCE

A. Wherever the installation requirements of this Section and the referenced standards or manufacturer requirements are in conflict, the more stringent provision shall apply.

B. Ductile Iron Pipe:

1. Refer to the latest edition of the DIPRA Installation Guide for Ductile Iron Pipe and the ductile iron piping manufacturer recommendations.

a. Where requirements from the manufacturer, requirements specified by the DIRPA Installation Guide, and requirements specified herein differ, apply the most stringent requirement of the three.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. Buried piping submittals shall be submitted under the specification section number corresponding to the buried piping material. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

a. Shop Drawings:

1) Catalog cuts and data sheets, including but not limited to:

a) Specifications for all components of the buried piping.

b) Illustrations in sufficient detail to serve as a guide for assembly and disassembly

c) A parts schedule that identifies the materials to be used for the various piping components and accessories.

d) Weights of all component parts.

e) Details on joining methods.

f) Details of pipe lining, coating, wrapping, insulation and painting.

g) Copy of details of piping, specials, joints, harnessing and thrust blocks, and connections to piping, structures, equipment, and appurtenances (pipe couplings, specials, and adapters shall be submitted for approval under Section 40 05 06, Couplings, Adapters, and Specials for Process Piping).

b. Layout and Installation Drawings:

1) Shall include plans, sections, and details showing location, elevations, and clearly marked dimensions.

2) Piece numbers which are coordinated with the tabulated pipe layout schedule shall be clearly marked.

3) The scale used shall be the greater of the following two (2) scales:

a) The scale used on the Contract Drawings that depict the process pipe for which the submittal pertains.

b) ¼-in = 1-ft - 0-in.

4) When special designs or fittings are required, the work shall be shown in large detail and the special or fitting completely described and dimensioned.

5) For HDPE Pipe, layout and installation drawings shall address locations and deflections of required fittings to prevent installation that exceeds a greater degree of bending than the manufacturer's recommended minimum bending radius for each size and class of HDPE pipe.

6) Include a north arrow.

7) Information on pipe supports, including:

a) Pipe support location.

b) Pipe support type.

c) Thrust block details.

d) All loads on the support (in either lbs. or kips.)

8) Location of pipe couplings, specials, and adapters.

9) Extent of lining, wrapping, and coatings.

c. A tabulated pipe layout schedule for each buried process pipe system. Submit a separate schedule for each pipe system and/or service. The pipe layout schedule shall include the following information for each pipe section, fitting, and appurtenance that comprises that system:

1) Service.

2) Pipe size.

3) Working pressure.

4) Weight (in lbs.)

5) Joint type.

6) Wall thickness.

7) Piece number.

8) Laying length.

d. Calculations for the design of the support structures.

1) Design calculations shall be signed and sealed by a Professional Engineer registered in the State of New York.

2) Calculations shall include a summary of design criteria used in the design, including a description of each load case and load combination considered.

3) A tabulation shall be provided giving the column vertical and horizontal reactions for each load combination.

e. For each buried process piping system that contains valves, submit a tabulated valve schedule. Submit a separate schedule for each pipe

system and/or service. The valve schedule shall include the following information for each valve:

1) Valve tag number.

2) Valve size.

3) Upstream pressure (units of psig).

2. Information Submittals:

a. Certified Letters of Compliance:

1) Certificate of compliance with the requirements of the Contract Documents for pipe, fittings, couplings, sleeves, cleanouts and harnessing.

2) For welded pipe and fittings, submit a certificate from an independent testing laboratory, approved by the City, for each welder assigned to the welding of pipe, fittings, and pipeline equipment.

3) For corrugated-wall, smooth interior HDPE gravity pipe:

a) Submit a certificate of joint compliance with ASTM F477 and these specifications for each pipe size. The statement shall include date of test.

b) Submit a certificate stating that materials used for the manufacturing of the pipe and fittings for this contract shall meet the standards per ASTM D3350

4) Linings and Coatings:

a) Manufacturer shall submit a certificates or copies thereof attesting to the fact that the applicator met the requirements of the corresponding piping specification, adherence to all standards and testing specified therein, and that the material used was as specified therein.

5) Materials Certificates of Conformance: Submit certificates of conformance with Referenced Standards specified in the corresponding piping specification section.

b. Metallic Pipe Welding Procedures and Qualifications:

1) Certificates shall be of current issue and conform to the requirements of the applicable reference standards. In addition:

a) Certificates that all welders and welding operators have been qualified in accordance with ASME Boiler and Pressure Vessel Code Section IX.

b) Certificates stating that the welding of steel and stainless steel shall conform to the requirements of ASME B31.1.

2) Copies of qualified procedures and list of names and identification symbols of qualified welders and welding operators, prior to welding operations.

c. Nonmetallic Pipe Welding Procedures

1) Certificates of HDPE pipe welder experience within the previous 12 mo. shall be submitted for all technicians performing heat fusion on HDPE pipe.

2) Submit certification of qualified persons before fabricating any HDPE saddle tees.

d. For butt welded HDPE piping, submit Heat Fusion Daily Test Reports.

1) Reports shall be submitted to the Contractor and Engineer daily.

2) Reports shall also include the results of any bent strap tests performed that day.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Polyethylene Underground Warning Tape:

1. Brady Corp., Milwaukee, WI;
2. Marking Services, Inc., Milwaukee, WI;
3. Seton Identification Products, Branford, CT;
4. Or Approved Equal.

2.02 MATERIALS / EQUIPMENT

A. Warning Tape:

1. General:

a. Tracer tape shall be of inert, acid- and alkali-resistant polyethylene.

b. All tape shall be suitable for direct burial.

c. Message:

1) Shall read as follows: "CAUTION [insert customized name of pipe service as specified in Section 40 05 97, Identification for Process Equipment] PIPE BURIED BELOW"

2) Shall be written with bold letters 2-in. high.

3) Messages shall be printed at maximum intervals of 2 ft.

4) Tape shall be custom colored the same as pipeline colors specified for associated pipe service in Section 40 05 97, Identification for Process Equipment.

2. For Metallic Pipelines:

a. Size:

1) Thickness: 4 mils.

2) Width: 6-in.

b. Tape shall:

1) Be capable of stretching to twice its original length.

3. For Non-Metallic Pipelines:

a. Size:

1) Thickness: 5 mils.

2) Width: 6-in.

b. Tape shall:

1) Have aluminum backing.

2) Have 15,000 psi tensile strength.

3) Have 140% elongation capability.

B. Polyethylene Encasement:

1. Provide polyethylene encasement for all buried ductile iron piping to prevent contact between pipe and surrounding bedding material and backfill.

2. Provide polyethylene encasement in accordance with AWWA C105.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Carefully examine pipe, fittings, valves, and specials for cracks, damage, and other defects while suspended above trench before installation.

1. Immediately remove defective materials from the Site and replace with acceptable products.

B. All pipe coating injured in any way during transit or laying shall be satisfactorily repaired prior to placing the backfill.

1. Ample provision shall be made for the prompt and efficient repair of all abrasions and injuries.

C. Inspect interior of all pipe, fittings, valves, and specials and completely remove all dirt, gravel, sand, debris, and other foreign material from pipe interior and joint recesses before pipe and appurtenances are moved into excavation. Bell and spigot-type mating surfaces shall be thoroughly wire brushed, and wiped clean and dry immediately before pipe is laid.

D. Certificates of welding qualifications conforming to the requirements of ASME B31.1, Section 6 and its Supplements, shall be submitted to the Engineer for approval prior to proceeding with any pipe welding.

3.02 INSTALLATION

A. General:

1. All piping shall be erected to accurate lines and grades, supported as shown, specified, or required.

a. Slope piping uniformly between elevations shown.

2. Where temporary supports are used during construction, sufficient strength and rigidity shall be provided to prevent shifting or distortion of the pipe.

3. All work shall be accomplished using the best methods and procedures of recognized pipe fabrication in a good and workmanlike manner in accordance with the latest edition of the applicable standards referenced in the Contract Documents, including (but not limited to):

a. For ductile iron pipe:

1) AWWA C105

2) AWWA C600.

3) AWWA M41.

b. For steel and stainless steel pipe:

1) AWWA C206.

2) AWWA M11.

c. For thermoplastic pipe:

1) ASTM D2321.

2) ASTM D2774.

3) AWWA C605.

4) AWWA M23.

5) AWWA M55.

4. All buried pipe, fittings, and appurtenances shall be installed in accordance with all of the following:

   a. The manufacturer's printed instructions and recommendations.

   b. The approved shop drawings.

   c. As specified in the Contract Documents.

5. Routing:

   a. Install piping in a neat manner with lines straight and parallel or at right angles to building walls or structures, unless otherwise shown on the Contract Drawings.

      1) Install horizontal lines true to line and elevation.

      2) Install vertical lines truly plumb in all directions.

   b. Where practicable, install piping in groups and parallel to building walls or structures.

   c. Clearance:

      1) Clearances shall be measured from the outermost edge of piping, flanges or other type of joint that extends beyond the nominal outside diameter of piping.

   d. Small diameter piping and/or piping not shown on the Contract Drawings:

      1) If specific locations and elevations are not shown on the Contract Drawings, install small diameter piping as specified herein, and as necessary and required to avoid obstructions.

6. Cuts:

   a. Use cutting methods and machines specially designed for cutting the pipe material and approved by the manufacturer. The following cutting methods are not acceptable:

      1) "Squeeze" type pipe cutters

      2) Cutting torches

      3) Diamond points

      4) Dog chisels.

b. Pipe Lengths:

1) Full standard lengths of pipe shall be used in each pipe run in so far as possible.

2) Shorter lengths than standard shall be used only to complete a straight run of pipe, to connect to established locations of valves, equipment, bends, and the like.

3) Random lengths of pipe or cuttings from standard lengths shall not be coupled together when a full standard pipe length will fit in the pipe run.

c. Pipe shall be cut square, and not upset, undersized, or out of round, except as follows:

1) Cut ends of push-on joint type pipe shall be tapered and sharp edges filed off smooth.

d. Ends shall be carefully reamed and cleaned before being installed.

e. Make cuts carefully without damage to coatings or linings.

7. Excavation:

a. Trench excavation shall conform to the requirements of Section 31 23 16 - Excavation, as applicable.

b. Dewater trench before pipe installation in accordance with Section 31 23 19 - Dewatering.

1) Keep groundwater level in trench at least 24-in. below bottom of pipe before laying pipe.

2) Do not lay pipe in water.

3) Maintain dry trench conditions until jointing and backfilling are complete.

4) Keep clean and protect interiors of pipe, fittings, valves, and appurtenances.

c. Excavate trenches below bottom of pipe by amount shown and indicated in the Contract Documents. Remove loose and unsuitable material from bottom of trench.

d. Excavate around joints in bedding as necessary and required to complete joint connection.

8. Placing:

a. Do not bring pipe into position until preceding length of pipe has been bedded and secured in its final position.

b. For coated pipe, care shall be exercised in laying and cradling the pipe to prevent injury to the coating.

c. Start laying pipe at lowest point and proceed towards higher elevations.

1) On steep slopes, prevent movement of pipe during installation.

d. Lay pipe so that pipe barrel bears uniformly on trench bottom.

e. Exercise care to avoid flotation when installing pipe in cast in-place concrete, and in locations with high groundwater.

f. Grade control equipment shall be of type to accurately maintain design grades and slopes during installation of pipe.

g. Unless otherwise specifically stated, install pipe in accordance with manufacturer's recommendations.

h. Install bell and spigot pipe so that bells face the direction of laying, unless otherwise shown on the Contract Drawings.

i. Allow extra length at future connection points to be cut to fit after backfill and prior to tie-in.

j. Notify the Engineer prior to installing pipe into trench and allow time for Engineer's inspection.

k. The Contractor shall correct irregularities found during inspection.

l. Complete tie-ins within trench whenever possible to prevent overstressed connections.

9. Bedding:

a. Backfill shall conform to the requirements of Section 31 23 23 - Fill, as applicable.

b. Carefully and thoroughly compact pipe bedding with hand held pneumatic compactors.

10. Jointing:

a. Thoroughly clean all pipe, fittings, valves, specials, and accessories before jointing.

1) Remove all cuttings and foreign matter from inside of pipe and tubing.

2) Clean joining area of pipe, fittings, and appurtenances as necessary and required and as per manufacturer instructions.

a) For cleaning pipe ends, solutions such as detergents and solvents, when required, shall be used in accordance with manufacturer's recommendations.

b. Use jointing methods recommended and approved by the pipe manufacturer.

c. Transitions from One Type of Pipe to Another:

1) Provide all necessary adapters, specials and connection pieces required when connecting different types and sizes of pipe or connecting pipe made by different manufacturers.

2) Connections between Dissimilar Metals:

a) Provide dielectric couplings, insulating couplings, unions, or other approved dielectric insulating devices, at all connections to pipelines or equipment of dissimilar metals, regardless of whether devices are shown on the Contract Drawings.

11. Bends and Turns:

a. Bends shall be of 45° or 90° unless otherwise shown on the Contract Drawings.

b. Pipe Flexibility:

1) Do not bend pipe to greater degree than minimum radius recommended by the pipe manufacturer for type and grade.

2) Do not subject pipe to strains that will overstress or buckle piping or impose excessive stress on joints.

12. Plugs:

a. Shall match the materials, linings, and coatings of the process piping, and shall have a square head.

13. Transitions:

a. Reducing fittings shall be used for all changes in pipe sizes, even when not specifically shown on the Contract Drawings.

1) Unless otherwise shown or specified, use eccentric reducing fittings.

b. Do not use bushings or nipples for buried piping.

c. Between pressure ratings:

1) Where lines of lower service rating tie into services, appurtenances, or equipment of higher service rating, the equipment, valve, or appurtenance between the two shall conform to the higher rating.

14. Restraints, Supports, and Thrust Blocks:

a. Provide concrete and metal cradles, collars, kickers, and blocks as shown on the Contract Drawings or as necessary and/or required to provide thrust restraint.

15. Temporary Blind Flanges, Plugs, Caps, and Bulkheads:

a. At the end of each day of work or other interruption of pipe installation, the Contractor shall provide temporary blind flanges, plugs, caps, or bulkheads as necessary and required.

1) Plug all bells at dead ends, tees, and crosses.

2) Cap all spigot and plain ends.

b. To perform the testing of buried piping as specified herein, or as per the sequence of work specified in the Contract Documents, the Contractor shall provide temporary blind flanges, line stops, plugs, and bulkheads suitable for and capable of withstanding the services and pressures for which they are intended.

1) Refer to Section 33 06 01, Schedule for Buried Piping, for service and test pressures.

2) Temporary blind flanges, line stops, plugs, and bulkhead shall be compatible with and shall not damage the piping materials, coatings, and linings specified in Section 33 06 01, Schedule for Buried Piping.

c. The Contractor shall uninstall all temporary blind flanges, plugs, caps, and when they are no longer needed for the Work.

B. Ductile Iron Pipe:

1. Cutting:

a. Where field cutting of ductile iron pipe is permitted by the Engineer, ductile iron pipe shall be cut only by means of abrasive saws, hack saws, wheel type cutters or milling type cutters.

2. End Connections:

a. Mechanical Joint:

1) Ensure that cut ends are tapered and sharp edges are filed off smooth. Thoroughly clean the plain end (spigot) and the socket of the pipe or fitting.

2) Brush the socket, spigot end, gasket, and adjacent areas immediately before making joint with soapy water in accordance with AWWA C111.

3) Slip the gland and gasket over the spigot with the small side of the gasket facing the socket and the lip side of the gland facing the socket.

4) Insert the spigot into the socket and press the gasket firmly and evenly into the gasket recess. Keep the joint straight during assembly.

5) Slide the gland towards the socket and center it around the pipe with the gland lip against the gasket.

6) Insert bolts and tighten nuts by hand.

7) With an ordinary ratchet wrench, tighten bolts evenly and alternately around. The pattern for tightening bolts shall be as per the manufacturer's recommendations. The bolt torque for mechanical joints shall be as per the DIPRA Installation Guide.

8) Do not deflect mechanical joint pipe after installation.

b. Push-On Joint:

1) Ensure that the spigot (plain) end is beveled as per the manufacturer's recommendations and that sharp edges are filed off smooth.

a) Use a heavy file or grinder to bevel the plain end.

b) Do not use a saw blade to bevel the plain end.

2) Thoroughly clean the groove and the bell socket of the pipe or fitting. Also clean the plain end of the mating pipe or fitting.

3) Except for pipe lined or coated, use a wire brush to clean the exterior surface of the spigot and the interior surface of the bell.

a) Use a method for cleaning coated or lined portions of the pipe recommended by the coating or lining manufacturer.

4) Insert gasket into joint recess and smooth out entire circumference of gasket to remove bulges and to prevent interference with proper entry of spigot of entering pipe.

a) Use a rubber gasket recommended by the pipe manufacturer.

(1) Do not use gaskets that have been scored or otherwise damaged.

b) Wipe clean rubber gaskets and flex gaskets until resilient. follow the manufacturer instructions for gasket resiliency when assembling joints in cold weather.

c) As per the DIPRA Installation Guide, make at least one (1) small loop and then insert the gasket into the socket.

(1) For pipe sizes larger than 20-in. nominal diameter, it may be necessary to make two loops in the gasket opposite each other.

(2) Make sure the gasket faces the correct direction as per the manufacturer's instructions and that it is properly seated.

5) Apply lubricant as per the manufacturer recommendations to the surface of the gasket that will come in contact with the entering spigot. Also apply lubricant to the outside of the entering spigot.

(1) As per the DIPRA Installation Guide, do not apply lubricant to the bell socket or the surface of the gasket in contact with the bell socket.

6) Push the spigot end into the bell socket of the mating pipe or fitting, ensuring the joint remains straight.

a) Pause insertion when the spigot end just makes contact with the rubber gasket.

b) After the gasket is compressed and before the pipe is inserted completely, carefully check the gasket for proper position around the full circumference of joint.

c) Final assembly shall be made by inserting the spigot end of the entering pipe past the gasket until it makes contact with the base of the bell.

7) Deflect push-on joint pipe only after the joint is assembled and not exceeding the deflection shown on the Contract Drawings and the maximum deflection specified in the DIPRA Installation Guide for the nominal diameter of pipe in question.

c. Grooved / Shouldered End Joints:

1) Grooved and shouldered end joints and their installation shall conform to the requirements of AWWA C606.

2) Thoroughly clean the joint ends to remove foreign matter. Except for coated pipe, use a wire brush to clean the exterior surface of the joint ends.

a) Use a method for cleaning the coated portion of the pipe recommended by the coating manufacturer.

3) Remove the bolts from the coupling.

4) Apply lubricant to the rubber gasket or inside of the coupling housing and joint ends as per the manufacturer recommendations.

5) Position and install the gasket over the gap between the joint ends.

6) Install the coupling housing around the gasket and over the grooved or shouldered joint ends. Insert bolts and install nuts tightly by hand.

7) Tighten the bolts uniformly and according to the manufacturer's instructions.

d. Flanged Connections:

1) All flange faces shall be in perfect alignment with the holes straddling the vertical center line of the piping.

2) Properly center the gasket. Use full-face gaskets for flat-face flanges.

3) Gaskets shall be suitable for the service conditions referenced in Section 33 06 01, Schedule for Buried Piping.

4) The gasket thickness shall be as recommended by the pipe manufacturer, with the exception that:

5) The minimum gasket thickness for raised face flanges shall be ⅛-in.

6) Bolts shall be of sufficient length so that when fully tightened, a minimum of two full threads shall extend beyond the nut.

7) Bolts shall be well lubricated over the entire thread length with a heavy graphite and oil mixture prior to the tightening operation.

8) Bolts shall be tightened with proper wrenches, care being taken to secure uniform pressure on the bolts and gasket and to avoid over stressing of the bolts, dishing of the flanges and compression of the gasket beyond its proper limits.

a) Commercial grade carbon steel bolts, ASTM A307, Grade B shall be tightened to obtain approximately 15,000 psi stress based on the root area of the thread.

b) Alloy steel bolts, ASTM A193, Grade B7 shall be tightened to obtain a stress of 45,000 psi.

c) The pattern for tightening bolts shall be as per the manufacturer's recommendations.

3. Support:

a. Ductile iron below floors that is not to be encased in concrete:

1) Where ductile iron pipe shall be buried below floor structures, the pipe shall be supported by concrete encased

adjustable clevis hangers anchored to the floor by means of bearing plates.

a) Supports shall conform to the requirements of Section 40 05 07, Hangers and Supports for Process Piping.

b) Hangers shall be spaced not more than 5 ft apart.

C. Steel Pipe:

1. General:

a. Install in accordance with the best piping practice with a minimum exposure to the elements and to other corrosive conditions.

b. Before erection, all uncoated pipes shall be placed on end and hammered to remove scale and loose particles.

c. Pipe compounds:

1) For general service: Use an approved mastic metallic compound, Teflon tape, or approved equal shall be used.

2) For oil service: Use an approved compound resistant to oil.

3) For potable water: Use a NSF61 approved pipe compound.

2. End Connections:

a. Flanged Connections:

1) All flange faces shall be in perfect alignment with the holes straddling the vertical center line of the piping.

2) Properly center the gasket. Use full-face gaskets for flat-face flanges.

3) Gaskets shall be suitable for the service conditions referenced in Section 33 06 01, Schedule for Buried Piping.

4) The gasket thickness shall be as recommended by the pipe manufacturer, with the exception that:

5) The minimum gasket thickness for raised face flanges shall be ⅛-in.

6) Bolts shall be of sufficient length so that when fully tightened, a minimum of two full threads shall extend beyond the nut.

7) Bolts shall be well lubricated over the entire thread length with a heavy graphite and oil mixture prior to the tightening operation.

8) Bolts shall be tightened with proper wrenches, care being taken to secure uniform pressure on the bolts and gasket and

to avoid over stressing of the bolts, dishing of the flanges and compression of the gasket beyond its proper limits.

a) Commercial grade carbon steel bolts, ASTM A307, Grade B shall be tightened to obtain approximately 15,000 psi stress based on the root area of the thread.

b) Alloy steel bolts, ASTM A193, Grade B7 shall be tightened to obtain a stress of 45,000 psi.

c) The pattern for tightening bolts shall be as per the manufacturer's recommendations.

b. Welded Joints:

1) All welding of the following shall be in strict conformity with the Code for Pressure Piping, ASME B31.1, Section 6 and its Supplements:

a) Steel and stainless steel pipe.

b) Steel and stainless steel butt-welding fittings.

c) Steel and stainless steel fabricated fittings.

2) Welding shall not be done when the atmospheric temperature is less than 32°F or when surfaces to be welded are wet.

3) The surface to be welded shall be free from loose scale, slag, rust, paint, oil and other foreign material. Joint surfaces shall be smooth, uniform and free from fins, tears and other defects which might affect proper welding.

4) Backing rings shall be used for all pipe welding butt joints unless otherwise specified.

a) Backing rings shall be of carbon steel with spacer nubs that strike-off or melt with the weld.

5) Field Welding of Stainless Steel:

a) No field welding of any stainless steel pipe or fittings shall be permitted unless otherwise shown on the Contract Drawings.

6) Welding of Cement Lined Steel:

a) Welding of cement lined steel pipe will be permitted only with the approval and under the observation of the Engineer where such welding is shown on the Contract Drawings.

7) The ends of the lined pipe for pipe-to-pipe joints shall be machine cut to provide an approximate bevel of 27½°.

a) Bevels shall be accurately cut by machining or by a mechanically guided cutting torch.

b) Ends may be chipped provided there is no damage to the cement lining.

8) Where fittings already having a bevel of 37½° are to be welded to pipe, pipe ends shall be beveled to a 17½° angle, making a total angle of bevel between joints approximately 55°. A ⅛-in. land shall be provided where possible.

9) Parts to be joined shall be approximately $^{1}/_{32}$-in. apart before tacking.

a) Backing rings shall not be used at welded joints.

10) Piping shall be carefully aligned before welding and maintain alignment.

11) Small tack welds shall be made using a ⅛-in. electrode.

a) Defective tack welds shall be removed before the final weld is made.

12) The first bead or layer of welding shall be laid by bridging across from bevel to bevel at the bottom of the groove just at the top of the land. A suitable crown reinforcement layer shall be made on the top of the joint to finish off.

a) All layers of welding shall be of the same quality as the final welds and shall be fused thoroughly therein.

13) Direct current (dc) shall be used for welding, with the base material on the negative side.

14) Passes:

a) The first pass shall be a stringer bead using a ⅛-in. electrode with a current of 80A to 90A at 50V to 55V.

b) The second and succeeding passes shall be woven beads using a ⅛-in. electrode and a current of 90A to 100A at 55V to 58V.

c) All passes shall be made slowly and with care not to burn through the land or the shoulder into the lining of the pipe.

d) The joint shall not be hotter than 100°F.

e) For large size pipe, a $^{5}/_{32}$-in. electrode may be used, provided the temperature of the joint is held within this limit.

f) The surface of the finished welds shall have a bright metallic luster after cleaning, a fairly smooth and uniform contour with regular ripples and be free from overlaps, undercuts and excessive convexity.

15) No stress-relieving of welded joints is necessary unless the pipe wall thickness warrants it.

16) Welds shall be sound throughout, fused thoroughly and free from gas pockets, oxide, slag inclusions and surface porosity. The inside of the pipe shall be free from globules of weld metal, spacers or other material which would restrict the pipe area or become loose to enter the fluid stream.

17) Defective or unsound welds shall be corrected by removing and replacing the welds. Pipe or fittings which cannot be re-welded satisfactorily shall be replaced with new pipe or fittings at the Contractor's expense.

18) All welded joints will be visually inspected by the Engineer for defects beyond those acceptable in ANSI B31.1. Method of repair shall be in accordance with instructions as received from the Engineer.

19) Filling of Cement Lined Joints:

a) After the weld is completed, the joints in the lining shall be filled with a special compound of a wet slurry mix of the same cement used for the lining.

b) Where accessible from the end of the pipe, the welded joint shall be swabbed with cement using a paint brush thoroughly wetted with the cement slurry.

20) Repairing of Cement Lined Joints:

a) Any defects causing leaks in welded joints shall be repaired by welding without damaging the cement lining using the procedures specified herein.

3. Connection of Steel Pipe to Cast Iron Bell and Spigot Pipe to:

a. Where connection is required between steel and bell and spigot cast iron pipe, a sleeve-type transition coupling meeting the requirements of Section 40 05 06, Couplings, Adapters, and Specials for Process Piping, shall be provided.

D. PVC Pipe Installation

1. End Connections:

a. Solvent-Welded Joints:

1) Make all solvent-welded PVC joints in accordance with ASTM D2855 and the solvent manufacturer's approved instructions.

2) Use primers and solvent cements meeting the requirements of ASTM F656 and ASTM D2564, respectively.

3) Do not make solvent cement joints if temperature is below 40°F.

4) Do not make solvent cement welded joints in wet conditions.

5) The following procedure shall be followed to ensure proper gluing of PVC pipe.

a) Ensure the end of the pipe is beveled.

b) Apply primer to the female end.

c) Apply primer to the male end.

d) Reapply primer to the female end; the primer must not dry.

e) Apply glue to the male end using an appropriately sized brush.

f) Apply glue with the brush to the female end.

g) Reapply glue to the male end.

h) Join the male and female ends with a quarter turn twist and hold for 30 sec.

6) After joint assembly, wipe excess cement from the pipe. A properly made joint will show a bead around the entire circumference. Any gaps in this bead indicate a defective joint, and the Contractor shall remake such joints at no additional cost to the City.

E. HDPE Pipe Installation:

1. End Connections:

a. Butt Welded Joints:

1) Butt weld via a heat fusion process in accordance with manufacturer's recommendation for butt fusion methods.

a) Personnel operating fusion equipment shall be certified by the HDPE pipe manufacturer.

2) Branch saddle fusions shall also be joined in accordance with manufacturer's recommendations and procedures.

a) Branch saddle fusion equipment shall be of size to facilitate saddle fusion within trench.

b. Flanged Connections:

1) Connect slip-on Type 316 stainless steel backup flanges with Type 316 stainless steel nuts and bolts.
2) Butt fuse fabricated flange adapters to pipe.
3) Observe following precautions in connection of flange joints.
   a) Align flanges or flange/valve connections to provide tight seal.
      (1) Require nitrile-butadiene gaskets if needed to achieve seal.
      (2) Integral flange adapters and gaskets are required for flange/valve connections.
   b) Place U.S. Standard round washers as may be required on some flanges in accordance with manufacturer's recommendations.
      (1) Bolts shall be lubricated in accordance with manufacturer's recommendations.
   c) Tighten flange bolts in sequence and accordance with manufacturer's recommendations. Do not over-torque bolts.
4) Pull bolt down by degrees to uniform torque in accordance with manufacturer's recommendation.
5) Install electrofusion couplers, where used, in accordance with manufacturer's specifications.

2. Fittings:
   a. Saddle tees 8-in. and smaller may be field fabricated. Saddle tees larger than 8-in. must be factory manufactured.

3. Placing:
   a. Maximum lengths of fused pipe to be handled as one section shall be placed according to manufacturer's recommendations as to pipe size, pipe SDR, and topography so as not to cause excessive gouging or surface abrasion, but shall not exceed 400 ft.
   b. Cap pipe sections longer than single joining (usually 50 ft) on both ends during placement, except during fusing operations.
   c. Allow pipe sufficient time to adjust to trench temperature prior to testing, segment tie-ins or backfilling activity.
   d. Install reducers adjacent to laterals and tees.
   e. To reduce branch saddle stress, install saddles at slope equal to and continuous with lateral piping.

f. Pipe shall be snaked in trench to allow a minimum of 12-in./100 ft for thermal contraction and expansion.

F. Corrugated-wall, smooth-interior HDPE Gravity Pipe:

1. General:

a. Corrugated-wall, smooth-interior HDPE gravity pipe shall be installed by open trench construction – directional bore installation shall not be permitted.

b. Installation shall conform to the requirements of ASTM D2321.

2. Cutting:

a. Field cuts shall be made with a handsaw or power pipe cutoff saw.

b. For pipes of annular corrugations, square cut only through a corrugation valley, never through a corrugation sidewall.

3. End Connections:

a. Bell and Spigot Joints:

1) Joint shall be soil-tight.

2) Pipe shall be joined meeting the requirements of AASHTO M252, AASHTO M294, or ASTM F2306, as applicable.

3) Gaskets:

a) Shall meet the requirements of ASTM F477.

b) Shall be installed by the pipe manufacturer and covered with a removable wrap to ensure the gasket is free from debris.

4) A joint lubricant supplied by the manufacturer shall be used on the gasket and bell during assembly.

4. Placing:

a. Pipe sections shall be lowered into the trench without damage to the pipe or pipe ends where couplings are to be made.

b. During handling, placement and joining, bell and spigot joints, other gasketed joints, and gaskets shall be free of mud, grit and other foreign material in order to enable effective joining and sealing.

c. When the assembling of pipes is interrupted, closures shall be placed at ends of pipes to prevent the introduction of dirt, water, animals and other foreign matter.

d. Lubricate joints in accordance with manufacturer's instructions for lubricant type and manner of application to the gasket, and/or the surface in contact with the gasket.

1) Each gasketed joint shall be inspected for cleanliness and proper lubrication before mating.

e. Align joint and drive the spigot end of one pipe its proper distance into the receiving bell of an adjoining pipe with a bar and block or mechanical equipment.

1) Prior to the use of such apparatus and method, demonstrate to the Engineer for approval the effectiveness and practicability of the proposed method of drawing the joints home.

2) The selected method shall avoid sudden thrusts of force and the gasket shall always remain in its intended groove.

5. Connection of corrugated-wall, smooth-interior HDPE gravity pipe to precast concrete manholes and other structures:

a. Soil-Tight Joints:

1) Grout void space between the pipe and structure with non-shrink grout.

b. Watertight Joints:

1) Provide a flexible boot fitting in accordance with ASTM F2510 and manufacturer recommendations.

6. Connection of corrugated-wall, smooth-interior HDPE gravity pipe to plastic drainage structures:

a. Provide adapter fitting in accordance with ASTM D3212, ASTM F477 and manufacturer recommendations.

G. Separation of Sewers and Potable Water Piping:

1. Requirements for the separation of sewers and potable water piping apply to all buried piping installation, regardless of piping materials.

2. In the event that the requirements specified herein differ from separations shown on the Contract Drawings and/or differ from separations required by Authorities Having Jurisdiction, the more stringent (i.e., greater separation distance) shall apply.

3. The Contractor shall install all buried potable water piping and sewers with the following separations:

a. For water mains installed parallel to sewers:

1) Where the depth to the bottom of the sewer cradle is less than 10 ft, the clearance between the outside of the water main and the centerline of the existing sewer should be not less than 6 ft plus one-half the sewer diameter.

2) Where the depth to the bottom of the sewer cradle is 10 ft or more, the clearance between the outside of the water main

and the centerline of the existing sewer shall be increased 1 ft for each additional 5 ft of depth over 10 ft, or portion thereof.

b. For water mains crossing sewers:

1) Wherever the clearance between the top of an existing sewer and the bottom of the proposed water main, at their crossing, is less than 1 ft, the water main is to be supported by a truss arrangement and the clearance space is to be filled with layers of compressible material to avoid excessive bearing pressure on the sewer pipe.

a) In no case, however, should this clearance be less than 6 in..

3.03 FIELD TESTING / QUALITY CONTROL

A. Test all buried piping in accordance with the requirements of Section 33 05 05.30 - Leakage Testing for Buried Piping.

B. Field Testing of HDPE Pipe:

1. The first butt fusion weld of each day's production welding and for each separate operator shall be tested by bent strap test method.

2. No production welds shall be performed until successful completion of bent strap test.

3. Each field fusion shall be recorded by such equipment and this information shall be made compiled into daily log reports.

C. Field Testing of corrugated-wall, smooth-interior HDPE pipe:

1. Deflection Testing

a. Measure for allowable deflection not less than 30 d following completion of installation.

b. Allowable deflection shall be no greater than 7.5%.

1) The base inside diameter used shall be calculated using the equation:

$$d_{i,base} = d_{i,design} - \sqrt{(\Delta d_{tolerance})^2 + (\Delta d_{out\ of\ round})^2}$$

where: $d_{i,base}$ = Base inside diameter
$d_{i,design}$ = Design inside diameter
$\Delta d_{tolerance} = 1.0\%$, as per ASTM F2306
$\Delta d_{out\ of\ round} = 3\%$

c. Visual Inspection:

1) Pipes 30-in. and greater in diameter shall be visually tested by entering and recording direct measurements.

2) For smaller pipes with runs no longer than 100 ft, visually inspect from the pipe end (lamping).

d. Videotape Inspection:

1) Pipes less than 30-in. diameter with runs that are greater than 100 ft, or present an environment too hazardous for an individual to enter, shall be visually inspected by video, or closed circuit television (CCTV).

e. Mandrel Testing:

1) Pipes less than 30-in. diameter may be tested by pulling a mandrel device from manhole to manhole, pre-set with the minimum allowable inside diameter specified herein.

2. Leakage Testing:

a. The Contractor shall perform infiltration or exfiltration testing in accordance with ASTM F2487.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

END OF SECTION

SECTION 33 05 05.30 – LEAKAGE TESTING FOR BURIED PIPING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified and required, to test all buried piping complete and operational.

B. The following index of this Section is presented for convenience:

Article	Title	Section Page
PART 1	GENERAL	1

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 33 05 05 – Buried Piping Installation.

B. Section 33 06 01 – Schedule for Buried Piping.

1.04 REFERENCES

A. Definitions:

1. Buried Piping: Includes all piping beginning at the outside face of a structures or foundation and extending away from structures. Buried piping includes piping beneath structures or foundations.

2. Exposed Piping: Includes all piping beginning at the outside face of a structures or foundation and extending inside. Exposed piping also includes all piping embedded in concrete, as well as all piping that is permanently or intermittently submerged and/or installed in a subaqueous environment.

B. Reference Standards:

1. ACI 350.1-10 Specification for Tightness Testing of Environmental Engineering Concrete Containment Structures and Commentary.

2. AWWA C600 Installation of Ductile-Iron Mains and Their Appurtenances.

3. Section 312 of The New York City Plumbing Code.

1.05 DESCRIPTION

A. This scope of this Section includes the requirements for the testing of buried piping, except where testing requirements for buried piping are shown or specified elsewhere in the Contract Documents. In addition:

1. The scope of this Section also includes the requirements for testing buried gravity sewers and concrete structures.

B. All buried pipelines, gravity sewers, and structures for which testing requirements are specified in this Section shall be watertight or airtight, including, but not limited to:

1. All buried piping and appurtenances installed under Section 33 05 05, Buried Piping Installation.

2. All buried piping, structures, and appurtenances installed under other Sections, but that specify testing under this Section.

C. Piping and structures which fail leakage tests shall be repaired or replaced at the Contractor's expense and to the satisfaction of the Engineer. These repaired piping and structures shall then be retested at the Contractor's expense until leakage test results meet the requirements specified herein.

1.06 QUALITY ASSURANCE

A. Not Used

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. Buried piping testing submittals shall be submitted under the specification section number

corresponding to the buried piping material. In addition, submittals shall include, but not be limited to:

1. Action Submittals:
    a. Testing Procedures:
        1) Submit proposed testing procedures, methods, apparatus, and sequencing.
        2) Testing procedures shall be submitted for approval at least 30 ccd prior to the test.
    b. Testing Report:
        1) Prior to placing the piping system or structure in service, submit for review and approval a detailed bound report summarizing the leakage test data, describing the test procedure and showing the calculations on which the leakage test data is based.
2. Informational Submittals:
    a. Certificate signed by manufacturer of each product certifying that product conforms to applicable referenced standards.
    b. Results of each specified field quality control test.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. The Contractor shall provide all labor, equipment, air, water and materials, including meters, gauges, blower, pumps, compressors, hoses, fuel, water, bulkheads, temporary bracing and restraints, temporary weirs, valves, plugs, and accessory equipment necessary and required to complete the testing as specified herein.

B. Testing medium:

1. The Contractor shall provide all air or gasses necessary or required for testing.

2. Unless otherwise specified, the existing facility shall provide all water (or process fluid) required for testing.
    a. The Contractor shall provide all means to convey the fluid into the piping being tested.
3. Refer to the Contract Drawings for availability of water to be used for testing.

2.03 FABRICATION / ASSEMBLING / FINISHES

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Notification:
1. Provide the Engineer with written notice at least 14 ccd prior to the date of testing.
    a. No tests shall be conducted without an approved written procedure.
    b. The Engineer shall respond in writing to the Contractor within 7 ccd of receiving the written notification.

B. All leakage tests shall be conducted in the presence of the Engineer.
1. All leakage tests shall be conducted in the presence of local authorities having jurisdiction, if required.

C. Remove or protect devices and appurtenances that could be damaged by testing.

D. Backfilling of buried or concealed pipelines:
1. Completely backfill all harnessed sections of buried or concealed piping before such sections are tested.
2. Non-harnessed sections of buried piping shall be tested before backfilling.

3.02 IMPLEMENTATION

A. General:
1. Perform leakage testing for all buried piping in accordance with the requirements of Section 33 06 01, Schedule for Buried Piping, except piping explicitly shown or specified as exempted from testing. For pipelines not listed in Section 33 06 01:
    a. Test all buried pipelines using a hydrostatic test.
    b. Test all gravity sewers and drain lines using either an infiltration or exfiltration test based on the groundwater elevation.

c. Test compressed air and gas pipelines using a hydrostatic test with compressed air.

d. Test all other pipelines not listed in Section 33 06 01, including outfall sewers, via a hydrostatic test with clean water.

e. Test vents and drains in plumbing systems and plumbing soil pipe lines in accordance with Section 312 of the New York City Plumbing Code, unless otherwise specified. Unless specified otherwise, test all vents and drains on process piping as for plumbing systems.

2. Operation of Existing Facilities:

a. Conduct all tests in a manner to minimize interference with operations of existing facilities or other contractors working on the site.

3. Testing of pipelines and conduit with non-circular cross-sections:

a. Leakage in pipelines of other than circular section shall not exceed an amount based on a circular section having an equivalent inner perimeter.

B. Hydrostatic Testing

1. Application:

a. Buried pipelines.

2. Test Procedure:

a. Maintain the testing medium at the specified pressure for a period of 4 hrs.

1) Unless otherwise specified, the testing medium shall be clean water.

2) Do not use air for hydrostatic testing of pipelines intended for liquid service – use compressed air (or gas) only for the hydrostatic testing of air (or gas) pipelines.

b. Test the piping as a whole or in sections.

1) The Contractor shall use valves or install temporary bulkheads at the ends of each section.

2) Remove temporary bulkheads at the conclusion of the hydrostatic testing.

c. Apply the specified hydrostatic test pressure to the piping through a tap in the pipe by means of a pump, compressor, or other approved method.

3. Test Pressures:

a. Test the pipeline at the pressure specified in Section 33 06 01, Schedule for Buried Piping.

b. If no test pressure is specified for a hydrostatic test, submit a test pressure of 1.5 times the maximum possible operating pressure of the pipeline, for approval by the Engineer

4. Leakage:

a. The allowable leakage shall not exceed the testing allowance given by the following formula from AWWA Standard C600:

$$L = \frac{S \cdot D \cdot \sqrt{P}}{148{,}000}$$

Where: L = testing allowance (makeup water) (gph).
S = length of pipe tested (ft).
D = nominal diameter of the pipe, (in.).
P = average test pressure during the hydrostatic test (psig).

5. Repair:

a. Replace broken pipe or joint assemblies found to leak.

b. When leakage occurs in excess of the specified amount, locate and repair defective valves, pipe, cleanouts or joints.

c. If defective portions cannot be located, remove and reconstruct as much of the original work as necessary to obtain piping that meets the leakage requirements specified herein and retest, all at no additional cost to the DEP.

C. Hydrostatic Testing of Valves

1. Test Procedure:

a. Prior to the application of the test pressure, operate the valve(s) through the number of complete cycles of closing and opening recommended by the manufacturer.

b. Next, apply the test pressure to one side of the valve (i.e., the first side).

1) The valve shall be in the closed position.

2) Introduce the liquid testing medium to the first side only and apply the test pressure.

a) The other side of the valve(s) (i.e., the second side) shall be dry and unpressurized (0 psig).

3) Maintain the testing medium at the specified pressure for a period of 4 hrs.

c. Then, reverse the side to which the test pressure is applied.

1) The valve shall still be in the closed position.

2) Now apply the test medium and pressure to the other side of each valve (i.e., the second side).

3) The side tested first (i.e., the first side) shall now be unpressurized (0 psig).

4) Maintain the testing medium at the specified pressure again for a minimum period of 4 hrs.

d. Hydrostatic testing of valve(s) may be concurrent with hydrostatic testing of pipeline section(s) to the extent permissible by the testing requirements specified herein.

e. The Contractor shall be responsible for draining and disposing of the test medium in accordance with the requirements of the Contract Documents, as necessary and required to test both sides of each valve in this manner.

2. Test Pressure:

a. Hydrostatic test each valve such that the differential pressure across the valve at the same test pressure specified for the pipe in which the valve is installed.

3. Leakage:

a. Stop all external and internal leakage through the valves.

b. No leakage across the valve shall be acceptable.

4. Movement:

a. Stop all valve movement or structural distress.

b. No movement of the valve is acceptable.

D. Infiltration Test

1. Application:

a. Gravity sewers where the groundwater level is above the crown of the sewer.

2. Test Procedure:

a. Do not start testing until normal infiltration conditions are established in the work to be tested.

1) Inspect the gravity sewer visually for infiltration.

2) If necessary, pump the sewers dry and make sure the groundwater level is above the crown of the sewer.

a) The Contractor shall dispose of water pumped from the sewer in accordance with the requirements of the Contract Documents.

3) Inspect the sewer on the inside and seal all visible leaks completely.

4) Conduct the infiltration test only after the sewer has been pumped out.

b. Measure the infiltrated flow of water by means of a weir set up in the invert of the sewer at a known distance from a temporary bulkhead or other limiting point of infiltration.

1) The leakage rate shall be defined as the amount of groundwater passing over the weir.

c. Carry on tests for a minimum of 8 hrs with readings at 60 min intervals.

3. Leakage:

a. In computing the length of sewer contributing to infiltration, include the length of house connections tested, if any, in the total length.

b. The leakage infiltration for any section of the sewer system shall not exceed 100 gal/in. diameter/mi length/24 hrs.

4. Repair:

a. When the measured leakage exceeds the specified amount, locate and repair defective manholes, pipe, and/or pipe joints.

1) If the defective portions cannot be located, remove and reconstruct as much of the original work as necessary and required to obtain a sewer within the allowable infiltration limits upon such retesting as necessary.

b. Regardless of the amount of infiltration or leakage measured, repair and seal in an approved manner all visible or detectable leaks in the sewers, manholes, structures, and other appurtenances.

E. Exfiltration Test

1. Application:

a. Gravity sewers where the groundwater level is below the crown of the sewer.

2. Test Procedure:

a. Construct a bulkhead in the sewer at the manhole at the lower end of the section under test.

b. Fill the section being tested with water until the level of water is 4 ft above the crown of the sewer in the manhole at the upper end of the test section.

1) For concrete sewers, allow the water to remain in the piping for at least 12 hr before conducting the tests.

c. Leakage will be the measured amount of water added to maintain the water at that level once the test commences.

d. Carry on tests for a minimum of 8 hr with readings at 60 min intervals.

3. Leakage:

a. In computing the length of sewer contributing to leakage, include the length of house connections tested, if any, in the total length.

1) The leakage exfiltration for any section of the sewer system shall not exceed 100 gal/in. diameter/mi length/24 hrs.

4. Repair:

a. When the measured leakage exceeds the specified amount, locate and repair defective manholes, pipe, and/or pipe joints.

1) If the defective portions cannot be located, remove and reconstruct as much of the original work as necessary and required to obtain a sewer within the allowable infiltration limits upon such retesting as necessary.

b. Regardless of the amount of infiltration or leakage measured, repair and seal in an approved manner all visible or detectable leaks in the sewers, manholes, structures, and other appurtenances.

F. Tests for Concrete Structures

1. Application:

a. Wet wells, tanks, channels, containment areas, and other water retaining structures.

2. Test Procedure:

a. Test according to the requirements of ACI 350.1 and as specified herein.

b. The Contractor shall supply all materials and labor needed to conduct the test as specified herein.

c. Prior to start of leakage testing, the following requirements shall be met:

1) All elements of the structure which resist any portion of the retained liquid pressure shall be in place and at specified strength levels. All concrete shall be fully cured.

2) Structure walls shall not be backfilled prior to leakage testing.

3) All valves, gates, blind flanges, and other non-concrete items which control the flow or otherwise retain the liquid contents of the structure, shall be checked for water-tightness. If not

water-tight, means shall be taken to assure water-tightness during the period of the leakage test.

4) The portions of the structure to be tested shall be cleaned of all construction debris, standing water, soil, foreign materials and any other material which interferes with the exposed concrete surfaces of the structure.

5) Defective concrete shall be repaired.

6) The Contractor shall notify the Engineer a minimum of 24 hrs prior to start of filling of structure for leakage testing.

7) Leakage testing shall not start until the structure is inspected by the Engineer.

d. Filling the Structure with Water:

1) The portion of the structure to be tested shall be filled at a rate not to exceed 2 ft/hr.

2) The structure shall be filled to the normal operating depth of the structure as indicated on the Contract Drawings.

a) Where no operating depth is indicated or where operating depth is controlled by flowing over a weir, the structure shall be filled to a depth 6 in. below the weir or top of wall elevation, whichever is lower.

3) Water in the structure shall be maintained at the specified test elevation for a minimum of 3 d prior to the start of the leakage test.

e. After water has been brought to the test elevation, the exposed elements of the structure shall be inspected for leakage.

1) All locations which exhibit any amount of leakage flow shall be repaired prior to the start of leakage testing.

f. Unless otherwise specified, the leakage test duration shall be based on ACI 350.1 or last 3 d, whichever is greater.

g. Measure for leakage at the test locations:

1) Structure cells which are less than 1000 ft^2 in area: measurements of water shall be taken at two (2) locations which are located approximately 180° apart.

2) Structure cells which are greater than 1000 ft^2 in area: measurements of water level shall be taken at four (4) locations which are located approximately 90° apart.

3) Each test location shall be marked and given a reference number.

a) A reference point shall be marked on the face of the wall above the test water surface in a manner which will prevent its movement or deterioration during the period of the test.

4) Test locations must be approved by the Engineer.

h. Account for evaporation and precipitation while measuring for leakage:

1) In open structures, a clear plastic calibrated open-top container not less than 18 in. in diameter and depth shall be partially filled, floated in the tank, and held in position near each measurement location.

2) The container shall be located so as not to be shaded by tank walls and away from any items passing over it such as beams or pipes.

i. Leakage tests shall not be started when periods of severe weather conditions or major changes in average daily temperature are predicted.

j. The following measurements shall be recorded at each test location at the start of the test period and at 24-hr intervals thereafter:

1) Distance from reference point to test water surface.

2) Depth of water in the floating container.

3) Temperature of the test water at 18 inches below water surface.

4) Temperature of the water in the evaporation-precipitation container at mid-depth.

3. Leakage:

a. The change in water surface elevation at each test location shall be averaged.

b. The total change in test water surface elevation shall then be adjusted by the average change in water surface elevation in the evaporation-precipitation containers.

c. Where averaged water temperature measurements vary by more than 3°F from start to completion of the test period, adjustment in tank volume shall be determined by change of water density resulting from the change in the average water temperature.

d. Leakage Allowance

1) For unlined concrete structures: the maximum allowable leakage rate shall be 0.075% of the volume per 24-hr period.

2) For concrete structures with walls lined by a waterproof material, the maximum allowable leakage rate shall be 0.050% of the volume per 24-hr period.

4. Retesting and Repair:

a. The leakage test shall be considered as failed if the specified leakage allowance is exceeded or if any leakage is observed.

b. If the test becomes unreliable due to excessive precipitation or other external factors, it shall be restarted.

c. If a leakage test fails, it may be retested immediately without repairs if approved by the Engineer.

d. If subsequent leakage tests fail, the Contractor shall repair all probable areas of leakage and the leakage test shall be repeated.

1) The structure shall be retested until it meets the specified leakage criteria.

2) Repairs shall be made to the probable leakage areas before each retest.

L. City of New York Department of Environmental Protection Sewer Design Standards

1.05 DESCRIPTION

A. Design Requirements

1. Except as otherwise shown or specified, construct sewer manholes and catch basins of precast reinforced concrete sections conforming to ASTM C478.

2. Unless otherwise shown, manholes and catch basins shall be built in accordance with the Sewer Design Standards of the Department of Environmental Protection, except that they shall be constructed without steps.

B. Construction of Manholes

1. Manhole Base Section: Unless otherwise shown, provide manhole base sections consisting of a base riser section with an integral floor. When benches are made at the manufacturing site, provide concrete used for benched inverts conforming to the requirements for concrete used for precast sections. When benches are made in the field, Class 45 concrete may be used. Benches shall be float finished and sloped to drain.

2. O-ring Joints: Join riser, cone and flat slab top sections with O-ring rubber gasket joints or self-sealing butyl gaskets, as shown in the Sewer Design Standards. Fill voids in the joints completely with mortar after assembly of the sections.

C. Precast Products

1. Unless otherwise shown or specified, precast concrete products shall be used for sanitary and storm sewer structures.

2. The number of joints in manhole and catch basin riser sections shall be kept to a minimum by using sections 8'-0" long in so far as possible. Joints shall be tongue and groove type conforming to AWWA C302, with continuous steel reinforcement in the tongue and bell.

3. Wet-cast methods only shall be used. Forms shall leave the surfaces smooth and free of irregularities or honeycombing.

4. Unless otherwise shown or specified, the following design loadings shall be used with 30 percent impact allowance in roads and 15 percent elsewhere.

a. Earth = 130 pcf

b. Wheel = H-20

5. Unless otherwise shown or specified, wall thickness for manholes and catch basins shall be not less than:

a. 5 inches for walls

b. 8 inches for top slab

6. No more than two (2) tapered lifting holes shall be provided per section of manhole or lifting holes shall be filled with tapered rubber plugs.

7. The point of intersection (P.I.) of pipes shall be marked with a pin in the manhole floor.

8. The date of manufacture and the manufacturer’s trademark shall be marked inside each manhole and catch basin barrel.

1.06 QUALITY ASSURANCE

A. Not Used

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. Shop and field test reports of concrete samples tested in an approved laboratory.

1.08 DELIVERY, STORAGE, AND HANDLING

A. General: Take every precaution to prevent injury to the structures during transportation and unloading. Unload manhole sections and other precast items using skids, pipe hooks, rope slings, or suitable power equipment, if necessary, and

keep the items under control at all times. Do not allow the items to be dropped, dumped or dragged under any conditions. Follow applicable requirements specified in Contract Documents Damaged Section: If any precast manhole section or other structural unit is damaged in the process of transportation or handling, reject and immediately remove the item from the site, and replace it at no increase in Contract Amount.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Precast Manholes shall be as manufactured by:

1. Precast Concrete Sales Company, Valley Cottage, NY;
2. Long Island Precast, Inc., Holtsville, NY;
3. Oldcastle Infrastructure, Middle Island, NY
4. Or approved equal.

B. Precast Inlets shall be as manufactured by:

1. Penn-Cast Products, Inc., Fredericksburg, VA;
2. Precast Concrete Sales Company, Valley Cottage, NY;
3. Oldcastle Infrastructure, Middle Island, NY
4. Or approved equal.

C. Precast Catch Basins shall be as manufactured by:

1. Penn-Cast Products, Inc., Fredericksburg, VA;
2. Long Island Precast, Inc., Brookhaven, NY;
3. Precast Concrete Sales Company, Valley Cottage, NY;
4. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Concrete, Steel Reinforcement and Aggregates: For precast manholes, catch basins, inlets, and other sanitary and storm sewer structures, reinforced concrete, cementitious materials, aggregates and steel reinforcement shall conform to the requirements of ASTM C478. If concrete rings are used for adjusting manhole frames to grade, they shall conform to the requirements of ASTM C139. For cast-

in-place structures, these materials shall conform to Sections 03 30 10 – Low Carbon Cast-in-Place Concrete and 03 21 00 – Reinforcing Bars.

B. Brick: If brick is used for adjusting manhole and catch basin frames to grade, it shall conform to ASTM C32, Grade MS, with minimum dimensions of 2 1/4 by 3 1/2 by 7 1/2 inches. Brick shall be new, solid, sound, hard burned throughout and uniform in size and quality.

C. Mortar: Provide mortar that is composed of one part Type II Portland cement or Portland pozzolan cement to two parts sand. Sand shall be natural sand that conforms to the requirements of ASTM C144.

D. Frames and Covers: Frames, covers, gratings and miscellaneous metal castings shown in the Sewer Design Standards or on the Contract Drawings for installation on manholes, catch basins, trench drains and other sanitary structures shall be gray iron and shall meet the requirements of Section 05 56 00.01- Miscellaneous Metal Casting. Grating for trench drains shall be compatible with the trench drain manufacturer's systems and recommendations.

E. O-Ring Rubber Gaskets: Provide O-ring rubber gaskets conforming to ASTM C443 for joining manhole sections.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Concrete Strength: Manhole sections will be inspected and tested by an independent, certified testing laboratory, retained by the City, to establish the strength of the concrete and the adequacy of curing, to certify the date that the sections were cast and to confirm that the reinforcing steel has been properly placed. This inspection and testing will be performed by the laboratory at the manufacturing plant prior to shipment.

1. A minimum of one set of three cylinders will be taken each day that manhole sections are cast, with batch samples to be designated by the laboratory representative. At least one set of cylinders will be taken from each 9 cubic yards of concrete used in manhole section construction. These samples will be tested for strength. If the samples fail to meet specified minimum concrete strength requirements, all manhole sections manufactured from the concrete from which the cylinders were made will be rejected.

2. The City reserves the right to core manholes either at the job site or point of delivery to validate strength of concrete and placement of steel. If cores fail to demonstrate the required strength or indicate incorrect placement of reinforcing steel, all sections not previously tested will be considered rejected until sufficient additional cores are tested, at no increase in Contract Amount, to substantiate conformance to these requirements.

B. Acceptance of flat slab tops will be based on the tops passing a proof-of-design test in accordance with ASTM C478. One flat slab top for each design shall be tested.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Manhole Frames: Firmly embed manhole frames in mortar. Provide wedges or shims for accurate and level placing of the frames.

B. Connections to Riser Section: Manufacture riser sections with openings properly located for making connections to sewers. The minimum distance between a joint in a manhole section and the nearest edge of an opening for a connecting sewer and the diameter of such openings shall be as shown in the Sewer Design Standards.

C. Coatings: No exterior coating shall be used for precast structures.

D. Laying Masonry:

1. Bricks shall be wetted before applying mortar.
2. Full bed, end and side joints shall be formed in one operation.
3. Horizontal joints shall be 3/8 inch maximum and radial joints shall be 1/4 inch maximum.
4. Keyways shall be completely filled with mortar.
5. The total amount of adjustment by bricks or concrete rings shall not exceed 12 inches.

E. Precast Items:

1. Place on crushed stone bed or concrete cradle set level as shown.
2. Place backfill in even lifts on all sides to prevent overturning loads.

F. Stubs for Future Connections: Where shown, provide stubs or bells cast in walls and provide approved plugs or caps.

G. Grading:

1. Manholes and catch basins shall be installed such that covers will be at final grade.
2. Structures shall not project above finished pavements.
3. Structures in areas with temporary working grades shall be initially installed to match the temporary grade, and adjusted later to final grade prior to regrading.
4. Contractor shall be responsible for setting structures to the proper grade. The Engineer's review will be general and will apply to components only.

3.03 FIELD TESTING / QUALITY CONTROL

A. Test for leakage as required by Section 33 05 05.30 – Leakage Tests for Buried Piping.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

J. AWWA C302 - Reinforced Concrete Pressure Pipe, Noncylinder Type

1.05 DESCRIPTION

A. Design Requirements

1. Concrete shall conform to Sections 03 30 00 – Cast-in-Place Concrete and 03 41 00 – Precast Structural Concrete, and when tested at the end of 28 days shall have the following minimum compressive strengths:

a. PRECAST PIPE - 4,000; 5,000; 6,000 psi

b. MONOLITHIC SEWERS - 3,500 psi

c. CRADLES AND ENCASEMENT - 3,500 psi

2. Design: Provide the classes of reinforced concrete sewer pipe as shown or specified. Conform pipe designs to the following requirements.

a. Use diameter, wall thickness, compressive strength of concrete and area of circumferential reinforcement as prescribed for Classes I to IV in Tables 1 to 5 in ASTM C76, except do not use Wall A thickness, elliptical reinforcing cages or quadrant reinforcing mats. Do not substitute modified designs for designs shown in the tables.

b. Provide special designs only for pipe with diameters and loads beyond those shown in Tables 1 to 5, pipe diameters that do not have steel reinforcement areas shown in the tables and pipe subject to

thrust forces encountered in jacking operations. Conform special designs with the requirements of Section 7.2.2 of ASTM C 76, except do not use Wall A thickness, elliptical reinforcing cages or quadrant reinforcing mats without prior approval. Retain a Registered Professional Engineer, licensed in the State of New York, to prepare, sign and seal all special designs for pipe.

3. Precast reinforced concrete pipe shall conform to the requirements of ASTM C76 for circular steel reinforcement and the three-edge bearing strength test requirements for the load to produce the 0.01 inch crack and for the ultimate load. When the strength test requirements specified in the Contract Documents are greater than the strength test requirements of ASTM C76, the thickness of the pipe wall may be increased, the area of circular steel reinforcement increased, or a combination of these, all as approved by the Engineer.

4. Joints:

   a. Provide joints for pipe, fittings and specials in gravity sewer and drain lines meeting the requirements of ASTM C443 and this Specification.

   b. Provide joints for pipe, fittings and specials in concrete pressure lines with test pressures of 125 ft. or less meeting the requirements of ASTM C361 and these specifications.

   c. Provide joints for pipe, fittings and specials in concrete pressure lines with test pressures over 125 ft. as described in the Contract Documents.

B. Schedules

1. Refer to the schedule contained in the Contract Documents for information on the piping that is to be constructed using the pipe materials and methods specified herein.

1.06 QUALITY ASSURANCE

A. General: Provide concrete pipe, fittings and specials that are precast or machine made and are the product of a company that can demonstrate by tests and installation records satisfactory experience in manufacturing concrete pipe of the quality and type specified.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

B.

1. All diameters and classes of reinforced concrete pipe, fittings and specials and for concrete sills showing dimensions, strength and materials specifications and standards, joint details and reinforcement position
2. Area of all cages of reinforcing steel
3. A minimum clearance of one inch for each cage of circumferential reinforcing steel shown
4. Angle of the joint
5. Length and thickness of bell and spigot
6. Length and thickness of joint
7. Manufacturer, size and type of gasket
8. Manufacturer's recommendations for gap dimension and tolerance for a properly installed pipe joint
9. Signature and title of authorized representative of the manufacturer
10. All requirements of the latest ASTM Specifications for Precast Reinforced Concrete Pipe as called for in these specifications will be complied with in the manufacture of the pipe

C. Joint Compliance: Submit notarized affidavit of joint compliance with ASTM C443 and these specifications for each pipe size. The statement shall include date of test.

D. Quality Control: Submit certified results of all shop tests for approval.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Do not ship pipe to the site of the work until the pipe test results are certified by the Engineer.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

Not Used

2.02 MATERIALS / EQUIPMENT

Not Used

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Reinforced Concrete Pipe

1. Manufacture:

a. Do not use admixtures or blends in concrete without prior approval.

b. The manufacturer shall maintain a satisfactory manufacturing schedule and shall have adequate storage facilities so that the work will not be delayed.

c. Cast pipe in steel forms to the exact dimensions shown, specified or required. Unless otherwise shown or specified, the inner and outer rings of reinforcement shall be concentric. Provide chairs and spacers to insure and maintain the proper position of reinforcement steel with respect to the protective concrete covering. Pipes in which reinforcing steel is placed beyond the tolerances allowed by ASTM C76 will be rejected. Use metal spacers at the top between the inner and outer forms to maintain uniform wall thickness in casting pipe. Where reinforcement mesh is used in the pipe, curve such reinforcement to shape on rolls having grooves for the longitudinal wires. In casting pipe, do not cut wires for form spacers or for other purposes. Provide continuous internal vibration of concrete during the pouring operation.

d. The Contractor will be responsible for meeting all requirements for the manufacture of precast pipe and checking at regular intervals all such requirements.

2. Lengths: Manufacture all reinforced concrete pipe in lengths of not more than 16 feet and not less than 8 feet as follows, except where shorter lengths are required and approved for pipeline curves or at junctions with structures.

a. Furnish subaqueous pressure pipe in lengths of not less than 16 feet for pipe up to and including 84 inches in diameter. Pipe larger than 84 inches in diameter may be of lengths less than 16 feet, decreased on a sliding scale in accordance with the manufacturer's recommendations and as approved by the Engineer.

b. Furnish pressure pipe to be installed inland in lengths not less than 12 feet, except that pipe to be laid in sheeted trench shall be furnished in lengths not less than 8 feet.

3. Labeling: Immediately after the stripping of forms, all pipe manufactured for the Department of Environmental Protection as required under this contract shall be marked and identified with the following data: DEP, contract name and number, class and diameter of pipe, number of pipe, date of manufacture and the name of the manufacturer. The numbering of the pipe shall be consecutive for each diameter of pipe. Brass lettering templates designed to stencil this information on each pipe shall be provided by the pipe manufacturer. The aforementioned data shall be stenciled on the inside and outside of each length of pipe with waterproof ink or paint. Any pipe arriving at the location of the work without this information stenciled thereon will be rejected. At the end of each day of casting of the

pipe, the manufacturer shall forward to the Engineer three copies of a report giving the diameters and the respective numbers of pipe cast that day.

4. Monolithic Sewers:

   a. Forms for monolithic concrete sewers shall be smooth, regular and true to shape. Forms which do not meet these requirements or which result in interior surfaces or thicknesses inferior to commercial precast concrete pipe shall not be used. Forms shall be thoroughly cleaned and approved by the Engineer before re-use. Sheeting shall not be used as exterior forms for monolithic concrete sewers.

   b. Concreting, unless otherwise approved by the Engineer, shall proceed in lengths of not less than 12 feet.

   c. Construction joints both longitudinal and transverse in monolithic concrete sewers shall have fabricated nickel-copper roofing sheet water stops conforming to the requirements of ASTM B127.

B. Reinforced Concrete Fittings and Specials

1. General: Provide reinforced concrete fittings and specials where shown, specified or required, and manufactured in accordance with the applicable sections of the respective standard for the adjoining pipe. Provide joints the same as in the adjoining pipe. Provide the interior surface of bends of the same smoothness and diameter as the adjoining pipe. Provide the center line radius of curvature of bends to be equal, in dimension, to the inside diameter of the pipe.

2. Strength: Design all reinforced concrete fittings and specials to have the same strength as the class of the adjoining pipe. Retain a Registered Professional Engineer, licensed in the State of New York to prepare, sign and seal all designs for fittings and specials.

3. Standard fitting such as bends, tees, wyes and reducers shall be formed of steel, cut, shaped and welded to the proper form. Interior and exterior concrete or mortar shall be placed in approved manner.

4. Special pieces and openings in standard pipe such as closures, wall fittings, adapters, manholes, air valve outlets, blow-offs and branches shall conform to details approved by the Engineer.

C. Joints:

1. General: Rubber gaskets shall be stored in as cool a location as practicable, preferably at 70 degrees F or less. In no case shall gaskets be exposed to the direct rays of the sun for a total of more than 24 hours.

2. Gravity Sewer and Drain Lines:

   a. Manufacture all gravity sewer and drain pipe, fittings and specials with watertight joints using rubber gaskets in accordance with the requirements of ASTM C443. Provide a preformed groove in the

tongue or spigot of sufficient depth to hold the gasket securely in place and produce the proper gasket compression. Reinforced concrete pipe joints shall be optional as to shape, except that no joint shall have a groove in which the wall thickness of the pipe is reduced to less than one-half, other than by a slight draw or taper, unless approved by the Engineer in writing.

b. Manufacture the pipe with perfectly machined castings for forming the bells and spigots so that they will be true circles and when laid together the annular space for the rubber gasket will be perfectly uniform. The diameters of the bell and spigot surfaces, depended upon to compress the gasket, shall not vary from the theoretical diameters by more than 1/16 inch. The joint shall not project beyond the body of the pipe.

c. Reinforce the bells of the pipe with a single cage of steel in which the circumferential members are the same gauge as those in the body of the pipe, but spaced on no more than 1 inch centers.

d. The type and the manufacturer of the flexible rubber gaskets to be used shall be submitted for approval before pipe laying begins.

D. Concrete Pressure Lines:

1. Provide all concrete pressure pipe, fittings and specials with watertight joints using rubber gaskets in accordance with the requirements of ASTM C361 and this Specification.

2. Connect adjacent pipes by self-centering steel joint rings sealed with a continuous round rubber gasket. The joint shall be tight under normal conditions of service, and shall be sufficiently flexible to permit expansion and contraction as well as slight deflection due to normal earth settlement.

3. Specially shape the rings which form the joint so that they will join with a close, sliding fit. The joint surfaces shall be such that the rubber gasket will be confined on all sides.

4. Provide the spigot ring with an external groove accurately sized to receive the gasket. Special section steel for spigot rings shall conform to ASTM A283/A283M, Grade A or B.

5. Place the bell ring to permit gradual deformation of the gasket when the joint is assembled. The minimum thickness of bell rings shall be 3/16 inch. Bell rings for pipe sizes 42 inches and larger shall have a minimum thickness of 1/4 inch. Bell rings 1/4 inch and thicker shall conform to ASTM A283/A283M, Grade A or B. Bell rings less than 1/4 inch thick shall conform to ASTM A570/A570M, Grade A.

6. Precisely size each ring by expansion beyond the elastic limit of the steel and then gaging on an accurate template. Protect all exposed surfaces of both rings with a corrosion-resistant coating of zinc applied by an approved metalizing process after cleaning.

7. Provide a continuous rubber gasket with smooth surfaces free from imperfections. It shall be circular and shall fill the grooved recess between the assembled joint rings. Rubber compound used shall conform to the requirements of Section 4.4.10 of AWWA C302.

E. Curing

1. Cure all pipe, fittings and specials by steam or membrane curing. Water curing is not permitted.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Shop Testing

1. Test concrete sewer pipe in accordance with the applicable provisions of ASTM C497, as required by the ASTM Specification for the pipe and as specified herein.

2. Test cylinders: Each day the Contractor shall prepare two test cylinders made from the concrete used for manufacturing the pipe under this contract.

a. Make test cylinders in accordance with the requirements of ASTM C31 and cure and store them under identical conditions with the pipe. Test cylinders shall be properly marked for identification and dated.

b. The Engineer will have the cylinders tested to determine whether the concrete complies with the strength requirements. Of each pair of test cylinders, one cylinder will be tested at 7 days, and the other test cylinder will be tested at 28 days. Test cylinders will be tested in accordance with ASTM C39 and the cost of such tests will be borne by the City.

3. Test Pipe Sections:

a. When lengths of pipe are 8 feet or less, the Engineer will select one length from every fifty lengths of each diameter and class.

b. When lengths of pipe are more than 8 feet, the Contractor shall provide a pipe test specimen four feet long for every 50 lengths of each diameter and class. Each test specimen shall be manufactured, marked for identification and shall meet the strength test requirements as specified for the pipe it represents. The manufacturing and marking of the pipe test specimen shall be witnessed by the Engineer.

c. Where less than 50 lengths are required for any pipe diameter, one eight-foot length of pipe will be selected by the Engineer or one pipe test specimen shall be provided for testing purposes; however, the Engineer may waive this requirement at his discretion.

d. Age of Pipe: Pipe selected or pipe tested specimens provided as specified for testing purposes shall be at least twenty-eight days old but shall not be over thirty days old at the time of testing.

1) Due to unforeseen conditions beyond the control of the Engineer and the manufacturer, special permission will be given in writing by the Engineer to delay a test beyond the 30 day aging period.

2) The three-edge load bearing strength at 0.01-inch crack and the ultimate load strength of pipe tested after twenty-eight days will be corrected to the 28 day strength by deducting 1/2 of one percent of the recorded strength for each day beyond the twenty-eight day age.

3) The Contractor may request tests to be made on pipe which has aged at least fourteen days and not more than 28 days but the tests must meet the 28 day strength test requirement in order to be accepted by the Engineer for installation in the work.

4. Basis of Acceptance: Conform the basis of acceptance for reinforced concrete pipe to Section 5.1.1 of ASTM C76 and this Specification.

a. The Engineer will reject all pipe of the lot which the tested length of pipe represents if the actual or corrected strength of the pipe tested fails to meet the three-edge load bearing strength test requirements. However, if the eight-foot length of pipe selected by the Engineer fails to meet the three-edge loading bearing strength test requirements, the Contractor may request that tests be made on two other eight-foot lengths of pipe representing that lot from which the original pipe tested was selected. The Engineer will select these two lengths of pipe. Should the tests on these two lengths of pipe prove satisfactory, the lot, represented by these lengths of pipe will be accepted. Should the tests on one or two of these lengths of pipe prove unsatisfactory, no further tests on any other lengths of pipe from this lot will be made, and all the pipe in this particular lot will be rejected.

b. The Engineer may accept precast pipe which meets the 0.01-inch crack strength test requirements but does not meet the ultimate load strength test requirements; however, the City will deduct 1/2 of one percent of the price bid per linear foot for that item which covers that particular pipe diameter and test strength requirements, for each one percent by which the ultimate load is below the required ultimate load. This deduction will be made on all pipe represented by the test specimen.

5. Proof-of-Adequacy Tests for Special Designs: Prior to manufacturing production run pipe of special design, test one pipe of at least four feet in

length of each diameter and class by the three-edge-bearing method to confirm that the pipe meets both the 0.01-inch crack and ultimate load requirements for which it is designed.

6. Joint Adequacy Tests:

   a. Prior to manufacturing production run pipe, fittings and specials, conduct all tests required by Sections 9 and 10 of ASTM C443 for each diameter of pipe.

   b. Give two weeks' notice in writing, before the day of testing, to both the Engineer and the approved laboratory, to witness the tests. The Department of Environmental Protection reserves the right to have an inspector or authorized representative present at the time of the tests.

   c. All manufacturers supplying reinforced concrete pipe to the Department of Environmental Protection shall, for each size of pipe and gasket combination submitted for approval, have on file with the Department a Certified Statement attested thereto by the City inspector or representative that the hydrostatic test on pipe and on rubber gasket was performed in accordance with the above-mentioned ASTM designation and passed.

7. Location of Tests: The pipe selected or the pipe test specimen provided for test shall be delivered by the Contractor to an approved testing laboratory and removed by the Contractor after the test has been made. The Contractor may request that tests be made at the manufacturer's plant; however, the pipe manufacturer shall provide an approved and certified testing machine with a hydraulically-operated jack and direct-reading gauges requiring no calibration.

8. Test Witnessing: All strength tests will be witnessed by the Engineer.

9. Costs of Tests: The Contractor shall pay all costs associated with tests and test witnessing.

B. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Install all reinforced concrete sewer pipe, fittings and specials in accordance with the manufacturer’s recommendations and approved shop drawings, and as follows.

1. Precast pipe lines shall be true to line and grade. The interior surface shall be smooth and uniform.

2. Season pipe 28 days prior to laying.

3. With the gasket in place, align the pipe, and draw the joints home with an approved tackle and apparatus. Prior to the use of such apparatus and method, demonstrate to the Engineer for approval the effectiveness and practicability of the proposed method of drawing the joints home.

4. The position and condition of the gasket will be examined from the inside of the pipe before successive pipe lengths are installed. If an unsatisfactory condition is located, the pipe shall be taken out and the operation of drawing the pipe together repeated with a new gasket.

5. Provide approved concrete sills for the temporary support of pipes which are to be permanently supported on concrete cradles for maintaining proper alignment and grade until the concrete cradle is poured. Completely embed such sills in the concrete cradle.

6. Cast concrete cradles for pipe in one pour to the exact size and dimensions shown on the Contract Drawings.

B. Jointing Pipe at Structures:

1. At manholes and other structures in precast concrete pipe lines, the construction may be of monolithic concrete. Submit details of such joints to the Engineer for approval.

2. Where precast concrete pipe for pressure pipe lines is joined to monolithic concrete pipe, cast iron or steel pipe, or other structure, the joint shall be similar to the joint between individual precast concrete pipes, enlarged if required. Submit details of such joints to the Engineer for approval.

3. Where provisions for future connections are required, provide similar joints and coat with an approved asphaltic compound for protection. If necessary, in the opinion of the Engineer, place a suitable collar entirely around the pipe at all such joints.

3.03 FIELD TESTING / QUALITY CONTROL

A. Test the reinforced concrete sewers for leakage after completion in accordance with Section 33 05 05.30 - Leakage Testing for Buried Piping

3.04 STARTUP / DEMONSTRATION

18.	AWWA M23	PVC Pipe – Design and Installation.
19.	AWWA M41	Ductile-Iron Pipe and Fittings.
20.	DIPRA	Installation Guide for Ductile Iron Pipe.
21.	NSF61	Drinking Water System Components Health Effects.

1.05 DESCRIPTION

A. The scope of this Section includes the requirements for the installation of exposed piping, except where installation requirements for exposed piping are shown or specified elsewhere in the Contract Documents. In addition:

1. The scope of this Section includes requirements for:

a. The jointing of exposed piping

b. The installation of gasket materials, specials, flexible couplings, mechanical couplings, harnessed and flanged adapters, sleeves, and tie rods.

c. Modifications and/or adjustments to existing exposed piping.

d. The installation of supports, restraints, and other anchors.

e. The cleaning, disinfecting, and field testing of all exposed piping.

2. The extent of exposed process piping is shown on the Contract Drawings. The Contractor shall provide additional exposed pipe as necessary and/or required to complete the Work as shown and specified. Exposed pipe service, pipe diameter, coating, lining, pressure rating, joint type, and testing requirements are specified in the following section(s):

a. Section 40 06 01 - Schedule for Exposed Piping.

3. Where shown on the Contract Drawings, the Contractor shall provide all labor and materials for making connections between exposed piping and existing lines(s) installed under other contracts, including all specials required to connect exposed pipe to pipe of dissimilar material(s).

1.06 QUALITY ASSURANCE

A. Not Used.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. Exposed piping submittals shall be submitted under the specification section number corresponding to the exposed piping material. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

a. Shop Drawings:

1) Catalog cuts and data sheets, including but not limited to:

a) Specifications for all components of the exposed piping.

b) illustrations in sufficient detail to serve as a guide for assembly and disassembly

c) A parts schedule that identifies the materials to be used for the various piping components and accessories.

d) Weights of all component parts.

e) Details on joining methods.

f) Details of pipe lining, coating, wrapping, insulation and painting.

g) Copy of pipe coupling, special, and adapter details (pipe couplings, specials, and adapters shall be submitted for approval under Section 40 05 06 - Couplings, Adapters, and Specials for Process Piping).

h) Copy of expansion joint details (expansion joints shall be submitted for approval under the specification section in which they are specified)

i) Copy of pipe hanger details (pipe hangers shall be submitted for approval under Section 40 05 07 - Hangers and Supports for Process Piping).

j) Copy of pipe insulation details (insulation shall be submitted for approval under Section 22 07 19 – Plumbing Piping Insulation).

b. Layout and Installation Drawings:

1) Shall include plans, sections, and details showing location, elevations, and clearly marked dimensions.

2) Piece numbers which are coordinated with the tabulated pipe layout schedule shall be clearly marked.

3) The scale used shall be the greater of the following two (2):

a) The scale used on the Contract Drawings that depict the process pipe for which the submittal pertains, or

b) A minimum scale of ¼-in = 1-ft - 0-in.

4) When special designs or fittings are required, the work shall be shown in large detail and the special or fitting completely described and dimensioned.

5) Include a north arrow.

6) Information on pipe supports, including:

a) Pipe support location.

b) Pipe support type.

c) hanger rod size.

d) Insert type.

e) All loads on the support (in either lbs. or kips.)

7) Locations where pipe and valve identification signs will be placed.

8) Location of pipe couplings, specials, and adapters.

9) Location of expansion joints.

10) Locations of pipe hangers and supports.

11) Extent of pipe insulation.

12) Extent of lining, wrapping, and coatings.

c. A tabulated pipe layout schedule for each exposed process pipe system. Submit a separate schedule for each pipe system and/or service. The pipe layout schedule shall include the following information for each pipe section, fitting, and appurtenance that comprises that system:

1) Service.

2) Pipe size.

3) Working pressure.

4) Weight (in lbs.)

5) Joint type.

6) Wall thickness.

7) Piece number.

8) Laying length.

d. Calculations for the design of the support structures.

1) Design calculations shall be signed and sealed by a Professional Engineer registered in the State of New York.

2) Calculations shall include a summary of design criteria used in the design, including a description of each load case and load combination considered.

3) A tabulation shall be provided indicating vertical and horizontal deflections for the supports and individual members, determined for each load combination identified above.

4) A tabulation shall be provided giving the column vertical and horizontal reactions for each load combination.

e. For each exposed process piping system that contains valves, submit a tabulated valve schedule. Submit a separate schedule for each pipe system and/or service. The valve schedule shall include the following information for each valve:

1) Valve tag number.

2) Valve size.

3) Whether the valve is manual or actuated. If actuated, the type of actuator.

4) 100% open Cv value for control valves.

5) Upstream pressure (units of psig).

2. Information Submittals:

a. Certified Letters of Compliance:

1) Certificate of compliance with the requirements of the Contract Documents for pipe, fittings, couplings, sleeves, cleanouts and harnessing.

2) Certificate from an independent testing laboratory, approved by the City, for each welder assigned to the welding of pipe, fittings, and pipeline equipment.

3) Materials Certificates of Conformance: Submit certificates of conformance with Referenced Standards specified in the corresponding piping specification section.

b. Welding Procedures and Qualifications:

1) Certificates shall be of current issue and conform to the requirements of the applicable reference standards. In addition:

   a) Certificates that all welders and welding operators have been qualified in accordance with ASME Boiler and Pressure Vessel Code Section IX.

   b) Certificates stating that the welding of steel and stainless steel shall conform to the requirements of ASME B31.1.

2) Copies of qualified procedures and list of names and identification symbols of qualified welders and welding operators, prior to welding operations.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. Structural Attachments:

1. Structural steel brackets required to support piping and appurtenances but not shown on the Contract Drawings shall be provided under this section.

2. Material for structural attachments shall be as specified under Section 05 12 00 - Structural Steel Framing.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Identification:

1. Provide in accordance with Section 40 05 97 - Identification for Process Equipment.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. All pipe coating injured in any way during transit or laying shall be satisfactorily repaired prior to placing the backfill.

1. Ample provision shall be made for the prompt and efficient repair of all abrasions and injuries.

B. Certificates of welding qualifications conforming to the requirements of ASME B31.1, Section 6 and its Supplements, shall be submitted to the Engineer for approval prior to proceeding with any pipe welding.

3.02 INSTALLATION

A. General:

1. All piping shall be erected to accurate lines and grades, permanently supported as shown, specified, or required.

2. Where temporary supports are used during construction, sufficient strength and rigidity shall be provided to prevent shifting or distortion of the pipe.

3. All work shall be accomplished using the best methods and procedures of recognized pipe fabrication in a good and workmanlike manner in accordance with the latest edition of the applicable standards referenced in the Contract Documents, including (but not limited to):

a. For thermoplastic pipe:

1) AWWA M23.

4. All exposed pipe, fittings, and appurtenances shall be installed in accordance with all of the following:

a. The manufacturer's printed instructions and recommendations.

b. The approved shop drawings.

c. As specified in the Contract Documents.

5. Routing:

a. Install piping in a neat manner with lines straight and parallel or at right angles to walls or column lines, unless otherwise shown on the Contract Drawings.

1) Install horizontal lines true to line and elevation.

2) Install vertical lines truly plumb in all directions.

b. Where practicable, install piping in groups and parallel to building walls.

c. Avoid installing piping through ductwork or directly under electric light outlets, or interfering with other pipe, lines, conduit, etc.

d. Leave all corridors, walkways, work areas, and similar spaces unobstructed.

e. Clearance:

1) Clearances shall be measured from the outermost edge of piping, flanges or other type of joint that extends beyond the nominal outside diameter of piping.

2) Provide a minimum clearance of 1-in. between pipe and other work.

3) Avoid installing pipe beyond furring lines as determined by the Architectural Drawings.

4) Provide a minimum headroom clearance under piping and pipe supports of 7.5 ft.

f. Small diameter piping and/or piping not shown on the Contract Drawings:

1) If specific locations and elevations are not shown on the Contract Drawings, install small diameter piping as specified herein, and as necessary and required to avoid ducts, equipment, beams, and other obstructions.

g. Multiple Pipe Runs:

1) In the support of multiple pipe runs on a common base member, a clip or clamp shall be used where each pipe crosses the base support member.

2) Spacing of the base support members shall not exceed the hanger and support spacing required for any individual pipe in the multiple pipe run.

6. Placing:

a. Install bell and spigot pipe so that bells face the direction of laying, unless otherwise shown on the Contract Drawings.

b. For coated pipe, care shall be exercised in laying and cradling the pipe to prevent injury to the coating.

7. Cuts:

a. Use cutting methods and machines specially designed for cutting the pipe material and approved by the manufacturer. The following cutting methods are not acceptable:

1) "Squeeze" type pipe cutters

2) Cutting torches

3) Diamond points

4) Dog chisels.

b. Pie Lengths:

1) Full standard lengths of pipe shall be used in each pipe run in so far as possible.

2) Shorter lengths than standard shall be used only to complete a straight run of pipe, to connect to established locations of valves, equipment, bends, and the like.

3) Random lengths of pipe or cuttings from standard lengths shall not be coupled together when a full standard pipe length will fit in the pipe run.

c. Pipe shall be cut square, and not upset, undersized, or out of round, except as follows:

1) Cut ends of push-on joint type pipe shall be tapered and sharp edges filed off smooth.

d. Ends shall be carefully reamed and cleaned before being installed.

e. Make cuts carefully without damage to coatings or linings.

8. Jointing:

a. Thoroughly clean all pipe, fittings, valves, specials, and accessories before jointing.

1) Remove all cuttings and foreign matter from inside of pipe and tubing.

2) Clean joining area of pipe, fittings, and appurtenances as necessary and required and as per manufacturer instructions.

a) For cleaning pipe ends, solutions such as detergents and solvents, when required, shall be used in accordance with manufacturer's recommendations.

b. Use jointing methods recommended and approved by the pipe manufacturer.

c. Unions:

1) Provide a union downstream of each valve with screwed connections.

2) Provide screwed or flanged unions at each piece of equipment, where shown, and where necessary to install or dismantle piping.

d. Transitions from One Type of Pipe to Another:

1) Provide all necessary adapters, specials and connection pieces required when connecting different types and sizes of pipe or connecting pipe made by different manufacturers.

2) Connections between Dissimilar Metals:

a) Provide dielectric couplings, insulating couplings, unions, or other approved dielectric insulating devices, at all connections to pipelines or equipment of dissimilar metals, regardless of whether devices are shown on the Contract Drawings.

b) Refer to Section 40 05 15 - Copper and Brass Process Pipe, for additional requirements for dielectric insulating devices for use with copper and brass process pipe.

9. Bends and Turns:

   a. Do not spring or deform piping to make up joints.

   b. Bending of pipe is not permitted.

      1) Use fittings for all changes in direction.

   c. Bends shall be of 45° or 90° unless otherwise shown on the Contract Drawings.

10. Plugs:

   a. Shall match the materials, linings, and coatings of the process piping, and shall have a square head.

11. Transitions:

   a. Reducing fittings shall be used for all changes in pipe sizes, even when not specifically shown on the Contract Drawings.

      1) Unless otherwise shown or specified, use eccentric reducing fittings.

   b. Do not use bushings, except where specifically shown on the Contract Drawings.

   c. Nipples shorter than 4-in in length shall be Schedule 80.

   d. Between pressure ratings:

      1) Where lines of lower service rating tie into services, appurtenances, or equipment of higher service rating, the equipment, valve, or appurtenance between the two shall conform to the higher rating.

12. Drainage:

   a. The Contractor shall provide all pipelines with a means for drainage at all low points in the lines.

      1) Provide appurtenances for condensate drainage, regardless of whether such means is shown on the Contract Drawings and/or the approved shop drawings.

   b. Drainage valves and appurtenances shall be:

1) A minimum of 1-in. nominal diameter, unless otherwise shown on the Contract Drawings.

2) Adequately sized.

3) Of the same size as the drain pipeline specified herein.

4) Meet the requirements of Section 40 05 56 - Process Valves, Smaller than Four-inch Diameter.

c. Where drainage valves or appurtenances are located so that liquids can discharge and cause damage to a structure or equipment, the Contractor shall provide drain pipe to the nearest gutter or drain.

1) Provide a single drain pipe, matching the size of the drain valve and appurtenances, for each drain valve on the carrier pipe.

2) Unless otherwise shown on the Contract Drawings, the drain pipe shall be of Schedule 80 CPVC conforming to the requirements of Section 40 05 31, Thermoplastic Process Pipe and the installation requirements for thermoplastic piping specified herein.

3) A quick connect coupling shall be provided at the end of the drain line for attachment of a hose.

13. Venting:

a. The Contractor shall provide all pipelines for liquids with vents at all high points in the lines.

1) Provide vents regardless of whether vent valves are shown on the Contract Drawings and/or the approved shop drawings.

b. Vents shall consist of the following three (3) components:

1) An automatic air release/vacuum relief valve.

a) The valve shall have a cast or ductile-iron body and cover, stainless steel internals, and Viton or Buna N seal, unless otherwise specified.

2) An outlet vent line.

a) The outlet vent line from the valve shall be of Schedule 80 CPVC conforming to the requirements of Section 40 05 31, Thermoplastic Process Pipe and the installation requirements for thermoplastic piping specified herein.

b) Vent line shall terminate at a point approximately 3 ft above the floor.

3) An isolation ball valve:

a) A ball valve shall be provided between the carrier pipe and the automatic air/vacuum release valve to allow removal of the automatic air/vacuum release valve for repair or replacement.

b) The body of the isolation valve shall be:

(1) For vents < 4-in.: Type 316 Stainless Steel.

(2) For vents ≥ 4-in.: The same material as the body of the automatic air/vacuum release valve.

c. Sizing:

1) For carrier pipelines ≤ 1-in.: Vents shall be the same size as the carrier pipe.

2) For carrier pipe > 1-in.: Vents shall be the size shown on the Contract Documents or 1-in., whichever is greater.

d. Vent valves (both the automatic air/vacuum release and isolation valve) shall meet the requirements of one (1) of the following Sections, depending on the size of the vent valve:

1) Section 40 05 53 - Process Valves Four-inch Diameter and Larger.

2) Section 40 05 56 - Process Valves, Smaller than Four-inch Diameter.

14. Insulation:

a. Refer to Section 40 06 01 - Schedule for Exposed Piping, and the Contract Drawings for the extent of insulated exposed piping.

b. Insulation shall be installed after the installation and testing of exposed piping.

15. Hangers and Supports:

a. Install pipelines with supporting devices in accordance with requirements of Section 40 05 07 - Hangers and Supports for Process Piping.

b. No piping shall be supported from metal stairs, ladders and walkways.

16. Restraints, Supports, and Thrust Blocks:

a. Provide concrete and metal cradles, collars, kickers, and blocks as shown on the Contract Drawings.

17. Seismic Requirements:

a. All piping and attached valves shall be supported and braced to resist seismic loads and in accordance with the SMACNA Seismic Restraint Manual.

18. Expansion and Contraction:

a. The Contractor shall provide ample provisions for flexibility in all pipelines to compensate for expansion and contraction.

1) Unless other forms of expansion compensation are shown or specified, the Contractor shall:

a) Provide lengths of pipe shorter than the theoretical length to the extent of one half of the expansion, and install said lengths of pipe such that they may be free to expand without increasing the stresses imposed when cold.

2) Otherwise, the Contractor shall install all piping with expansion devices to allow for proper expansion and contraction.

a) Expansion devices shall allow the pipe to expand and contract freely without damage to any part of the piping system.

b) Expansion devices shall include, but not be limited to: expansion joints, expansion couplings, swivel or swing joints or pipe bends, including such anchors as may be shown, specified, or required to make the devices effective.

b. Cold sprung pipe:

1) Install with metal filler pieces bolted between flanges or tack welded between weld joints.

2) After the pipe, anchors, hangers and supports have been installed, the spacers shall be removed and the joint made.

c. Swing Joints:

1) For pipelines 2-in. nominal diameter or smaller, rated at working pressures up to 150 psig:

a) Screwed end swing or swivel joints may be used.

b) Otherwise expansion shall be taken up with nipples and fittings as required.

2) A sufficient number of fittings and pipe lengths in connection with swing joints shall be provided to assure the absence of distortion of either the pipelines or branches.

d. Branch Tees:

1) Install branch tees on risers in locations that will allow the branch lines, when expanded by heat, to drain properly.

e. Pipe Expansion Bends:

1) Pipe bends of approved design for compensating thermal expansion when shown, specified or required shall be fabricated and furnished as herein specified.

2) In pipelines operating under high pressures or high temperatures in which offsets occur in alignment that may be subject to bending stresses excessive for the fittings, or where otherwise deemed necessary, use appropriate pipe bends to make the offset.

3) Where possible, all bends shall have radii equal to a least six diameters ($r = 6 \times d$) of the pipe and tangents or straight lengths of the pipe shall be neatly made, true to radius, free from buckles and flat surfaces.

f. Application guide and anchor requirements for expansion joints shall be in accordance with the recommendations of the manufacturer or the Standards of the EJMA.

g. The Contractor shall adjust all expansion devices after installation (but prior to operation) so that the pipelines shall be fluid-tight through the full range of operating conditions.

19. Wall Sleeves:

a. Where piping passes through walls, partitions, floors, roofs, or structures, provide wall sleeves of wearing material to prevent abrasion damage to piping.

1) Pipe sleeves shall be Schedule 40.

2) Sleeves through walls shall be flush with wall face.

b. Anchor sleeves to concrete and masonry walls as shown on the Contract Drawings.

c. All annular spaces in exterior walls or walls subjected to hydrostatic pressure shall be completely watertight.

d. Do not install sleeves and pipes through structural members unless specifically shown on the Contract Drawings.

20. Temporary Blind Flanges, Plugs, Caps, and Bulkheads:

a. At the end of each day of work or other interruption of pipe installation, the Contractor shall provide temporary blind flanges, plugs, caps, or bulkheads as necessary and required.

1) Plug all bells at dead ends, tees, and crosses.

2) Cap all spigot and plain ends.

b. To perform the testing of exposed piping as specified herein, or as per the sequence of work specified in the Contract Documents, the Contractor shall provide temporary blind flanges, line stops, plugs, and bulkheads suitable for and capable of withstanding the services and pressures for which they are intended.

1) Refer to Section 40 06 01 - Schedule for Exposed Piping, for service and test pressures.

2) Temporary blind flanges, line stops, plugs, and bulkhead shall be compatible with and shall not damage the piping materials, coatings, and linings specified in Section 40 06 01 - Schedule for Exposed Piping.

c. The Contractor shall uninstall all temporary blind flanges, plugs, caps, and when they are no longer needed for the Work.

21. Flow Measuring Devices:

a. If not shown on the Contract Drawings, position flow measuring devices in pipe lines so that they have the amount of straight upstream and downstream runs recommended by the manufacturer, unless specific location dimensions are shown.

B. PVC and CPVC Pipe Installation

1. End Connections:

a. Solvent-Welded Joints:

1) Make all solvent-welded PVC and CPVC joints in accordance with ASTM D2855 and the solvent manufacturer's approved instructions.

2) For PVC pipe, use primers and solvent cements meeting the requirements of ASTM F656 and ASTM D2564, respectively.

3) For CPVC pipe, use solvent cements meeting the requirements of ASTM F493.

4) Do not make solvent cement joints if temperature is below 40°F.

5) Do not make solvent cement welded joints in wet conditions.

6) The following procedure shall be followed to ensure proper gluing of PVC and CPVC pipe.

a) Ensure the end of the pipe is beveled.

b) Apply primer to the female end.

c) Apply primer to the male end.

d) Reapply primer to the female end; the primer must not dry.

e) Apply glue to the male end using an appropriately sized brush.

f) Apply glue with the brush to the female end.

g) Reapply glue to the male end.

h) Join the male and female ends with a quarter turn twist and hold for 30 sec.

7) After joint assembly, wipe excess cement from the pipe. A properly made joint will show a bead around the entire circumference. Any gaps in this bead indicate a defective joint, and the Contractor shall remake such joints at no additional cost to the City.

b. Threaded Joints:

1) Cut the end of the thermoplastic pipe square and smooth with a knife or a file.

2) Thread the pipe in accordance with the pipe manufacturer's recommendations. Brush threads clean.

3) After threading pipe, starting with second full thread, and continuing over the thread length, wrap 100% virgin Teflon thread tape in the direction of the thread. Overlap each wrap by one-half width of tape.

4) After application of the Teflon thread tape, screw fitting or coupling onto the pipe end to be joined. Hand tighten. Then tighten the connection an additional one or two threads past the point of hand tightness.

3.03 FIELD TESTING / QUALITY CONTROL

A. Test all exposed piping in accordance with the requirements of Section 40 05 05.30 - Leakage Testing for Exposed Piping.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

SECTION 40 05 05.30 – LEAKAGE TESTING FOR EXPOSED PIPING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified and required, to test all exposed piping complete and operational.

B. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 40 05 05 – Exposed Piping Installation.

B. Section 40 06 01 – Schedule for Exposed Piping.

1.04 REFERENCES

A. Definitions:

1. Buried Piping: Includes all piping beginning at the outside face of a structures or foundation and extending away from structures. Buried piping includes piping beneath structures or foundations.

2. Exposed Piping: Includes all piping beginning at the outside face of a structures or foundation and extending inside. Exposed piping also includes all piping embedded in concrete, as well as all piping that is permanently or intermittently submerged and/or installed in a subaqueous environment.

B. Reference Standards:

1. AWWA C600-10 Installation of Ductile-Iron Mains and Their Appurtenances

2. Section 312 of The New York City Plumbing Code.

1.05 DESCRIPTION

A. This scope of this Section includes the requirements for the testing of exposed piping, except where testing requirements for exposed piping are shown or specified elsewhere in the Contract Documents.

B. All exposed pipelines for which testing requirements are specified in this Section shall be watertight or airtight, including, but not limited to:

1. All exposed piping and appurtenances installed under Section 40 05 05 - Exposed Piping Installation.

2. All exposed piping and appurtenances installed under other Sections, but that specify testing under this Section.

C. Piping and structures which fail leakage tests shall be repaired or replaced at the Contractor's expense and to the satisfaction of the Engineer. These repaired piping and structures shall then be retested at the Contractor's expense until leakage test results meet the requirements specified herein.

1.06 QUALITY ASSURANCE

A. Not Used

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. Exposed piping testing submittals shall be submitted under the specification section number corresponding to the exposed piping material. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

a. Testing Procedures:

1) Submit proposed testing procedures, methods, apparatus, and sequencing.

2) Testing procedures shall be submitted for approval at least 30 ccd prior to the test.

b. Testing Report:

1) Prior to placing the piping system or structure in service, submit for review and approval a detailed bound report summarizing the leakage test data, describing the test procedure and showing the calculations on which the leakage test data is based.

2. Informational Submittals:

a. Certificate signed by manufacturer of each product certifying that product conforms to applicable referenced standards.

b. Results of each specified field quality control test.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

2.02 MATERIALS / EQUIPMENT

A. The Contractor shall provide all labor, equipment, air, water and materials, including meters, gauges, blower, pumps, compressors, hoses, fuel, water, bulkheads, temporary bracing and restraints, valves, plugs, and accessory equipment necessary and required to complete the testing as specified herein.

B. Testing medium:

1. The Contractor shall provide all air or gasses necessary or required for testing.

2. Unless otherwise specified, the existing facility shall provide all water required for testing.

a. The Contractor shall provide all means to convey the fluid into the piping being tested.

3. Refer to the Contract Drawings for availability of water to be used for testing.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Notification:

1. Provide the Engineer with written notice at least 14 ccd prior to the date of testing.

a. No tests shall be conducted without an approved written procedure.

b. The Engineer shall respond in writing to the Contractor within 7 ccd of receiving the written notification.

B. All leakage tests shall be conducted in the presence of the Engineer.

1. All leakage tests shall be conducted in the presence of local authorities having jurisdiction, if required.

C. Remove or protect devices and appurtenances that could be damaged by testing.

D. Concealed pipelines:

1. Test all pipelines prior to concealment.

3.02 IMPLEMENTATION

A. General:

1. Perform leakage testing for all exposed piping in accordance with the requirements of Section 40 06 01 - Schedule for Exposed Piping, except piping explicitly shown or specified as exempted from testing. For pipelines not listed in Section 40 06 01:

a. Test all pipelines not listed in Section 40 06 01 via a hydrostatic test with clean water.

b. Test vents and drains in plumbing systems and plumbing pipe lines in accordance with Section 312 of the New York City Plumbing Code, unless otherwise specified. Unless specified otherwise, test all vents and drains on process piping as for plumbing systems.

2. Operation of Existing Facilities:

a. Conduct all tests in a manner to minimize interference with operations of existing facilities or other contractors working on the site.

B. Hydrostatic Testing:

1. Application:

a. Exposed pipelines:

2. Test Procedure:

a. Maintain the testing medium at the specified pressure for a period of 4 hrs.

1) Unless otherwise specified, the testing medium shall be clean water.

2) Do not use air for hydrostatic testing of pipelines intended for liquid service – use compressed air (or gas) only for the hydrostatic testing of air (or gas) pipelines.

b. Test the piping as a whole or in sections.

1) The Contractor shall use valves or install temporary bulkheads at the ends of each section.

2) Remove temporary bulkheads at the conclusion of the hydrostatic testing.

c. Apply the specified hydrostatic test pressure to the piping through a tap in the pipe by means of a pump, compressor, or other approved method.

3. Test Pressures:

a. Test the pipeline at the pressure specified in Section 40 06 01 - Schedule for Exposed Piping.

b. If no test pressure is specified for a hydrostatic test, submit a test pressure of 1.5 times the maximum possible operating pressure of the pipeline, for approval by the Engineer

4. Leakage:

a. The allowable leakage shall not exceed the testing allowance given by the following formula from AWWA Standard C600:

$$L = \frac{S \cdot D \cdot \sqrt{P}}{148{,}000}$$

Where: L = testing allowance (makeup water) (gph).
S = length of pipe tested (ft).
D = nominal diameter of the pipe, (in.).
P = average test pressure during the hydrostatic test (psig).

5. Repair:

a. Replace broken pipe or joint assemblies found to leak.

b. When leakage occurs in excess of the specified amount, locate and repair defective valves, pipe, cleanouts or joints.

c. If defective portions cannot be located, remove and reconstruct as much of the original work as necessary to obtain piping that meets the leakage requirements specified herein and retest, all at no additional cost to the DEP.

C. Hydrostatic Testing of Valves:

1. Test Procedure:

a. Prior to the application of the test pressure, operate the valve(s) through the number of complete cycles of closing and opening recommended by the manufacturer.

b. Next, apply the test pressure to one side of the valve (i.e., the first side).

1) The valve shall be in the closed position.

2) Introduce the liquid testing medium to the first side only and apply the test pressure.

a) The other side of the valve(s) (i.e., the second side) shall be dry and unpressurized (0 psig).

3) Maintain the testing medium at the specified pressure for a period of 4 hrs.

c. Then, reverse the side to which the test pressure is applied.

1) The valve shall still be in the closed position.

2) Now apply the test medium and pressure to the other side of each valve (i.e., the second side).

3) The side tested first (i.e., the first side) shall now be unpressurized (0 psig).

4) Maintain the testing medium at the specified pressure again for a minimum period of 4 hrs.

d. Hydrostatic testing of valve(s) may be concurrent with hydrostatic testing of pipeline section(s) to the extent permissible by the testing requirements specified herein.

e. The Contractor shall be responsible for draining and disposing of the test medium in accordance with the requirements of the Contract Documents, as necessary and required to test both sides of each valve in this manner.

2. Test Pressure:

a. Hydrostatic test each valve such that the differential pressure across the valve at the same test pressure specified for the pipe in which the valve is installed.

3. Leakage:

a. Stop all external and internal leakage through the valves.

b. No leakage across the valve shall be acceptable.

4. Movement:

a. Stop all valve movement or structural distress.

b. No movement of the valve is acceptable.

SECTION 40 05 06 – COUPLINGS, ADAPTERS, AND SPECIALS FOR PROCESS PIPING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified, and required to furnish, install, and test all couplings, adapters, and specials in pipelines, complete and operational.

B. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. This Section includes requirements for providing couplings, adapters, and specials in accordance with applicable standards and regulations. In addition:

1. The scope of this Section shall include all buried and exposed process pipe.

2. The extent of process piping is shown on the Contract Drawings. Process pipe service, pipe diameter, pressure rating, joint type, and testing requirements are specified in the following section:

a. Section 40 06 01, Schedule for Exposed Piping.

1.06 QUALITY ASSURANCE

A. Qualifications of Manufacturers:

1. The manufacturer(s) shall have a minimum of five (5) years of experience in the design and fabrication of coupling, adapter, and specials of similar size, capacity, and type to those shown on the Contract Drawings and specified in the Contract Documents, and shall show evidence of at least five (5) substantially similar installations in satisfactory operation.

B. Supply and Compatibility:

1. Couplings, adapters, and specials shall be designed, fabricated, and installed in accordance with the latest standards referenced herein.

C. Regulatory Requirements:

1. Use only NSF61-approved materials in potable water lines.

2. Pipe couplings for making field joints between plain end, grooved end, and shouldered end pipe and fittings shall meet the requirements of ASME B31.1.

D. Quality Assurance Inspections

1. Quality Assurance inspections may be made by NYC DEP Bureau of Engineering Design and Construction, Quality Assurance Section or its representative at the manufacturer's facility.

2. Quality Assurance inspections shall be in accordance with the requirements of the Contract Documents.

3. The Contract shall give ample notice to the Engineer prior to the beginning of any fabrication, so that Quality Assurance inspection may be made.

4. Quality Assurance inspections shall include (but are not limited to) the following activities:

a. Obtain copies of Certified Materials Test Reports (both chemical and physical) and Manufacturer Certificates of Conformance.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition:

1. Action Submittals:

a. The Contractor shall submit the following Shop Drawings and material specifications for the approval of the Engineer:

1) Location of couplings, adapters, and specials in pipeline.

2) Catalog data showing dimensions, materials, and component parts of each type of coupling, adapter, or special.

3) Harnessing and restraints where required.

4) Associated pipeline materials.

5) Working and test pressures.

6) Additional product data sufficient to demonstrate compliance with the Contract Documents.

2. Information Submittals:

a. Manufacturer instructions for handling, storing, installing, and adjusting of products.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver equipment and materials provided under this Section in accordance with the requirements of the Contract Documents.

B. The Contractor shall store equipment and materials provided under this Section in accordance with the requirements of the Contract Documents.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Sleeve type couplings shall be as manufactured by:

1. For ductile iron pipelines:

a. ≤ 12-in.:

1) Style 138, as manufactured by Dresser Manufacturing, a Division of Dresser Industries, Bradford, PA.

2) 12" and smaller - Type 441, as manufactured by Smith-Blair Co., Texarkana, AR.

3) Or approved equal.

b. > 12-in.:

1) Style 38 , as manufactured by Dresser Manufacturing, a Division of Dresser Industries, Bradford, PA.

2) Larger than 12" - Type 411, as manufactured by Smith-Blair Co., Texarkana, AR.

3) Or approved equal.

2. For joining dissimilar piping materials:

a. Style 162, as manufactured by Dresser Manufacturing, a Division of Dresser Industries, Bradford, PA.

b. Type 441, as manufactured by Smith-Blair Co., Texarkana, AR.

c. Or approved equal

B. Groove and shoulder type couplings shall be as manufactured by:

1. For copper pipelines:

a. Grooved-type coupling:

1) Rigid Type:

a) Victaulic® Style 606, as manufactured by Victaulic Co., Easton, PA.

b) Or approved equal.

C. Groove and shoulder type full flow fittings shall be as manufactured by:

1. Victaulic Co., Easton, PA.

2. American Cast Iron Pipe Co., Birmingham, AL.

3. U.S. Pipe and Foundry Co., Bessemer, AL.

4. Or approved equal.

D. Flexible couplings:

1. Victaulic® Depend-O-Lok® EXE Type 1 or Type 2, as manufactured by Victaulic Co., Easton, PA.

2. Or approved equal.

E. Thread Lubricant:

1. G-N paste (Molykote), as manufactured by Dow-Corning Industries, Auburn MI.

2. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. General:

1. Coupling design and construction shall facilitate easy assembly in the field.

2. Flexible couplings shall be designed and constructed to ensure permanently tight joints under all conditions of expansion, contraction, shifting and settlement to which the pipelines may be subjected as a result of the operation and layout of the process system in which they are installed.

3. Rigid couplings shall be designed and constructed to provide a tight joint and prevent pipe movement at the joint.

B. Couplings shall be either one of the following three types:

1. Sleeve Type:

a. Sleeve type couplings shall be solid (axially un-split/unbolted) and have a middle ring or sleeve placed around the pipe joint.

b. The middle ring shall be sealed by two wedge-shaped gaskets evenly compressed by follower flanges or rings tightened by bolts and nuts.

2. Groove and Shoulder Type:

a. Groove and shoulder type couplings shall have a C-shaped (cross section) sealing gasket placed around the joint.

b. The gasket shall be enclosed in a split-type housing which shall engage shoulders or grooves in the pipe.

c. The housing shall be assembled by bolts and nuts.

3. Bolted Split Sleeve Type.

C. Sleeve Type Couplings:

1. General:

a. The maximum working pressure of the sleeve-type couplings shall be not less than:

1) For pipe sizes ≤ 54 in.: 250 psig.

2) For pipe sizes > 54 in. 200 psig.

2. For Ductile Iron Pipe Lines:

a. Materials of Construction:

1) For pipe sizes ≤ 12 in.: ductile iron or steel.

2) for pipe sizes > 12 in.: steel.

b. The middle ring or sleeve shall be steel, ASTM A513 or ASTM A635.

c. The middle ring or sleeve shall have flared or beveled ends.

d. The follower rings or flanges shall be of ductile iron, ASTM A536, or malleable iron, ASTM A47 (Grade 32510), for pipe sizes 12-in. and smaller, and shall be of steel ASTM A283/A283M (Grade A) for pipe larger than 12-in.

e. The middle ring shall not have a center pipe stop, unless otherwise specified, and shall have the same minimum dimensions as specified above for couplings for steel pipe.

3. Gaskets:

a. Gaskets shall be resilient, wedge-shaped gaskets with a maximum angle of 40° at the wedge end.

b. Gasket material shall be compatible with the type and temperature of the fluid in the pipeline, and shall be the material recommended

by the manufacturer for the service specified in Section 40 06 01, Schedule for Exposed Piping.

D. Groove and Shoulder Type Fittings:

1. For Copper Pipe:

a. Grooved end fittings shall be provided with rolled grooves and shall be designed for a working pressure not less than 300 psig.

E. Bolted Split-Sleeve Type Couplings:

1. General:

a. Bolted split sleeve type couplings shall consist of four (4) basic components: two-piece housing, gasket assembly, bolts and nuts with restraining end rings as required for pipe restraint.

b. The selected couplings shall be designed for the type, size and working pressure of the pipe with which they are to be used.

2. Materials and Construction:

a. For stainless steel pipe: Coupling housing shall be manufactured from Type 316 stainless steel.

b. For carbon steel pipe: Coupling housing shall be manufactured from carbon steel.

3. The split-sleeve coupling shall be constructed with a double arch cross section which closes around either:

a. pipe section ends that have been smoothed for expansion or contraction, or

b. pipe section ends with steel end rings affixed for restraining purposes.

4. The coupling shall confine an elastomeric gasket beneath the sleeve arches to create a radial seal as the coupling closes.

5. Elastomeric gasket materials shall have properties as designated by ASTM D2000 suitable for air service up to 240°F with intermittent exposure to 280°F.

6. Gasket sealing members shall consist of two O-ring gaskets and an elastomeric sealing pad bonded to an integral sealing plate. Internal pressure shall not be a requirement for fully completing the sealing function.

7. Restraining rings shall be furnished with the couplings and shall be of the same material as the coupling housing.

a. Restraining rings for fixed type couplings shall be shop welded to the piping by the piping fabricator.

b. The restraining rings shall be forwarded to the piping fabricator for shop mounting and welding in place.

c. The coupling manufacturer's recommendation for size and amount of welding required for properly attaching the restraining rings shall be followed without exception.

8. When deflection is required at a pipe joint, a flexible coupling shall be provided.

a. Minimum deflection for basic, lighter duty split sleeve (non-shouldered) design (e.g., Victaulic® Depend-O-Lok® Type 1) couplings shall be as specified in Table 40 05 06-3:

TABLE 40 05 06-3
MINIMUM DEFLECTION FOR BASIC, NON-SHOULDERED SPLIT SLEEVE COUPLINGS

Nominal Pipe Diameter: (in.)	**Minimum Deflection: (deg.)**
8 - 14	4.50
16-24	4.00
30 and 36	3.00
42 - 54	2.00
60	1.75
66 and 72	1.50
≥ 84	1.00

b. Maximum deflection for heavier duty (shouldered) design (e.g., Victaulic® Depend-O-Lok® Type 2) couplings shall be as recommended by the manufacturer.

c. Coupling width shall not be less than 10-in. for pipe sizes 8-in. through 84-in., and not less than 12-in. for larger size pipe.

d. Minimum wall thickness of couplings shall be computed by the following formula:

$$t = \frac{P \cdot d}{2s}$$

Where: P = Design pressure in psig.
d = Pipe O.D. in in..
s = 18,000 psig design stress.

9. Bolts, nuts and miscellaneous hardware shall be furnished by the coupling manufacturer and shall be Type 316 stainless steel conforming to ASTM A276 and having a minimum tensile strength of 85,000 psig.

F. Bolts and Nuts:

1. Bolts:

a. Bolts shall be Type 316 stainless steel, ASTM A 193/A 193M, Grade B8, Class 2.

b. Bolts shall have American Screw Threads, Coarse Thread Series, ASME B1.1.

c. For all sleeve-type couplings, bolts shall be double radius head or buttonhead track type. The collars under the heads shall fit oval or square holes in the follower rings.

d. For all groove-and shoulder-type couplings, bolts shall be track type oval neck bolts. The collars under the heads shall engage the oval slots in the housing.

2. Nuts:

a. Nuts shall be Type 316 stainless steel conforming to ASTM A194/A194M.

b. Nuts shall be American Standard Heavy Dimension Series, ASME B18.2.2.

G. All flexible couplings shall be harnessed.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Inspection:

1. The Contractor shall not install damaged items until repairs are made in accordance with manufacturer's written instructions and approval by Engineer.

a. All damaged items requiring remedial work shall be returned to the manufacturer for repair or replacement.

B. Preparation:

1. Ends of pipe, fittings and couplings shall be cleaned of all scale, dirt and thick outside coatings.

2. Before assembly, the ends of pipe and/or fittings and the outside of the coupling gasket shall be lubricated as recommended by the manufacturer.

3. Fasteners shall be assembled using a thread lubricant.

3.02 INSTALLATION

A. Install couplings, adapters, and specials for process piping in complete accordance with the manufacturer's printed installation instructions and the approved shop drawings. In addition:

1. Couplings shall be assembled by tightening diametrically opposite bolts evenly and progressively.

a. Bolts on sleeve-type couplings shall not be tightened beyond the point of stretching (when the mill scale on the shank begins flaking off).

b. Bolts on groove- and shoulder-type couplings shall be tightened only until there is metal to metal contact between housing segments and the pipe.

B. Field Assembly of Groove-type Couplings:

1. Field grooving of pipe shall not be done unless approved by the Engineer, and then shall be limited to steel pipe 24-in. or under nominal diameter and to ductile and cast iron pipe 12-in. or under nominal diameter.

2. Field grooving shall be done only with special tools provided by the coupling manufacturer.

C. Harness for Sleeve-type Couplings:

1. In all pipelines under pressure, and elsewhere where shown, specified or required, sleeve-type couplings shall be harnessed.

a. On all pressurized steel pipe, cast steel "crow-foot" lugs shall be welded on diametrically opposite sides of the pipe, and the joint shall be harnessed with stainless steel tie-bolts and nuts.

1) The dimensions, sizes, spacing and materials for lugs, tie-bolts and nuts shall be based on the use of a minimum of two bolts and four lugs per joint, in conformity with Section 13 (Table 13.4) of AWWA Manual M11 or the standard specifications of the coupling manufacturer for the pipe size, wall thickness and test pressure specified.

2) Welding shall conform to the requirements specified under Section 40 05 22 - Steel and Stainless Steel Pipe.

b. On all pressurized ductile iron pipe, couplings shall be harnessed with stainless steel tie bolts and nuts connected to flanges or fittings installed on the pipe on each side of the coupling as shown, specified or required for the pipe sizes and specified test pressures.

1) The harnessed length from flange to flange shall not exceed 3 ft.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

SECTION 40 05 07 – HANGERS AND SUPPORTS FOR PROCESS PIPING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified, and required to furnish, install, and test all hangers, supporting devices, and appurtenances shown, specified or required for process pipes, fittings, valves, and other in-line equipment, complete and operational, excluding the supports and hangers for double containment piping within trench boxes.

1.05 DESCRIPTION

A. This Section includes requirements for providing hangers and supports for process piping in accordance with applicable standards and regulations.

1. Included are rod hangers; clevis hangers, spring hangers; stanchion, roller and pipe pole supports and saddle stands; supports of structural steel; concrete saddles, concrete anchor blocks and bases, and all necessary

guides, restraints, fastening devices, anchor bolts, pipe anchors and appurtenances.

2. The Contractor shall provide all temporary pipe supports required during construction.

3. The Contractor shall provide hangers and supports of sufficient strength to maintain the pipelines and appurtenances in proper position and alignment under the maximum combination of peak loading conditions to include pipe weight, process fluid/gas weight, process fluid/gas movement and pressure forces, thermal expansion and contraction, vibrations, seismic forces, and all probable externally applied forces for all operating conditions.

4. The Contractor may retain the services of a pipe support designer for providing the design of all piping hangers and support systems in accordance with the requirements of this Section, unless otherwise shown or specified.

5. Stressors in hangers, rods and brackets shall be in accordance with Table 2 of MSS-SP-58.

1.06 QUALITY ASSURANCE

A. Qualifications of Manufacturer and Pipe Support Designer:

1. Pipe hangers, supports, and appurtenances shall be standard products of the manufacturer specified herein.

2. Each type of hanger and support shall be the product of a single manufacturer.

3. The pipe support designer, if retained by the Contractor, shall have a minimum of five (5) years of experience in the design of pipe supports and shall show evidence of having completed at least five (5) substantially similar, successful pipe support projects of equal complexity as the systems specified.

a. The pipe support designer shall be a New York State Registered Professional Engineer.

B. Supply and Compatibility:

1. All hangers and supports for process piping included in this section shall be provided by the Contractor through a single, qualified ductile iron process pipe manufacturer.

2. The pipe and fittings shall be designed, fabricated, and installed in accordance with standards referenced herein.

C. Regulatory Requirements:

1. All hangers and supports shall conform to the applicable requirements of ASME B31.1, MSS SP-58, SP-59, SP-69 and SP-90, except as modified herein, and be of standard manufacture wherever possible, and best suited for the service required.

2. Unless otherwise approved, all hangers, supports and concrete inserts shall be listed with Underwriters' Laboratory, Inc.

D. Quality Assurance Inspections

1. Quality Assurance inspections may be made by NYC DEP Bureau of Engineering Design and Construction, Quality Assurance Section or its representative at the manufacturer's facility.

2. Quality Assurance inspections shall be in accordance with the requirements of the Contract Documents.

3. The Contract shall give ample notice to the Engineer prior to the beginning of any fabrication, so that Quality Assurance inspection may be made.

4. Quality Assurance inspections shall include (but are not limited to) the following activities:

a. Obtain copies of Certified Materials Test Reports (both chemical and physical) and Manufacturer Certificates of Conformance.

b. Perform visual inspection of welding, as per applicable welding code.

c. Perform visual and dimensional inspection of completed work.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

a. Shop Drawings shall include, but not be limited to:

1) Detailed drawings showing all hangers and supports for each piping system. Drawings shall show:

a) Location, installation, material, loads, forces, stresses and deflections of all hangers and supports.

b) Reaction forces imparted to structures to which hangers and supports are attached shall be shown.

c) Contractor shall provide detailed drawings of each pipe support. Each drawing shall contain enough information to verify the pipe support design and to allow the manufacture of the device. At a minimum, the Contractor shall submit:

(1) Scaled details of the device with dimensions.

(2) A table of applied forces and moments.

(3) A complete bill of materials.

(4) An isometric showing the applied forces and moments.

(5) Detailed connections to existing structure.

(6) Shop and field welds.

2) Manufacturer's catalogs and engineering data on all hangers and supports.

3) Load ratings.

4) Materials.

5) Installation details.

b. Submit the name and qualifications of the support and hanger engineer.

c. All drawings and design calculations included in the shop drawings shall be signed and sealed by a New York State Registered Professional Engineer.

d. Pipe support design shall include detailed load and movement calculations:

1) In the design of hangers, supports and anchors, unless otherwise shown or specified, pipe pressures shall be the maximum test pressures specified for pipelines carrying gases and twice the maximum test pressures specified for pipelines carrying liquids.

2) The following loads shall be included in pipe support design and pipe stress analysis:

3) The gravity force, including the weight of the pipeline plus the weight of any appurtenances, contents, insulation, etc.

4) The thermal expansion force developed by the restraint of free end displacement of the piping.

5) Hydrostatic forces developed by internal pressure during operation of the piping system.

6) Loading due to expansion joint reaction forces.

7) Seismic forces, as required by the latest edition of the New York City Building Code.

8) Occasional load calculations and pipe stress analysis shall be provided where required by the Contract Documents, Building Codes, or Standards referenced herein. Occasional loads include:

a) Seismic forces.

b) Pressure waves produced by sudden changes in fluid momentum, commonly referred to as water hammer.

c) Wind, snow or ice loads.

d) Safety valve thrust loads.

e. Calculated forces shall be included in the pertinent shop drawings as called for by the submittal requirements specified herein.

2. Information Submittals:

a. Qualifications Statements:

1) Installer's Qualifications.

B. Each submittal package for pipe hangers and supports shall have the stamp of a New York State Registered Professional Engineer experienced in pipe support design.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver equipment and materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. Hanger inserts which are to be embedded in low carbon cast-in-place concrete shall be delivered in ample time not to delay the Work.

B. The Contractor shall store equipment and materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. Hangers and supports shall be protected from condensation, corrosion, and deterioration.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer’s standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Standard pipe supports and components shall conform to the requirements of MSS SP-69 and MSS SP-58, as manufactured by:

1. B-Line

2. Carpenter & Patterson

3. Grinnell

4. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. General:

1. The Contractor shall provide hangers and supports for all process piping and associated appurtenances, including, but not limited to valves, fittings, and specials, as follows:

a. Where shown on the Contract Drawings: Provide hangers and supports as shown and as specified herein.

b. Where not shown on the Contract Drawings: Provide hangers and supports in compliance with MSS SP-58 Table 2, and the requirements specified herein.

2. All hangers and supports shall allow minimum 3-in. of vertical adjustment.

B. Types:

1. Hangers for Single Pipes:

a. Single pipes shall be supported by hangers suspended by rods from structural steel members, inserts in concrete ceilings and beams, bottom of trapeze hangers and wall mounted steel angle brackets. The strength of the rod shall be based on its root diameter.

b. Except for piping subject to thermal expansion and contraction or as otherwise shown or specified, pipe hangers shall be adjustable clevis type MSS SP-58 Type-1.

c. Piping subject to thermal expansion and contraction shall be supported on rollers.

2. Hangers or Supports for Multiple Pipes:

a. Multiple pipes, running parallel in the same horizontal plane, and adjacent to each other, shall be suspended by trapeze type hangers or supported on wall brackets. Trapeze hangers shall consist of channel sections supported from threaded rods or attached to concrete walls, columns or structural steel support members.

b. Except as otherwise specified herein, pipe anchors used for attaching pipe to trapeze or multiple pipe wall brackets, shall be anchor or pipe chairs as required.

3. Supports for Single Pipe:

a. Single pipes located in a horizontal plane close to the floor shall be supported by one of the methods specified herein or as shown on the Contract Drawings.

b. Pipes shall be supported by adjustable stanchions, pipe saddle or roll supports with "U" bolts. Stanchions shall provide at least 4-inches adjustment and be flanged-mounted to floor.

c. Stanchions and saddle stands shall be of Type 316L stainless steel.

d. Pipe pole supports for pipe runs above ground, out-of-doors, and where otherwise required, shall consist of a suitable length of stainless steel pipe set upright in at least four feet of concrete; two stainless steel angles secured to the top of the pipe, at right angle and on each side; a stainless steel plate welded to the top of the angles to serve as a horizontal support for the pipes. Supports shall be provided with attachments in the form of stands, clamps, rolls, rods or similar devices of the screw adjustable type in the vertical direction.

e. Where specified or shown, column supports of built-up welded stainless steel shall be provided, as approved by the Engineer.

f. Pipe rollers shall be cast ductile iron, unless otherwise shown or specified. Hardware and appurtenances shall be stainless steel.

4. Wall Supported Pipes:

a. Single or multiple pipes located adjacent to walls, columns or other structural members, and an excessive distance from ceilings or underside of beams, shall be supported using stainless steel wall brackets, MSS SP-58 Type 32 or 33.

b. Where pipes rest on top of bracket pipe supports, pipe anchors used for attaching pipe to trapeze or multiple pipe wall brackets shall be anchor or pipe chairs as required

5. Supports for Base Elbows:

a. Where pipes change direction from horizontal to vertical through a bend, a welded or cast base anchor support shall be installed at the bend to carry the load.

6. Supports for Vertical Pipes:

a. Pipe riser clamps shall be used to support all vertical pipes extending through floor slabs.

b. Riser clamps shall be MSS SP-58 Type 42 or 8.

c. Insulation shall be removed from insulated pipes prior to installing riser clamps.

7. Supports for Pipelines with Thermal Expansion:

a. Pipe rolls for single rod hangers: Stainless steel frame construction, ductile iron roller and stainless steel roller rod provided with threaded nuts; vertical adjustment permitted; for pipe sizes 6 in. or less unless otherwise approved.

b. Pipe rolls for double rod hangers: Ductile iron roller, stainless steel roller rod, malleable iron threaded sockets which permit vertical adjustment.

8. Supports for Pipelines Subject to Temperatures Greater than 300°F:

a. Spring hangers of heavy stainless steel construction.

9. Supports for Thermoplastic Pipes:

a. All thermoplastic pipe attachments shall have a continuous bearing cradle or saddle on the lower 120° of pipe circumference and a minimum length of one quarter pipe diameter, but not less than 6-in. nor more than 12-in.

10. Supports for Copper & Brass Pipes:

a. All copper and brass pipe supports shall be specifically manufactured for use with copper and brass pipe.

b. Hangers shall be provided with a copper finish.

11. Concrete Supports:

a. Where pipeline or mechanical equipment is shown, specified or required to be supported on concrete supports, supports shall be as specified herein.

b. Concrete supports for equipment shall be of a size and mass that will resist all forces, both static and dynamic, which may be developed by the equipment.

c. Concrete supports for pipe, fittings, valves and appurtenances shall be designed to carry the weight of the pipeline and appurtenances.

1) Cradles and anchor blocks shall safely withstand all stresses imposed by the pipelines, under all operating conditions.

2) Concrete cradles shall be shaped to fit the contour of the pipe.

d. Concrete supports shall be anchored to the floor of main structures by doweling or other approved means.

1) Anchor bolts, extension plates, saddle yokes and other hold-down devices in concrete bases shall be placed before pouring of concrete.

2) Expansion bolts shall not be used on new concrete supports except with the specific approval of the Engineer.

e. Concrete supports shall be not less than Class 25 as specified in Section 03 30 00, Cast-in-Place Concrete.

12. Protection Saddles for Insulated Pipe:

a. Contractor shall furnish steel protection saddles on all supports for insulated pipe.

b. For insulated pipes < 12-in. nominal diameter:

1) Provide saddles of No. 14 U.S. gauge stainless steel curved 180° for use with roller hangers or structural trapeze hangers.

2) Provide saddles of No. 16 U.S. gauge stainless steel curved 120° for use in clevis hangers.

3) Saddles shall be at least 12-in. long.

4) Saddle gripping side edges shall be turned up at least to the thickness of insulation.

c. For insulated pipe ≥ 12-in. nominal diameter:

1) Provide saddles of No. 12 U.S. gauge stainless steel with a welded centerplate to provide three-edge support.

2) Saddles shall:

a) Be at least as long as the pipe diameter.

b) Provide 120 degree coverage.

c) Have edge and centerplate depths equal to the insulation thickness.

C. Materials:

1. Hangers and supports shall conform to ASME B31.1 and be compatible with the chemicals contained in the supported pipe.

2. Structural steel shall conform to ASTM A36 and ASTM A283.

3. Iron castings shall conform to ASTM A48 (Class No. 35).

4. Stainless steel shall conform to ASTM A 276:

a. Use type 316 stainless steel for non-welded items.

b. Use type 316L stainless steel for welded or fabricated items.

c. Tensile Strength: 70,000 psi, minimum.

d. Yield Strength: 25,000 psi minimum.

e. Elongation in 2-in.: 35%.

f. Reduction of area: 45%.

g. For stainless steel pipe and tube: Use type 316L stainless steel conforming to the requirements of ASTM A778.

5. Rollers:

a. Rollers, including stands and bases, shall be of cast iron, hot-dipped galvanized conforming to ASTM A123.

6. Expansion anchors for use in existing concrete structure:

a. Material shall be Type 316 stainless steel.

7. Hanger Rods:

a. Material shall be Type 316 stainless steel.

b. Maximum allowable working stress shall be 5,800 psi, calculated based on the root diameter.

c. Rods shall have a square head nut on top and running thread on bottom end.

8. Supports:

a. Material shall be Type 316 stainless steel.

9. Appurtenances:

a. Brackets, guides, restraints, rods, bolts, nuts and anchors shall be Type 316 stainless steel unless otherwise specified.

b. Concrete inserts shall be of malleable iron with galvanized finish.

D. Sizing:

1. Size single and double rods based on the nominal pipe diameter in accordance with the Table 40 05 07-1.

a. Hanger loads shall be calculated based on the weight of pipe filled with water plus 50 psf of dead load.

TABLE 40 05 07-1
MINIMUM PERMISSIBLE HANGER ROD DIAMETER FOR NOMINAL PIPE SIZES

Pipe Size (in.)	Single Rod (in.)	Double Rod (in.)	Max. Load per Hanger (lbs.)
¾ to 1½	⅜	⅜	300
2	⅜	⅜	325
2½	½	⅜	350
3	½	⅜	400
3½	½	⅜	450
4	⅝	½	850
5	⅝	½	950
6	¾	⅝	1,075
8	*⅞	⅝	1,350
10	*⅞	⅝	1,750
12	*⅞	¾	2,200
14	*1	⅞	2,500

* To be used subject to the Engineer's specific approval

E. Concrete Inserts, Attachment Plates, and Clamps:

1. Hanger Rods:

a. Hanger rods up to ⅞-in. diameter: Shall be attached to new concrete structures using concrete inserts of Type 18 in MSS SP-58.

1) Inserts shall be malleable iron with galvanized finish.

a) The use of steel inserts is prohibited.

2) Design of the inserts shall permit the rods to be adjusted laterally in one plane and to lock the rod nut or head to the body.

3) The inserts shall be provided with openings or recesses to receive reinforcing rods.

4) To facilitate installation, slots shall be provided in the exposed flanges of the insert.

5) Inserts shall be rated to safely carry the maximum load which can be supported by the hanger rod.

b. Hanger rods larger than ⅞-in. diameter: Shall be attached to new concrete by means of approved hook anchors as shown on the Contract Drawings.

c. All hanger rods shall be attached to existing concrete structures using stainless steel expansion anchors as specified in Section 05 50 00 - Metal Fabrications.

2. Steel beam clamps:

a. Shall be malleable iron.

b. For wide flange or I-beams: conform to MSS SP-58 Type 28 or Type 29.

c. For channel sections or where it is necessary to locate the hanger rod off the beam centerline: conform to MSS SP-58 Type 20.

3. Steel U-shape beam attachments welded to the underside of beams and welded steel brackets fastened to structural steel columns:

a. Shall be subject to specific approval of the Structural Steel and Pipe Supports Shop Drawings.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Galvanizing:

1. Conform to the requirements of Section 05 05 13.10, Galvanizing, except as follows:

a. Malleable iron and concrete inserts shall be galvanized in conformance with the manufacturer's specifications.

B. Painting:

1. Conform to the requirements of Section 09 91 00, Painting.

C. Surfaces Protection:

1. Surfaces of hangers and supports in contact with aluminum, brass, plastic and copper pipelines or pipeline equipment shall be protected with an approved plastic coating to prevent abrasion.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. The City may elect to conduct shop inspections. The inspections may include but not be limited to: mechanical and chemical testing, material sampling, material certifications, traceability of parts, blasting and painting, visual and dimensional inspection, and free iron contamination check on stainless steel parts.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. The Contractor shall coordinate the Work such that all process piping hangers, supports, and restraining systems shall be installed and secured prior to the testing or activation of the process pipeline on which they are installed.

3.02 INSTALLATION

A. Design:

1. Types of hangers and supports shall be kept to a minimum.

2. Wherever possible, pipe supports shall be designed using manufacturer's standard catalog products.

3. Hangers and supports shall be located to prevent vibration or swaying and to provide for expansion and contraction.

4. Hanger and support units installation methods shall be in accordance with manufacturer's recommendations.

5. Hangers and Supports for piping systems subject to thermal expansion and contraction, or to similar movements imposed by other sources, shall be designed to provide flexibility, and pipe stress analysis shall be provided.

a. Hangers and supports shall provide for expansion and contraction throughout the full operating temperature range.

6. Where resonance with imposed vibration and/or shock occurs during operation, suitable dampeners, restraints, anchors, etc., shall be added to remove those effects.

7. Hangers' rods shall be straight and vertical. Chain, wire, strap or perforated bar hangers shall not be used. Hangers shall not be suspended from piping.

8. Contact between dissimilar metals shall be prevented by use of copper plated, rubber or vinyl coated hangers or supports.

B. Hangers and Supports Embedded in Concrete:

1. Concrete embedded items shall be installed before concrete placement.

2. Embedded items shall be fastened securely to prevent movement during concrete placement.

3. Hangers and supports shall be adjusted and grout placed as specified in Section 03 60 00, Grouting, to bring pipelines to specified elevations.

C. Supports and Hangers for Horizontal Pipes:

1. Supports and hangers for all piping shall be placed no farther apart than shown below, unless otherwise shown or specified:

a. For thermoplastic pipe, based on the following nominal pipe diameters:

1) ≤ 1-in. dia.: 2 ft-6 in. center to center.

2) 1½-in. to 3-in. dia.: 4 ft-0 in. center to center.

3) 4-in. to 8-in. dia.: 6 ft-0 in. center to center.

4) > 8-in. dia.: 8 ft-0 in. center to center.

b. Tubing less than 1-inch diameter: In accordance with best piping practice and ASME B31.1, and as approved by the Engineer.

2. Hangers, supports, and accessories shall be located within maximum span lengths specified to support continuous pipeline runs unaffected by concentrated loadings.

3. Where hanger or support spacing does not correspond with joist or rib spacing, structural steel channels shall be attached to joists or ribs, and the pipes suspended therefrom.

D. Supports for Vertical Piping:

1. Spacing:

a. Vertical piping shall be supported at each floor and between floors by stays or braces to prevent rattling and vibration. Maximum spacing shall not exceed 25 ft.

2. Riser Clamps:

a. Riser clamp shall be placed under hub, fitting or coupling with approved solid bearing on steel sleeve.

b. Where riser clamps are used with plastic piping they shall be modified so as not to exert any compressive forces on the pipe.

3. Base elbows or welded equivalent shall be provided at vertical piping bases.

4. Top support shall have a horizontal connection, and provide for pipe expansion.

E. Pipelines installed under plumbing work shall be spaced in conformity with the requirements of the New York City Building Code or as specified herein.

F. Additional Supports:

1. In addition to any and all requirements for the placement of supports specified herein, the Contractor shall provide additional supports as follows:

a. Additional supports shall be placed immediately adjacent to any change in piping direction, at equipment, and on both sides of valves, expansion joints and couplings.

b. Suspended or supported ductile iron pipe shall have a hanger or support adjacent to each hub or flanged end.

c. Except where otherwise shown or required, horizontally valves 6-inches and larger shall be supported on each side of the valve, by pipe hangers or supports.

d. At all flexible couplings, supports shall be placed on each side and as close to the coupling as possible. Supports shall be the guide type which prevent axial movement from resulting in pipe deflection and misalignment.

e. Supports, anchorage and guidance for grooved end pipe shall be in accordance with the applicable sections of these specifications and the recommendations of the manufacturer.

G. Anchors and Sway Braces:

1. Anchors and sway braces shall be provided when required to hold the pipelines and equipment in position or alignment. Pipe anchors and braces for rigid fastening to the structures shall be attached to stainless steel anchor plates and anchor bolts set into the forms when placing concrete of new structures. Brackets and braces shall be attached to existing concrete structures with through bolts or expansion anchors.

2. Anchors, guides and restraints shall be provided for the proper operation of pipeline expansion joints.

3. All pipe anchors, guides and restraints shall be designed to conform to ASME B31.1.

H. Expansion Joints and Flexible Couplings:

1. Supports, guides and anchors for flexible couplings and expansion joints shall be in accordance with the coupling and joint manufacturer's specification and the standards of the Expansion Joints Manufacturers Association.

I. Protection Saddles for Insulated Pipe:

1. Before placing the saddles, saddles shall be filled with either insulating cement or high density insulation cut to fit. For vapor barrier insulation, the barrier must be maintained; contact between hanger and support and bare pipe will not be permitted.

J. Adjustability:

1. Hangers and supports shall be capable of adjustment after placement of piping.

2. All points of adjustment for pipe and duct hanger rods shall be locked securely in place using double-nutting. Double-nutting means two nuts torqued directly against each other under each point of adjustment in addition to a third nut on top of the bracket. Damaging threads or tack welding as a method of locking adjustment is not permitted.

3. All threaded assemblies shall be double nutted or provided with pinned nuts. Alternately, tack welding of bolted assemblies may be acceptable unless provisions for vertical adjustment is required.

K. Any required pipe supports, for which the supports called for in this Section are not applicable, shall be fabricated or constructed from standard stainless steel shapes, concrete and anchor hardware, and shall be subject to the approval of Engineer.

3.03 FIELD TESTING / QUALITY CONTROL

A. Each pipe support system shall be tested in conjunction with the respective piping pressure tests.

1. Tests shall include cycling the piping system to duplicate operating conditions.

2. If any part of the pipe support system proves to be defective or inadequate, as evidenced by vibration or excessive movement, it shall be repaired or augmented at no additional cost to the City.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Touch-up shall be provided in the field, as required. Coating touchup shall be applied in accordance with the manufacturer's recommendations, and shall be free from spots and brush marks, to the satisfaction of the Engineer.

END OF SECTION

SECTION 40 05 19 – DUCTILE IRON PROCESS PIPE
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified, and required to furnish, install, and test all ductile iron process pipe complete and operational.

B. The following index of this Section is presented for convenience:

C. Schedules:

1. Refer to the following Section(s) for additional information on the piping that is to be constructed using the pipe materials and methods specified herein:

   a. Section 33 06 01 - Schedule for Buried Piping.

   b. Section 40 06 01 - Schedule for Exposed Piping.

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 09 91 00 – Painting.

B. Section 22 07 19 - Plumbing Piping Insulation.

1.05 DESCRIPTION

A. This Section includes requirements for providing ductile iron process pipe and accessories in accordance with applicable standards and regulations. In addition:

1. The scope of this Section shall include all ductile iron process pipe, fittings, and specials.

2. The extent of ductile iron process piping is shown on the Contract Drawings. Ductile iron process pipe service, pipe diameter, coating, lining, pressure rating, joint type, and testing requirements are specified in the following section(s):

a. Section 33 06 01 - Schedule for Buried Piping.

b. Section 40 06 01 - Schedule for Exposed Piping.

3. Ductile iron process pipe, fittings, appurtenances, and specials shall be furnished and installed complete with all necessary jointing materials, wall castings, wall sleeves, specials, adapters, and other appurtenances as shown on the Contract Drawings, as specified herein, and/or as necessary and required for a complete installation.

a. Couplings for ductile iron process pipe shall be provided as specified in Section 40 05 06 - Couplings, Adapters, and Specials for Process piping.

b. Hangers and support for ductile iron process pipe shall be provided as specified in Section 40 05 07 - Hangers and Supports for Process Piping.

4. Where shown on the Contract Drawings, the Contractor shall provide all labor and materials for making connections between ductile iron process pipe and existing lines(s) installed under other contracts, including all specials required to connect ductile iron process pipe to pipe of dissimilar material(s).

5. The scope of this Section shall include all painting, coating, lining, gaskets, harnesses, bolts, nuts, and other appurtenances and material required to provide and assemble the lines.

1.06 QUALITY ASSURANCE

A. Qualifications of Manufacturer:

1. The manufacturer shall have a minimum of five (5) years of experience in the design and fabrication of ductile iron process pipe, fittings,

appurtenances, and specials of similar size, capacity, and type to those shown on the Contract Drawings and specified in the Contract Documents, and shall show evidence of at least five (5) substantially similar installations in satisfactory operation.

2. Linings and coatings:

   a. Lining and coating manufacturer shall have a minimum of five (5) years of experience in protecting pipelines exposed to the service conditions specified in the Contract documents, and shall show evidence of at least five (5) substantially similar installations in satisfactory operation.

3. When linings and coatings are not applied by the manufacturer, the lining and coating Subcontractor shall have a minimum of five (5) years of experience in the application of the specified linings and coatings for the specified service, and shall show evidence of at least five (5) substantially similar installations.

B. Quality Assurance Inspections

1. Quality Assurance inspections may be made by NYC DEP Bureau of Engineering Design and Construction, Quality Assurance Section or its representative at the manufacturer's facility.

2. Quality Assurance inspections shall be in accordance with the requirements of the Contract Documents.

3. The Contract shall give ample notice to the Engineer prior to the beginning of any fabrication, so that Quality Assurance inspection may be made.

4. Quality Assurance inspections shall include (but are not limited to) the following activities:

   a. Obtain copies of Certified Materials Test Reports (both chemical and physical) and Manufacturer Certificates of Conformance.

   b. Perform visual and dimensional inspection of completed work.

C. Supply and Compatibility:

1. All ductile iron process pipe, fittings, appurtenances, and specials included in this Section shall be provided by the Contractor through a single, qualified ductile iron process pipe manufacturer.

2. The pipe and fittings shall be designed, fabricated, and installed in accordance with standards referenced herein.

3. The Contractor shall bear responsibility for the quality of all factory-applied linings and coatings, regardless of the location of application.

4. The Contractor shall verify compatibility between the ductile iron process pipe, fittings, appurtenances, specials, and other Work.

D. Regulatory Requirements:

1. Ductile iron process pipe shall conform to the American National Standards Institute (ANSI) and American Water Works Association (AWWA) Standards specified herein and recommendations as given in the Ductile Iron Pipe Research Association (DIPRA) "Handbook of Ductile Iron Pipe."
2. Ductile iron pipe for City water shall conform to the rules and regulations of the Bureau of Water Supply; requirements contrary to such rules and regulations specified herein shall be disregarded.

1.07 SUBMITTALS

A. Submittals for all ductile iron process pipe shall comply with the requirements of Section 33 05 05 - Buried Piping Installation, and Section 40 05 05 - Exposed Piping Installation.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. Pipes shall be loaded on properly padded saddles not less than 6-in. in width so that they do not bear against each other.
2. The whole load shall be securely fastened together as well as to any vehicle to prevent movement in transit.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. Special care in handling shall be exercised during delivery, storage and handling of pipe to avoid damage and setting up stresses. Pipe and specials stored prior to use shall be stored in such a manner as to keep the interior free from dirt and foreign matter.
2. The Contractor shall maintain the circular shape of the pipe and prevent distortion. Each length of pipe shall be temporarily braced with an approved type of internal spider in each end of the pipe during erection.
3. Handling Coated Pipe:
   a. Coated pipe shall be protected at all times and handled with equipment designed to prevent damage to the coating, such as stout wide canvas slings and wide padded skids.
      1) The use of bare chains, cables, hooks, metal bars or narrow skids in contact with the coating will not be permitted.
   b. All pipe handling and hauling equipment shall meet the approval of the Engineer before use.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Ductile iron process pipe and fittings shall be as manufactured by the following:

1. American Cast Iron Pipe Co., Birmingham, AL;
2. McWane Inc., Birmingham, AL;
3. U.S. Pipe and Foundry Co., Birmingham, AL;
4. Or approved equal.

B. Ceramic Epoxy Lining:

1. Protecto 401, as manufactured by Induron Protective Coatings, Birmingham, AL.
2. Or approved equal.

C. Expansion Joints:

1. Series 500, as manufactured by Mercer Rubber Company, Hauppauge, NY;
2. Or approved equal.

D. Flanged Adapters:

1. McWane Inc., Birmingham, AL;
2. Smith-Blair, Inc., Texarkana, AR;
3. Victaulic Co., Easton, PA;
4. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Pipe shall be in accordance with AWWA C151 for push-on or mechanical joint pipe and AWWA C115 for flanged pipe and shall be of grade 60-42-10 ductile iron. The above standards cover ductile iron pipe with nominal pipe sizes from 3-in. up to and including 64-in. in diameter. Working pressure for the pipe shall be as called for in these Standards.

B. Pipe:

1. All pipe, including flanged pipe, for sizes up to and including 12-in. shall have a wall thickness equal to Special Thickness Class 56 as specified in AWWA C151.

2. All pipe, including flanged pipe, for sizes over 12-in. and up to 54-in. shall have a wall thickness equal to Special Thickness Class 54 as specified in AWWA C151.

3. All pipe sizes 60-in. and 64-in. shall have a wall thickness equal to pressure class 350.

C. Fittings:

1. Fittings shall be ductile iron and shall be in accordance with AWWA C110. Any other fittings, not included in AWWA C110, shall conform in design and performance to the requirements of this Standard.

2. Blind, filler, companion and reducing flanges shall conform to ANSI/ASME B16.1.

3. Where compact fittings are shown or indicated, items shall be in accordance with AWWA C153.

D. Flanged Joints:

1. Threaded Flanges: Shall be solid, threaded, ductile-iron, flanges meeting the requirements of AWWA C115. Threaded flanges and pipe shall be assembled and faced by the pipe manufacturer; field or shop assembly will not be accepted. Threaded flanges shall be screwed on tight without overstressing the threads and, when properly assembled, shall be concentric with the pipe.

2. The dimensions of all flanges for pipe fittings and specials and the number and sizes of bolts, up to and including 54-in., shall be in accordance with ANSI B16.1, Class 125 standard flanges.

3. For pipe larger than 54-in., flanged pipe shall have ANSI Class 125 flanges integrally cast solid and at right angles to the pipe axis, and accurately faced and drilled smooth and true. Flange bolt holes shall be backfaced or spot-faced as required by ANSI specifications.

4. Flanges shall be tapped where tap or stud bolts are required.

5. Bolts: Bolts shall be in accordance with Appendix A of AWWA C115 and as follows: Flanged joints shall be made with bolts or stud-bolts with a nut on each end. Bolts, stud-bolts and nuts shall be ANSI heavy dimension, semi-finish, with square heads and cold-punched hexagonal nuts. For bolts 1¾-in. in diameter and larger, stud-bolts shall be used. Bolt size shall be American Standard for ANSI Class 125 flanges. Where flanged joints are in manholes or submerged in tanks, bolts, stud-bolts, and nuts shall be silicon bronze, ASTM B98, Alloy A, of dimensions and sizes equal to steel bolts, stud-bolts, and nuts specified in Appendix A of AWWA C115.

6. Gaskets: Flange gaskets shall be in accordance with Appendix A of AWWA C115. They shall be full-face gaskets for flanged joints on 12-in. diameter and smaller pipe and shall be of the ring type for flanged joints on larger pipe.

7. After each flanged joint has been made, all bolt heads and nuts, and all surfaces of the flanges not to be painted shall be given two coats of asphaltic coating meeting the requirements of AWWA C151.

E. Grooved-Type Joints:

1. Shall be in accordance with AWWA C606 and Section 40 05 06 - Couplings, Adapters, and Specials for Process piping

F. Push-On Type Joints

1. Shall be in accordance with AWWA C111.

G. Expansion Joints:

1. Heavy Duty Rubber Expansion Joints shall be installed where shown on the Contract Drawings.

2. Each Expansion Joint shall be installed with minimum of two control rods and compression sleeves, and as shown on the Contract Drawings.

H. Mechanical Joints:

1. Mechanical joints shall be assembled in accordance with AWWA C600 where required or shown on the Contract Drawings. Joints shall be restrained or harnessed to withstand test and surge pressure.

I. Flanged Adaptors:

1. Bolt hole and bolt patterns shall conform to the mating flange patterns as specified in the piping paragraphs. Bolts, nuts, and flange gaskets shall conform to the specifications for the adjacent piping.

2. Shall have ductile iron bodies.

3. Shall have a rated working pressure of 175 psig.

4. Pipe shall be anchored by using anchor studs drilled into the coupling and connected pipe for nominal pipe size 12-in. and smaller. For nominal pipe sizes over 12-in., pipe shall be restrained by harnesses or pipe supports as specified for sleeve type couplings.

J. Harnesses:

1. Where shown, specified or required, harnesses for pipe with mechanical joints shall be provided.

2. For ductile-iron pipe and fittings with mechanical joints that require harnessing, restrained type mechanical joint pipe will be considered as an alternate upon submission to the Engineer for approval.

3. Joint Assemblies: Joint assemblies shall be designed to resist pullout of the joints at the test pressures specified for the piping system.

K. Sleeves:

1. Sleeves shall be in accordance with AWWA C110. They shall be of ductile iron and shall be provided at all points where pipes will pass through walls and floors and where wall or floor castings are not provided. Unless otherwise shown, sleeves shall have intermediate collars not less than ½-in. thick and 1½ to 2-in. high located at the center of the wall.

2. For exterior walls of structures, wall sleeves shall be plain ends and of flush wall design.

3. Where shown on the Contract Drawings, modular wall seals shall be installed in the annular space between the pipe and the sleeve. In all other locations, caulk shall be installed in the annular space between the pipe and the sleeve. Caulking materials shall be in accordance with N.Y. Spec 24-C-38. For flanged pipe, sleeves shall be fabricated large enough to accommodate flanges.

L. Sleeve-Type Couplings:

1. Sleeve-type couplings shall be in accordance with Section 40 05 06 - Couplings, Adapters, and Specials for Process piping

2. Pipe and fittings for use with sleeve-type flexible couplings shall be plain end.

3. Sleeve wall thickness shall be the same as the associated ductile iron process pipe wall thickness.

M. Wall Castings, Connecting Pieces, and Special Fittings:

1. Wall castings and connecting pieces shall be in accordance with AWWA C110, 250 psi pressure rating, unless specified otherwise. Concrete encased wall castings connected to sluice gates and valves shall be cast from alloy iron, Ni-Resist Type 1, International Nickel Co. or approved equal. Wall castings and connecting pieces shall be furnished with ANSI Class 125 flanged ends, bell ends, flare ends and/or spigot ends where shown, specified or required.

2. Wall castings shall be of standard wall pipe dimensions, unless piping layout precludes their use, in which case special castings shall be furnished.

3. Design of Specials: Special fittings where required shall be of an approved design that meet the same specifications and have the same diameters and thicknesses as standard fittings. Any tees, crosses, elbows, laterals, reducers or other fittings of current ANSI or AWWA standard dimensions are not considered specials.

4. Intermediate Collar: Wall castings shall have an integrally cast intermediate collar not less than ½-in. thick and 1½-in. to 2-in. high located at the center of the wall unless otherwise shown.

5. Where space limitations prevent the use of through bolts for assembling flange connections, stud bolts shall be provided on wall casting flanges.

N. Cleanouts:

1. Cleanouts shall be furnished and installed where shown or specified.

2. Size: Cleanout openings shall be not less than 6-in. diameter for pipe 8-in. in diameter or larger. For pipe 6-in. in diameter or smaller, they shall be of the same diameter as the pipe.

3. Cleanout Covers: Cleanout covers which are blind flanges shall be in accordance with AWWA C110, except where conformation is required with the inside curvature of the pipe, in which case the covers shall be flanged plugs of proper shape with American Standard flange drilling.

4. Covers shall be fastened by means of Type 316 stainless steel studs, washers, and nuts, and shall be drilled and tapped for a 1½-in. diameter pipe connection.

5. Flange plugs shall be equipped with a dowel or other suitable means to provide proper setting.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Coatings and Linings:

1. General:

a. Ductile iron process pipe shall be lined and coated in accordance with the piping schedule(s) included in the following Section(s):

1) Section 33 06 01 - Schedule for Buried Piping.

2) Section 40 06 01 - Schedule for Exposed Piping.

b. All bolts, nuts, couplings and the like shall be coated after the joint has been made.

c. Painting shall be in accordance with Section 09 91 00 - Painting.

d. Pipe and fittings that are to be encased in concrete shall not be painted.

2. Cement Lining:

a. All ductile-iron pipe and fittings shall be furnished with a cement-mortar lining not less than twice the standard thickness and seal coating meeting the requirements of AWWA C104.

3. Glass Lining Pipe and Fittings

a. Glass lining, pipe and fittings shall consist of a minimum of two (2) glass lining coats, one bonded or primer coat and one finish or gloss coat.

1) Each coating shall be applied in controlled thickness after the inside surface of the pipe has been prepared as required to assure a continuous and unbroken bond of the coating to the pipe.

2) The combined, finished coatings shall have a thickness from 8 to 12 mils, and a surface hardness of at least 6 on the Mohs scale.

3) The bond of the glass lining to the metal shall be sufficient to withstand a strain of 0.001-in./in. without damage to the glass.

4) Surface of glass shall have a dense, glazed finish nonadherent to grease, scum, wax or other sticky substances found in sludge.

b. Ensure that firing of pipe and applied coating layers shall provide a complete fusion to the pipe wall.

1) The compounding, firing and annealing technique shall assure a lining capable of withstanding thermal shock up to 260 °F without damage to the surface or structure of the coating or to its bond with the pipe material.

c. Finish coating shall be free from craters, porosity, crazing, scaling, or pinholes evident from visual inspection.

1) Pipe need not meet a spark test for continuity, but will be rejected for any faults detectable by visual inspection.

d. Finish coating shall be resistant to attacks from acids equivalent to a weight loss not greater than 3 mg /in^2 as determined by the procedure for testing against citric acid, ASTM C283. The coating shall protect against etching or loss of gloss when subjected to cleaning procedures employing a 200°F water-steam mixture.

e. Glass-lined pipe shall not deviate more than 0.0125-in./ft of length from a centerline perpendicular to the flange face or square end of the pipe.

4. Ceramic Epoxy Lining:

a. Lining applicator:

1) Lining shall be applied by a certified firm or manufacturer with a successful history of applying linings to the interior of ductile iron pipe and fittings.

2) Manufacturer must be independently inspected at least two (2) times per year with certification stating compliance with the requirements specified herein.

b. Lining materials: Amine cured novolac epoxy containing at least 20% by volume of ceramic quartz pigment, and shall have:

1) A permeability rating of 0.00 as per Method A of ASTM E 96, Procedure A (test duration of 30 days).

2) Results equal to 0.0 undercutting after two years as per ASTM B 117.

3) Results to equal no more than 0.5mm undercutting after 30 days as per ASTM G 95 cathodic disbondment 1.5 volts at 77°F.

4) Immersion testing rated using ASTM D 714, with the following results after two years' duration testing of:

a) 20% Sulfuric acid: No effect.

b) 140°F 25% Sodium Hydroxide: No effect.

c) 160°F Distilled Water: No effect.

d) 120°F Tap Water (scribed panel): 0.0 undercutting with no effect.

5) Results of only trace growth using ASTM G 22 at 30°C after 7 days.

6) An abrasion resistance of no more than 3 mils (.075 mm) loss after one million cycles using European Standard EN 598, Section 7.8.

c. Application:

1) Condition of pipe prior to application: Prior to application of the ceramic epoxy lining:

a) Interior: No other coating or lining shall have been applied to the entire interior of the pipe.

b) Exterior: No other coating or lining shall have been applied to the first six inches of the exterior of the spigot ends.

2) Surface preparation:

a) Inspect application area for oil, grease, etc. prior to abrasive blasting. Solvent clean if necessary or required for coating application.

b) Abrasive blast application area using sand or grit abrasive media to remove all rust, loose oxides, etc. Only slight stains and tightly adhering oxide shall remain on application surface. If rust reappears before application, or if more than 12 hours elapses before application, repeat blasting procedure specified herein.

3) Lining:

a) Pipe shall be lined within 12 hours of surface preparation.

b) Apply 40 mils nominal dry film thickness to interior of pipe.

c) Lining shall not take place when the substrate or ambient temperature is below 40°F.

d) Ensure surface is dry and dust free.

e) Do not apply lining to flange faces.

4) Coating of Bell Sockets and Spigot Ends

a) Apply joint compound as per Manufacturer's instructions to the gasket area and spigot end up to 6 in. back from the end of the spigot end.

b) Apply 6 mils nominal, 10 mils maximum even coverage.

c) Manufacturer's joint compound shall be applied by brush to ensure full and complete coverage.

d) Care should be taken that the joint compound is smooth without excess buildup in the gasket seat or on the spigot ends.

e) Coating of the gasket seat and spigot ends shall be done after the application of the lining.

5) Number of Coats

a) The number of coats of lining material applied shall be as recommended by the lining manufacturer.

b) In no case shall lining material be applied above the dry thickness per coat recommended by Manufacturer in printed literature.

c) The maximum or minimum time between coats shall be that time recommended by Manufacturer.

d) To prevent delamination between coats, no material shall be used for lining which is not indefinitely re-coatable with itself without roughening of the surface.

6) Touch-Up and Repair

a) Use Manufacturer's joint compound for touch-up or repair in accordance with Manufacturer instructions

d. Inspection:

1) All ductile iron pipe and fitting linings shall be checked for thickness using a magnetic film thickness gauge as per SSPC PA-2.

2) Test interior of all pipe and fittings for pinholes with a non-destructive 2500-volt test in accordance with ASTM D5162. Any defects found shall be repaired and re-inspected prior to shipment.

e. Mark each pipe joint and fitting with the date of application of the lining system along with its numerical sequence of application on that date. Numerical sequence shall correspond with records maintained by the applicator of the Work.

5. Exterior Primer:

a. Pipe and fittings shall be shop coated on the outside in accordance with Section 09 91 00 - Painting, for use in exposed locations, such as inside buildings where finish painting or insulating is required.

6. Painting:

a. Pipe and fittings shall be painted in accordance with the requirements of Section 09 91 00 - Painting.

7. Asphaltic Coating:

a. Pipe and fittings that will not be exposed to view shall be coated with the standard asphaltic outside coating specified in AWWA C151, at twice the specified thickness.

b. Unlined pipe shall be coated with the standard asphaltic inside coating specified in AWWA C151.

8. Epoxy and Urethane Coatings:

a. Epoxy and urethane coatings shall be applied in accordance with Section 09 91 00 - Painting.

9. Concrete Encased Pipe:

a. Pipe and fittings which are to be encased in concrete where water-tightness is to be obtained shall not be coated or painted on the outside.

10. Labels:

a. In addition to the information required to be cast onto the pipe by AWWA C151, the letters "N.Y.C." shall be painted on the outside of each pipe, fitting, and special casting.

11. Pipe Couplings:

a. Where flexible or rigid couplings are to be used, the exterior coating on the ends of pipe and fittings shall be left off for approximately 8-in., but the interiors shall be lined throughout.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Damaged pipe will be rejected and shall be replaced at the Contractor's expense.

3.02 INSTALLATION

A. Install ductile iron process pipe, fittings, and specials in accordance with the requirements of the following Section(s):

1. Section 33 05 05 - Buried Piping Installation.
2. Section 40 05 05 - Exposed Piping Installation.

3.03 FIELD TESTING / QUALITY CONTROL

A. Perform field testing and quality control of ductile iron process pipe, fittings, and specials in accordance with the requirements of the following Section(s):

1. Section 33 05 05 - Buried Piping Installation.
2. Section 40 05 05 - Exposed Piping Installation.

3.04 STARTUP / DEMONSTRATION

A. All potable water pipe shall be disinfected before they are placed into service, as specified in Section 33 01 10.60 - Disinfection of Piping, Tanks, Structures, and Equipment

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

1.05 DESCRIPTION

A. This Section includes requirements for providing thermoplastic process pipe and accessories in accordance with applicable standards and regulations. In addition:

1. The scope of this Section shall include all thermoplastic process pipe, fittings, and specials.

a. Thermoplastic process pipe includes:

1) PVC process pipe.

2) CPVC process pipe.

2. The extent of thermoplastic process piping is shown on the Contract Drawings. Thermoplastic process pipe service, pipe diameter, pressure rating, joint type, and testing requirements are specified in the following section(s):

a. Section 33 06 01, Schedule for Buried Piping.

b. Section 40 06 01, Schedule for Exposed Piping.

3. Thermoplastic process pipe, fittings, appurtenances, and specials shall be furnished and installed complete with all necessary jointing materials, wall castings, wall sleeves, specials, adapters, and other appurtenances as shown on the Contract Drawings, as specified herein, and/or as necessary and required for a complete installation.

   a. Hangers and support for thermoplastic process pipe shall be provided as specified in Section 40 05 07, Hangers and Supports for Process Piping.

4. Where shown on the Contract Drawings, the Contractor shall provide all labor and materials for making connections between thermoplastic process pipe and existing lines(s) installed under other contracts, including all specials required to connect thermoplastic process pipe to pipe of dissimilar material(s).

1.06 QUALITY ASSURANCE

A. Qualifications of Manufacturer:

1. The manufacturer shall have a minimum of five (5) years of experience in the design and fabrication of thermoplastic process pipe, fittings, appurtenances, and specials of similar size, capacity, and type to those shown on the Contract Drawings and specified in the Contract Documents, and shall show evidence of at least five (5) substantially similar installations in satisfactory operation.

B. Supply and Compatibility:

1. All thermoplastic process pipe, fittings, appurtenances, and specials included in this section shall be provided by the Contractor through a single, qualified thermoplastic process pipe manufacturer.

2. The pipe and fittings shall be designed, fabricated, and installed in accordance with the latest standards referenced herein.

3. The manufacturer shall verify compatibility between the thermoplastic process pipe, fittings, appurtenances, specials, and other Work.

C. Regulatory Requirements:

1. Thermoplastic pipe and fittings shall conform to the New York City Building Code with respect to plumbing and other applications covered by these laws.

2. Use only NSF61-approved materials in potable water lines.

1.07 SUBMITTALS

A. Submittals for all thermoplastic process pipe shall comply with the requirements of Section 33 05 05, Buried Piping Installation, and Section 40 05 05, Exposed Piping Installation.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. PVC process pipe and fittings shall be as manufactured by:

1. IPEX, Inc.
2. Spears Manufacturing Company.
3. Or approved equal.

B. CPVC process pipe and fittings shall be as manufactured by:

1. IPEX, Inc.
2. Spears Manufacturing Company.
3. B. F. Goodrich (now Lubrizol Advanced Materials, Inc.), Cleveland, OH;
4. Lewis Pipe Company, Ardmore, AL;
5. Or approved equal.

C. PVC Solvent cement shall be as manufactured by:

1. Weld-On®, as manufactured by IPS Corp., Compton, CA;
2. Or approved equal.

D. Wall sleeve annular seals as manufactured by:

1. Link-Seal®, as manufactured by Thunderline Corp., Stafford, TX;
2. MetraSeal, as manufactured by the Metraflex Corp., Chicago, IL;
3. The Pipe Seal, as manufactured by Flexicraft Industries, Chicago, IL;
4. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. General:

1. Thermoplastic process pipe shall be as uniform as commercially practicable in color, capacity, density and other physical properties.
2. Nominal length of thermoplastic pipe shall be 20 ft.

B. PVC Process Pipe and Fittings:

1. General:
   a. PVC pipe and fittings shall meet the requirements of ASTM D1785, Type I, Grade I.
   b. PVC pipe and fittings shall be Sch. 80, unless otherwise shown or specified.
2. Materials and Construction:
   a. PVC pipe and fittings shall be manufactured from PVC compounds meeting the requirements of ASTM D1784, Class 12454-B.
3. End Connections:
   a. Solvent weld socket type fittings shall conform to ASTM D2467.
   b. Flanges where shown on the Contract Drawings and/or explicitly specified herein.
      1) Bolts and stud bolts shall be of steel, ASTM A307, Grade B, cadmium plated. Bolts and stud bolts shall conform to the dimensional requirements of ASME B18.2.1 with rolled threads conforming to ASME B1.1, Coarse series, Class 2 fit.
      2) Bolts and stud bolts and nuts shall be of American Standard heavy unfinished hexagonal type.
4. PVC Solvent Cement:
   a. PVC solvent cement shall be compatible and suitable for use for the fluid being processed.
   b. Threaded fittings shall conform to ASTM D2464.

C. CPVC Pipe and Fittings:

1. General:
   a. CPVC pipe and fittings shall meet the requirements of ASTM F441.
   b. CPVC pipe and fittings shall be Sch. 80, unless otherwise shown or specified.
2. Materials and Construction:
   a. CPVC pipe and fittings shall be manufactured from CPVC compounds meeting the requirements of ASTM D1784.
3. End Connections:
   a. Socket-type fittings shall conform to ASTM F439.

b. Threaded fittings shall conform to ASTM F437.

c. Flanges

D. Sleeves:

1. Provide steel pipe sleeves at all points where pipes pass through walls or floors of structures.

2. Provide steel sleeves of Schedule 40 minimum thickness, with waterstop. The O.D. of the collar shall be four inches greater than the O.D. of the sleeve, fabricated from steel plate with a minimum thickness equal to the sleeve thickness and double welded to the sleeve.

E. Wall Sleeve Annular Seals:

1. For penetrations through walls, partitions, or floors where fire-rated construction is not required:

a. Provide modular mechanical type seals consisting of interlocking synthetic rubber links shaped to continuously fill the annular space between the pipe and the wall sleeve to provide an effective hydrostatic seal.

b. Bolts and nuts shall be stainless steel.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Damaged pipe will be rejected and shall be replaced at the Contractor's expense.

3.02 INSTALLATION

A. Install thermoplastic process pipe, fittings, and specials in accordance with the requirements of the following Section(s):

1. Section 33 05 05 - Buried Piping Installation.

2. Section 40 05 05 - Exposed Piping Installation.

3.03 FIELD TESTING / QUALITY CONTROL

A. Perform field testing and quality control of thermoplastic process pipe, fittings, and specials in accordance with the requirements of the following Section(s):

1. Section 33 05 05 - Buried Piping Installation.

2. Section 40 05 05 - Exposed Piping Installation.

3.04 STARTUP / DEMONSTRATION

A. Not Used.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Cleaning:

1. During construction, all piping shall be thoroughly cleaned before placement and the lines kept free from foreign matter of whatever origin. The pipes shall be left thoroughly clean to the satisfaction of the Engineer.

2. Flush all process and potable water piping with clean water.

SECTION 40 05 32 – DOUBLE CONTAINMENT CHEMICAL PIPING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified, and required to design, furnish, install, and test all double containment chemical piping, including leak detection systems, complete and operational.

B. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. The extent of double containment chemical piping is shown on the Contract Drawings. Double containment chemical pipe service, pipe diameter, pressure rating, joint type, and testing requirements are specified in the following section(s):

1. Section 33 06 01, Schedule for Buried Piping.

2. Section 40 06 01, Schedule for Exposed Piping.

B. The system design shall meet the requirements of ASME/ANSI B31.3 for design criteria.

C. The system design shall meet the stated minimum requirements of Federal Regulations 40 CFR-280.

1.06 QUALITY ASSURANCE

A. Qualifications of Manufacturer:

1. The manufacturer shall have a minimum of ten (10) years of experience in the design and fabrication of double containment chemical piping, fittings, appurtenances, and specials of similar size, capacity, and type to those shown on the Contract Drawings and specified in the Contract Documents, and shall show evidence of at least five (5) substantially similar installations in satisfactory operation.

B. Obtain components from a single source having responsibility and accountability to answer and resolve problems regarding proper installation, compatibility, performance and acceptance.

C. Supply and Compatibility:

1. All double containment chemical piping, fittings, appurtenances, and specials included in this section shall be provided by the Contractor through a single, qualified thermoplastic process pipe manufacturer.

2. The pipe and fittings shall be designed, fabricated, and installed in accordance with the latest standards referenced herein.

3. The manufacturer shall verify compatibility between the double containment chemical piping, fittings, appurtenances, specials, and other Work.

D. Design, fabricate and install double containment piping to meet ASME/ANSI B31.3 and provide thermal stress analysis demonstrating the ability of the double-containment piping system to handle the stated piping conditions with a restrained or a flexible design in compliance with B31.3.

1.07 SUBMITTALS

A. Submittals for all thermoplastic process pipe shall comply with the requirements of Section 33 05 05, Buried Piping Installation, and Section 40 05 05, Exposed Piping Installation. In addition:

1. Action Submittals:

a. Product data for each type of double containment specified including details of construction relative to materials, dimensions of individual components, profiles, and finishes.

b. Product certificates signed by manufacturer of double-containment product stating compliance with stated requirements.

2. Informational Submittals:

a. Welder certificates certifying that welders comply with the installation procedures as outlined by ASME NM.1 and/or ASTM D2657 and/or AWS B2.4 and/or DVS 2207prior to construction.

b. Qualifications of manufacturer supplying double containment piping. Firms must have the appropriate experience in installation (fusion welding) and operation of a thermoplastic piping system.

c. Manufacturer's Delegated Design Engineer's professional engineering license information, verifying valid licensure in the State of New York, and professional resume, demonstrating the requisite experience for double containment chemical piping systems.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents.

1. Deliver double-containment piping as a factory assembled unit with protective wrapping/coverings.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents.

1. Care shall be taken to prevent damage to the supplied components. Avoid scraping, denting, and gouging the components. Surface damage deeper than 10% of the wall thickness shall be rejected. Pipe shall have adequate support at all times to prevent sagging or distortion.

2. Store products on elevated platforms in a dry location with protection from elements.

3. Lift, support, and transport double containment piping per manufacturer's recommendations.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Turn over to DEP, at end of construction, necessary welding equipment as suggested by manufacturer for repair and maintenance of the double-containment product.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Double Containment Chemical Piping:

1. Asahi/America, Inc., of Lawrence, Massachusetts.

2. No substitution allowed.

B. Electronic Low-Level Leak Detection Systems:

1. LiquidWatch II® Series manufactured by PermAlert.

2. Or approved equal.

C. Continuous Cable Leak Detection Systems:

1. PAL-AT® System as manufactured by PermAlert.

2. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Double Containment Chemical Piping:

1. Pipe and Fittings: Polyethylene (PE) pipe PE100-RC resin 15494 supplement B [Minimum Required Strength of MRS 10] ASTM D3350 minimum cell class PE445586C (1/2" - 12") (20mm - 315mm), advanced polyethylene resin with a slow crack growth resistance of greater than 9,000 hours when conducted with the PENT test ASTM F1473, and greater than 8,760 hours with a full notch creep test (FNCT) according to ISO 16770. SDR 11 Pipe and fittings have been tested and confirmed by the DVGW Test Laboratory Energy of DBI-GTI for permeation and tightness, to be considered H2 Ready.

2. For Sodium Hypochlorite: EDTFE (Halar) shall be used for the carrier pipe (2", 3") and ChemPro Advanced PE RC100 for the containment pipe, For Sodium Bisulfate: both carrier and containment lines are to be ChemPro Advanced PE RC100.

3. Pressure Rating: Both inner and outer pipes shall conform to requirements for establishing a hydrostatic design basis:

   a. Product Pipe The product pipe shall have a standard dimensional ratio of SDR-11 for pipes 1" through 12" and shall be pressure rated to 150 psi at 68° F for all diameter sizes.

   b. Containment Pipe The containment pipe shall have a standard dimensional ratio of SDR-11 for 3"and shall be pressure rated to 150 psi, SDR-33 for all other diameters 4" and larger rated to 45 psi.

B. Double Containment Chemical Piping Fittings:

1. All pressure rated fittings will be per the piping SDR rating, unless specifically identified on drawings or datasheet. Molded fittings shall be central injection gate molded PE100-RC rated to a minimum of the pressure pipe.

2. Drainage pattern fittings including laterals, sanitary tees, wyes, flush reducers, flush reducing tees, cleanouts, p-traps, drains, or any other non-full pressure rated items shall be rated to a minimum of 10 feet of H2O.

3. Unlisted Components: Any special fittings, welded areas, etc. not supplied as part of the normal product offering shall be classified as unlisted components. Products falling into this category shall be pretested to twice the maximum operating pressure for a period of 2 hours minimum.

C. Double Containment Valves:

1. Valving arrangements that are to be double contained shall be supplied preassembled and tested to 150% of the maximum operating pressures. Actuators, stem extensions, and other accessories shall be part of a preassembled package where appropriate.

D. Pipe Supports: Supports, guides, etc. for product pipe shall be provided of same resin as containment pipe. Supports shall be placed in a manner that a maximum of 0.1" deflection is allowed between supports. Supports shall allow axial movement of product pipe within containment pipe. Supports shall maintain a concentric relationship between product pipe and containment pipe. Supports shall supply a minimum of 1.5" wide surface area to prevent point loading of product pipe.

E. Simultaneous Weld Discs: Simultaneous weld discs shall be provided of the same resin group as product pipe and containment pipe. Molded simultaneous weld discs shall supply 4 openings on 90° spacing to allow for drainage and venting of the annular space. Fabricated simultaneous weld discs shall be designed with vent and drain openings. All simultaneous weld discs shall be sized to maintain alignment of product pipe within +/- 10% of wall thickness.

F. Vents/Drains: High-point vents and low-point drains shall provide adequate flows to completely drain annular space. Location of vents/drains shall be coordinated with piping manufacturer. Vents/drains shall be of same resin as product pipe.

G. Leak Detection Systems:

1. General:
   a. The double containment piping manufacturer shall provide the leak detection systems.
   b. Provide electronic low-level leak detection systems as shown on the Contract Drawings.
   c. Provide continuous cable leak detection systems for all buried chemical piping unless otherwise indicated.
2. Low-Level Electronic Leak Detection Systems:
   a. Enclosure: NEMA 4X
   b. Supply Voltage: 115 volt, 1 phase, 60 Hz.

H. Leak detection shall be provided per contract drawings and leak detection manufacturer's requirements. Low Point leak detection stations shall be of same resin as pipe.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Anchorage:
   1. Anchors shall be provided of same resin group as product pipe and containment pipe. Anchors shall be of same wall thickness as product and containment pipe, and be of unitary construction. Anchors shall be fully pressure rated. Anchors shall be dogbone style.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Damaged pipe will be rejected and shall be replaced at the Contractor's expense.

3.02 INSTALLATION

A. Install double-containment piping to comply with manufacturer's recommended procedures.

B. Installers shall be pre-qualified through sufficient training in butt fusion techniques according to ASTM D2657 Section 9.

C. Hot gas welding shall not be allowed for wetted components.

D. Manufacturer/Manufacturer's Representative shall provide on-site training in the assembly, installation, and operation of double containment system.

3.03 FIELD TESTING / QUALITY CONTROL

A. Testing shall be conducted in accordance with manufacturer's recommendations.

B. Prior to pressure testing, the system shall be examined for the following items:

1. Pipe shall be completed per drawing layout with all pipes and valve supports in place.
2. Pipe, valves, and equipment shall be supported as specified, without any concentrated loads on the system.
3. Pipe shall be in good condition void of any cracks, gouges or deformation.
4. Pipe flanges shall be properly aligned. All flange bolts should be checked for correct torques.
5. All diaphragm valve bonnet bolts shall be checked for correct torques.
6. All joints should be reviewed for appropriate welding technique.
    a. Butt fusion welds: to have two beads, 360° around the joint.
7. Verify that all high points are provided with an adequate vent for hydro testing.

C. Field Testing:

1. Pressure Systems: Product Pipe Should be tested hydrostatically to 150% of operating pressure per ASME B31.3 part 345.
2. Containment Pipe: The containment piping shall be tested hydrostatically to 150% of operating pressure per ASME B31.3. The product pipe must be pressurized to the same pressure as the test to prevent collapsing of product pipe.
    a. Alternate to containment pipe hydrostatic test: To avoid moisture in the containment space, an air test can be conducted on the containment pipe. Pressure test is recommended at 5 psi and shall not exceed 10 psi. The inner carrier pipe shall be full of water and under pressure to avoid any possible collapse. When testing with air, the ambient temperature should be above 32 °F and extra safety precautions for personnel shall be put in place during the test.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

END OF SECTION

SECTION 40 05 53 – PROCESS VALVES FOUR-INCH DIAMETER AND LARGER
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified and required, to furnish, install, and test all process valves four-inch diameter and larger complete and operational.

B. The following index of this Section is presented for convenience:

Article	Title	Section Page

1.05 DESCRIPTION

A. The scope of this Section includes requirements for all process valves, four-inch diameter and larger, in accordance with applicable standards and regulations. In addition:

1. All other valves referenced in Schedule 40 05 53-1, located after the "End of Section" designation, shall be for liquid service.

2. Electric actuators for electrically actuated valves shall be provided by the valve manufacturers. Electric actuator motors shall conform to the requirements of Section 26 05 91 - Low Voltage Electric Motors.

B. All valves larger than four inches that are part of the Work are exposed valves, even though adjoining pipelines may be primarily specified under Section 33 06 01 - Schedule for Buried Piping.

1.06 QUALITY ASSURANCE

A. Quality Assurance Inspections:

1. Quality Assurance inspections may be made by NYC DEP Bureau of Engineering Design and Construction, Quality Assurance Section or its representative at the manufacturer’s facility.

2. Quality Assurance Inspections shall be in accordance with the requirements of the Contract Documents.

3. The Contract shall give ample notice to the Engineer prior to the beginning of any fabrication, so that QA inspection may be made.

4. QA inspections shall include (but no be limited to) the following activities:

a. Obtain representative material samples of main components.

b. Obtain copies of Certified Materials Test Reports (both chemical and physical) and Manufacturer's Certificates of Conformance.

c. Perform visual and dimensional inspection of completed work.

d. Witness surface preparation and coating and lining operations, paint peel tests, and holiday tests.

e. Witness any required hydrostatic, shop leakage and performance tests.

B. Manufacturer's Qualifications:

1. Manufacturer shall have a minimum of 5 years of experience in the production of substantially similar valve equipment, and shall show evidence of satisfactory service in at least 5 installations.

C. Supply and Compatibility:

1. Each type of valve, inclusive of all sizes specified for that type of valve, shall be the product of one (1) manufacturer.

D. Welding Work:

1. All welding work, qualification, and inspections shall conform to the requirements of Section 05 05 23.01 - Welding, and is subject to Quality Assurance inspection.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

a. Quality Assurance Requirements:

1) All information necessary and required to substantiate approval of a valve manufacturer in accordance with the quality assurance requirements of this Section.

b. Shop Drawings:

1) Associated valve tag number(s) as specified in Schedule 40 05 53-1, located after the "End of Section" designation.

2) Complete catalog information, descriptive literature, specifications, and identification of all materials of construction.

3) Product data sheets for make and model. The valve(s) with size(s) and option(s) being submitted for approval are specifically identified in the product data sheet(s).

4) Power and control wiring diagrams, including terminals and numbers.

5) Complete nameplate data of electric actuators.

6) Spare parts list.

7) Special tools list.

c. Calculations:

1) Sizing of electric actuators.

2) Sizing of operating mechanisms with extension stems.

3) Sizing of gear actuators.

4) Sizing of anchor bolts.

d. Operation and Maintenance Data: Submit complete manuals including:

1) Copies of all approved Shop Drawings, test reports, maintenance data and schedules, description of operation, and spare parts information.

2. Information Submittals:

a. Material test reports representing all major components of valves and operators shall be submitted. All such components shall be traceable to the original heat and/or lot numbers unless otherwise approved.

b. Certificates of compliance with AWWA Standards, if applicable.

c. Certificate of chemical composition and compliance with ASTM standard for anchor and miscellaneous mounting bolts.

d. Certificate of suitability of all valve materials for the specified service.

e. Certified copies of shop test results and inspection data.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. Valves and associated appurtenances shall be handled carefully. Valves which are dropped, dented, cracked, and/or otherwise damaged shall not be accepted.

2. Provide full-face protectors of waterproof material fastened to each side of the valve body to protect joints and the valve interior.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Contractor shall provide spare parts and special tools necessary to service, disassemble, repair, and adjust the equipment provided under this Section, and as per the requirements of the Contract Documents. In addition:

1. Provide spare part sets for the following types of valves:

a. Plug Valves: Each spare part set shall consist of the following:

1) One (1) set of gaskets.

2) One (1) set of packing.

3) One (1) set of upper and lower journal bearings.

2. The quantities of spare parts sets to be furnished as part of the Work are given in Table 40 05 53-1, below. Furnish the quantity of spare parts sets

given in the table for each type and each size of valve included in this Section.

TABLE 40 05 53-1
QUANTITIES OF SPARE PARTS SETS TO FURNISH

Number of Valves Installed	Sets of Spare Parts Required
1 - 5	1

B. Tools: Provide standard and special tools and supplies necessary to service, disassemble, repair, and adjust the equipment, products. In addition:

1. The following tools shall be furnished:

a. T-Handle Operating Wrenches: As specified herein.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Plug Valves (Liquid Service):

1. DeZurik, as manufactured by DeZurik APCO Hilton, Inc., Sartell, MN;
2. Or approved equal.

B. Motor-Operators (Open/Close and Modulating):

1. AUMA Actuators, Canonsburg, PA;
2. EIM Controls, Houston, Texas.;
3. Limitorque, Irving, TX;
4. Rotork, Bath, United Kingdom;
5. Or approved equal.

C. Position Indicators:

1. Trumbull Industries, Inc., Youngstown, OH.
2. Or approved equal.

D. Stainless Steel Bracket for Position Indicators:

1. Trumbull Industries, Inc., Youngstown, OH.
2. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. General:

1. Materials of Construction:

a. Compatibility for Service:

1) All materials of construction of the valves shall be confirmed suitable for the application by the valve manufacturer.

b. Wetted parts of the valve shall be protected from galvanic corrosion.

c. Ferrous Metals:

1) Cast iron of the valves, unless otherwise specified, shall conform to ASTM A 126, Class B.

d. Non-Ferrous Metals:

1) Non-ferrous metals shall be provided with standard composition and physical properties conforming to ASTM standards except as otherwise indicated.

2) All non-ferrous metals shall be made from new metals of purest commercial quality. Scrap can be used only when it is the result of the processes of manufacture of articles of similar composition.

3) Bronze items shall have one of the following compositions as specified herein:

a) Composition "A" conforming to ASTM B61 (Alloy UNS No. C92200) or B 62 (Alloy UNS No. C83600).

b) Composition "B" conforming to ASTM B61 (Alloy UNS No. C92200) or an approved standard composition having good wear and corrosion resisting qualities and sufficiently ductile for peening into dove-tail grooves.

c) Composition "C" conforming to ASTM B584, Copper Alloy UNS No. C86500 or C86400; or ASTM B 21, Copper Alloy UNS No. C46400; or ASTM B 124, Copper Alloy UNS No. 37700.

d) Composition "D" conforming to ASTM B584, Copper Alloy UNS No. C86200 or C86700; or B 21, Copper Alloy UNS No. C46400.

e. Metal Castings:

1) Castings shall be true to pattern, sound, smooth, and without injurious cold shuts, swells, lump scabs, scoria, sand holes, and/or other defects and imperfections.

2) Weld repair will not be allowed without the written permission of the Engineer.

   a) Map all defects over ¼-in. wide or ¼-in. deep.

      (1) If such defects add up to ten percent or more of the total open surface area, then the casting will be rejected unless waived by the Engineer.

   b) Map defects smaller than ¼-in. if they are densely concentrated, and report to the Engineer for approval or repair.

   c) Conduct repairs permitted by the Engineer per approved procedures.

      (1) Any acceptable casting defect that affects the paint integrity shall be plugged or filled using approved methods and only with the consent of the Engineer.

3) All castings shall be thoroughly, inside and outside, free from sand and dust.

   a) Use wire brushes, scrapers or other approved mechanical appliances for this purpose.

   b) Do not use acid or other corrosive liquids in cleaning castings.

4) Deviation in casting thickness (for each valve):

   a) For valve body castings having a standard thickness < 0.8-in.:

      (1) Maximum deviation from the standard thickness: < 0.08-in.

   b) For valve body castings having a standard thickness ≥ 0.8-in.:

      (1) Maximum deviation from the standard thickness: ≤ 10% of standard thickness.

   c) Maximum area of casting over which deficiencies in thickness extend: ≤ 50% of surface area.

5) Identification and Pressure Rating:

   a) All valves shall have manufacturer's name and rated pressure cast in raised letters on the valve body.

6) Direction to Open:

   a) All valves shall have permanent markings for direction to open.

2. End Connections:
   a. Unless otherwise explicitly shown or specified, valves shall be furnished with the following end connections:
      1) For exposed valves:
         a) Shall have flanged ends.
         b) Flanges shall conform to:
            (1) For Class 150 valves: ANSI B16.1, Class 125.
            (2) For Class 250 valves: ANSI B16.1, Class 250 and Class 300.
         c) Pressure class of valve flanges shall be based on pressure class of connected piping as specified in Section 40 06 01 - Schedule for Exposed Piping.
      2) For buried valves:
         a) Shall be provided with one of the following:
            (1) Mechanical or push-on joints, based on connected piping specified in Section 33 06 01 - Schedule for Buried Piping.
            (2) Joints shall be restrained or unrestrained, based on connected piping specified in Section 33 06 01 - Schedule for Buried Piping.
3. Operation:
   a. Manual operators shall include hand wheel, chain, crank, lever and a T-handle operating wrench.
   b. Direction: clockwise to close (unless otherwise specified in Schedule 40 05 53-1 - located after the "End of Section" designation).
   c. Force required to open or close manual valves: ≤ 40-lbf.
      1) Applies to all manual valves, with or without extension stems.
      2) Shall apply to open or close against the specified criteria for the adjoining pipeline specified in:
         a) Section 40 06 01 - Schedule for Exposed Piping.
         b) Section 33 06 01 - Schedule for Buried Piping.
   d. Design pull force on manual operator: ≥ 200-lbf.
   e. Design input torque on actuator nut: ≥ 300 ft-lbs.

4. All valves shall be constructed such that operation at the lower range of operating pressures specified shall not result in any leakage.

B. Plug Valves (Liquid Service):

1. General:

a. All plug valves shall be of rectangular port, eccentric type unless otherwise specified.

1) Minimum Port Area: 100% of nominal pipe area.

a) Plug valves shall permit pigging with pigs equal to the interior diameter of the connected piping.

b. Design Working Pressures:

1) For valves ≤ 12-in.: 175 psig.

c. Maximum Fluid Temperature: 180°F.

2. Materials:

a. The materials of construction for the various components of each valve shall be as follows:

1) Body: Ductile-iron, Grade 65-45-12.

a) Shall conform to the requirements of ASTM A 536.

2) Plug Core: Ductile-iron, Grade 65-45-12.

a) Shall conform to the requirements of ASTM A 536,

3) Plug Facing: Neoprene.

a) Hardness: ≥ 70 (Shore A) durometer.

4) Seats:

a) Overlay:

(1) Nickel content: ≥ 90%.

5) Stem Bearings: Type 316 stainless steel, that has been sintered and oil-impregnated.

6) Seal: Neoprene.

7) All internal and external bolting and other hardware including pins, set screws, studs, bolts, nuts and washers: Type 316 stainless steel.

3. Construction:

a. Plug:

1) Shall have a cylindrical seating surface eccentrically offset from the center of the plug shaft.

a) The interface between the plug face and body seat, with the plug in the closed position, shall be externally adjustable in the field with the valve in the line under pressure.

2) Shall be supported to top bearing by the use of spring that is externally adjustable.

3) For valves > 6 in.

a) Plugs with rubber facing shall be furnished, unless fully encapsulated plugs are specified herein.

4) Thickness of rubber lining: ≥ ⅛-in.

5) The rubber to metal bond shall withstand minimum 75 lbf. pull conforming to ASTM D 429, Method B.

b. Seats:

1) Shall have a welded overlay ≥ ⅛-in. thick.

2) Overlay shall cover all surfaces contacting the plug face.

c. Valves shall provide drip-tight bi-directional shutoff at the design working pressure, operating pressures, and test pressures.

d. Stem seal shall be multiple V-Ring type.

e. Stem bearings shall be permanently lubricated.

f. Packing and packing gland:

1) Shall be accessible without disassembly of the valve; and

2) Shall be externally adjustable; and

3) Shall be accessible for adjustment without requiring the removal of actuator from the valve.

4. Appurtenances:

a. Valves shall be tagged or marked by the manufacturer to indicate the proper mounting position as specified herein.

b. Gear Actuators for Manual Valves:

1) Each valve shall be provided with gear actuators as specified herein, except:

a) 4-in. valves located < 6 ft. above the operating floor.

2) The gear actuators shall be sized for the following differential pressures:

a) For valves ≤ 8-in.: 175 psig.

b) For valves > 8-in.: 100 psig, unless a greater pressure differential is specified in Schedule 40 05 53-1, located after the "End of Section" designation.

C. Gear Actuators for Manual Valves:

1. General:

a. Gear actuators shall be designed to hold the valve in any intermediate position without creeping or vibrating.

2. Materials:

a. Housing: Cast Iron, ASTM A126, Class B.

b. Gear Sector: Ductile Iron, ASTM A536.

c. Worm Gear: Steel, AISI 1144, hardened and tempered to an average Rc 40 and within range of Rc 35-45.

d. All Bearings: Bronze oil impregnated.

e. All Hardware including Bolts, Nuts, Washers, Set Screws and Pins: Type 316 stainless steel.

3. Construction:

a. Each actuator shall have all gearing totally enclosed.

b. The operator shaft and the gear sector shall be supported on permanently lubricated bronze bearings.

c. Metal encased spring loaded seals shall be provided in top and bottom covers of the gear housing.

d. Diameter ratio of the handwheel or the chainwheel and the gear sector: < 2.

e. For buried or submerged valves, the gear actuator shall be grease-packed and designed to withstand submersion and be droptight in water to 20 ft. head.

4. Appurtenances:

a. A valve position indicator shall be provided on each actuator. Stop-limiting devices shall be provided for open and closed position.

b. An adjustable stop shall be provided to adjust the seating pressure.

D. Electric Actuators (Open/Close):

1. General:

a. Electric actuators for open/close service shall conform to the requirements of AWWA C542.

b. Application Criteria:

1) Ambient Temperature Rating: -20°F to +150°F.

2) Ambient Humidity: 100%.

3) Maximum design differential pressures and forward/reverse flows applicable to the valves:

a) Refer top Schedule 40 05 53-1, located after the "End of Section" designation.

b) For the service conditions of buried piping on which the actuated valve is installed, refer to Section 33 06 01 – Schedule for Buried Piping.

c) For the service conditions of exposed piping on which the actuated valve is installed, refer to Section 40 06 01.

4) Opening and Closing Speeds: 11 sec.

5) Power Supply: 120 volts, single phase, 60 Hz.

6) Control Voltage: 120 volts, single phase, 60 Hz.

7) Torques: Per valve manufacturer.

8) Duty Cycle: ≥ 6 starts / hr.

9) Each electric actuator shall be equipped with a handwheel for manual operation.

a) The handwheel shall be connected such that operation by the motor will not cause the handwheel to rotate.

b) Should power be returned to the motor while the handwheel is in use, design of the unit shall prevent transmission of the motor torque to the handwheel.

10) The actuator shall be operable with handwheel or chainwheel even after the electric motor has been disengaged and removed for repairs.

c. Remote Control Panels:

1) Provide separate remote control panels for all valves with electric actuators located ≥ 6.00 ft. above the operating floor.

2) The separate remote control panels shall be provided with separate push-button stations.

3) The separate remote control panels shall be installed approximately 5 ft. above the operating floor at an approved location.

4) Electrical wiring shall be modified as required for the remote location of the control panels.

d. Sizing of each electric actuator shall be coordinated with the valve manufacturer who shall furnish the valve and the electric actuator as a unit.

e. The electric actuators shall be suitable for the valve orientation as shown on the Contract Drawings.

f. All electrical components shall conform to the area classification shown on the Contract Drawings.

2. Materials and Construction:

a. Electric Motor:

1) Motor shall be in accordance with the requirements of Section 26 05 91 - Low Voltage Electric Motors.

2) Motor shall be specifically designed for valve actuator service. It shall have high torque characteristics and shall have a maximum continuous total temperature rating of 70°C.

3) The motor shall be sized for at least 1.5 times the actuator torque requirement.

b. Actuator Gearing:

1) Housing: Die-cast aluminum.

2) Close coupled to electric motor.

3) Input Shaft Gearing: Spur or bevel gear assembly.

4) Output Shaft Gearing: Self-locking worm gears with minimum gear backlash to prevent valve disc chatter or vibration. The gearing shall be rated for twice the required actuator torque.

5) All gearing shall be of hardened alloy steel or a combination of hardened alloy steel and alloy bronze, accurately cut by hobbing machine.

6) Lubrication: Oil bath or grease.

7) Bearings: Ball or roller with a minimum B-10 life of 100,000 hrs.

8) Input Shaft: Hardened alloy steel.

9) Provide mechanical stops adjustable from 0° to 90° at each end of travel.

c. Limit Switches:

1) Each actuator shall be provided with "end of travel" limit switches to allow control of desired end position for each direction of travel.

2) Travel stops shall be threaded and of Type 316 stainless steel to allow adjustment at each end of actuator stroke.

3) Open and close limit switches shall be geared to the drive mechanism and in step at all times, whether the unit is operated electrically or manually and whether or not the

actuator is powered by the 3-phase power supply. Friction devices or set-screw arrangements shall not be used to maintain the setting.

4) Limit switch gearing shall be appropriately lubricated.

5) The driven mechanism shall be totally enclosed to prevent entrance of foreign matter or loss of lubricant.

6) Each actuator shall be provided with four auxiliary contacts. Two contacts shall close and two contacts shall open at a desired end position for each direction of travel.

7) Switches shall be rated 5A or 10A at 120V, as applicable for the specified equipment.

d. Torque Switches:

1) Adjustable torque switches shall be provided with each valve actuator.

a) The torque switches shall operate during the complete valve cycle without the use of auxiliary relays, linkages, latches or other devices.

2) Torque switches shall be wired to de-energize the valve actuator motor in the event excessive torque is developed during either direction of travel.

3) It shall be possible to select the torque switches to control the open and close limit positions in either direction of valve travel.

4) Dry contacts, 5A or 10A, 120V, as applicable for the specified equipment, shall be provided for remote high torque alarm for automatically controlled valves.

3. Appurtenances:

a. Handwheel:

1) Provide each electric actuator with a handwheel.

2) Maximum Effort on Rim of Handwheel:

a) For seating or unseating Load: ≤ 80 lbf.

b) For Running Load: ≤ 60 lbf..

3) The handwheel shall have an arrow and the word "OPEN" or "CLOSE" indicating required rotation.

4) The handwheel shall operate in the clockwise direction to close.

5) Handwheels shall conform to the requirements specified separately herein.

b. All fasteners shall be Type 316 stainless steel.

4. Controls:

a. Provide each electric actuator with controls:

1) Provide controls in a separate compartment integral with the actuator.

2) Enclosure: NEMA 4X, unless NEMA 7 is required for duty in the actuator location.

3) Starter:

a) Provide a combination reversing magnetic starter with circuit breaker and disconnect switch.

b) Housing:

(1) For nonhazardous areas: NEMA 4X, Type 316 SS enclosure.

(2) For hazardous areas: Class 1 Division 2 cast aluminum housing.

4) Control Power Transformer:

a) Provide a transformer to transform the rated three phase, 60 Hz power to 120V, single phase.

b) The transformer shall be complete with a grounded and fused secondary and dual primary fuses.

5) Provide LOCAL/OFF/REMOTE Selector Switch. "LOCAL" position provides operation from open/close/stop push buttons.

a) "OFF" position disables local and remote operation.

b) "REMOTE" position enables open/close/stop control from a remote source.

6) Provide OPEN/CLOSE/STOP push buttons with a hold-to-run or momentary contact selection.

7) Provide OPEN/CLOSE/STOP indicating lights.

8) Provide thermal overload and single phasing protection of the motor.

9) Provide a set of dry contacts to remotely indicate that the actuator is available for remote operation.

10) The actuator circuit boards shall be rated for high temperature service, minimum 55°C.

11) Provide electrical interlocks as shown on the Contract Drawings.

12) For monitoring of the actuator, provide a set of SPDT dry contacts. The monitor relay shall indicate that the actuator is available for remote operation.

b. Remote Mounted Control Panels:

1) Remote mounted controls for the electric actuators will be incorporated into the respective chemical fill station.

E. Appurtenances for Exposed Metallic Valves

1. Provide appurtenances for all exposed valves of metallic construction, unless otherwise specified.

2. Provide handwheels for all valves located < 6 ft. above the operating floor.

a. All handwheels shall conform to the applicable AWWA Standards.

b. Material of Construction: Ductile iron or cast aluminum.

c. Arrow indicating direction of opening and word “OPEN” shall be cast on the trim of the handwheel.

d. Maximum Handwheel Diameter: 30 inches.

F. Appurtenances for Buried Metallic Valves

1. Wrench Nuts:

a. Wrench nuts shall be provided on all buried valves and shall be of nominal 2-in. size conforming to AWWA C500.

b. Arrow indicating direction of opening the valve shall be cast on the nut along with the word "OPEN".

c. Material: Ductile iron.

d. The nut shall be secured to the stem by mechanical means.

2. T-Handle Operating Wrenches:

a. Contractor to provide from valve manufacturer.

b. Provide T-Handle operating wrenches in lengths to permit operation of all valves by operators.

c. Furnish one (1) wrench per type and size of each buried metallic valve installed.

3. Valve Boxes:

a. Valve boxes shall be as indicated and as required.

b. Type: Heavy duty, suitable for highway loading, telescopic, and adjustable.

c. Material: Cast or ductile iron.

d. Coating: Two coats of asphalt varnish conforming to FS TT-C494B.

e. Marking: As required for service.

G. Anchor and Miscellaneous Mounting Bolts

1. All bolts, nuts and washers furnished for connection of the valve appurtenances to the concrete structure or other structural members shall be furnished by the valve equipment manufacturer, and shall be of ample size and strength for the purpose intended.

2. Anchor bolts shall be hooked or adhesive type.

3. All bolts and washers shall be of Type 316 stainless steel and nuts shall be UNS S21800 alloy stainless steel and shall conform to the requirements of ASTM A194 Grade 8SA.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. General:

1. Stainless Steel:

a. Fabricated stainless steel items shall be cleaned and descaled in accordance with ASTM A380, and shall be as follows:

1) All stainless steel welded fabricated items shall be passivated after manufacture by immersion in a pickling solution of 6% nitric acid and 3% hydrofluoric acid.

a) Temperature and detention time shall be sufficient for removal of oxidation and ferrous contamination without etching of surface.

b) Perform a complete neutralizing operation by immersion in a trisodium phosphate rinse followed by clean water wash.

2) The welds shall be scrubbed with the same pickling solution or pickling paste and stainless steel wire brushes after fabrication to remove weld discoloration, and then shall be neutralized and washed clean.

b. Anti-seize Compound:

1) For all stainless steel bolting, anti-seize compound, graphite free, shall be used to prevent galling.

2) Strength of bolting shall not be affected by anti-seize compound.

2. Painting of Exposed Valves and Appurtenances:

a. Exterior steel, cast-iron, and ductile iron surfaces except machined or bearing surfaces of all exposed valves and appurtenances shall be finish painted in the shop.

b. The surface preparation, priming, finish painting, and field touch-up painting shall conform to Section 09 91 00 - Painting.

3. Painting of Buried Valves:

a. Exterior steel, cast-iron, and ductile iron surfaces except machined or bearing surfaces of all buried valves shall be shop-painted with two coats of asphalt varnish conforming to FS TT-C 494B.

4. Nameplates:

a. All valves shall be provided with Type 316 stainless steel nameplates attached with Type 316 stainless steel screws.

b. The nameplates shall have engraved letters and shall include the following information as a minimum:

1) Valve size.

2) Pressure and temperature ratings.

3) Date of manufacture.

4) Manufacturer's name and address.

5. Identification:

a. The valves shall be provided with identification conforming to the requirements of Section 40 05 97 - Identification for Process Equipment.

B. Plug Valves (Liquid Service):

1. Interior Coating:

a. All plug valves shall be coated inside.

b. If the pipe connecting to the plug valve, as specified in Section 33 06 01 - Schedule for Buried Piping, and/or Section 40 06 01 - Schedule for Exposed Piping, shall not have glass lining, the interior of the plug valve shall be coated as follows:

1) The steel, cast-iron, and ductile iron surfaces, except machined surfaces, shall be epoxy coated in accordance with AWWA C550.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Plug Valves (Liquid Service):

1. Perform shop tests on all plug valves for liquid service.

2. Open/Close Test:

a. Each plug valve (with the actuator mounted directly on the valve) shall be shop operated three (3) times from the fully closed to the fully opened position and the reverse under a no-flow condition.

3. Leakage Tests:

a. Plug valves shall be given a leakage test at the design working and operating pressures.

b. During the test, the plug valves shall be drip-tight.

c. Duration:

1) For plug valves < 20-in.: 5 min.

d. The tests shall be repeated with pressure in the opposite direction.

4. Hydrostatic Test:

a. All plug valve bodies shall be subjected to an internal hydrostatic pressure equivalent to twice the rated pressure.

b. During the hydrostatic test, there shall be no leakage through the metal, end joints, or shaft seal, nor shall any part be permanently deformed.

c. The duration of the hydrostatic test shall be sufficient to allow visual examination for leakage.

d. Duration:

1) For plug valves ≤ 8-in.: 1 min.

2) For plug valves 8-in. through 20 in.: 3 min.

B. Electric Actuators (Open/Close):

1. Shop test each actuator in accordance with the requirements of AWWA C542.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Install valves in complete accordance with the manufacturer's printed instructions and the approved Shop Drawings.

B. All valves shall be installed plumb and level. The valves shall be free from distortion and strain caused by misaligned piping, equipment or other causes.

C. All valves shall be installed so that operating handwheels or levers may be conveniently turned from operating floor without interfering with access, and shall be as approved by the Engineer. Chain operators shall be oriented out of the way from the walking areas.

D. For motor-operated valves located less than 6.00 ft. above the operating floor, the orientation of the motor actuator shall permit easy access to the push buttons and the handwheel.

E. For buried valves:

1. The valve boxes shall be set plumb and centered.

2. Carefully tamp to a lateral distance of 4 ft. on all sides of the valve box.

3. If the undisturbed trench face is less than 4 ft. from the valve box in any direction, carefully tamp to the undisturbed trench face.

F. Provide identification accordance with the requirements of Section 40 05 97 - Identification for Process Equipment.

3.03 FIELD TESTING / QUALITY CONTROL

A. All parts and components shall be adjusted as required to provide correct operation.

B. A functional field test of each valve shall be conducted in the presence of the Engineer to demonstrate that each part and all components function together correctly.

3.04 STARTUP / DEMONSTRATION

A. Where specified herein, the Contractor shall provide the services of qualified factory-trained service technicians to check and approve the installation.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Provide field touch up painting in accordance with the requirements of Section 09 91 00 - Painting.

SECTION 40 05 54 – RUPTURE DISCS
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified and required, to furnish, install, and test all rupture discs, complete and operational.

B. The following index of this Section is presented for convenience:

Article	Title	Section Page

C. The following schedule, after the End of Section designation, is a part of this Section:

1. Schedule 40 05 54-1, Rupture Disc Schedule.

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Not Used

1.04 REFERENCES

A. Not Used

1.05 DESCRIPTION

1. Rupture Discs shall fit between two points in the tank pressure relief system and rupture when a predetermined pressure level is reached. They shall eliminate over-pressurization and help prevent system damage, resulting in improved safety and efficiency.

1.06 QUALITY ASSURANCE

A. Manufacturer's Qualifications:

1. Manufacturer shall have a minimum of 5 years of experience in the production of substantially similar rupture disc equipment and shall show evidence of satisfactory service in at least 5 installations.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

a. Shop Drawings:

1) Complete catalog information, descriptive literature, specifications, and identification of all materials of construction.

2) Product data sheets for make and model.

3) Spare parts list.

4) Special tools list.

b. Operation and Maintenance Data: Submit complete manuals including:

1) Copies of all approved Shop Drawings, test reports, maintenance data and schedules, description of operation, and spare parts information.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Contractor shall provide spare parts and special tools necessary to service, disassemble, repair, and adjust the equipment provided under this Section, and as per the requirements of the Contract Documents

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Fike Corp., Blue Springs, CO

B. Mersen, Salem, VA

C. Zool Chagrin Falls, OH

D. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Rupture Disc:

1. The rupture discs used shall be suitable for the specified chemical and rupture when a predetermined pressure level is reached.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Install rupture discs in complete accordance with the manufacturer's printed instructions and the approved Shop Drawings.

B. Manufacturer's Representative:

1. The Contractor shall furnish the services of accredited representatives of the rupture disc manufacturer to supervise the installation, adjustment, and field tests of the equipment and to provide training for DEP operating personnel.

2. The services of the manufacturer's representative shall be furnished for installation supervision for at least the following number of days:

Visit:	Purpose:	Number of Visits:	Person-days per visit
No. 1	Installation Supervision	3	1

3. Should additional days of service be necessary for a successful installation, such services shall be provided by the Contractor at no additional cost to the City

SECTION 40 05 56 – PROCESS VALVES SMALLER THAN FOUR-INCH DIAMETER
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified and required, to furnish, install, and test all process valves smaller than four-inch diameter complete and operational.

B. The following index of this Section is included for convenience.

10. Naval Publications and Form Center (NPFC) A-A-59326D General Specification for Coupling Halves, Quick-Disconnect, Cam-Locking Type.

1.05 DESCRIPTION

A. The scope of this Section includes requirements for all process valves smaller than four-inches, in accordance with applicable standards and regulations. In addition:

1. All other valves referenced in Schedule 40 05 56-1, located after the "End of Section" designation, shall be for liquid service, unless otherwise explicitly indicated for air or digester gas service.
2. Electric actuators for electrically actuated valves shall be provided by the valve manufacturers.

1.06 QUALITY ASSURANCE

A. Manufacturer's Qualifications:

1. Manufacturer shall have a minimum of 5 years of experience in the production of substantially similar valve equipment, and shall show evidence of satisfactory service in at least 5 installations.

B. Supply and Compatibility:

1. Each type of valve, inclusive of all sizes specified for that type of valve, shall be the product of one (1) manufacturer.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

a. Quality Assurance Requirements:

1) All information necessary and required to substantiate approval of a valve manufacturer in accordance with the quality assurance requirements of this Section.

b. Shop Drawings:

1) Associated valve tag number(s) as specified in Schedule 40 05 56-1, located after the "End of Section" designation.

2) Complete catalog information, descriptive literature, specifications, and identification of all materials of construction.

3) Product data sheets for make and model. The valve(s) with size(s) and option(s) being submitted for approval are specifically identified in the product data sheet(s).

4) Power and control wiring diagrams, including terminals and numbers.

5) Complete nameplate data of electric actuators.

6) Spare parts list.

7) Special tools list.

c. Calculations:

1) Sizing of electric actuators, if applicable.

d. Operation and Maintenance Data: Submit complete manuals including:

1) Copies of all approved Shop Drawings, test reports, maintenance data and schedules, description of operation, and spare parts information.

e. Samples:

1) 1 ft. of chain for chain wheel operated valves.

2. Information Submittals:

a. Material test reports representing all major components of valves and operators shall be submitted. All such components shall be traceable to the original heat and/or lot numbers unless otherwise approved.

b. Certificates of compliance with AWWA Standards, if applicable.

c. Certificate of suitability of all valve materials for the specified service.

d. Certified copies of shop test results and inspection data.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. Valves and associated appurtenances shall be handled carefully. Valves which are dropped, dented, cracked, and/or otherwise damaged shall not be accepted.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Contractor shall provide spare parts and special tools necessary to service, disassemble, repair, and adjust the equipment provided under this Section, and as per the requirements of the Contract Documents. In addition:

1. The quantities of spare parts sets to be furnished are given in Table 40 05 56-1, below. Furnish the quantity of spare parts sets given in the table for each type and each size of valve included in this Section.

TABLE 40 05 56-1
QUANTITIES OF SPARE PARTS SETS TO FURNISH

Number of Valves Installed	Sets of Spare Valves Required
1-5	1
6-10	2
11-15	3
16-30	5
Greater than 30	5 + (1 for every 10 additional valves)

B. Tools: Provide standard and special tools and supplies necessary to service, disassemble, repair, and adjust the equipment, products.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Solenoid Valves:

1. Automatic Switch Company, Florham Park, NJ;
2. Automatic Valve Corporation, Novi, MI;
3. Or approved equal.

B. Ball Valves:

1. Stockham Valves and Fitting Company, Cullman, AL;
2. CVC Valves, former Lunkenheimer Company, Cincinnati, OH;
3. Or approved equal.

C. Pressure Reducing Valves:

1. Cla-Val Company, Milford, CT;
2. Watts Water Technologies, Inc., North Andover, MA;
3. Or approved equal.

D. Thermoplastic Ball Valves:

1. Asahi/America, Lawrence, MA;

2. Hayward Industries, Inc., Elizabeth, NJ;
3. NIBCO, Inc., Elkhart, IN;
4. Or approved equal.

E. Thermoplastic Check Valves:
1. Asahi/America, Lawrence, MA;
2. Hayward Industries, Inc., Elizabeth, NJ;
3. Or approved equal.

F. Quick Connect Couplings - Chemical Service:
1. Banjo Corporation, Crawfordsville, IN;
2. Bee Valve, Inc., Elyria, OH;
3. Or approved equal.

G. Electric Motor Actuators:
1. To be provided by valve manufacturer.

H. Pressure Relief Valves:
1. Asahi/America, Lawrence, MA;
2. Chemline Inc., St. Louis, MO
3. Or approved equal.

I. Backpressure Valves:
1. Model RVDT by Plast-O-Matic
2. Or approved equal.

J. Pulsation Dampener:
1. Blacoh Fluid Control
2. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. General:
1. Materials of Construction:
a. Compatibility for Service:
1) All materials of construction of the valves shall be confirmed suitable for the application by the valve manufacturer.
b. Wetted parts of the valve shall be protected from galvanic corrosion.

c. Ferrous Metals:

1) Cast iron of the valves, unless otherwise specified, shall conform to ASTM A126, Class A.

d. Non-ferrous Metals:

1) Non-ferrous Metals shall have standard composition and physical properties conforming to ASTM standards except as otherwise indicated.

e. Metal Castings:

1) All valves shall have manufacturer's name and rated pressure cast in raised letters on the valve body.

2) All valves shall have permanent markings for direction to open.

2. End Connections:

a. Shall be (at a minimum) suitable for the test pressure of the piping connected to the valve in question, as specified in:

1) For buried valves: Section 33 06 01 - Schedule for Buried Piping.

2) For exposed valves: Section 40 06 01 - Schedule for Exposed Piping.

3. Operation:

a. Direction: Clockwise to close (unless otherwise specified in Schedule 40 05 56-1, located after the "End of Section" designation).

4. All valves shall be constructed such that operation at the lower range of operating pressures specified shall not result in any leakage.

5. All valves shall be blowout proof.

B. Metallic Valves:

1. Solenoid Valves:

a. Type: Packless construction with screwed end connections and threaded conduit connection.

b. Materials: Bronze body and wetted parts with type 304 stainless steel hardware.

c. Coil: Continuous duty, epoxy encapsulated.

d. Failure Mode: Fail open, energize to close.

e. Electrical Power: 120 volt, 60 Hz, single phase.

f. Each solenoid valve shall be protected with a strainer upstream.

2. Ball Valves:

a. Body: Bronze, semi-steel or316 Stainless Steel. as specified herein.

b. Ball, Stem Handle and Hardware: Type 316 stainless steel.

c. Seat, Packing and Gasket: Polytetrafluoroethylene.

d. End Connections: Screwed.

e. Rating: 150 psig Water, Oil or Gas (W.O.G.).

f. All ball valves shall be full port.

3. Needle Valves:

a. Type: Long tapered plug for fine flow regulation.

b. Body and Wetted Parts: Bronze.

c. Handwheel: Malleable iron.

d. Hardware: Type 316 stainless steel.

e. End Connections: Screwed.

f. Rating: 150 psig.

4. Pressure Reducing Valves:

a. Type: Balanced, soft closing, single seat. Constant downstream pressure regardless of upstream pressure or flowrate. Drop tight shutoff when downstream pressure greater than spring setting.

b. Strainer: Integral with the valve, Type 316 stainless steel.

c. Body and Cover: Bronze with pressure gauge taps.

d. Trim: Type 316 stainless steel.

e. End Connections: Screwed.

f. Diaphragm: Ethylene propylene diene monomer rubber, fully guided at top and bottom.

g. Pressures and Flows: As specified in this section.

C. Valves for Thermoplastic Piping

1. Ball Valves:

a. Type: True union, full port.

1) Vented ball valve shall be provided for sodium hypochlorite services.

b. Body and Ball: Poly (Vinyl Chloride) (PVC) Compounds, ASTM D1784, Cell Classification 12454A.

1) A pre-drilled and de-burred 1/8-inch vent hole shall be provided to prevent pressurization when the valve is in the closed position for sodium hypochlorite services.

c. Stem: Type 316 stainless steel.

d. Seats: Polytetrafluoroethylene.

e. Seals:

1) Material: Fluoropolymer elastomer synthetic rubber.

2) Provide double seals.

f. O-Rings: Ethylene propylene diene monomer rubber.

g. End Connections: See Schedule 40 05 56-1.

1) Valves shall be provided with butt ends chemically compatible with chemical process piping.

h. Rating: 150 psig at 70°F.

2. Check Valves:

a. Type: True union, ball.

b. Body and Ball: PVC Compounds, ASTM D1784, Cell Classification 12454.

c. Seats: Polytetrafluoroethylene.

d. Seals: Fluoropolymer elastomer synthetic rubber.

e. O-rings: Ethylene propylene diene monomer rubber.

f. End Connections: See Schedule 40 05 56-1.

g. Rating:

1) Valves ≤ 2 inches: 150 psig at 70°F.

2) Valves > 2inches : 100 psig at 70°F.

D. Electric Motor Actuators:

1. General:

a. Electric motor actuators shall be provided by the valve manufacturer.

b. Electric motor actuators shall conform to the requirements of AWWA C542.

c. Type: Open-Close, reversing.

d. Open-Close Time for Ball Valves: 10 sec.

2. Materials and Construction:
   a. Housing: NEMA 4X with corrosion resistant epoxy coating.
   b. Power: 120 vac, 60 Hz, single phase.
   c. SPDT switches shall be provided for remote valve position indication.
   d. Space heater and thermostat shall be provided in the housing.
   e. Integral thermal overload protection shall be provided with automatic reset.
   f. Limit switches shall be in accordance with the requirements for electric motor actuators specified in Section 40 05 53 - Process Valves Four-inch Diameter and Larger.

E. Appurtenances and Miscellaneous Items
1. Corporation Stops:
   a. Type: AWWA standard tapered thread, ball valve.
   b. Material: Bronze.
   c. End Connection:
      1) Copper Pipe: Threaded flare.
      2) Thermoplastic Pipe: Compression with Type 304 stainless steel stiffener rings.
2. Strainers:
   a. Type: Y-pattern.
   b. Body:
      1) Metallic Piping: Bronze, screwed ends.
      2) Thermoplastic Piping: CPVC Compounds, true union ends.
   c. Screens: Monel, No. 20 mesh, 2.5 times the inlet area.
   d. Rating: 125 psig.
3. Quick Connect Couplings - Water Service:
   a. Type: Dual cam and groove, male end dimensionally meeting the requirements of A-A-59326D, with dust cap, Type 304 stainless steel chain and lock.
   b. Body: Cast iron.
   c. Cam Arms: Type 304 stainless steel.
   d. Gaskets: Acrylonitrile butadiene synthetic rubber.
4. Quick Connect Couplings - Chemical Service:

a. Type: Dual cam and groove, male end dimensionally meeting the requirements of A-A-59326D, with dust cap, Type 316 stainless steel chain and lock.

b. Body: Polypropylene.

c. Cam Arms: Type 316 stainless steel.

d. Gaskets: Ethylene propylene diene monomer rubber.

e. End Connections: Solvent socket welded.

5. Dielectric Pipe Couplings:

a. Provide at every location where copper pipe connects to steel, stainless steel or ductile iron pipe or equipment.

b. Body: Steel with non-conducting bushings on each end.

c. End Connections: Screwed.

d. Rating: 200 psig at 225°F.

6. Valve Boxes, Floor Boxes and Operating Wrenches:

a. Provide in accordance with Section 40 05 53 – Process Valves Four-inch Diameter and Larger.

7. Valve Chain Operators:

a. All ball, butterfly and diaphragm valves 1½-in. and larger located more than 6 ft.-0 in. above the operating floor level shall be equipped with a manual gear operator mounting assembly and a chain operator adapted to fit the gear operator, chain guide and sprocket wheel bolted directly to the valve operating wheel.

b. Aluminum or type 316 stainless steel chain shall be provided to hang three feet above the operating floor. All operators shall be equipped with a ½-in. hook bolt located to keep chain out of walking areas or to permit access to equipment.

c. Chain shall be of welded link type with smooth finish. Chain that is crimped and has links type with exposed ends that may scratch or cut the operator shall not be acceptable.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. General:

1. Painting of Exposed Valves and Appurtenances:

a. Exterior steel, cast-iron, and ductile iron surfaces except machined or bearing surfaces of all exposed valves and appurtenances shall be finish painted in the shop.

b. The surface preparation, priming, finish painting, and field touch-up painting shall conform to the requirements of Section 09 91 00 – Painting.

2. Nameplates:

a. All valves shall be provided with Type 316 stainless steel nameplates attached with Type 316 stainless steel screws.

b. The nameplates shall have engraved letters and shall include the following information as a minimum:

1) Valve size.

2) Pressure and temperature ratings.

3) Date of manufacture.

4) Manufacturer's name and address.

3. Identification:

a. The valves shall be provided with identification conforming to the requirements of Section 40 05 97 – Identification for Process Equipment.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Shop test all valves in accordance with the manufacturer’s standard test procedures.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Install valves in complete accordance with the manufacturer's printed instructions and the approved Shop Drawings.

B. All valves shall be installed plumb and level. The valves shall be free from distortion and strain caused by misaligned piping, equipment or other causes.

C. All valves shall be installed so that operating handwheels or levers may be conveniently turned from operating floor without interfering with access, and shall be as approved by the Engineer. Chain operators shall be oriented out of the way from the walking areas.

D. For motor-operated valves located less than 6.00 ft. above the operating floor, the orientation of the motor actuator shall permit easy access to the push buttons and the handwheel.

E. For buried valves:

1. The valve boxes shall be set plumb and centered.
2. Carefully tamp to a lateral distance of 4 ft. on all sides of the valve box.
3. If the undisturbed trench face is less than 4 ft. from the valve box in any direction, carefully tamp to the undisturbed trench face.

F. Provide identification accordance with the requirements of Section 40 05 97 – Identification for Process Equipment.

3.03 FIELD TESTING / QUALITY CONTROL

A. All parts and components shall be adjusted as required to provide correct operation.

B. A functional field test of each valve shall be conducted in the presence of the Engineer to demonstrate that each part and all components function together correctly.

3.04 STARTUP / DEMONSTRATION

A. Where specified herein, the Contractor shall provide the services of qualified factory-trained service technicians to check and approve the installation.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Provide field touch up painting in accordance with the requirements of Section 09 91 00 – Painting.

SECTION 40 05 89 – AUTOMATIC SELF-CLEANING STRAINERS
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified and required, to furnish, install, and test all automatic self-cleaning strainers, complete and operational.

B. The following index of this Section is presented for convenience:

Article	Title	Section Page
PART 1	GENERAL	1
1.01	Summary	1
1.02	Payment	1
1.03	Related Sections	1
1.04	References	2
1.05	Description	2
1.06	Quality Assurance	2
1.07	Submittals	2
1.08	Delivery, Storage, and Handling	3
1.09	Spare Parts, Special Tools, and Supplies	3
1.10	Warranty	3

3.05	Adjusting / Protection / Cleanup	5

C. The following schedule, attached after the End of Section designation, is a part of this Section:

1. Schedule 40 05 89-1, Automatic Self-Cleaning Strainer Schedule.

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Not Used

1.04 REFERENCES

A. Not Used

1.05 DESCRIPTION

A. Automatic self-cleaning strainers shall be electrically driven with a self-cleaning process that initiates either when the pressure differential across the screen reaches a pre-set value or after an adjustable pre-determined lapse or time.

B. Design Requirements:

1. Type of Fluid: Combined sewer.
2. Maximum Flow Rate: 110 gpm.
3. Minimum Working Pressure: 22 psi.
4. Maximum Working Pressure: 120 psi.
5. Maximum Working Temperature: 140 degrees F.
6. Flushing Requirements: 25 gpm at 22 psi.
7. Refer to Schedule 40 05 89-1, Automatic Self-Cleaning Strainer Schedule, located after the "End of Section" designation for specific requirements for each strainer.

1.06 QUALITY ASSURANCE

A. Manufacturer's Qualifications:

1. Manufacturer shall have a minimum of 5 years of experience in the production of substantially similar automatic self-cleaning strainer equipment and shall show evidence of satisfactory service in at least 5 installations.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

a. Shop Drawings:

1) Complete catalog information, descriptive literature, specifications, and identification of all materials of construction.

2) Product data sheets for make and model. The valve(s) with size(s) and option(s) being submitted for approval are specifically identified in the product data sheet(s).

3) Power and control wiring diagrams, including terminals and numbers.

4) Spare parts list.

5) Special tools list.

b. Operation and Maintenance Data: Submit complete manuals including:

1) Copies of all approved Shop Drawings, test reports, maintenance data and schedules, description of operation, and spare parts information.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Contractor shall provide spare parts and special tools necessary to service, disassemble, repair, and adjust the equipment provided under this Section, and as per the requirements of the Contract Documents. In addition:

1. Two (2) screen o-rings.

2. One (1) spare screen per size.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. TAF Series as manufactured by Amiad Water Systems, Mooresville, NC.

B. No alternate manufacturer or product will be accepted.

2.02 MATERIALS / EQUIPMENT

A. Automatic Self-Cleaning Strainer:

1. General:

a. Strainer shall operate under a positive pipeline pressure on the discharge side or downstream from the pump. Pipeline pressure and water shall efficiently backwash strainer media. A valve on the backwash discharge pipe shall control pressure drop and amount of water wasted in back flushing.

2. Materials and Construction:

a. Filter Housing and Lid: Nylon.

b. End Connection Type: NPT.

c. Screen: Type 316 stainless steel with polypropylene construction.

d. Exhaust Valve: Plastic, natural rubber.

e. Seals: NBR.

B. Controller:

1. General:

a. Integral controllers shall be provided by the automatic self-cleaning strainer manufacturer. Battery-powered controllers will not be accepted.

b. Backflushing:

1) Backflushing shall initiate based on a user-adjustable value for differential pressure, user-adjustable time interval, and manual operation.

2. Materials and Construction:

a. Power: 120 vac, 60 Hz, single phase.

b. Control Voltage: 24 VAC.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Install automatic self-cleaning strainers in complete accordance with the manufacturer's printed instructions and the approved Shop Drawings.

B. Manufacturer's Representative:

1. The Contractor shall furnish the services of accredited representatives of the automatic self-cleaning strainer manufacturer to supervise the installation, adjustment, and field tests of the equipment and to provide training for DEP operating personnel.

2. The services of the manufacturer's representative shall be furnished for installation supervision for at least the following number of days:

Visit:	Purpose:	Number of Visits:	Person-days per Visit:
No. 1	Installation Supervision	3	1

3. Should additional days of service be necessary for a successful installation, such services shall be provided by the Contractor at no additional cost to the City.

C. Provide identification accordance with the requirements of Section 40 05 97 – Identification for Process Equipment.

3.03 FIELD TESTING / QUALITY CONTROL

A. All parts and components shall be adjusted as required to provide correct operation.

B. Perform the following functional tests:

1. Dry Flushing Cycle Operation – Operate a “dry” flushing cycle based on to verify proper operation of the controller, motor, and solenoid valve.

2. Wet Flushing Cycle Operation – Operate a “wet” flushing cycle based on to verify proper operation of the controller, motor, and solenoid valve. During this test, the service water connection shall be opened and the strainer outlet valve shall be closed.

C. The Contractor shall provide the services of the automatic self-cleaning manufacturer's representative at such times and for such durations of time as are needed to perform the field testing tasks required of the representative.

1. The services of a manufacturer's representative shall be furnished for field testing for at least the following number of days:

Visit	Purpose:	Number of Visits:	Person-days per Visit:
No. 2	Field Testing	3	1

3.04 STARTUP / DEMONSTRATION

A. Where specified herein, the Contractor shall provide the services of qualified factory-trained service technicians to check and approve the installation.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

SECTION 40 05 97– IDENTIFICATION FOR PROCESS EQUIPMENT
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified and required, to furnish and install all components of the system for identification of exposed piping and equipment.

B. The following index of this Section is presented for convenience:

Article	Title	Section Page

J. New York City Local Law 30

1.05 DESCRIPTION

A. This Section describes the system for the identification of piping and equipment. This includes the placing of identification signs and direction-of-flow arrows on all visible, exposed plant piping, the placing of nameplates on plant equipment and structures, and painting in color of all equipment and pipe (except stainless steel or aluminum surfaces) as shown on the Contractor's Shop Drawings submitted under other Section(s) for equipment, piping, and valves, and as required.

1.06 QUALITY ASSURANCE

A. Provide the specified items from firms regularly engaged in the manufacture of identification devices of types and sizes required, with at least five (5) years' experience in manufacturing signs.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

a. Submit samples of the lettering to be used for fiberglass reinforced plastic signs to the Engineer for approval before manufacturing begins.

1) Such samples must show the height, width and spacing of letters and numbers for any three (3) legends of ten or more letters and spaces as specified herein.

b. Submit sample direction-of-flow arrows for both sizes of pipe identification signs to the Engineer for approval before installation.

c. Submit details of the method of fastening nameplates to the Engineer.

1) Since it is impractical to detail each means of attachment in the Contract Drawings, each means of attachment shall receive approval only on its own merits – submit for approval sketches of each type of attachment proposed.

2. Information Submittals:

a. Submit certification on acid resistance to the Engineer prior to installation.

b. Submit manufacturer's guarantee and warranty, in writing.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Contractor shall provide spare parts and special tools necessary to service, disassemble, repair, and adjust the materials provided under this Section, and as per the requirements of the Contract Documents.

B. In addition, provide the following spare parts for identification of piping and equipment:

1. For every twenty (20) pipe identification signs installed:

a. One (1) pair stainless steel mounting screws

b. One (1) pair stainless steel threaded brackets

c. One (1) pair fiber or plastic washers

d. One (1) pair stainless steel banding seals

2. One (1) set banding tools and banding accessories

3. One (1) stainless steel banding strap, approximately 1000 ft.

4. One (1) complete nameplate mounting assembly for every twenty (20) nameplates installed

5. One (1) stainless steel cable and splice for every twenty (20) valve identification tags

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Mounting assembly "Steelbinder" strapping units:

1. A.J. Gerrard & Co., Lake City, FL;

2. Independent Metal Strap, Roslyn, NY;

3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Construction:

1. Construct fiberglass reinforced plastic identification signs and nameplates of 100 mils thick fiberglass reinforced plastic conforming to ASTM D709.

2. Provide fiberglass reinforced plastic process with a blemish free, low gloss surface of superior permanence and durability in the colors selected.

3. Construct all signs and nameplates in conformity with ASTM D523, D638, D646, D790, D792, and D5420.

4. Make direction-of-flow arrows for attachment to pipe identification signs from No. 16 U.S. gauge Type 304 stainless steel, the full width of the sign.

5. Chemical Resistance:

a. Provide fiberglass reinforced plastic signs resistant to abrasion, impact, corrosion, and the following acids, alkalis, salts, and solvents in accordance with ASTM D543:

1) 10% citric acid

2) 5% acetic acid

3) 3-30% sulfuric acid

4) 10% ammonium hydroxide

5) 10% sodium chloride
6) turpentine
7) mineral spirits
8) heptane
9) kerosene
10) ethyl alcohol
11) ethyl acetate
12) transformer oil
13) heavy duty detergents
14) water
15) 15% sodium hypochlorite
16) 22% sodium bisulfite

B. Lettering:

1. Provide lettering made by silk screening or other permanent embedment of subsurface printed graphics in the material so as to produce a clear, legible sign.

C. Grommets and Holes:

1. Provide signs for piping and valve identification with two ⅜-in. diameter grommet-protected holes located on the long side center line, the center of the hole to be ½-in. from the edge.
2. Provide nameplates for equipment and structures with four ⅜-in. diameter grommet-protected holes, the center of the hole located ½-in. away from the edges.
3. Provide all holes with suitable brass or stainless steel grommets.
4. Shall be of Type 304 stainless steel construction.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Dimensions of Signs and Tags:

1. Provide identification signs and nameplates rectangular in shape and of the dimensions specified in Schedule 40 05 97-1, Dimensions of Identification Signs and Nameplates, located after the "End of Section" designation.
   a. A dimensioned tolerance of $\pm 1/16$- in. is permissible.

B. Lettering of Signs:

1. Perform all lettering and numbering on identification signs and nameplates in block style in size and spacing to suit the size of sign, as approved by the Engineer.

2. Unless otherwise approved by the Engineer, the following limits shall apply:
   a. Limit the legend on pipe identification signs to one (1) line and to a total of 12 letters and spaces
   b. Limit the legend on equipment nameplates to two (2) lines and a maximum of 35 letters and spaces.
3. Do not place lettering, symbols or markings containing the name of the manufacturer on the signs.
   a. The contract number and the year of the contract as given on the Contract Drawings may be placed in small lettering on the front of the sign, if approved by the Engineer.

C. Colors:
1. Provide each identification sign and nameplate in two colors and with the legend specified.
   a. Provide the backside of the sign in black or some other uniform color.
2. Code pipeline signs and equipment nameplates and finish coats of paint for pipe lines and equipment in basic colors.
3. Provide brilliant colors, distinctive shades matching as closely as possible (without custom color blending) the basic colors as specified by the Munsell Color System (MN) in Schedule 40 05 97-2, Table of Standard Colors, located after the "End of Section" designation:
4. Provide identification signs for pipelines of all sizes, mechanical equipment, sluice gates, and valves in the color combinations specified in Schedule 40 05 97-3, General Color Code, located after the "End of Section" designation.
5. Provide vents and drains of the same color combination as the contents of tanks and equipment vented and drained.
6. Identification signs for services not included in the Schedule 40 05 97-3 shall be black letters on a white background.

D. Legend for Pipe Identification Signs:
1. Provide identification signs, to identify the pipe line service, with the words or abbreviations in color combinations shown in Schedule 40 05 97-4, Pipe Identification Signs, located after the "End of Section" designation.
2. Number sluice gates and valves in conformity with the Basic Code as specified by the Operation and Maintenance Manual for the plant. Perform color combinations for such lines and valves in the same color combinations as the medium serviced and as specified in Schedule 40 05 97-3.

3. In addition to the identification requirements listed above, for all gas piping at pressures above ½ psig, show the maximum pressure level within the piping as required by New York City Local Law 30.

E. Valve Identification Tags:

1. Furnish and attach valve identification tags to all valves, gates, and controls.

2. Provide round fiberglass reinforced plastic tags, in sizes per Schedule 40 05 97-1, made in conformity with the requirements specified herein. Provide tags with one ⅛-in. grommet protected hole at the top for fastening to the valve body using $^{1}/_{16}$-in. diameter cable and splices or pins as approved. Provide grommets, cable splices and pins of stainless steel or other approved corrosion resistant material.

3. Provide numbering code for the identification tags in conformity with the Basic Code as specified by the Operation and Maintenance Manual for the plant. Assign identification numbers subject to the approval of the Engineer and in conformity with the entire piping and equipment identification system. Provide identification code for each valve and control without duplication. Provide lettering on identification tags not less than $^{5}/_{16}$-in. high and limited to two lines. Silk-screen lettering in correct color combination; stenciled or painted numbers and lettering will not be accepted.

4. In addition to the tagging requirements listed above, provide tags at all gas valves at pressures above ½ psig with the operating pressure within the valve shown as required by New York City Local Law 30.

F. Arrows:

1. Make the arrow head with a tapered point, about 90° at the apex, extending one half of the sign width from the sign edge and one half of the sign width extending under the sign.

   a. Make point with a radius of ¼-in. for the 3½-in. wide sign and a radius of $^{3}/_{16}$-in. for the 1½ in. wide sign.

2. Finish all edges of the arrow.

3. Punch detents on the arrows to prevent twisting of the point.

4. Drill one hole in the arrow in alignment with the hole in the pipe identification sign so that both sign and arrow can be mounted with the same screw and bracket.

G. Nameplates:

1. Provide nameplates for equipment and structures in the same color combination as the medium they service. Legends for nameplates must follow the terminology shown. Provide numbering system as described in the Operation and Maintenance Manual.

2. Schedule 40 05 97-5, Nameplates, located after the "End of Section" designation, is a representative list (and not necessarily complete) of nameplate legends with appropriate color combinations to which the equipment identification number(s) shall be added.

H. Additional Signs and Nameplates:

1. In addition to the legends specified above, the Engineer may order the Contractor to furnish and install additional identification signs, arrows and nameplates at no additional cost to the City.

2. Such additional signs may be requested near completion of the work and will be limited to no more than five (5) signs for each of the five (5) types listed in Schedule 40 05 97-1.

3. Conform legends and color combinations for additional signs to the requirements specified.

I. Color of Pipelines and Equipment:

1. Paint all pipelines and equipment in conformity with the requirements of Section 09 91 00 - Painting.

a. Color code the color of the final coats of paint.

2. Match the color of the final coats as closely as possible, without custom blending, to the colors presented in Schedule 40 05 97-6, Pipeline and Equipment Identification, located after the "End of Section" designation.

a. The colors in Schedule 40 05 97-6 and Schedule 40 05 97-7 are identified by a name and their SAE AMSSTD595 color identification number and shall match this standard; the names of the colors in Schedules 40 05 99-6 and 40 05 97-7 are for convenience only.

3. Do not paint aluminum or stainless steel ductwork or jackets on insulated pipelines. Should the Contract Documents state that flanges, flexible couplings, valves, and/or fittings for such jacketed lines not be covered, paint only the flanges, flexible couplings, valves, and/or fittings in accordance with the piping color code.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Location:

1. Locate identification signs for piping along straight line runs at intervals of not more than 30 ft, near valves, branches and junction points and where pipes pass through walls or ceilings.

2. Place direction-of-flow arrows as shown or required.

3. Locate signs on large valves on or adjacent to the valve itself.

4. Place all piping identification signs so as to be easily visible from operating locations.

5. Locate nameplates on equipment bases and on structures at readily visible levels in such positions relative to the equipment and structures so as to prevent damage to the nameplate.

3.02 INSTALLATION

A. Mounting:

1. Mount identification signs and arrows on piping parallel and tangent to the pipe and valves by fastening with screws, plastic or fiber washers, threaded brackets, and banding straps and seals.

2. Provide screws and brackets of stainless steel with 5/16 - 18 American Standard Coarse Threads; provide No. 25 U.S. gauge stainless steel, /4 inch wide bands.

3. Where pipe is insulated, use care in mounting the signs so to prevent the banding straps from crushing the insulation.

4. Provide mounting assembly "Steelbinder" strapping units.

5. Mount nameplates in the manner specifically approved by the Engineer, after the installation of equipment or the construction of structures is complete.

6. Mount valve identification signs with approved stainless steel brackets or approved stainless steel strapping in such a fashion that sharp corners or edges on signs, brackets, bolts, chain or strapping will not constitute a hazard to personnel operating the valves.

7. Do not attach identification tags or signs to handwheels.

8. Use of flange bolts or bonnet bolts as a means of attachment of brackets shall receive consideration by the Engineer.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

SECTION 40 05 98 – SEAL WATER SYSTEM
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified and required, to furnish, install, and test all seal water systems complete and operational

B. The following index of this Section is presented for convenience:

Article	Title	Section Page

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 22 07 19 – Plumbing Piping Insulation

B. Section 22 11 16 – Domestic Water Piping

C. Section 40 05 56 – Process Valves Smaller Than Four-inch Diameter

D. Section 40 70 71 – Measurement

1.04 REFERENCES

A. Not Used.

1.05 DESCRIPTION

A. Seal water systems shall be provided for each set of duplex chemical sump pumps as shown on the Contract Drawings.

B. The seal water system components include, not is not limited to the following:

1. Seal water feeder line, including piping and hoses.

2. Seal water valves, flow indicators, gages, and appurtenances.

3. Seal water monitoring and control units.

C. Seal water systems shall utilize service water piping. It shall be designed, constructed and installed for the service intended.

1. Each seal water system shall provide a flush to the column bearings of each chemical sump pump.

2. Each seal water system shall be designed to provide 6 gpm to each chemical sump pump at a pressure range of 30 to 60 psi.

1.06 QUALITY ASSURANCE

A. Manufacturer's Qualifications:

1. Manufacturer shall have a minimum of five years experience producing substantially similar equipment and shall be able to show evidence of at least five installations in satisfactory operation for at least five years.

B. Component Supply and Compatibility

1. All components shall be specifically constructed for the specified service conditions and shall be integrated into the overall seal water assembly.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

a. Shop Drawings:

1) Drawings Showing: Fabrication, assembly, installation and wiring diagrams.

2) Manufacturer's literature, illustrations, specifications and engineering data including; materials, dimensions, weights, performance data, part lists for all components furnished, and test reports

b. Operation and Maintenance Data: Submit complete manuals including:

1) Copies of all approved Shop Drawings, test reports, maintenance data and schedules, description of operation, and spare parts information.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Contractor shall provide spare parts and special tools necessary to service, disassemble, repair, and adjust the equipment provided under this Section, and as per the requirements of the Contract Documents. In addition, provide the following spare parts for each seal water system provided:

1. One pressure reducing valve.
2. Gaskets for all valves, gages, and meters.
3. One Seal Water Control and Monitoring Unit of each type supplied.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Seal Water Control and Monitoring Unit:

1. Safematic Safeunit, as manufactured by John Crane Company.
2. Seal Water Control System, as manufactured by Flexaseal.
3. Seal Water Flow Meter, as manufactured by Kytola Instruments.
4. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Seal Water Control and Monitoring Unit:

1. General:

a. Each Seal Water Control and Monitoring Unit shall include the following components:

1) Flow rate indicator.

2) Pressure gage.

3) Flow regulating valve.

4) Push-to-clean feature.

5) Low-flow alarm feature, with 120 volt output.

6) Mounting bracket and hardware.

b. Maximum Temperature: 170 degrees F.

c. Maximum Pressure: 145 psi.

2. Construction:

a. Connections: 3/8-inch barbed hose fitting connectors with industrial braided tubing for connection to pump.

B. Seal Water Feeder Piping: Provide copper in accordance with Section 22 11 16 – Domestic Water Piping. Provide insulation in accordance with Section 22 07 19 – Plumbing Piping Insulation.

C. Solenoid Valves: Provide in accordance with Section 40 05 56 – Process Valves Smaller Than Four-inch Diameter.

D. Ball Valves: Provide in accordance with Section 40 05 56 – Process Valves Smaller Than Four-inch Diameter.

E. Needle Valves: Provide in accordance with Section 40 05 56 – Process Valves Smaller Than Four-inch Diameter

F. Pressure Reducing Valves: Provide in accordance with Section 40 05 56 – Process Valves Smaller Than Four-inch Diameter.

G. Pressure Gages: Provide in accordance with Section 40 70 71 – Measurement.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Mounting bracket and hardware for the Seal Water Control and Monitoring Units shall be provided by the manufacturer.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Contractor shall verify that structures, pipes, and equipment are compatible.

3.02 INSTALLATION

A. Install seal water system in complete accordance with the manufacturer's printed instructions and the approved Shop Drawings.

B. Support piping independent of seal water unit.

C. Seal water piping located underneath ductwork shall be insulated.

3.03 FIELD TESTING / QUALITY CONTROL

A. A functional field test of each seal water system shall be conducted in the presence of the Engineer to demonstrate that each part and all components function together correctly. All parts and components shall be adjusted as required to provide correct operation.

B. The Contractor shall provide the services of the seal water system manufacturer's representative at such times and for such durations of time as are needed to approve the installation and perform the field testing tasks required of the representative.

1. The services of a manufacturer's representative shall be furnished for field testing for at least the following number of days:

Visit	Purpose:	Number of Visits:	Person-days per Visit:
No. 1	Field Testing	3	1

3.04 STARTUP / DEMONSTRATION

A. Not Used.

3.05 ADJUSTING / PROTECTION / CLEANUP

SECTION 40 06 01 – SCHEDULE FOR EXPOSED PIPING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified and required, to furnish, install, and test all exposed piping as indicated in the exposed piping schedule, complete and operational.

B. The following index of this Section is presented for convenience:

Article	Title	Section Page

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish, install, calibrate, test, start-up, commission, and place in operation a complete Process Monitoring Control System (PMCS). The PMCS shall be as specified in this Section, the Sections listed in the Related Sections of this Section, and as shown on the Contract Drawings.

B. PMCS shall be designed to control, monitor, store, display and log process and equipment operating information and alarms and to perform various control functions and generate various alarms.

C. The unit processes which the PMCS shall control and monitor are shown on the Contract Drawings and described herein.

D. Contractor shall coordinate with all PMCS equipment manufacturers to ensure that all control and instrumentation signals are incorporated properly.

E. P&IDs, Specifications of Division 40 and the Related Sections of this Section illustrate and describe the overall PMCS functional and operational requirements.

F. The System includes, but is not limited to the following:

1. New Main Control Panel (MCP-10) at the Flushing Bay Combined Sewer Overflow (CSO) Facility associated with TI-010, including interface and coordination with new field instruments, chlorination systems, and other auxiliary systems shall be provided as shown on the drawings and as specified in the Control Strategies.

2. New DC-5 Control Panel (DC5-CP-10) at the Lawrence & Peck Pump Station including interface with new non-contact flow meters shall be provided as shown on the drawings and as specified in the Control Strategies.

3. New Sodium Bisulfite Control Panel (SBS-CP-10) at the TI-010 Dechlorination Facility including interface and coordination with new Dechlorination systems, and other auxiliary systems shall be provided as shown on the drawings and as specified in the Control Strategies.

4. New Main Control Panel at the TI-011 Disinfection Facility (MCP-11), including interface and coordination with new field instruments, Chlorination systems, Dechlorination systems, and other auxiliary systems shall be provided as shown on the drawings and as specified in the Control Strategies.

5. Interface of new field instruments to an existing Regulator TI-09 Control Panel for the TI-011 facility which will be provided by a different contractor under the Floatables Removal Contract. Work with the Other Contractor to coordinate the placement of new flow

transmitters and associated intrinsic safety barriers in this existing panel which is being provided under the separate contract.

6. New Fill Station Panels at the Flushing Bay CSO Facility, TI-010 Dechlorination Facility, and the TI-011 Disinfection Facility.

7. Configuration of Programmable Logic Controllers (PLCs), Operator Interface Terminals (OITs) and CCFISS HMI displays.

8. Configuration of new cellular modems and coordination with City to effect communication with the DEP CCFISS Network, and to connect the different control panels to the overall CCFISS Network, as indicated on the drawings.

9. Coordination with the Process Monitoring Camera Systems Integrator under Section 28 00 00, for proper interface of CCTV control panels at the TI-010 and TI-011 facilities, with the respective process control panels via ethernet communication.

10. Provide interfacing with all systems as indicated on the P&IDs and as specified.

11. Field instruments specified herein.

12. All other appurtenances as listed in the various sections within Division 40.

G. The following index of this Section is presented for convenience:

1.04 REFERENCES

A. Definitions

1. AI - Analog Input
2. AO - Analog Output
3. Area Process - A number of unit processes grouped either because of their similar equipment operation or similar function in a Plant. Area Process also comprise groupings of dissimilar unit

processes designated a single group function.

4. CPU - Central Processing Unit
5. CS - Control Strategy
6. CSO - Combined Sewer Overflow
7. DEP BIT - DEP Bureau of Business Information Technology.
8. DI - Digital Input
9. Distributed I/O - Hardware specifically designed to function as Remote I/O.
10. Distributed
11. Control System Area - A control system comprising Unit and Process connected by a communication network which facilitates control and monitoring of the entire system from a central point such as a Plant control room.
12. DO - Digital Output
13. Fixed PLC - PLC whose hardware configuration comprises a fixed number of I/O, a CPU and power supply all in one enclosure.
14. HMI - Human Machine Interface are electronic displays and windows providing operator access to monitor access, and set parameters of a Unit Process control system.
15. I/O - Input/Output
16. Modular - A style of PLC assembly where I/O, CPU and power supply are each mounted in cards which are insertable to a mounting chassis or backplane.
17. OAD - Operational Availability Demonstration
18. OIT - Operator Interface Terminal; another name for HMI.
19. Control Panel - Control Panel includes any enclosure provided to house electrical equipment, instrumentation, controls wiring terminations, network hardware or connections, indicators, displays, computer hardware, panels of

packaged systems etc. provided under any Section of this Contract.

20. P&ID - Process and Instrumentation Diagrams included in the Contract Documents.
21. Plant - Combined Sewer Overflow (CSO) Facility
22. PLC - Programmable Logic Controller
23. PMCS - Process Monitoring and Control System
24. Remote I/O - Any I/O that functions physical remote from its location of the CPU and I/O located on backplane.
25. SCADA - Supervisory Control and Data Acquisition
26. SFT - Start-up and Field Testing
27. Unit Process - Any standalone equipment or process operation such as a pump in which all the logic for control of the equipment or process resides in the local installation.
28. URT - Upset and Recovery Testing
29. WFAT - Witnessed Factory Acceptance Tests

B. Reference Standards

The following organizations have generated standards that are to be used as guides in assuring quality and reliability of components and systems; govern nomenclature; define parameters of configuration and construction, in addition to specific details in this Section and the Contract Drawings:

1. BWT PDS - BWT Design Guideline, Program Development Standards.
2. BWT PLC - BWT Design Guideline, Programmable Logic Controllers.
3. BWT SCADA Software. - BWT Design Guideline, SCADA
4. ISA 5.1 Identification - Instrumentation Symbols and
5. ISA 5.2 Operations - Binary Logic Diagrams for Process
6. ISA 5.3 Control/Shared Logic and Computer - Graphic Symbols for Distributed Display Instrumentation, Systems.

7.	ISA 5.4	-	Instrument Loop Diagrams.
8.	ISA 5.5	-	Graphic Symbols for Process Displays.
9.	ISA 18.1 Specifications.	-	Annunciator Sequences and
10.	ISA 18.2 Process	-	Management of Alarm Systems for Industries.
11.	ISA TR20.00.01 Measurement General	-	Specification Forms for Process and Control Instruments Part1: Considerations.
12.	ISA 51.1	-	Process Instrumentation Terminology.
13.	ISA RP60.3	-	Human Engineering for Control Centers.
14.	ISA 101	-	Human Machine Interfaces for Process Automation Systems.
15.	NEMA 250	-	Enclosures for Electrical Equipment (1000 Volts Minimum).
16.	NEMA ICS 1	-	Industrial Control and Systems General Requirements.
17.	NEMA ICS 2	-	Industrial Control and System Controllers, Contactors and Overload Relays Rated 600V.
18.	NEMA ICS 4	-	Terminal Blocks.
19.	NFPA 79	-	Electrical Standard for Industrial Machinery.
20.	NYCEC	-	New York City Electrical Code.
21.	MIL-STD -1916	-	DOD Preferred Methods for Acceptance of Product.
22.	NYCEC	-	New York City Electrical Code.
23.	UL 508	-	Industrial Control Equipment.
24.	UL 1059	-	Terminal Blocks.

1.05 DESCRIPTION

A. The PMCS shall be a Distributed Control System (PLC and SCADA).

B. The system shall comprise unit processes organized into major process areas and a central monitoring and control point.

C. Unit processes shall be fully capable of accomplishing control, monitoring, storing and logging equipment operation at local point.

D. Unit Processes shall have the ability to transfer control to remote Area Control points or a remote Central Control point.

E. The system includes the following major equipment and all other appurtenances listed in the various Division 40 Sections:

F. Environmental Conditions:

1. The PMCS shall be designed and constructed for continuous operation under the following temperature and humidity conditions:

a. Control Rooms:

1) Ambient Temperature

a) Normal Range 60-degree F to 80-degree F.

b) Extremes 40-degree F to 105-degree F.

2) Relative Humidity

a) Normal 80 percent

b) Maximum 95 percent

b. Indoor locations for digital processing equipment hardware, control panels and instruments:

1) Ambient Temperature 40-degree F to 120-degree F.

2) Relative Humidity 98 percent maximum.

c. Outdoor locations

1) Ambient Temperature -10-degree F to 120-degree F.

2) Relative Humidity 100 percent maximum.

1.06 QUALITY ASSURANCE

A. Criteria

1. The PMCS facilities outlined in the Contract Documents and included herein have been designed to meet stringent quality standards. The criteria for selection of this system include, but are not limited to the following:

a. The use of standard, "non-custom" equipment and application software.

b. The ability of City's personnel to make modifications and adjustments in the field to react to actual field conditions.

c. The ability of City to obtain training of City's personnel in a well-established equipment manufacturer training program.

d. The availability of factory service and a well-stocked spare parts inventory, which could be drawn upon by the City in emergency situations.

B. PMCS Supplier

1. The PMCS shall be furnished by a single Supplier who shall assume responsibility for providing a complete and integrated system.

2. The system is to contain products of a single manufacturer, when possible, and to consist of equipment models, which are currently in production.

3. The Supplier shall identify those system components, which are not of his manufacture.

4. The Supplier shall supply his company's quality assurance plan, and for components which are not of his manufacture, the component manufacturer's quality assurance plan. The plans shall include but not necessarily be limited to:

   a. Method of testing, raw material criteria, methods of documentation, station control, "Burn-In", final tests and serialization coding and packaging.

   b. Plans should be in accordance with M.I.L.-STD-1916.

C. Supplier's Qualifications

1. Shall be a financially sound firm having at least five (5) years continuous experience in designing, implementing, supplying and supporting instrumentation and control systems, which are comparable to the PMCS in terms of hardware, software, cost and complexity.

2. Shall have manufactured and supported standard lines of digital processing and control equipment and application software continuously for the last five (5) years.

3. Shall have in existence at the time of bid advertisement, an experienced Engineering and Technical staff capable of designing, implementing, supplying and supporting the PMCS and handling the PMCS submittal and training requirements.

4. Shall provide system hardware components and software packages of fully developed, field proven standardized designs and therefore shall furnish a system which is not a highly unique, custom one-of-a-kind system.

5. Shall have a minimum of five (5) years' experience in operator interface software configuration and hardware application and programming of distributed microprocessor based controllers and data highway systems.

6. Shall provide standard course offerings in general process control applications and in operation, programming and maintenance of the control system and equipment at a facility specifically utilized for training purposes. The facility shall have been in operation continuously for the last five (5) years.

7. Shall have a thorough working knowledge of Plant operation and control philosophy in accordance with standard practices of the industry.
8. Shall have a system of traceability of the manufactured units and purchased components through production, assembly and testing.
9. Shall have a system of "Burn-In" for all components and available supportive documentation.
10. Shall have a demonstrated record of prompt response to field failures.
11. Shall have a documented program of failure analysis.
12. Shall have a UL approved panel shop.
13. Shall have a record of prompt shipments in accordance with Contract obligations required for previous projects.

D. Technical Proposal Requirements

1. The Contractor shall submit a copy of a Technical Proposal from the Supplier which he has selected to provide the PMCS.
2. The Technical Proposal shall be complete and at a minimum contain all information as specified below:
   a. Financial Statement
      1) Shall include the value of distributed microprocessor based control systems delivered during the last five (5) fiscal years.
      2) Shall include the value of other process instrumentation and controls shipped during the period.
   b. Experience
      1) Shall provide evidence of compliance with the specific experience requirements under the Supplier Qualification listed in this Section in the form of an experience certification signed by an officer of the company.
      2) Shall furnish list of last five (5) projects completed.
      3) Shall describe at least three (3) completed municipal projects utilizing instrumentation and control equipment identical to or similar to (indicate which) that specified in this Section.
      4) Shall indicate project name, value, completion date, names and phone numbers of representatives familiar with each project.
      5) Letters of recommendation submitted does not relieve the Contractor from complying the requirements in this Section
   c. Personnel

1) Shall provide a listing of those personnel committed to be assigned to the Contract.
2) List shall include Project Manager, Project Engineer, Field Representative, Local Service Representative, and Sales Representative.
3) Shall identify addresses of personnel not based at supplier's main office.
4) Shall provide documentation including resumes of personnel demonstrating experience in Plant operations.

d. Exceptions
1) Shall list all exceptions and deviations from the requirements of the Contract.
2) Shall reference the Drawing Number, Section number, article, and paragraph of proposed variance and provide an explanation of why the proposed exception or deviation meets (or exceeds) the functional or equipment requirements specified.

e. Shipment Records
1) Shall provide evidence of timely delivery of equipment on past projects.

f. PMCS Hardware and Software:
1) Shall provide a general system configuration drawing and include designations for model numbers and types of the proposed distributed control system components and all other proposed system components.
2) Shall provide descriptive literature and manufacturer's catalog information covering all aspects of the hardware design and software functions and capabilities of the specific distributed control system and data highway system proposed for the PMCS.
3) Shall provide descriptive literature and catalog information covering the features and capabilities of all proposed hardware components.
4) Shall describe standard software packages proposed, including any customized software required to meet the functional intent of the system Specifications.
5) Descriptions shall address the following:
a) Overview of system software including the functions, organization and interrelationship of the major software modules provided.

b) Estimated memory requirements to accomplish the specified graphic display, logging, reporting and alarming functional requirements.

c) Examples of graphic displays, methods of display access and procedures for display definition and generation, including use of the standard symbols library and capabilities for generating and storing user defined symbols in the symbol library.

d) Real-time data logging and reporting software features and capabilities including examples of logs and reports, procedures for automatic reporting and logging file setups, limitations on sampling and computing frequency for data acquisition and logging, and utilities for log file and report modifications and file maintenance.

e) Alarm handling software features and capabilities including an alarm display example, methods of defining alarms and alarm files, automatic printing of alarms, acknowledgements and return to normal conditions, chronological sorting and time-tagging of alarms, and alarm file maintenance utilities.

f) Distributed system programming and documentation software features and capabilities, including screen display and printout examples for a fully annotated and cross-referenced ladder diagram and the ladder diagram elements.

g) Use of system level diagnostics for monitoring the performance of and detecting and reporting faults associated with the distributed communications data highway.

g. Instrumentation and Panel Mounted Devices

1) The Contractor shall provide descriptive literature and catalog cuts for each type of sensor, transmitter, indicator, and other such devices required by the Contract.

h. Training

1) The Contractor shall provide information and literature as to the organization proposed and the factory facilities to be utilized for the training specified.

2) Indicate the qualifications of the factory training staff.

i. Availability Demonstration

1) The Contractor shall indicate how the Availability Demonstration will be accomplished.

j. Maintenance

1) The Contractor shall provide the following information:

a) Location of service facility along with minimum and maximum response time.

b) Location of parts facility with delivery time and method.

E. Supplier's Responsibility

1. The Contractor shall retain the PMCS supplier to assume the responsibilities specified below. However, execution of these specified duties by the System Supplier shall not relieve the Contractor of the ultimate responsibility for the PMCS.

a. Design, fabrication, implementation and applications programming of the PMCS and all subsystems in accordance with the Contract Documents and all referenced standards and codes.

b. Preparation, assembly and correction of all PMCS submittals in accordance with the Contract Documents.

c. Proper interfacing of the PMCS hardware, software, field devices and panels, including required interfacing with packaged control systems furnished by other equipment suppliers, and with the Facility's PMCS.

d. Supervision of the installation of PMCS, instruments, panels, consoles, cabinets, wiring and other components required.

e. Calibration, testing and start-up of the PMCS.

f. Training of the City personnel in operation and maintenance of the PMCS.

g. Handling of all warranty obligations for the control system components.

h. Maintenance of two (2) reproducible copies of the complete PMCS system and running software at the supplier's facility for the duration of the warranty period.

1) Software copies shall be maintained on the bulk storage medium used by the supplier for system program development and shall be directly loadable on the supplied system.

F. Coordination and Progress Meetings:

1. The Contractor shall be responsible for the scheduling and coordinating the system installation with regard to all other work on

the site and in accordance with the provisions of the General Conditions. Said coordination shall be documented on the project schedule.

2. Routine progress and coordination meetings will be scheduled by Engineer. The Contractor and a representative of the System Supplier shall be required to attend a minimum of one meeting per month for the length of Contract.

3. The purpose of the meetings shall be to review the progress of the work involving the PMCS and provide coordination for installation of the equipment to ensure construction schedules are met.

4. Representatives at the meetings shall have the competence and authority to make any and all necessary decisions. Decisions and statements made at the meetings shall commit the Contractor and the System Supplier to agreed procedures and schedules.

1)

G. System Supplier Project Personnel

1. The Contractor shall require the System Supplier to provide the following project personnel:

a. Project Manager

1) The System Supplier shall appoint a Project Manager who shall coordinate and schedule all work and assure that the Contract schedule is met.

2) The Project Manager shall have a minimum of five (5) years' experience in coordination, scheduling and delivery of instrumentation and control contracts under similar Plant Facilities as this Contract along with thorough working knowledge of contract administration as both a prime and sub-prime Vendor/Contractor.

3) The Project Manager shall act as the liaison with the Contractor for the installation of the PMCS and shall assist in all matters required for proper coordination and interfacing of the equipment and processes.

b. Field Engineer

1) The System Supplier shall appoint a Field Engineer with responsibilities as follows:

a) Provide advice and technical consultation relative to installation techniques and procedures for equipment furnished.

b) Installed system checkout, calibration, adjustment and start-up including tuning of every control loop.

c) Maintenance services during availability demonstration.

d) Involvement in the on-site system training of pumping station personnel.

e) Resolving of control problems encountered during initial start-up and testing of all PMCS monitoring equipment.

2) The Field Engineer shall have a minimum of five (5) years' experience in systems engineering and start-up and shall have a thorough working knowledge of both the hardware and software supplied for the PMCS.

c. Training Personnel:

1) Comply with requirements of Section 40 61 26 - PMCS Training.

1.07 SUBMITTALS

A. Shop Drawings General

1. The Contractor shall submit Shop Drawing and material specifications for the approval of the Engineer.

2. Shop Drawing preparation shall not commence until after the pre-submittal conference specified below.

3. Manufacture of the PMCS shall not commence until related and interfacing equipment submittals have been approved by the Engineer.

4. Shop Drawings shall be submitted in complete packages grouped to permit review of related items as generally outlined in this Section under Submittal Requirements.

5. Review of Shop Drawings will be for conformance with Contract Documents and with regard to functions specified to be provided.

B. Pre-Submittal Conference

1. The Contractor shall arrange and conduct a pre-submittal conference on the PMCS within thirty (30) days of notification of preliminary acceptance of the proposed PMCS and Supplier by the City and the Engineer.

2. The Pre-submittal conference shall be attended by representatives of Contractor, the PMCS Supplier, the Engineer, and the City. The Contractor shall allocate one (1) full working day for the conference and that time shall be included in the price of this Contract. The

meeting shall be held at the job site or location approved by the Engineer.

3. The purpose of the pre-submittal conference shall be to review informally and approve the manner in which the control system supplier intends to respond to the Contract requirements before any submittals are prepared.

4. Contractor shall prepare the items listed below for presentation at the pre-submittal conference. The information shall be submitted to Engineer three (3) working weeks prior to the date of the conference.

   a. List of equipment and materials required for the PMCS and the brand and model which Contractor proposes to use for each item or component of the proposed system.

   b. List of proposed exceptions to the plans and specifications along with a brief explanation of each.

      1) Approval of exceptions and substitution shall be subject to a formal submittal according to the Contract procedure.

   c. Sample of each type of submittal specified herein. These may be submittals prepared for other projects.

   d. A flow chart showing the steps to be taken in preparing and coordinating each control system submittal to the Engineer, and a list of proposed submittals.

   e. Schedule for all PMCS related activities from the pre-submittal conference through start-up and training.

      1) Particular emphasis shall be given to dates relative to submittal, design, fabrication, programming, factory testing, delivery, installation and field testing.

      2) The schedule shall be subdivided to show activities relative to each major item or group of items when everything in a given group is on the same schedule.

      3) Schedule shall conform to requirements for Contract schedules.

   f. General outline of the type of tests to be performed to verify that the PMCS and all its components including sensors/transducers, instruments and digital processing equipment are functioning properly.

C. Sensors/Transducers and Panel Instruments.

1. Submit product information for all sensors/transducers and panel instruments. Include the following:

   a. Manufacturer's product name and model number.

   b. Instrument tag number from Contract Documents.

c. Manufacturers' standard catalog product data.

d. Description of construction features.

e. Performance and operation data.

f. Installation and mounting details, instructions and recommendations.

g. Service requirements.

h. Dimensions.

D. PMCS Information:

1. System Description

a. Detailed block diagram showing system hardware configuration and identifying model numbers of system components.

b. Software language and organization:

1) Format, protocol and procedures for data highway communications and local communications with Input/Output modules and peripheral devices.

2. HMI details:

a. Control and failure modes.

b. On line and off line capabilities for programming, system utilities and diagnostics.

c. Input/Output point listing with I/O module cross reference identification for each distributed controller.

d. Data base listing including all Input/Output points.

e. Suggested detailed format and configuration of all log reports, alarm summaries, printer outputs, displays and graphics.

f. List of spare parts and test equipment.

3. Equipment Hardware

a. Layout drawings showing front, rear, end and plan views to scale of all processing equipment, I/O components, power supplies and peripheral devices.

b. Construction details, features and procedures.

c. Interconnection diagrams including termination details, cable identification list and cable length.

d. Plans showing equipment layout in control panels.

e. Installation requirements, instructions and/or recommendations

4. Software Description

a. Standard technical documentation covering all aspects of the PMCS software functions and capabilities, including instruction set description and programming procedures related to control, monitoring, display, logging, reporting and alarming functions

b. Standard technical and instructional documentation covering software for utility, system support, system documentation, display, communications, data logging and storage and diagnostic functions.

c. Functional Description:

1) Detailed functional descriptions of application programs explaining control, display, logging and alarming features to be provided and functions to be performed.

2) Operational descriptions covering the procedures for programming, operation, startup, shutdown and calibration of the control system equipment and explaining how the various control functions are performed.

3) Provide complete narratives of the Control Strategies, including initial setpoints, and methods of programming.

4) Verbatim cut and paste of the specifications will not be acceptable.

d. Documentation describing memory type, size and structure and listing size of system memory, I/O and data table memory and size of memory available for control programs. Also define estimated control program memory requirements and processor execution times and program scan times.

e. Documentation describing central monitoring station main and secondary memory type size and requirements to perform the display, logging, reporting and alarming functions required.

5. Panels, Consoles and Cabinets Information:

a. Layout Drawings shall include the following:

1) Front, rear, side, end and plan views to scale.

2) Dimensional information

3) Tag number and functional name of components mounted in and on panel, console or cabinet.

4) Product information on all panel components.

5) Nameplate location and legend including text, letter-size and colors to be used.

6) Location of anchoring connections and holes.

7) Location of external wiring and/or piping connections.

8) Mounting and installation details.

9) Proposed layouts and sizes of graphic display panels.
10) Calculations for heating and cooling.

b. Wiring and/or piping diagrams shall include the following:
1) Name of panel, console or cabinet.
2) Wiring sizes and types.
3) Piping sizes and types.
4) Terminal strip numbers.
5) Color coding.
6) Functional name and manufacturer's designation for components to which wiring and piping are connected.

c. Provide System Architecture Diagram including detailed physical layout of the PLC Panels, arrangement of the PLC, power supplies, I/O Modules, terminal blocks, and other components with dimensions, mounting arrangements, cable routing, and with annotations. Include detailed product numbers and actual connections based on the equipment that is actually provided.

d. Electrical control schematics in accordance with NFPA 79.

e. Plan showing equipment layout in each area.

6. Field piping diagrams shall include the following:
a. Piping sizes and types.
b. Location, functional name and manufacturer's designation of items to which piping is connected.

7. Instrument loop diagrams for all analog display, control and I/O loops prepared using ISA standard symbols in accordance with ISA 5.4 shall include the following:
a. Instrument tag numbers from Contract Documents.
b. Functional name of each item.
c. Manufacturer's model, product, or catalog number for each item.
d. Location of each item.
e. Showing loop diagrams as part of the Control Panel layout will not be accepted as a substitution.

8. Logic Diagrams such as function block diagrams that illustrate the logic and sequencing of control functions programmed into the PLC. Show relationship between input signals, output actions, timers, and other control elements. Showing logic diagrams as part of the Control Panel layout will not be accepted as a substitution.

9. ISA Data Sheets:

a. ISA Data Sheets shall comply with ISA–TR20.00.01–2001 requirements and shall be computer generated.

b. All field and panel instruments ISA Data Sheets shall contain the following information, as a minimum.

1) Tag number in accordance with Section 40 96 20 – Pump Monitor and Control System Instrument Index and Contract Drawings.

2) Product (item) name used herein and on the Contract Drawings.

3) Name of manufacturer or supplier.

4) Manufacturer's complete model number.

5) Location of the device.

6) Input-output characteristics.

7) Range, size, and graduations.

8) Physical size with dimensions, NEMA enclosure classification and mounting details.

9) Materials of construction of all components.

10) Instrument or control device sizing calculations, where applicable.

11) Certified calibration data on all flow metering devices, where applicable.

12) Environmental requirements during storage and operation.

10. PMCS I/O Loop Wiring Diagrams

a. Contractor shall prepare drawings on a module-by-module basis and include the following information:

1) Rack numbers, slot number, module type and module terminal point numbers. Also, include location and identification of all intermediate panel terminal block and strip numbers to which I/O wiring and power supply wiring is connected. Identify all power supply circuit numbers and ratings.

2) Wiring sizes, types, wire numbers and color-coding.

3) Location, functional name, tag numbers and manufacturer model numbers of panel and field devices and instruments to which I/O wiring is connected. For discrete I/O devices, use JIC electrical symbols tagged with designation shown on P&IDs.

11. System Software Documentation: Prepare and submit two copies of preliminary software documentation at least four (4) weeks prior to expected initiation of factory testing as specified in Section 40 80 81, PMCS Factory Testing. Submittal shall be for information only and

shall not be subject to formal approval. Software documentation shall be available as physical and digital format with all required software and licenses provided and shall include the following as a minimum:

a. Complete hard copies of all ladder diagram programming. Documentation shall include complete external and internal I/O coil, contact and signal cross-referencing, addressing and rung numbering. Documentation shall clearly distinguish between internal and real I/O and shall also incorporate extensive English language to identify contact, coil and signal functions and for labeling and description of program, sub-program and rung purpose and action.

b. Complete listing of external and internal I/O address assignments, register assignments and preset constant values along with unused/undefined I/O and data table registers available.

c. Complete hard copies of all program documentation for all types of programs.

d. Detailed system memory map defining memory segments used and spare memory segments available for system memory, I/O tables, Data Tables, and control program.

e. Complete database listing including listings for log, report, and alarm file setups.

f. Hard copies of all system graphic displays for formats for all logs, reports, and the alarm summary.

g. User's manuals describing procedures and providing examples for use of operator's consoles, workstations and programming terminal, accessories, and system utility routines to perform control, display and logging program generation, program modification, program verification, diagnostics, program documentation, loading and backup and other required system support functions.

h. Graphic displays: Submit samples of each type of display.

E. The Contractor shall include a submittal of related PMCS record drawings, the furnishings of licenses for plant personnel to allow changes of software, settings, and include the furnishing of Operations and Maintenance Manuals.

F. Spare Parts and Test Equipment:

1. General:

a. Furnish the spare parts and test equipment in accordance with the Contract Documents, identical to and interchangeable with similar

materials and equipment provided for the Process Control System under the Contract.

b. Provide source quality control for spare parts as part of factory testing prior to shipment of process control system equipment.

c. For process sensors and other analog instruments, the Supplier shall submit a separate quotation for recommended list of spare parts and test equipment. Separately list and price each item recommended. Upon request, Supplier shall submit documentation that stock of spare parts and test equipment is obtainable within 48 hours of receipt of City's order.

2. Furnish the following spare parts:

a. Ten (10) of each type of Input/Output relay for each quantity of forty or fraction thereof provided under the Contract.

b. Two (2) of each type of PLC Input/Output module or card used.

c. Two (2) spare processor for each type of PLC used.

d. Two (2) replacement power supply for each type and size provided under the Contract.

e. Two-year supply of all expendable or consumable materials.

f. Two (2) per quantity of five (5) or fraction thereof of gauges, indicators, and switches provided, complete with diaphragm seals, filled and ready to use.

g. Two (2) per quantity of ten (10) or fraction thereof provided, per range of field instruments. No spares are required for inline instruments such as magnetic flow meters through which flow is conveyed.

h. Twelve (12) of each type and size of fuse used in instruments.

3. Furnish the following test equipment:

a. Four (4) Fluke, Hewlett-Packard, or approved equal (latest in series) digital multimeter plus amp probe, high-voltage probe, test leads, case, and other recommended spares and accessories.

b. Two (2) of each set of special tools required to insert, extract, and connect internal or external connectors, including edge connectors.

c. Two (2) sets of special calibration equipment required for system calibration.

d. Two (2) signal simulators (4 to 20 mADC; 1 to 5 VDC), including case. One simulator shall be battery-powered and shall include charger.

e. Two (2) portable flow meter calibrator, for magnetic flow meter use only.

G. PMCS Operation and Maintenance (O&M) Manuals

1. The Contractor shall furnish O&M manuals for the PMCS in accordance with the Section 01 78 25 – Operation and Maintenance Manuals, this Section and the following minimum requirements:

a. Name, address and telephone number of the PMCS Supplier's local service representative.

b. Complete list of supplied system hardware parts with full model numbers referred to system part designations, including spare parts and test equipment provided.

c. Copy of all approved submittal information and system shop drawings as specified herein with corrections made to reflect actual system as tested and delivered to the site for installation.

d. Half-size black line reproductions shall be provided for all shop drawings larger than 11 by 17 inches.

e. All drawings shall be 11 by 17 inches minimum size.

1) Drawings 8-1/2 by 11 inches are not acceptable.

f. Manufacturer's Original Copies of Hardware, Software and Installation, Assembly and Operations Manuals for the PMCS central monitoring station and peripheral devices, and all other control system components.

g. Manuals shall include the following information:

1) General descriptive information covering the basic features of the equipment

2) Physical description covering layout and installation requirements and all environmental constraints.

3) Functional and operational descriptions covering the procedures for programming, operation, start-up, shutdown, and calibration of the distributed control system equipment and explaining how the various control functions are performed.

4) Principles of operation explaining the logic of operation; provide information covering operation to a component level.

5) Maintenance procedures covering checkout, troubleshooting, and servicing.

a) Checkout procedures shall provide the means to verify the satisfactory operation of equipment,

b) Troubleshooting procedures shall serve as a guide in determining faulty components and

c) Servicing procedure shall cover requirements and recommended time schedule for calibration, cleaning, lubrication and other housekeeping and preventive maintenance procedures.

6) As-Built wiring, schematic and logic diagrams.

7) Safety considerations relating to operation and maintenance procedures.

H. Record Drawings and Documentation

1. The Contractor shall require the System supplier to revise all system shop drawings, submittals and software documentation to reflect as-built conditions in accordance with the requirements of the Contract Documents and the supplemental requirements.

2. All revised shop drawings and documentation shall be submitted to the Engineer per Section 01 78 40 – Final Record Documents to replace outdated drawings and documentation contained in the system O&M Manuals.

3. Half-size black line sets shall be provided for all drawings larger than 11 x 17. Specific instructions for outdated drawing removal and replacement shall be provided with the record drawing submittal.

4. Half-size black line prints of wiring diagrams applicable to each control panel shall be provided inside a clear plastic envelope and stored in a suitable print pocket or container inside each control panel.

I. Reports:

1. The following report shall be submitted shall be submitted to the Engineer:

a. Factory Test Reports as specified in Section 40 80 81 - PMCS Factory Testing.

b. Installation Inspection, Field Calibration, and Field Testing. Reports, as specified in Section 40 80 82 - PMCS Factory Testing.

c. Training as specified in Section 40 61 26 – PMCS Training.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The PMCS equipment shall be delivered, stored and handled in accordance with the Sections listed under Related Specification of this Section, the Specifications, the manufacturer’s recommendations and the following:

1. PMCS equipment shall be packaged at the factory prior to shipment to site, to protect each item from damage during shipment and storage.
2. Containers shall be protected against impact, abrasion, corrosion, discoloration and/or other damages.
3. Clearly label contents of each container and provide information on the required storage conditions necessary for the equipment.
4. PMCS equipment shall be inspected for shipping damage or loose parts when received.
5. Evidence of water which may have entered equipment during transit shall be checked.
6. PMCS equipment shall be lifted, rolled or jacked into locations shown on the Contract Drawings.
7. PMCS equipment shall be stored in a clean, dry location in which a uniform temperature is maintained.
8. PMCS equipment shall be protected in storage with suitable covering and air circulation maintained to ensure the equipment is kept dry and free from condensation.
9. Where dampness or condensation may be encountered, heaters shall be provided for equipment to prevent moisture damage.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall furnish and deliver to the Engineer, at that part of the site and at such time as the Engineer may direct, spare parts for the PMCS in accordance with the Sections listed under Related Specifications of this Section.

B. The spare parts shall be listed in an index and packed in containers suitable for long term storage, bearing labels clearly designating the manufacturer's part number with complete information for use and reordering.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer’s standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. PMCS/s shall be as manufactured by:

1. Optimum Controls Corp, Reading, PA;
2. PCS Systems Integrators, Fairfield, NJ.

3. A.K. De Rama Industrial Control System Inc., Mountainside, NJ.
4. Avantech, Inc., Columbia, SC.
5. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Design Criteria

1. Power Supplies:

a. All electrically powered equipment and devices shall be suitable for operation on 115-volt +/- 10 percent, 60 Hz. If a different voltage or closer regulation is required, a suitable regulator or transformer shall be provided.

b. Appropriate power supplies shall be furnished by the Contractor for all two (2) wire transmitters, loops for monitoring discrete inputs and all necessary outputs.

c. Power supplies shall be mounted in enclosures and installed in the appropriate indoor or field panel.

d. Power supplies shall be sized adequately for signal converter and repeater loads.

e. Design all power supplies for a minimum of 130 percent of the maximum simultaneous current draw.

f. A power on-off switch or an air circuit breaker shall be furnished for each item requiring electrical power.

g. Provide isolation transformers, line voltage regulators and power distribution panels for the distributed digital portions of the PMCS to eliminate electrical noise and/or transients entering on the primary power line.

2. Signal Requirements

a. The control system shall be designed to use 4 to 20 mA DC analog signals, unless otherwise specified.

b. Signal converters and repeaters shall be provided where required and in addition analog inputs to the distributed control system shall be through appropriate repeaters to provide signal isolation where series looped with other devices and to allow the loop to maintain integrity even if the distributed control system is out of service.

c. Signals shall be isolated from ground.

d. Signals shall not have a transient dc voltage exceeding 300 volts over one millisecond nor a dc component over 300 volts.

e. Equipment ranges, scales and set-point values specified in Division 40 and as shown on the P&IDs are for initial setting and

configuration. Contractor shall coordinate these values with actual equipment furnished to implement proper and stable process action as systems are placed in operation.

f. For any items where ranges, scales and set-points may not have been specified, Contractor shall submit a recommendation to the Engineer for review and approval.

g. Design all logic and control loops for fail-safe operation.

h. Surge protection shall be provided for all PMCS and all other control system components which could be damaged by electrical surges.

i. The system and associated Input/Output wiring will be used in a Plant environment where there can be high energy ac fields, dc control pulses, and varying ground potentials between the sensors/transducers or input contact locations and the system components. The system design shall be adequate to provide proper protection against interference from all such possible situations.

B. Miscellaneous:

1. All PMCS components shall be heavy-duty types, designed for continuous service in a Combined Sewage Overflow Plant environment.

2. All equipment provided are to be of Modular construction and to be capable of field expansion through the installation of plug-in circuit cards and additional cabinets as necessary.

3. All instrumentation and PMCS components shall be designed to return automatically to accurate measurement within 15 seconds upon restoration of power after a power failure or when transferred to standby power supply.

4. All field-mounted instruments and system components shall be designed for installation in humid and corrosive service conditions.

5. All field mounted cabinets, instrument enclosures, junction boxes and appurtenances shall conform to NEMA 4X requirements and be made of 12 gage 316 stainless steel, unless otherwise specified. For Class 1 Division 1 or Division 2 locations, provide NEMA 7. Unless otherwise stated, all transmitters installed outdoors shall be mounted in thermostatically heated enclosures.

6. All relays with interconnections to field devices shall be wired through terminal blocks. Terminals as part of the relay base are not an acceptable alternate.

7. All panel mounted instruments, switches, and other devices shall be selected and arranged to present a pleasing coordinated appearance. All panel door mounted devices shall be of the same manufacturer and model line.

8. Ranges and scales specified herein shall be coordinated to suit equipment actually furnished.

9. All components furnished, including field and rear of panel instruments, shall be tagged with the item number and nomenclature indicated on the Contract Documents and/or approved Shop Drawings.

10. All instruments and devices shall be tagged with the associated tag number from the Instrument List and/or Instrument Data Sheets.

11. All I/O shall be tagged with the associated tag number from the I/O List.

12. All PLCs, I/O racks, and all networking equipment shall be tagged with a unique identification tag number which will be provided to the Contractor as a numbering range system for the affected equipment.

13. Tag numbers for sensors and field instruments shall be as listed on the Contract Drawings and Instrument List/Instrument Data Sheets. The prefix shall be included with ISA Tag Number.

14. The identifying tag number shall be permanently etched or embossed onto a stainless-steel tag which shall be fastened to the device housing with stainless-steel rivets or self-tapping screws of appropriate size.

15. Where neither of the above fastenings can be accomplished, tags shall be permanently attached to the device by a circlet of 1/16-inch diameter stainless-steel wire rope.

16. All sensors and field instruments mounted on or within panels shall have the stainless-steel identification tag installed so that the numbers are easily visible to the service personnel.

17. Field-mounted devices shall be treated with an anti-fungus spray.

18. Field-mounted devices shall be protected from exposure to freezing temperatures.

C. System Designs:

1. Range, scale, and setpoint values specified in other Division 40 Sections are for initial setting and configuration. The Contractor shall coordinate these values with actual equipment furnished to implement proper and stable process action as systems are placed in operation.

2. For any items where ranges, scales, and setpoints may not have been specified, the Contractor shall submit a recommendation for review and approval.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Control Strategies

1. Functional descriptions of all monitoring and control sequences for the PMCS shall be as specified in Section 40 61 96 - PMCS Control Strategies.

2. The general guidance on how the control strategies shall be implemented in the PMCS shall be as specified in Section 40 61 95 – PMCS Monitoring and Control Criteria.

B. PLCs and HMIs

1. Programmable Logic Controllers and HMIs for the PMCS shall be as specified in Section 40 63 43 - PMCS Programmable Logic Controllers.

C. Network Equipment

1. Networking Equipment including ethernet switches and cellular modems shall be as specified in Section 40 63 53 – PMCS Network Equipment.

D. Panels and Enclosures

1. Panels and Enclosure for the PMCS shall be as specified in Section 40 67 16 - PMCS Panels and Enclosures.

E. Panel Mounted and Field Instruments

1. Instruments and Devices installed on panels and in the field for the PMCS shall be as specified in Section 40 78 90 - PMCS Panel Mounted Instruments and Devices.

2. Standalone instruments and devices for the PMCS shall be as specified in Section 40 79 91 - PMCS Field Instruments.

F. Lists and Index

1. PMCS I/O shall be as specified in Section 40 61 93 – PMCS Input Output List.

2. The list of instruments, their ranges, Tag Numbers, and P&ID shall be as specified in Section 40 61 94 – PMCS Instrument Index.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Factory Tests

1. Factory testing for the PMCS shall be as specified in Section 40 80 81 – PMCS Factory Testing.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Not Used

3.03 FIELD TESTING / QUALITY CONTROL

A. Field Testing

1. Field Testing for the PMCS shall be as specified in Section 40 80 82 – PMCS Startup and Field Testing

B. Training

1. Training on the operation and Maintenance of the PMCS shall be as specified in Section 40 61 26 – PMCS Training.

3.04 STARTUP / DEMONSTRATION

A. Operational Availability

1. The system test and Operational availability of the PMCS shall be as specified in Section 40 80 82 – PMCS Startup and Field Testing.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

END OF SECTION

NO TEXT ON THIS PAGE

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and coordinate all required training at times acceptable to the City and the Engineer.

B. The following index of this Section is presented for convenience:

Article	Title	Section Page

1.04 REFERENCES

A. Definitions

1. Section 40 61 13 – PMCS General Requirements defines the terms abbreviations used in this Section and the PMCS.

B. Reference Standards

1. Section 40 61 13 – PMCS General Requirements lists the standards applicable to the PMCS.

1.05 DESCRIPTION

A. General

1. The Contractor shall retain the services of the PMCS Supplier to provide and perform standardized, structured training courses on site and off site, as specified in this Section, and the Specifications covering both operation and maintenance of the PMCS equipment.

2. For equipment items not manufactured by the Supplier(s), Supplier shall provide on-site training by an authorized representative of the equipment manufacturer as part of their services. The manufacturer's representative shall be fully knowledgeable in the operation and maintenance of the equipment.

3. The Contractor shall be responsible for all costs associated with training and shall provide all required materials including training facility rental, computers, simulators, texts and required supplies.

4. On-Site Training

a. On-site training shall be within the building where the PMCS will be installed.

b. On-site training shall make extensive use of the installed PMCS to ensure Plant personnel develop an enhanced understanding and level of comfort with the PMCS.

c. On-site training submittals which in the opinion of the Engineer does not meet the objectives stated in this Section and the Specifications shall be rejected.

5. Off-site Training

a. Off-site training shall be conducted at an approved facility within a 10-mile radius of the Contract site.

b. The training facility shall be staffed with regular full-time training instructors.

c. If a the PMCS Supplier does not have a training facility with a ten-mile radius of the Contract Site a suitable facility shall be rented.

d. Off-site training submittals which in the opinion of the Engineer does not meet the objectives stated in this Section and the Specifications shall be rejected.

6. All training, except Follow-up Training specified in this Section, shall be scheduled so that it is completed prior to Acceptance of the PMCS by the City.

7. The City will send the following personnel to attend training courses:

a. Operations Training – 4 persons min

b. Maintenance Training - 4 persons

c. Supervisor Training - 4 persons

d. Engineer Training - 4 persons

8. All training shall be conducted during the hours of 8:00 AM to 12:00 PM until the conclusion of the training course.

9. All training sessions shall be provided twice and shall be scheduled by the City to accommodate their shift schedule.

1.06 QUALITY ASSURANCE

A. General:

1. For equipment items not manufactured by the PMCS Supplier, the PMCS Supplier shall provide for training by an authorized representative of the equipment manufacturer as part of PMCS Supplier services.

2. The manufacturer’s representative shall be fully knowledgeable in the operation and maintenance of the equipment.

B. PMCS Supplier's Training Qualifications

1. Section 40 61 13 – PMCS General Requirements specifies the PMCS Supplier’s training qualifications.

C. PMCS Supplier's Training Responsibility:

1. Section 40 61 13 – PMCS General Requirements specifies the PMCS Supplier's training responsibility.

D. PMCS Supplier Training Personnel

1. The Contractor shall require the System Supplier to provide the following training personnel:

a. Lead Trainer

1) The System Supplier shall appoint a Lead Trainer who shall coordinate, schedule and conduct all work and assure that the Training schedule is met.

2) The Lead Trainer shall have a minimum of five (5) years' experience in coordination, scheduling and delivery of instrumentation and control training at/under similar Plant Facilities as this Contract including a thorough working knowledge of training administration as both a prime and sub-prime Vendor/Contractor.

3) The Lead Trainer shall be the PMCS Supplier's liaison with the Contractor for all PMCS training requirements and shall assist in all matters required for proper coordination and interfacing of the training with the City.

1.07 SUBMITTALS

A. Shop Drawings General

1. Once all submittals of the proposed systems and equipment have been approved, including Functional Descriptions, Control Panels, Field Instruments, and all related Equipment, the Contractor shall submit for approval of the Engineer, Shop Drawings detailing the proposed plan for training, including but not limited to all course outlines and schedules.

2. Shop Drawing preparation shall not commence until after the pre-submittal specified in Section 40 61 13 – PMCS General Requirements.

3. Shop Drawings shall be submitted in complete packages grouped to permit review of related items as generally outlined in this Section.

B. Reports:

1. Training reports shall be submitted to the Engineer.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The PMCS training equipment and materials shall be delivered, stored and handled in accordance with this Section, the Specifications, the PMCS Supplier's recommendations and the following:

1. PMCS training equipment and material shall be packaged to protect each item from damage during shipment and storage.

2. Containers shall be protected against impact, abrasion, corrosion, discoloration and/or other damages.
3. Clearly label contents of each container and provide information on the required storage conditions necessary for the equipment and materials.
4. PMCS training equipment and materials shall be inspected for shipping damage or loose parts when received.
5. Evidence of water which may have entered equipment during transit shall be checked.
6. PMCS training equipment and materials shall be stored in a clean dry location in which a uniform temperature is maintained.
7. PMCS training equipment and materials shall be protected in storage with suitable covering and air circulation maintained to ensure the equipment and materials are kept dry and free from condensation.

3.04 STARTUP / DEMONSTRATION

A. Training of Plant Personnel

1. Operator Training

a. Provide an 8 hour (2 days, 4 hours per day) course covering the structure and the functions of the PMCS, its components and devices.

b. The course shall familiarize the Operator with the procedures for applying the PMCS to process control situations or scenarios and develop operator issue resolution capability.

c. The Contractor shall rent and install a computer projector for the training sessions. The projector shall be suitable for HDTV sources utilizing HDMI for connectivity.

d. As a minimum, the course shall cover the following topics:

1) Overview of PMCS functional capabilities.

2) Equipment overview including PMCS component functions, operating principles and proper use.

3) Loading and start-up of the digital system hardware components.

4) Use of PMCS commands.

5) Development of programs and control schemes.

6) Development and use of system displays.

7) Programming concepts and techniques.

8) Use of bulk storage device for system backup.

9) The training shall familiarize staff with HMI, overlays, navigation, alarm pages, trend displays, startup/shutdown procedures, emergency responses to faults/malfunctions/upsets and process events.

2. Maintenance Training Course:

a. Provide 8 hours (2 days, 4 hours) course covering preventive and troubleshooting maintenance for the PMCS components.

b. The course shall familiarize the maintenance personnel with diagnostic capabilities of the system, both software and hardware, and also the routine maintenance procedures on the system and the common peripheral devices.

c. As a minimum the course shall cover the following topics:

1) PMCS overview description including the power subsystems and logic components of the processor bus.

2) Description of the maintenance and troubleshooting aids of the system including software diagnostic programs.

3) Description of all bus operations.

4) Description of peripheral and process interface devices.

5) The use of hardware diagnostic routines, test equipment and test procedures as required to enable the City's personnel to detect and isolate system faults to the circuit board or module level and to implement repairs by replacing failed circuit boards or modules.

6) Instruction for PLC hardware maintenance, troubleshooting, and maintenance planning.

3. Supervisor/Engineer Training

a. Provide an 8-hour (2 days, 4 hours) manufacturer's standard training in the use and configuration of the PMCS HMI software.

b. An instructor certified by the software manufacturer to furnish such training shall perform this training.

c. The course shall be structured as follows:

1) Fundamentals

a) One two-day course (minimum) shall be provided which shall serve as a PMCS familiarization course for project management personnel, engineers, and key operating/maintenance personnel.

b) This course shall be a prerequisite for the advanced course.

2) Advanced

a) One three-day (minimum) PMCS configuration and operating course shall be provided.

b) The level of training shall be sufficient to familiarize the City personnel with the configuration and application of all PMCS programs.

c) All essential system operating procedures shall be described as required to enable the City personnel to operate and configure the PMCS via all interfaces such as Work Stations, Large Display Screens and local control panels.

d. Upon completion of the training the City personnel shall be able to make modification to Control Strategies and have them run in the PMCS.

e. Training shall be provided in the following subjects:

1) At a minimum, include:

a) System overview and capabilities

b) Database configuration

c) Graphic display configuration, including linking of data to displays

d) Historical data configuration (collection, manipulation, and display)

e) Real-time and historical trending

f) Report configuration, generation, printing, and customization

g) System security

h) I/O driver and configuration

i) System back-up and recovery

j) Dynamic Data Exchange (DDE) linking, where applicable

k) System command language

l) Trouble-shooting

m) System optimization

n) System start-up and shutdown procedures

o) LAN and WAN communications, as appropriate

p) Cellular Communications

B. On-Site Training

1. Primary Sensors/Transducers and Field Instruments: Provide on-site operation and maintenance training by Supplier(s) and the equipment manufacturer representatives prior to placing the equipment in continuous operation. The services of the equipment manufacturer's representatives shall be provided for a minimum of one (1) hour for each type of instrument provided.

2. Training shall accomplish the following:

a. Provide instruction covering the use and operation of the equipment to perform the intended functions.

b. Provide instruction covering procedures for routine, preventative, and troubleshooting maintenance including equipment calibration.

c. Explain procedures for placing the equipment in and out of operation and explain necessary actions and precautions to be taken regarding the overall plant monitoring and control system.

3. Training Covering Control Equipment:

a. The Supplier(s) shall provide a two (2) day, eight (8) hours per day of operations sessions training covering all system components.

b. Training session shall accomplish the following:

1) Operators:

a) Provide all instructions necessary to operate and utilize all system components.

b) Provide all instruction necessary to monitor and control the system processes from the designated control panel for each panel.

c) Explain procedures for control of the system during scheduled or rescheduled shutdown and the subsequent startup.

d) Provide instructions for regular care-taking operations.

2) Maintenance:

a) Same training as specified above for Operators.

b) Hands on Repair Instruction.

c) Use of test equipment to troubleshoot.

C. Follow-up Training

1. The PMCS Supplier shall provide operation and maintenance training covering all PMCS equipment provided.

2. The Follow-up Training shall take place after Acceptance of the PMCS by the City but prior to Substantial Completion.

3. The Follow-up Training shall repeat the On-Site Training specified in this Section.

4. The Follow-up Training shall in addition, target those areas of PMCS equipment where Plant personnel have highlighted either operational or maintenance issues.

1.04 REFERENCES

A. Definitions

1. I/O – Input/Output
2. SFT – Start-up and Field Testing.
3. OAD – Operational Availability Demonstration.
4. URT – Upset and Recovery Testing.
5. WFAT - Witnessed Factory Acceptance Tests.
6. Section 40 61 13 – PMCS General Requirements defines the terms and abbreviations used in this Section and the PMCS.

B. Reference Standards

1. Section 40 61 13 – PMCS General Requirements lists the standards applicable to this Section and the PMCS.

1.05 DESCRIPTION

A. General

1. The I/O point list shall be used to configure the I/O interface hardware of all controllers of the PMCS.
2. The listing includes information on signal functions, signal ranges and range conversions.
3. As a minimum, the Contractor shall provide all hardware [and software] to provide the I/O points listed in the accompanying I/O List as indicated in the Contract documents and as required.
4. The Contractor shall furnish and install as spares, twenty-five (25) percent of each type of I/O of the listed I/O point hardware.

5. The Contractor shall furnish and install spare hardware and fully configure all spare points into the PMCS databases, displays, trends, alarms and controllers.

6. All I/O points designated as spares shall be completely prewired to equipment and panel terminal blocks such that only field connections need to be complete when the I/O is activated.

B. I/O List Column Headings

1. NO or Ref NO or Item NO – is a sequential number starting with a discrete number used to order the entries in the I/O List and permitting the list to sorted and resorted to its original order.

2. TAG NUMBER – is an alpha numeric character string used to identify the I/O point and laid out as follows ISA_###_Y where:

   a. ISA – is the functional identifier of the I/O and follows ISA 5.1.

      1) ISA identifiers will be provided with the I/O Lists.

   b. ### - is a 3-digit number identifying the loop or field device.

   c. Y – is a digit or letter identifying duplicate instruments or devices on the same loop.

3. I/O Type is a two letter describing the I/O as follows:

   a. AI designates an analog input (4 to 20 mA DC).

   b. AO designates an analog output (4 to 20 mA DC).

   c. DI designates a discrete input.

   d. DO designates a momentary, maintained or latched discrete output.

   e. ETH designates ethernet communication.

4. DESCRIPTION – is an alphanumeric string that describes the I/O Point such as:

   a. Sodium Hypochlorite Transfer Pump No. 1 Running

   b. Sodium Bisulfite Storage Tank No. 2 Level

5. SIGNAL FROM – is an alphanumeric string that describes the equipment where the signal originates from.

6. SIGNAL TO – is the listing of the physical location of the instrument or device generating the I/O Point.

7. P&ID NUMBER – is the listing of the P&ID Drawing where the I/O point can be found.

8. REMARKS – can be used for supplementary information or to cross-reference information.

1.06 QUALITY ASSURANCE

A. The Contractor shall comply with the Quality Assurance requirements listed in Section 40 61 13 – PMCS General Requirements, this Section and the Specifications.

B. The Contractor shall not commence production of database until the configuration of all I/O points has been approved by the Engineer.

C. For each I/O attribute listed in the I/O list which cannot be used exactly as listed, submit an explanation of the reason for the deviation and propose a method to modify the I/O list information.

D. I/O information specific to all controllers shall in addition be submitted with the submittal covering that controller.

E. I/O Lists shall be kept current, updated regularly and shall be available for inspection by the City at the project site.

1.07 SUBMITTALS

A. The Contractor shall comply with submittal requirements listed in Section 40 61 13 – PMCS General Requirements, this Section and the Specifications.

B. Contractor shall submit all I/O lists and schedules for the approval of the Engineer.

C. The Contractor is solely responsible for the timing of I/O listing submittal to enable approval by the Engineer and subsequent use by the PMCS Supplier.

D. The Contractor shall create, maintain and submit for review, an updated I/O Listing of all device, instruments and I/O points.

E. Submittal shall be made at least 90 days in advance of any proposed use by the PMCS Supplier.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall comply with delivery, storage and handling requirements listed in Section 40 61 13 – PMCS General Requirements.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. PMCS I/O Lists shall be implemented by the PMCS Supplier.

2.02 MATERIALS / EQUIPMENT

A. Not Used

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. PMCS Factory Test shall conform to the requirements of Section 40 80 81 – PMCS Factory Tests.

B. Section 40 80 81 details how the configuration of I/O specified under this Section shall be verified against approved submittals.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 APPLICATION

A. I/O Configuration

1. Implement the control system database fields in a consistent manner by using the following procedures:

a. Use abbreviations and acronyms already established in the Contract Documents.

b. In particular use the information in the I/O List.

c. Use only abbreviation or acronym for a word or group of words respectively.

d. Use the same subject and word order within data fields.

e. Use the same term (either phrase, word or acronym) to denote the same meaning.

f. Do not use multiple terms for a single meaning.

g. Use the point names, descriptions, logic state descriptions, ranges and units of measurement exactly wherever the point is referenced.

h. Show point names and descriptions for all point references on documentation.

i. Spell correctly.

j. Maintain lists of acronyms and abbreviations used.

B. I/O Hardware Configuration

1. Partition the I/O among cards within an I/O enclosure to provide control loop integrity.

a. Put all inputs of the same I/O type associated with a device (e.g. pump, blower, clarifier or other piece of equipment) on the same card.

b. Put all inputs of the same I/O type for devices arranged in process trains (e.g. a pump, its inlet valve and its outlet valve, or a pump and its associated macerator) on the same card or cards if more than one card is needed to accommodate the points.

c. Put all outputs of the same I/O type associated with a device or group of devices in a process train on the same card.

d. Where the preceding requirements specified in this subparagraph would cause more than 20 percent spare points on a card, points for a device or process train may be split between two consecutive cards.

e. Make unused terminals resulting from partitioning the I/O into pre-wired spares.

f. Provide pre-wired spare points with all cabling and termination internal to controllers as done for other I/O points.

C. Spares Utilization

1. If I/O is added by change order, incorporate pre-wired spare points into the active point data base at no increase in Contract price.

a. Include changing point names, descriptions, ranges, or statuses from spare to the new point.

b. Include adding points to group displays and summary displays.

c. Include related documentation changes.

2. Spares utilization will be subject to the following limitations:

a. The incorporation will not alter the control software configuration except to make the point accessible to displays, reports and future control software configuration.

b. The incorporation will not alter the local area panels or field wiring to the device.

c. Additions will not increase the size of reports or number of displays beyond that specified.

d. The change will not be made subsequent to the controller shop drawing approval for a given process area.

3. Treat changing of active points to spare points in the same manner as incorporation of spares.

D. Point Data Fields

1. I/O point data fields will be subject to review and modification by the Engineer during the shop drawing review phase.

2. Incorporate changes directed by the Engineer completely into the entire system at no increase in Contract price subject to the following limitations:

3. Limit the total number of modifications to 20 percent of the total number of I/O points.

4. Each unique change will count as one modification. For example, modifying the description, range, and engineering unit on an analog input count as 3 modifications.

5. Analog input alarm limit definition will not be counted as a modification.

3.03 FIELD TESTING / QUALITY CONTROL

A. PMCS Field Testing shall conform to the requirements of Section 40 80 82 – PMCS Startup and Field Testing.

B. Section 40 80 82 details how the configuration of I/O specified under this Section shall be verified during Field Testing.

3.04 STARTUP / DEMONSTRATION

A. Section 40 80 82 – PMCS Startup and Field Testing details the requirements for OAD and PMCS Upset and Recovery Testing.

B. The OAD and the PMCS Upset and Recovery Testing shall serve as the final verification of the configuration of all PMCS I/O.

C. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

SECTION 40 61 94 – PMCS INSTRUMENT INDEX
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. This Section provides a listing of the minimum field and panel Instruments to be provided by the Contractor.

B. Additional Instruments may be required based on the actual equipment provided by the Contractor, and these additional Instruments shall be provided at no additional cost to the City.

C. The Instrument Index is given in a table after the "End of Section" and is available from the Engineer on electronic media. Allow 30 days from request to delivery of the media.

D. The following index of this Section is presented for convenience:

Article	Title	Section Page
PART 1	GENERAL	1
1.01	Summary	1
1.02	Payment	1
1.03	Related Sections	2

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

1.04 REFERENCES

A. Definitions

1. I/O – Input/Output
2. SFT – Start-up and Field Testing.
3. OAD – Operational Availability Demonstration.
4. URT – Upset and Recovery Testing.
5. WFAT - Witnessed Factory Acceptance Tests.
6. Section 40 61 13 – PMCS General Requirements defines the terms and abbreviations used in this Section and the PMCS.

B. Reference Standards

1. Section 40 61 13 – PMCS General Requirements lists the standards applicable to this Section and the PMCS.

1.05 DESCRIPTION

A. Field and Panel Instruments:

1. As a minimum, the Contractor shall furnish and install all field and panel instruments indicated in the accompanying Instrument Index.
2. The Contractor shall review the P&IDs, Mechanical and Electrical drawings and individual equipment specifications for additional requirements.
3. Individual control and indicating devices such as selector switches, pushbuttons and indicating lights are not included in the Instrument Index

and must be accounted for from the drawings, control sequence descriptions and individual equipment specifications.

4. The listing includes information on signal functions, signal ranges and range conversions and set points.

5. As a minimum, the Contractor shall provide all hardware [and software] to provide the Instruments in the accompanying Index as indicated in the Contract documents and as required.

B. Instrument Index Column Headings

1. NO or Ref NO or Item NO – is a sequential number starting with a discrete number used to order the entries in the Index and permitting the Index to sorted and resorted to its original order.

2. TAG NUMBER – is an alpha numeric character string used to identify the instrument function and is defined in Section 40 61 83 – Input/Output Lists.

3. INSTRUMENT TYPE – is an alphanumeric string up 30 positions describing the kind of Instrument such as:

   a. Rotameter

   b. Magnetic Flow Meter

   c. Pressure Gauge

   d. Level Transmitter

   e. CL2 Analyzer

4. DESCRIPTION – is an alphanumeric string describing where the instrument is used.

5. SERVICE – is an alphanumeric string up 30 positions describing the process function the Instrument is used for.

6. LOCATION – is the listing of the physical location of the instrument.

7. P&ID NUMBER – is the listing of the P&ID Drawing where the Instrument can be found.

8. RANGE – is the monitoring range of the Instrument in engineering units.

9. SET POINT – is the setting in engineering units at which Instrument will initiate an action in the PMCS or equipment control or just provide an alarm indication.

10. REMARKS – can be used for supplementary information or to cross-reference information.

1.06 QUALITY ASSURANCE

A. The Contractor shall comply with the Quality Assurance requirements listed in Section 40 61 13 – PMCS General Requirements, this Section and the Specifications.

B. For each Instrument listed in the Instrument Index which cannot be used exactly as listed, submit an explanation of the reason for the deviation and propose a method to modify the Instrument Index information.

C. Information specific to all Instruments shall in addition be submitted with the submittal covering that Instrument.

D. Instrumentation Index shall be kept current, updated regularly and shall be available for inspection by the City at the project site.

1.07 SUBMITTALS

A. The Contractor shall comply with submittal requirements listed in Section 40 61 13 – PMCS General Requirements, this Section and the Specifications.

B. Contractor shall submit Instrument Index and schedules for the approval of the Engineer.

C. The Contractor is solely responsible for the timing of Instrument Index submittals to enable approval by the Engineer and subsequent use by the PMCS Supplier.

D. The Contractor shall create, maintain and submit for review, an updated Instrument Index of all instruments.

E. Submittal shall be made at least 90 days in advance of any proposed use by the PMCS Supplier.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall comply with delivery, storage and handling requirements listed in Section 40 61 13 – PMCS General Requirements.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. PMCS Instrument Index shall be implemented by the PMCS Supplier.

2.02 MATERIALS / EQUIPMENT

A. Not Used

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. PMCS Factory Test shall conform to the requirements of Section 40 80 81 – PMCS Factory Tests.

B. Section 40 80 81 details how the Instruments specified under this Section shall be verified against approved submittals.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 APPLICATION

A. Not Used

3.03 FIELD TESTING / QUALITY CONTROL

A. PMCS Field Testing shall conform to the requirements of Section 40 80 82 – PMCS Startup and Field Testing.

B. Section 40 80 82 details how the Instruments specified under this Section shall be verified during Field Testing.

3.04 STARTUP / DEMONSTRATION

A. Section 40 80 82 – PMCS Startup and Field Testing details the requirements for OAD and PMCS Upset and Recovery Testing.

B. The OAD and the PMCS Upset and Recovery Testing shall serve as the final verification of the correct functioning of all Instruments.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

END OF SECTION

NO TEXT ON THIS PAGE

NO.	TAG NUMBER	INSTRUMENT TYPE	DESCRIPTION	LOCATION	P&ID NUMBER	RANGE	SETPOINT	REMARKS
1	LE/SE/FIT-101	NON-CONTACT FLOW METER	CHANNEL NO. 1 NON-CONTACT FLOW METER	FLUSHING CSO FACILITY CHANNEL NO. 1	I-101.00	LEVEL: 0 - 18 FEET FLOW: XX MGD	N/A	PROVIDED UNDER SPECIFICATION SECTION 40 79 91
2	LE/SE/FIT-102	NON-CONTACT FLOW METER	CHANNEL NO. 2 NON-CONTACT FLOW METER	FLUSHING CSO FACILITY CHANNEL NO. 2	I-101.00	LEVEL: 0 - 18 FEET FLOW: XX MGD	N/A	PROVIDED UNDER SPECIFICATION SECTION 40 79 91
3	PIT-105	PRESSURE TRANSMITTER	STORAGE CELL NO. 7 LEVEL (PRESSURE) TRANSMITTER	FLUSHING CSO FACILITY STORAGE CELL NO. 7	I-101.00	0 - XX FEET	N/A	PROVIDED UNDER SPECIFICATION SECTION 40 79 91
4	PIT-106	PRESSURE TRANSMITTER	STORAGE CELL NO. 15 LEVEL (PRESSURE) TRANSMITTER	FLUSHING CSO FACILITY STORAGE CELL NO. 15	I-101.00	0 - XX FEET	N/A	PROVIDED UNDER SPECIFICATION SECTION 40 79 91
5	PSH-110	PRESSURE SWITCH (HIGH)	FBCSO-SMP-1 DISCHARGE HIGH PRESSURE SWITCH	FBCSO-SMP-1 DISCHARGE	I-101.00	0 - XX PSI	XX PSI	PROVIDED UNDER SPECIFICATION SECTION 40 79 91
6	FSL-112	SWINGING VANE TYPE FLOW SWITCH (LOW)	FBCSO-SMP-1 DISCHARGE LOW FLOW SWITCH	FBCSO-SMP-1 DISCHARGE	I-101.00	0 - 15 GPM	LOW FLOW / NO FLOW	PROVIDED UNDER SPECIFICATION SECTION 40 79 91
7	FE-114	ROTAMETER	FBCSO-SMP-1 TO CHLORINE ANALYZER ROTAMETER	FBCSO TOTAL CHLORINE RESIDUAL ANALYZER PANEL	I-101.00	0 - 300 mL/MIN	N/A	PROVIDED UNDER SPECIFICATION SECTION 40 79 91
8	AE/AIT-114	TOTAL CHLORINE RESIDUAL ANALYZER	FBCSO CHLORINE ANALYZER NO. 1	FBCSO TOTAL CHLORINE RESIDUAL ANALYZER PANEL	I-101.00	0 - 10 PPM	N/A	PROVIDED UNDER SPECIFICATION SECTION 40 79 91
9	PSH-115	PRESSURE SWITCH (HIGH)	FBCSO-SMP-2 DISCHARGE HIGH PRESSURE SWITCH	FBCSO-SMP-2 DISCHARGE	I-101.00	0 - XX PSI	XX PSI	PROVIDED UNDER SPECIFICATION SECTION 40 79 91
10	FSL-117	SWINGING VANE TYPE FLOW SWITCH (LOW)	FBCSO-SMP-2 DISCHARGE LOW FLOW SWITCH	FBCSO-SMP-2 DISCHARGE	I-101.00	0 - 15 GPM	LOW FLOW / NO FLOW	PROVIDED UNDER SPECIFICATION SECTION 40 79 91
11	FE-119	ROTAMETER	FBCSO-SMP-2 TO CHLORINE ANALYZER ROTAMETER	FBCSO TOTAL CHLORINE RESIDUAL ANALYZER PANEL	I-101.00	0 - 300 mL/MIN	N/A	PROVIDED UNDER SPECIFICATION SECTION 40 79 91
12	AE/AIT-119	TOTAL CHLORINE RESIDUAL ANALYZER	FBCSO CHLORINE ANALYZER NO. 2	FBCSO TOTAL CHLORINE RESIDUAL ANALYZER PANEL	I-101.00	0 - 10 PPM	N/A	PROVIDED UNDER SPECIFICATION SECTION 40 79 91
13	LE/LIT-121	ULTRASONIC LEVEL TRANSMITTER	TI-010 HYPO-T-1 LEVEL TRANSMITTER	TI-010 HYPO-T-1	I-102.00	0 - 10 FEET	XX FEET; OPERATOR ADJUSTABLE AT THE INSTRUMENT	PROVIDED UNDER SPECIFICATION SECTION 40 79 91
14	LI-121	TANK LEVEL GAUGE	TI-010 HYPO-T-1 LEVEL GAUGE	TI-010 HYPO-T-1	I-102.00	0 - XX FEET	N/A	PROVIDED UNDER SECTION 43 41 45.01
15	FSH-122	SWINGING VANE TYPE FLOW SWITCH (HIGH)	TI-010 HYPO-T-1 OVERFLOW SWITCH	TI-010 HYPO-T-1	I-102.00	0 - 15 GPM	HIGH FLOW / FLOW DETECTED	PROVIDED UNDER SPECIFICATION SECTION 40 79 91
16	LE/LIT-124	ULTRASONIC LEVEL TRANSMITTER	TI-010 HYPO-T-2 LEVEL TRANSMITTER	TI-010 HYPO-T-2	I-102.00	0 - 10 FEET	XX FEET; OPERATOR ADJUSTABLE AT THE INSTRUMENT	PROVIDED UNDER SPECIFICATION SECTION 40 79 91
17	LI-124	TANK LEVEL GAUGE	TI-010 HYPO-T-2 LEVEL GAUGE	TI-010 HYPO-T-2	I-102.00	0 - XX FEET	N/A	PROVIDED UNDER SECTION 43 41 45.01
18	FSH-125	SWINGING VANE TYPE FLOW SWITCH (HIGH)	TI-010 HYPO-T-2 OVERFLOW SWITCH	TI-010 HYPO-T-2	I-102.00	0 - 15 GPM	HIGH FLOW / FLOW DETECTED	PROVIDED UNDER SPECIFICATION SECTION 40 79 91
19	LE/LIT-127	ULTRASONIC LEVEL TRANSMITTER	TI-010 HYPO-T-3 LEVEL TRANSMITTER	TI-010 HYPO-T-3	I-102.00	0 - 10 FEET	XX FEET; OPERATOR ADJUSTABLE AT THE INSTRUMENT	PROVIDED UNDER SPECIFICATION SECTION 40 79 91
20	LI-127	TANK LEVEL GAUGE	TI-010 HYPO-T-3 LEVEL GAUGE	TI-010 HYPO-T-3	I-102.00	0 - XX FEET	N/A	PROVIDED UNDER SECTION 43 41 45.01
21	FSH-128	SWINGING VANE TYPE FLOW SWITCH (HIGH)	TI-010 HYPO-T-3 OVERFLOW SWITCH	TI-010 HYPO-T-3	I-102.00	0 - 15 GPM	HIGH FLOW / FLOW DETECTED	PROVIDED UNDER SPECIFICATION SECTION 40 79 91
22	PI-130	PRESSURE GAUGE	TI-010 HYPO-TP-1 SUCTION PRESSURE GAUGE	TI-010 HYPO-TP-1	I-102.00	XX PSI	N/A	PROVIDED UNDER SPECIFICATION SECTION 40 70 01
23	PI-131	PRESSURE GAUGE	TI-010 HYPO-TP-1 DISCHARGE PRESSURE GAUGE	TI-010 HYPO-TP-1	I-102.00	0 - XX PSI	N/A	PROVIDED UNDER SPECIFICATION SECTION 40 70 01
24	PSH-131	PRESSURE SWITCH (HIGH)	TI-010 HYPO-TP-1 DISCHARGE PRESSURE SWITCH HIGH	TI-010 HYPO-TP-1	I-102.00	0 - XX PSI	XX PSI	PROVIDED UNDER SPECIFICATION SECTION 40 79 91
25	PI-132	PRESSURE GAUGE	TI-010 HYPO-TP-2 SUCTION PRESSURE GAUGE	TI-010 HYPO-TP-2	I-102.00	0 - XX PSI	N/A	PROVIDED UNDER SPECIFICATION SECTION 40 70 01
26	PI-133	PRESSURE GAUGE	TI-010 HYPO-TP-2 DISCHARGE PRESSURE GAUGE	TI-010 HYPO-TP-2	I-102.00	0 - XX PSI	N/A	PROVIDED UNDER SPECIFICATION SECTION 40 70 01
27	PSH-133	PRESSURE SWITCH (HIGH)	TI-010 HYPO-TP-2 DISCHARGE PRESSURE SWITCH HIGH	TI-010 HYPO-TP-2	I-102.00	0 - XX PSI	XX PSI	PROVIDED UNDER SPECIFICATION SECTION 40 79 91
28	PI-140	PRESSURE GAUGE	TI-010 HYPO-MP-1A SUCTION PRESSURE GAUGE	TI-010 HYPO-MP-1A	I-103.00	0 - XX PSI	N/A	PROVIDED UNDER SPECIFICATION SECTION 40 70 01

SECTION 40 61 95 – PMCS MONITORING AND CONTROL CRITERIA
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide the services of the PMCS Supplier, to develop, load, configure, test, document and place in satisfactory operation all software associated with the PMCS and all its ancillary devices, as described herein, as required by other Sections, as indicated on the Contract Drawings and as necessary for the Contractor to provide a properly operating and integrated system.

B. The Contractor shall provide a uniform appearance, seamless integration between all PMCS equipment and simplification of operation and maintenance, for the software being used and developed for all operator interfaces throughout the Contract.

C. The following index of this Section is presented for convenience:

Article	Title	Section Page
PART 1	GENERAL	1
1.01	Summary	1
1.02	Payment	1
1.03	Related Sections	2

3.03	Field Testing / Quality Control	18
3.04	Startup / Demonstration	19
3.05	Adjusting / Protection / Cleanup	19

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

1.04 REFERENCES

A. Definitions

1. HMI – Human Machine Interface; refers to CCFISS Workstations and panel located OITs.
2. I/O – Input/Output
3. SFT – Start-up and Field Testing.
4. OAD – Operational Availability Demonstration.
5. OIT – Operator Interface Terminal.
6. URT – Upset and Recovery Testing.
7. WFAT - Witnessed Factory Acceptance Tests.
8. Section 40 61 13 – PMCS General Requirements defines the terms and abbreviations used in this Section and the PMCS.

B. Reference Standards

1. Section 40 61 13 – PMCS General Requirements lists the standards applicable to this Section and the PMCS.

1.05 DESCRIPTION

A. PMCS Software Required

1. The software packages the Contractor will be required to furnish, install, customize, configure, and develop shall include, but shall not be limited to:

a. OIT Operating Systems.

b. OIT Networking Software.

c. PLC Ladder Logic Development and Documentation Software.

d. PLC Ladder Logic Application Software.

e. PLC Specialty Software and Programming Languages.

f. PLC Controller Configuration Software.

1.06 QUALITY ASSURANCE

A. The Contractor shall comply with the Quality Assurance requirements listed in Section 40 61 13 – PMCS General Requirements, this Section and the Specifications.

B. The PMCS Supplier shall utilize System and Software engineers who have been factory trained and certified on the respective software packages, to perform all programming functions, develop control strategies, create graphic displays, customize applications, document all work and coordinate the software interface.

C. System and Software engineers shall be intimately familiar with the details of this Plant, instrumentation and control in general and the Contract goals and requirements.

D. System and Software engineers shall have a minimum of five years of experience in the PMCS development work required under this Contract.

1.07 SUBMITTALS

A. The Contractor shall comply with submittal requirements listed in Section 40 61 13 – PMCS General Requirements, this Section and the Specifications.

B. The PMCS Supplier shall submit, through the Contractor, the following information for approval prior to beginning of the actual work of developing software for this Contract:

1. Qualifications and certifications of system software engineers.

2. A listing of all proposed software packages indicating quantities and where they will be installed.

3. Preliminary ladder logic for all PLC(s) and general methods of implementing the various control strategies.

4. Preliminary database and I/O listing showing system tag names and references.

5. Preliminary screen display count with general system structure.

6. Preliminary screen display development, general display organization and common components.

C. The PMCS Supplier shall submit all completed items to the Engineer for review and approval. As a minimum, the items to be submitted shall include, but shall not be limited to:

1. PLC Controller ladder logic with full documentation and annotation
2. Full Color copies of all unique Graphic display screens
3. Screen animation and control
4. Databases
5. Alarm and event log lists, formats and messages

D. Submittals shall be made at least 60 days in advance of any proposed use by the PMCS Supplier.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall comply with delivery, storage and handling requirements listed in Section 40 61 13 – PMCS General Requirements.

B. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. PMCS Monitoring and Control Criteria shall be implemented by the PMCS Supplier.

B. Existing CCFISS SCADA HMI software shall be utilized for HMI displays configuration at CCFISS. Contractor shall provide software and licenses required for the OITs and PLCs.

C. OIT visualization software shall be as manufactured by:

1. Wonderware, Lake Forest, CA;
2. No substitution allowed.

2.02 MATERIALS / EQUIPMENT

A. Not Used

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. PMCS Factory Testing shall confirm to the requirements of Section 40 80 81 – PMCS Factory Testing.

B. PMCS Monitoring and Control Criteria specified under this Section shall be functionally verified during PMCS Factory Testing.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 APPLICATION

A. PMCS Software

1 . Software package used for HMIs in this Contract shall be approved by the City and Engineer.

2. All HMI modifications, new HMI displays, database, alarming, trends, reports, historian etc., required for the sites shall be performed at existing CCFISS (Citywide Collection Facilities Integrated SCADA System) SCADA servers and software. No additional software or licenses for SCADA HMI shall be provided by the scope of this Contract.

3. Once installed and operating and the Contract completed and accepted, all licenses, media, documentation and packaging shall be turned over/ returned to the City.

4. It shall be the responsibility of the Contractor to maintain all items entrusted to her or him in excellent condition.

5. Any damaged items or items not returned shall be replaced at the Contractor's expense.

6. For City furnished PMCS Software required by this Section, it shall be the responsibility of the PMCS Supplier to provide factory training for her or his personnel, to allow them to become intimately familiar with all aspects of the supplied software package. This cost shall be included in the bid price and shall be done at no additional cost to the City.

7. It shall also be the responsibility of the Contractor, through the services of the PMCS supplier to install, setup, configure and place in optimum working order all PMCS Software as well as all other software referenced in this Section and as required.

8. All software shall be installed and configured with strict adherence to manufacturer's recommendations and the requirements of this Section, on all workstations supplied under this Contract.

B. General Control Philosophy

1. In order for the Contractor to provide the most reliable and fault tolerant PMCS, the following approach to programming shall be implemented:

a. All control logic, loop control, critical alarming and I/O shall be done in the controller at the local level.

b. HMIs and OITs shall contain the database for their attached controllers.

c. Remote controllers shall access needed data from the respective local controller via the PMCS network shown in the Contract Drawings.

d. Where the PMCS network is an Ethernet LAN the Contractor shall obtain designated non-routable IP addresses for this contract from DEP OIT.

e. Workstations and OITs shall send only valid data to the PLC where it shall be "latched in" until such time as new valid data is made available.

f. A failure of the workstation shall not prevent the PLC from continuing to function normally using the last valid data it received.

g. All workstations, OITs, controllers and network components, shall be monitored for failures by the redundancy of components and through the use of "watchdog timers" programmed into the software.

h. Failure of any component shall be alarmed and annunciated at the next level of control and the information shall be immediately made available on the network.

i. Workstations and OITs shall monitor and display all digital and analog data available on their local PLCs and all pertinent data available on the network.

j. Where possible, the software shall be configured to verify the validity of that data.

k. Data that is in disagreement or out of valid range shall be indicated as such through the extensive use of displays and alarms.

C. PLC Programming Conventions

1. General

a. All logic, sequencing, interlocking, safety and critical alarm and control, shall be implemented at the PLC local level in the respective PLC using ladder type logic.

1) Individual "rungs" shall be provided for each logic function.

2) Subroutines shall be used where repetitive logic is required.

3) Alarm logic shall not be performed in subroutines as they may not be active at all times.

b. Commands such as start, stop, open, close, operating mode, sequence selection, etc., that are sent from the remote workstation by operator initiative or response, shall be "pulsed" and "latched" into the PLC logic.

c. All analog loop control such as temperature, flow or level shall be performed at the local PLC level not in the workstation.

d. All calculations and logic necessary to keep an individual loop in operation, in the event of failure of, or loss of communication with the HMI, shall also be done in the local PLC.

e. Where possible, all data points both analog and digital associated with the PLC based loop controllers, shall be available to the operator at the HMI and fully displayed and adjustable.

f. The ladder program shall be so written that the operator, via a local or remote workstation/OIT, can select the mode in which each individual loop is to operate, i.e., manual/auto or local/remote setpoint.

g. The operator also be able to view and manually adjust all parameters such as setpoint, output, gain, integral, derivative, etc., from the HMI.

h. Once entered, the valid data shall remain stored in the PLC until such time as new valid data is received.

2. Program Structure

a. All programming shall be implemented using ladder logic style programming only.

b. Other styles of programming, where necessary, shall only be used with the prior written permission of the Engineer and only when the task cannot be performed using ladder type logic.

c. The program shall be written using a well-organized and well documented structured approach.

d. All common elements shall be grouped together as much as possible.

e. For example, all logic for a single piece of equipment such as start/stop, indication, fault and alarm logic shall be grouped together to allow a phased or sequential startup and trouble-shooting.

3. Safeties and Interlocks

a. Upon initial startup or a subsequent restart of the PLC programs shall be written as follows:

1) First initialize all logic and data

2) Second bring all equipment and controls to a safe and ready status as allowed by safety and interlock status.

3) Only when equipment is in the safe and ready status shall equipment be permitted to be started as indicated in the individual control strategies.

4) When all start permissives are satisfied, a "ready" status for each piece of affected equipment, shall be issued for display by the HMI.

b. Upon startup or restart of equipment and/or systems after a power failure, the program shall retain the status of all equipment prior to the interruption.

c. Upon restoration of stable power, with a suitable and adjustable time delay on each piece of equipment, the program shall check the status of all controlled equipment and systems for faults and/or safety trips and only then allow equipment to be started as indicated in the individual control strategies.

d. Items indicating a faulted or unsafe condition shall be immediately locked out and the appropriate alarms generated for display by the HMI.

e. Where at all possible, all preset values (for timers, counters, etc.) and variables shall be stored in register memory and shall be made available to the operator at the HMI for both display and adjustment.

D. PMCS Programming Conventions

1. General

a. The operator interface to the PMCS Software shall be through an organized system of graphic displays and tabular data displayed on the HMIs,OITs and interface units installed throughout the PMCS.

b. Graphic displays shall be based on schematic representations of the process, as shown on the Contract P&IDs and general equipment arrangement.

c. While only one of each type of similar equipment may be detailed on the P&IDs, all equipment, instrumentation and devices shall be represented on graphic displays in the level of detail depicted for the one typical equipment, device or instrument shown.

d. Displays of process equipment and piping shall be neatly laid out so as to be uncluttered and easily interpreted.

e. PMCS shall be displayed on multiple screens to allow all equipment and data to be shown clearly.

f. Displays of process piping and vessels shall be color coded to match the colors listed in the process piping schedules and shall match painting color schemes.

g. Color coding shall allow the operators to easily identify, by color, what process is being viewed.

h. If no color has been assigned to a certain process, the Contractor shall notify the Engineer who shall assign one.

i. Extensive use of animation; color and appearance change and sound shall be employed within displays.

j. Log-on and Password protection shall be required for all functions other than viewing general displays.

k. The Engineer shall decide the operator access level for each function provided by the Contractor.

2. Display System Structure

a. Displays shall be generally organized into areas based on the process with which they are associated.

b. An area index screen shall be provided showing “links” which when picked, will access all other screens in that system.

c. A general plant-wide index screen, accessible from the area index screen, having links to access all other area index screens shall be provided.

d. If previously created, the plant-wide index screen and all associated software shall be updated under this Contract to reflect the additions and/or changes made as part of this Contract.

e. All changes and updates shall be made on a plant wide basis, updating all workstations in the plant with the latest screens and information.

f. All displays throughout the PMCS shall have certain common elements. These elements shall include but shall not be limited to the following:

1) There shall be a group of quick access “buttons” located at the top of each screen.

a) Each of these buttons shall be assigned to screen within an area and shall provide a link, which when picked, will display the assigned screens.

b) When there are no alarms present on a given screen, the button shall be blank and disabled.

c) When there is any unacknowledged alarm present on a screen, its assigned button shall flash the system name in amber.

d) These screen names shall be assigned by the Engineer.

e) When the alarm(s) has (have) been acknowledged but is(are) still present, the system name shall show steady amber on the button.

f) The relative position of these buttons shall not change from screen to screen within an area.

2) There shall be additional buttons provided at the bottom of each screen allowing access to frequently needed items as follows:

a) The first items shall be an alarm SILENCE button and an ACKNOWLEDGE button.

(1) The SILENCE button shall silence alarms generated on any screen from any screen.

(2) This button shall silence both workstation audio alarms and any audible devices in the field and control room.

(3) The ACKNOWLEDGE button shall only acknowledge alarms generated on that screen.

(4) All alarms and alarms not associated with a given screen, shall be acknowledged from the alarm history screen.

b) The second item shall be an ALARM HISTORY button.

(1) This button shall immediately bring up the alarm history tabular display screen with the most recent alarms on the top of the list.

c) The third common item shall be an INDEX button. This button shall immediately bring up on the display, the area index screen previously described.

d) The remaining bottom buttons shall be used to provide direct links to other screens associated with the current screen.

(1) Some of these associated screens will be defined later.

(2) When possible, buttons for links to a particular screen shall occupy the same relative position from screen to screen.

3. Equipment Control Location Status

a. Each process and piece of process equipment (pumps, grinders, blowers, fans, etc.) shall have selector switches to transfer control of the equipment from one control location to another control location.

b. The graphic representation for each unit shall have an adjacent text field indicating where the current control location is.

c. The text background shall read "SCADA" on a blue background when control is at the workstation and read "LOCAL" as appropriate on a gray background when control is elsewhere.

4. Equipment Start/Stop Control

a. All equipment started and stopped by the PLC shall have an operator graphic display on one or more of the graphic display screens.

b. As indicated on the P&IDs, each piece of equipment shall have a specific method of starting and stopping inclusive of emergency stop or one or a combination of the following

1) Manual ON/OFF control

2) Manual START/STOP

3) Combination of HAND/OFF/AUTOMATIC.

c. Starting, stopping or changing operating mode of any equipment or system shall require double action followed by a confirming dialog box.

1) The operator shall "double click" on a predefined pick box within the desired equipment symbol causing a dialog box to appear.

2) The dialog box shall contain buttons for the different mode selections available to the operator for that piece of equipment or system.

3) An "OK" button shall also appear in the box which shall confirm the selection.

4) Once completed, a second dialog box shall appear to reconfirm the selection with dialog such as "DO YOU WISH TO PLACE PUMP 3 IN RUN MODE".

5) The operator shall select a "YES" or "NO" button to confirm the selection.

6) All dialog boxes shall have a "CANCEL" button which shall leave the system unchanged.

5. Alarms

a. Provide eight (8) levels of alarming for each analog variable. There shall be high-high-high, high-high, high, deviation low, deviation high, low, low-low, low-low-low.

b. Annunciate alarm with horn provided in the HMI/s and display appropriate alarm.

c. Assign alarm to printer(s) for logging.

d. The software shall display alarm status via color change or blink in line, text, or fill attributes.

e. The software shall have both alarm summary and alarm history displays with configurable message text including: DATE, TIME, TAG NAME, ALARM EVENT, ALARM TYPE, VALUE, SETPOINT, SEVERITY.

f. The alarm summary and alarm history displays shall be configurable for color of alarm window, new alarms, ACK alarms, and RTN alarms.

g. Momentary alarms shall be reported by the software if the signal made a transition from the normal state to the alarm state and back to the normal state between the polling sequences of a remote unit.

h. Momentary normal states shall be reported by the software if the signal made a transition from the alarm state to the normal state and back to alarm state between the polling sequences of a remote unit.

i. Multiple alarm and multiple normal states shall be reported by the software if multiple transitions were made between polling sequences.

j. Alarms shall be able to be routed to screen, printer, and/or disk file.

k. Proposed alarms shall be submitted to the City, Plant Operations, and the Engineer for approval, and will be based on specific monitoring parameters.

l. Provision shall be made in the PLC logic to suppress nuisance alarms and control actions by the following means:

1) For alarms and control actions derived from analog input signals, use adjustable time delays and deadbands.

2) For alarms and control actions derived from discrete input signals, use adjustable time delays.

3) Initial settings for time delays shall be 10 seconds (range 0-120 seconds). Initial settings for deadbands shall be 5% of span (0-100%).

4) Equipment that is started or stopped manually by the operator shall start or stop immediately, with no time delay.

6. Trending

a. Software shall allow the configuration of real time trend displays which update continuously as new values are acquired.

b. Real time trend display shall be in Variable versus Time format.

c. Real time trend display shall support scaling of both variable and time axes.

d. Real time trend display shall support a minimum 4 variables per graph.

e. Software shall allow any number of real time trend graphs per screen.

f. Software shall allow configuration of Real time trends and Historical trends on same screen.

g. Software shall allow configuration of trend graphs and other animation (bar charts, push buttons, etc.) on the same screen.

h. Real time trend shall support trending result of arithmetic and/or logical expressions involving Tag names by typing in the expression in the desired pen field.

i. The PMCS supplier shall develop and assign real time trends for all monitored system analog variables, and shall submit proposed trend plot groupings as part of the system software documentation submittal.

j. All trending requirements shall be discussed in detail with the City including Plant Operation and Process Engineers prior to submission. Based on this discussion, the samples of trends graphs

shall be submitted to the City for review and approval. The historical trends and frequency of storage shall be discussed with the City.

7. Historical Data Management

   a. The PMCS shall use the City's existing historian to configure historical data collection for the Plant sites.

   b. The Historical data shall be collected from the real time database and from these samples.

   c. The Historical system shall be configurable to calculate the average, maximum, minimum, standard deviation and total values over sampled data time intervals configurable on a per point basis.

   d. Signal values from the Historical Data Base shall be available for graphic displays, reports and trending.

   e. The size of the Historical Data Base in the local OITs shall be limited only by available disk space which at minimum shall be capable of holding 18 months of data. Archiving capability shall be provided.

8. Reports

   a. PMCS shall use City's existing reporting software for processing and reporting data related to the Plant sites.

   b. Set up report templates that allows screen prints based on demand (i.e. push button), event, time, or combination thereof.

   c. PMCS Supplier shall submit actual copies of suggested report layouts for review and approval in accordance with the requirements of this Section.

   d. Configuration shall be flexible so that contents of the reports can be easily modified. At a minimum, the PMCS Supplier shall provide a report with the following details of parameters:

      1) Date and Time Stamps

      2) Tank Levels and Rate of Change

      3) Dry Weather Flow Rates

      4) Wet Weather Flow Rates

      5) Flow Totalizations for:

         a) Yesterday's Flow

         b) Today's Flow

         c) Monthly Flow

         d) Yearly Flow

6) TRC Residual Readings

e. As a minimum, the following data collection functions shall be provided for all analog variables:

1) Instantaneous value; value at the end of the data collection interval.

2) Average value over the time interval.

3) Totalization over the time interval.

4) Highest value over the time interval.

5) Lowest value over the time interval.

f. Equipment Run Times shall be monitored, calculated and reported for all major process equipment items in the system.

g. Report data developed shall include year-to-date and month-to-date run times and starts for each item.

h. The maximum time intervals shall depend on the variable being measured and shall be discussed and coordinated with the City, and then submitted for review as part of the Proposed Reports shop drawing.

i. Each log report page shall have the capability to contain information for ten log points as a minimum. Log points per page shall be configurable and adjustable based on user preferences. Dynamic page sizing shall be used based on the available data.

j. Periodic log reports shall be printed automatically at the end of the time period. Provide scheduling capabilities for automated report generation. Options shall be provided for digital distribution in addition to printing via email.

k. A calculation extension capability shall be provided to perform calculations on data that has been accumulated for report generation. These reports shall include customization capabilities.

1) Calculations shall consist of addition, subtraction, multiplication, and division functions for calculations of such items as engineering unit changes, totalization values where measurement values are different, and performance indexes.

2) Provisions shall be made for a minimum of 200 calculation extensions.

l. All reports shall be free form, thereby printing all general information, headings and data in an established format at the time of generation.

1) Pre- printed sheets shall not be acceptable.

2) Each page of a report shall have printed the plant name, type of report, date and time the report was printed, and page numbers.

m. Software shall be provided for generation of special event, hourly, daily, monthly and annual reports. Include options for real-time notifications in addition to the scheduled reports.

1) Reports shall be generated using process input/output, event information, analog, digital, manual and/or computed point information from records in database.

9. Process Variable Indicators and Controllers

a. Where indicated on the P&IDs, required by the specifications or wherever available, all instruments providing analog data whether real or calculated shall be graphically displayed on the screen in its relative position in the process or in tabular form as required.

b. Process indicators such as “PI”, “FI”, “TI”, “FIC”, “TIC”, etc., shall be provided with all of the following features.

1) Each “instrument” shall appear as a standard instrument “bubble” or “lollipop” containing the ISA instrument type designation.

2) The instrument tag number shall appear using the same format as the Contract Drawings.

3) When instruments of the same equipment number appear on the same screen, the loop number alone shall be sufficient provided there are no duplicate loop numbers and it is clear what equipment the instrument is associated with.

4) Adjacent to the instrument symbol, the current “real time” value of the variable, in engineering units, shall be displayed.

5) Next to this shall appear the appropriate units.

c. All analog values, whether real or calculated, shall have alarm points configured in the software.

1) Those of a critical nature or where used to control equipment shall have this performed in the local PLC while being set and monitored from a remote point.

2) While within the normal range, variables shall appear in black.

3) When the variable moves outside the normal range, the text shall flash in red and the bubble shall flash amber.

4) Once acknowledged, both will cease flashing and remain steady colors until the condition is corrected.

5) A signal out of range or containing invalid data shall cause the text to display question marks on a flashing red background.

d. The operator shall be able to "double click" the instrument symbol and cause a dialog box to appear.

1) This box shall contain the full tag number of the instrument, measured variable name (i.e. Sodium Hypochlorite Pumps No. 1, 2 & 3 Common Discharge Flow), calibrated range and current alarm points.

2) One button shall be provided in the box to edit the alarm setpoints.

3) A second button shall allow the operator to display a trend graph, on a partial screen, of the variable against a time base of minutes, or hours (selectable).

10. Accumulators

a. Provide HMI configuration for accumulations.

1) Include run time for each piece of equipment.

2) Include downtime information for each piece of equipment. Include options for displaying historical run time trends for predictive maintenance planning.

3) Include number of starts for each motor.

4) Include totalized values for all flows, including totalized values daily, monthly, yearly, and since the system initialization.

11. Security

a. System Protection from unauthorized access to the PMCS interfaces shall be provided by means of software and hardware interlocks. Coordinate with the City for the latest Security Standards to accommodate the system.

b. Provide at least four (4) levels of security.

c. All new HMI displays developed shall comply with the existing user access security registrations currently available on CCFISS.

d. Software interlocks shall provide a minimum of two levels of security, Operator and Process/System Engineer.

e. Operators shall only be permitted access to PMCS HMI software allowing only operating and configuration of equipment for

operational actions only, such as start, stop, modes changes such as local and remote, placing multiple items of similar equipment in and out of service, generating trends, dealing with alarms and all actions required by Operators to maintain processes 24 hours a day, 365/366 days a year.

f. Only Process/System Engineers shall be allowed to exit the HMI software and access the operating system and other resident software applications for hardware and software operating system, controller/PLC programming and editing.

g. Program editing access shall require entry of a minimum sixteen (16) character entry code. Code shall be required to be a string of mixed-case letters, numbers, and symbols. Provide notification alert to user that the password must be a "Strong Password that is unique and used for only one account", and shall be configured within the controller program.

h. All PMCS users shall be required to log on to the LAN network and PMCS Software interface with a predefined username and password before access to operate or modify the system can be obtained.

i. All defined user names shall be associated with a set security level.

j. Each display shall be assigned a security level required to access it.

k. All signals and control functions shall have separately assignable security levels required for viewing functions signal value change functions to restrict control access where required or desired.

l. Provide password login as follows:

View Only – Level 1	No Login Required
Operator Level – Level 2	Login required for normal controls including setpoint changes.
Supervisor Level – Level 3	Login required for controls and adjustments.
System Engineer Level – Level 4	Full access.

m. Login / Logout: The operator or user shall enter username and password to gain access to the system. Exceeding the standby time of 15 minutes shall cause a timeout function to automatically log out the user.

3.03 FIELD TESTING / QUALITY CONTROL

A. PMCS Field Testing shall conform to the requirements of Section 40 80 82 – PMCS Startup and Field Testing.

B. PMCS Monitoring and Control Criteria specified under this Section shall be verified during PMCS Startup and Field Testing.

3.04 STARTUP / DEMONSTRATION

A. Section 40 80 82 – PMCS Startup and Field Testing details the requirements for OAD and PMCS Upset and Recovery Testing.

B. The OAD and the PMCS Upset and Recovery Testing shall serve as the final verification of the correct implementation of the PMCS Monitoring and Control Criteria specified under this Section.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

SECTION 40 61 96 – PMCS CONTROL STRATEGIES
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish Control Strategy diagrams, configuration sheets and Control Strategy descriptions as shop drawings for approval for all control strategies specified in this section.

B. The Contractor shall perform all programming, configuration, and tuning required to implement each Control Strategy listed in this Section.

C. The following index of this Section is presented for convenience:

Article	Title	Page
PART 1	GENERAL	1
1.01	Summary	1

1.04 REFERENCES

A. Definitions

1. CS - Control Strategy
2. Section 40 61 13 – PMCS General Requirements defines the terms and abbreviations used in this Section and the PMCS
3. HMI – Human Machine Interface which refers to the CCFISS SCADA Screens, and the respective control panel OIT where the signal is interfaced with its respective PLC.

B. Reference Standards

1. Section 40 61 13 – PMCS General Requirements lists the standards applicable to this Section and the PMCS.

1.05 DESCRIPTION

A. The Control Strategies in this Section are written descriptions of the basic configuration and/or programming required to implement regulatory and sequential control of the unit processes as shown on the P&IDs.

B. The Control Strategies do not in all cases describe the process characteristics fully, many of which may only become apparent during shop drawing assembly or during start-up.

C. Control Strategies shall fully reside in the memory of the designated PLC.

D. The process inputs/outputs referred to in the Control Strategies are all shown on the P&IDs.

E. Any additional I/O (Maximum 20%) required shall be added during Shop Drawing Review and shall be provided at no additional cost to the City.

F. Process Control Functions

1. Process control function shall be structured to permit the realization of all Control Strategy requirements.

2. Each control function shall be designed so that bumpless, balance free transfers are obtained during operating mode changeover and/or initialization.

3. Where applicable, user-changeable parameters shall be automatically defaulted to a preset value if a specific value is not given during system generation.

4. Provision shall be made to include certain control functions that apply to all analog inputs, virtual variables, analog controllers and discrete control whether or not shown on the P&IDs, even though one or more of the functions may be disabled by the user for a given data base point:

a. Analog Data Scaling

1) This control function shall scale all analog inputs to a common span and shall normalize the digital representation of each analog input to a percent of the operating span.

2) The processed value shall be expressed as a binary number that specifies the analog input's position on a straight line lying between zero and full scale as defined for a given input by the zero span values in the data base.

b. Amplitude Limit Check

1) This control function shall perform dual level, high/low amplitude limit checking and shall identify a limit violation every time a measured or virtual variable goes out-of-limits and returns back into limits.

2) The control function shall determine the time at which each limit excursion occurred.

3) A deadband shall be provided on each limit and shall be expressed as a percentage of span or in engineering units.

4) Low and high limiting default values will be set-up for each measured or calculated variables used in the process control loops.

c. Engineering Unit Conversion

1) This control function shall convert scaled analog data to engineering units by means of the following equation:

a) Y = ((H - L) (D/DH) + L) where

b) Y is the value in engineering units.

c) H is the high value of span, expressed in engineering units

d) L is the low value of span, expressed in engineering units.

e) D is the digitized scaled input value in counts.

f) DH is the full scale digitized value in counts

d. Manual Control

1) It shall be possible for operator or plant engineer to interrupt any sequence, loop or automatic operation and operate the same manually through panel OIT.

e. Verification of Digital Outputs

1) This control function shall verify that the equipment has responded to the digital commands before proceeding to next step during automatic operation.

2) If any discrepancy is detected, an alarm will be annunciated.

G. Hardware

1. The Contractor shall provide all the hardware, whether or not shown or specified that may be necessary to implement the Control Strategies as described in this Section or the Specifications.

H. Configuration

1. All set points, tuning parameters and engineering scales, etc., shall be documented for each control point and each control strategy on configuration sheets or similar documents.

2. These documents shall be updated during factory testing and finally during start-up and commissioning.

I. Control Strategy Displays

1. Control Strategy displays shall be submitted for review to the Engineer and the City.

2. Displays shall clearly show initial conditions, start, and progression of the control strategies.

3. Each Control Strategy shall be displayed in a minimum number of displays for ease of monitoring by the operator.

J. Power Failure

1. Equipment controlled by the PLC shall be programmed to automatically reset upon failure. During shop drawing review, restart logic and status of

equipment controlled by PLC shall be confirmed with Engineer and the City.

K. Restart

1. All equipment and motors shall be automatically restarted or require manual intervention as approved by the Engineer and the City during shop drawing review.

2. Final approval of the restart sequence shall be given by the Engineer during factory testing and start-up.

L. Position indication of Gates and Valve in transition.

1. Open pilot lights and indicators in/at all Control Stations and HMIs shall blink when a gate or valve is in the open transition and shall stay steady on when fully open.

2. Closed pilot lights and indicators in/at all Control Stations and HMIs shall blink when a gate or valve is in the closed transition and shall stay steady on when fully closed.

1.06 QUALITY ASSURANCE

A. The Contractor shall comply with the Quality Assurance requirements listed in Section 40 61 13 – PMCS General Requirements.

1.07 SUBMITTALS

A. Control Strategies detailed in this Section shall be submitted for approval by the Engineer.

B. The Contractor shall comply with submittal requirements listed in Section 40 61 13 – PMCS General Requirements.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall comply with delivery, storage and handling requirements listed in Section 40 61 13 – PMCS General Requirements.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Control Strategies shall be as implemented by the PMCS Supplier.

2.02 MATERIALS / EQUIPMENT

A. Not Used

2.03 FABRICATION / ASSEMBLING / FINISHES

A. The control strategies included in this Section are organized based on the control strategy numbering designation (CS-XX). These numbers are associated with those indicated on the P&IDs in the I-Drawing Set. The functional descriptions include:

1. CS-01: TI-010-FBCSO Chlorination Control Description
2. CS-02: TI-010-DC-5 Disinfection Control Description
3. CS-03: TI-010-Dechlorination Control Description
4. CS-04: TI-010-Sodium Hypochlorite System Control Description
5. CS-05: TI-010-Sodium Bisulfite System Control Description
6. CS-06: TI-011-Disinfection and Dechlorination Control Description
7. CS-07: TI-011-Sodium Hypochlorite System Control Description
8. CS-08: TI-011-Sodium Bisulfite System Control Description
9. CS-09: TI-010 Auxiliary Systems Control Description
10. CS-10: TI-011 Auxiliary Systems Control Description

B. TI-010 – Flushing CSO Chemical Disinfection (CS-01):

1. Reference Drawing(s): I-101.00
2. Process Overview:
   a. Flow enters from the sewer barrels into Diversion Chamber No. 3 (DC-3) to Diversion Chamber No. 2 (DC-2), and then finally through Diversion Chamber No. 4 (DC-4) into the Flushing Bay CSO Retention Facility (FB CSO). The FB CSO will fill up and can overflow to an overflow channel that discharges to the Fowler Avenue sewer barrel. The Facility can also be closed off by closing influent sluice gates, and diverting all flow to the Diversion Chambers outlined below.
   b. DC-3 splits flow to either FB CSO or to Diversion Chamber No. 5 (DC-5), when the FB CSO cannot accept any flow.
   c. DC-2 and DC-4 are secondary overflow locations that diverts flow to the Fowler Avenue sewer barrel when FB CSO cannot accept flow.
   d. Storm water enters the FB CSO and splits into five channels, each equipped with a coarse bar screen to capture and remove large debris and floatable.
   e. After the flow is screened, it combines again before splitting into two channels to pass the flow through Storage Cells 1-7 and 8-15. The two channels have a sodium hypochlorite injection point for disinfection. Flow monitoring will be provided in Channel No. 1 and Channel No. 2 and level monitoring will be provided in Storage Cell

No. 7 and Storage Cell No. 15. Two sample pump feed lines, one from Storage Cell No. 7 and one from Storage Cell No. 15 will be used to measure the Total Chlorine Residual (TCR) in the effluent overflow to the outfall.

3. Control:

   a. Pressure Transmitters (PIT-105 & PIT-106) measure the level in Storage Cell No. 7 and Storage Cell No. 15, with the associated level signals input to the MCP-10 PLC.

   b. When the level in the Storage Cell No. 7 and No. 15 is reading above an operator adjustable "Wet Weather Level Activation" setpoint (Initial setpoint: 16 FT), and after an operator adjustable time delay (initial 10 seconds), the CSO wet weather event is activated. When the level in both Storage cells drops below "Wet Weather Level Deactivations" setpoint (Initial setpoint: 16 FT), and after an operator adjustable time delay (initial 10 seconds), the CSO wet weather event is deactivated.

   c. Upon CSO wet weather event activation, the facility shall not initiate sodium hypochlorite dosing until the following permissives have been met:

      1) At least one Sodium Bisulfite pump is in Ready mode: A pump is running at minimum speed and flow meter (FIT-350) is detecting flow based on the operator adjustable "Low Flow" setpoint.

      2) Sample pump TI-010-SMP-2 is running, flow switch (FSL-309) is detecting flow, and Total Chlorine Residual (TRC) analyzer (AIT-311) is online with no faults.

   d. Sample Pumps (FBCSO-SMP-1 and FBCSO-SMP-2) shall draw flow from Storage cells 7 & 15 respectively to a Total Chlorine Residual (TCR) Analyzer (AIT-114 & AIT-119) for monitoring of Total Chlorine Residual on the effluent overflow.

      1) The pump controls will be designed with a Local/Off/Remote (L/O/R) selector switch at the Local Control Station (LCS) provided under Division 26. When the L/O/R selector switch is in local mode, start/stop control of the pump will be accomplished from the pushbuttons located at the LCS. When the L/O/R selector switch is in remote mode, pump control will be based on the control signals received from the MCP-10 PLC.

      2) When in remote mode, the operator shall have provisions at the HMI for Automatic/Manual (A/M) control of the pump via soft selector switch. When A/M switch is in manual mode, the pump will be operated from the start/stop soft pushbuttons from the OIT screen. When the A/M switch is

in automatic mode, pump will be controlled based on the following logic:

a) When a CSO wet weather event is activated, the control systems shall energize the pump discharge three-way valve to close the feed line from service water, and open the feed line from the storage cells to allow sample flow to pass through the automatic strainer and then to the TCR Analyzer (AE/AIT-114 & AE/AIT-119).

b) When a CSO wet weather event is deactivated, stop the sample pumps and de-energize the pump discharge three-way valve to open the feed line from service water and close the feed line from the storage cells to allow service water flow to pass through the TCR Analyzers.

3) MCP-10 PLC shall send a pump start signal to the pump starter and confirm pump running status. A high discharge pressure switch shall be used for pump protection such that at high pressure, after a user adjustable time delay the pump shall automatically stop and display an alarm condition. A low flow switch shall be installed on the discharge of the automatic strainer to alarm if no flow is detected through the strainer, while the sample pump is running.

4) Configure interlocks to trip the sample pump regardless of local or remote pump operation:

a) High discharge pressure

b) Pump Fault

c) Pump Emergency Stop Activated

e. Refer to CS-04 for Sodium Hypochlorite Dosing for Channel No. 1 and Channel No. 2.

C. TI-010 – Diversion Chamber No. 5 Disinfection (CS-02):

1. Reference Drawing(s): I-201.00

2. Process Overview:

a. Combined Sewer enters DC-5 from DC-3 via three sewer barrels. Sluice gates at the inlet of DC-5 in each barrel shall control the flow passing through. Each barrel has a motor actuated gate which open and close based on level conditions from a separate control panel.

b. Flow passes through DC-5 through three barrels. Two of the barrels pass flow through Avery Avenue and into the downstream Mixing Chamber. One of the barrels passes flow through Fowler Avenue and into the downstream Mixing Chamber. Flow diverted from

Diversion Chamber No. 4 (DC-4) and Diversion Chamber No. 2 (DC-2), will also combine in the Fowler Avenue barrel prior to the Mixing Chamber.

3. Control:

a. Non-contact area-velocity flow meter shall be installed in each of the three sewer barrels, at DC-5. The sensor shall measure level, velocity and surcharge level, surcharge velocity, and master flow. A CSO event shall be determined based on the level signal obtained from the non-contact flow meter(s) (FIT-220/FIT-240/FIT-260). The operator shall select the level from either of the flowmeters, an average of two flowmeters or an average of three flowmeters for the initiation of the CSO event. Initial setpoint shall be set to XX feet.

b. Three chemical feed lines shall be installed in each of the three (3) barrels downstream of the gates. When a CSO event is initiated, based on the level signal mentioned above, the chemical metering pumps shall be requested to start dosing. The sluice gates may open and close in sequence based on signal from a separate, existing control panel. The CSO wet-weather event trigger shall be removed once the level signal drops to XX feet.

c. Flow passing through each sewer conduit shall be used for chemical dosing as described in CS-4.

1) In the event one of the flowmeters fail, the flow through the barrels shall be assumed to be uniform and the flow reading recorded by the flowmeter in operation shall be used for the dosing calculations in the three barrels. Transmitters shall provide a loss of signal alarm to the DC5-CP PLC.

d. Refer to CS-04 for Sodium Hypochlorite Dosing at DC-5.

D. TI-010 – Dechlorination (CS-03):

1. Reference Drawing(s): I-301.00

2. Process Overview:

a. Process flow passes from the FB CSO Facility and/or from DC-5, DC-4, or DC-2 sewer barrels into the Mixing Chamber. From the Mixing Chamber the three sewer barrels flow through a Tide Gates Structure where three tipping gates allow the CSO flow to pass through the downstream barrels and to the TI-010 outfall. The CSO flow is dechlorinated at the Tide Gate Structure prior to discharge to the TI-010 outfall.

3. Control:

a. When a CSO wet weather event is activated at FBCSO and/or DC5, flow through the mixing chamber shall be calculated as a sum of the CSO flow over the Storage cells at FBCSO, and flow out of DC5

(FIT-101/FIT-103 and FIT-240/260/280). This combined flow value shall be used to calculate sodium bisulfite dosing, downstream of the tide gates. Chemical feed lines dose sodium bisulfite at each of the three barrels.

b. Sample Pumps (TI-010-SMP-1 and TI-010-SMP-2) shall draw flow upstream and downstream of the Tide Gates Structure to its respective Total Chlorine Residual (TCR) Analyzer (AE/AIT-305 and AE/AIT-311) for monitoring Total Chlorine Residual, pre and post sodium bisulfite dosing.

1) The pump controls will be designed with a Local/Off/Remote (L/O/R) selector switch at the Local Control Station (LCS) provided under Division 26. When the L/O/R selector switch is in local mode, start/stop control of the pump will be accomplished from the pushbuttons located at the LCS. When the L/O/R selector switch is in remote mode, pump control will be based on the control signals received from the SBS-CP-10 PLC.

2) When in remote mode, the operator shall have provisions at the SBS-CP-10 OIT for Automatic/Manual (A/M) control of the pump via soft selector switch. When A/M switch is in manual mode, start/stop control of the pump will be accomplished from the start/stop soft pushbuttons from the OIT screen. When the A/M switch is in automatic mode, pump will be controlled based on the following logic:

a) When a CSO wet weather event is activated adjust the pump discharge three-way valve to close the feed line from service water and open the feed line from the sample feed line to allow sample flow to pass through the automatic strainer and then to the Total Chlorine Residual (TCR) Analyzers (AE/AIT-305 & AE/AIT-311).

b) When a CSO wet weather event has ended and the system is deactivated, adjust the pump discharge three-way valve to open the feed line from service water and close the feed line from the sample feed line to allow service water flow to pass through the TCR Analyzers.

c) SBS-CP-10 PLC shall send a pump start signal to the pump starter and confirm pump running status. A high discharge pressure switch shall be used for pump protection such that at high pressure, after a user adjustable time delay, the pump shall automatically stop and display an alarm condition. A low flow switch shall be installed on the discharge of

the automatic strainer to alarm if no flow is detected through the strainer.

3) Configure interlocks to trip the sample pump regardless of local or remote pump operation:

a) High discharge pressure

b) Pump Fault

c) Pump Emergency Stop Activated

4) The piping between the two TCR Analyzers shall be such that either Sample Pump can pump to either of the two TCR Analyzers based on the position of the interconnection pipe solenoid actuated valve. In normal operation interconnection sample line valves shall be closed and the sample pump will pump flow to its respective TCR Analyzer. If a TCR Analyzer fails, the respective sample pump shall pump flow to the alternate analyzer by first opening the respective solenoid actuated valve.

4. Refer to CS-05 for Sodium Bisulfite Dosing for the three barrels prior to discharge to TI-010 Outfall.

E. TI-010 Sodium Hypochlorite System (CS-04)

1. Reference Drawing(s): I-102.00, I-103.00, I-104.00

2. Process Overview:

a. The sodium hypochlorite storage and feed system are designed to store and dose sodium hypochlorite to the CSO at the FB CSO and Diversion Chamber-5.

b. The sodium hypochlorite tanks (3) are provided with level transducers for continuous level measurement.

c. A Fill Station is provided for the three tanks. Manual valves are located on the fill lines to each of the tanks.

d. Two transfer pumps (duty/standby) are provided to recirculate/ transfer the tank contents. Motorized valves are provided on the recirculation suction line and discharge line to the tanks.

e. There are two sets of three chemical metering pumps (Duty/Standby 1 /Standby 2). Each set is dedicated for the two dosing locations – FB CSO and DC-5.

f. A Sump Pump Control System with pumps and floats will be provided under Section 43 23 31.3 - Vertical Centrifugal Pumping Units to pump chemical that flows into the chemical containment sump.

g. A reed level switch will be provided under Section 40 79 91 – PMCS Field Instruments to alarm of a high level in the containment sump.

3. Control Descriptions:

a. Sodium Hypochlorite Fill Station:

1) PLC shall be programmed to provide tank high level and tank available indications at the fill station. The level transmitters will be provided with two 4-20 mA outputs. One shall be input directly to the MCP-10 PLC, and the second shall be input directly to the Fill Station Panel for display on the local indicator on the face of the panel.

2) Programming shall be provided to place each tank to be In-Service or Out-of-Service. If a tank is Out-of-Service, all alarms associated with the tank shall be suppressed.

3) A tank shall be considered "Available" if the tank is selected to be "In- Service" and level is below the "Tank Low / Ready for Filling" setpoint.

4) The high tank level alarm and shall annunciate the horn and strobe light at the fill station. A silence push button shall be provided to reset these alarms.

b. Valve Pit:

1) A new motorized valve will be installed in the valve pit and will interface with the Sodium Hypochlorite Fill Station Panel (HYPO-FP-10) for valve opened and closed feedback signals, as well as open and close commands. Relay logic shall be provided at the Fill Station panel such that based on the selection of a FP/SCADA selector switch on the face of the Fill Station panel. When in FP mode, the Fill Station panel shall have open/close control provisions for the drain valve. When in SCADA mode, the control of the valves shall be from the MCP-10 PLC.

c. Sodium Hypochlorite Transfer Pumps:

1) Local Control:

a) A LOCAL/OFF/REMOTE (L/O/R) selection is available at the Local Control Station of each pump. When in Local, the pump shall be controlled by the start/stop buttons at the LCS. When the LOCAL/REMOTE selector switch is in Remote, the pump shall receive a remote Start/Stop command from the PLC. Normally the L/O/R switch is set to Remote position.

2) Remote Control:

a) While in remote, the transfer pumps and its associated Motorized Valves shall be programmed to

run in three basic modes of operation: Manual, Automatic Transfer and Recirculation.

b) Transfer pumps shall operate in Duty/Standby configuration, such that only one pump will be used for the operation.

3) In Remote-Manual Mode:

a) Operators shall be able to control (start/stop) the duty pump manually. Operator shall place the suction and discharge motorized valves on each of the tanks in Open / Close position based on the tank desired to be recirculated.

b) Safety interlocks shall prevent the operation of the pump if a clear flow path is not established (based on the associated motorized valves limit switch position). An indication on the HMI shall inform the operator of an instance of this type is preventing the start of a pump.

c) Manual controls and position indications shall be provided to visualize and manually operate the motorized valves at will from the HMI.

4) In Remote-Automatic Transfer Mode:

a) Operator shall assign the Duty/Standby configuration for the pumps. Operator shall also select the tank that needs to transfer chemical to a subsequent tank. Upon initiation of the mode, the Duty pump shall transfer the stored chemical from one tank to the subsequent tank. The respective discharge and recirculation valve of the tank(s) shall open and close to allow chemical to be pumped in and out as per the selection.

(1) Interlocks shall be configured at the PLC at the receiving tank for a high level alarm based on the tank level transmitter, which shall prevent any more chemical from being transferred to it.

(2) In addition, an interlock shall be configured at the sending tank for a low level alarm based on the tank level transmitter, which shall prevent any more chemical from being transferred from it.

b) Once the transfer cycle has completed, a prompt shall alert the operator of the completion to allow a change to the operation mode.

5) In Remote-Recirculation Mode:

a) Operator shall assign the Duty/Standby configuration for the pumps. Operator shall also select the tank / the order of the tanks to be placed in the recirculation mode. Upon initiation of the mode, the Duty pump shall recirculate/mix the stored chemical in the selected tank. The respective The PLC and HMI shall be configured, such as operators can set the pump operating frequency and duration (based on pump runtime, or on tank volume).

b) Runtime Based: Recirculation duration shall be initially set for 60 min (adjustable).

c) Tank Volume Based: Pump flowrate shall be manually entered and stored in the PLC. There are three tank turnover scenarios that the operator can select at the HMI (half volume, full volume and twice volume). The PLC shall be programmed to calculate the runtime of the pump based on the pump flowrate (manually entered), and the calculated volume of chemical in the tank (as measured by respective level instruments) and the operator selected turnover scenario.

d) Frequency operation shall initially be set to reoccur every 24 hours (adjustable). A visual indication on the HMI shall be configured to display the time that has passed since the last recirculation cycle.

e) PLC shall be configured to automatically open the suction and discharge valves of the tank being selected for recirculation. Recirc valves of the tanks not in operation shall remain closed. If multiple tanks are selected for the recirc operation, the valves shall be sequentially opened and closed such that only one tank is in operation at a time.

f) Logic in the PLC shall be configured to prevent the automatic recirculation of the duty pump in any case where the LSH is active or where level in the tank is below an operator configurable capacity, initially set to 10% (configurable).

g) If the Duty pump fails, Standby pump shall take over operation from the next cycle.

h) PLC shall send a pump start signal to the pump starter and confirm pump running status. A high discharge pressure switch shall be used for pump protection such that at high pressure, after a user adjustable time delay, the pump shall automatically stop and display an alarm condition.

6) Configure interlocks to trip the pump regardless of local or remote pump operation:

a) High discharge pressure

b) Pump Fault

c) Hose Leak Detected

d. Sodium Hypochlorite Metering Pumps:

1) Local Control:

a) A LOCAL/REMOTE (L/O/R) selection is available at the local control station of each pump. When in Local, the pump shall be controlled by the start/stop buttons at the LCS. Speed shall be controlled from the local control station. When the LOCAL/REMOTE selector switch is in Remote, the pump shall receive a remote Start/Stop command and Speed control signal from the PLC. Normally the L/O/R switch is set to Remote position.

2) PLC and HMI Control:

a) In Remote- Manual mode, control is governed by the soft On/Off switch. The operator shall have the ability to run the pumps from the HMI. Operators shall be able to control the Pump Speed via manual speed setpoint input from the HMI.

b) In Remote-Auto, pumps shall run in the Duty/Standby configuration. Metering Pumps 1A-1B are dedicated to the dosing locations in FBCSO, and 2A-2B are dedicated to dosing location in DC5.

c) When a pump is called to run in either Remote-Manual or Remote- Auto mode, the pump's suction valve shall be confirmed fulled opened prior to start the pump. If suction valve does not open after an operator adjustable time delay, generate an alarm and remove the pump call to run.

d) When the pump is called to stop, the pump shall stop. Then, the suction valve should close. If the valve

does not close after an operator adjustable time delay, generate an alarm.

e) Sodium hypochlorite pumps can only be operated in remote/auto mode when a CSO wet weather event has been activated at the Flushing Bay CSO and all permissives are met as described in Article CS-01.

f) When the CSO wet weather event is deactivated, the sodium hypochlorite system shall continue to run for a period of time that ensure the pipe volume is completely flushed. The following is the flushing sequence:

(1) Stop the duty pump.

(2) Close all tank outlet valves.

(3) Open service water valve.

(4) Start all pumps at 35% speed (operator adjustable) and run them for a period of time that ensure the pipe volume is completely flushed. Totalize the pump flow rate as measured by its flow meter until the "Flushing Volume" setpoint is reached (initially 150 gallons to FBCSO and 270 gallons to DC-5).

3) Metering Pumps 1A and 1B Remote-Auto Operation:

a) The pump shall operate in either of the flow control modes specified.

(1) Flow Mode – Operator shall enter a desired flow setpoint for the pump, and the pump speed shall be modulated to achieve the setpoint.

(2) Flow with closed loop - Operator shall enter a desired flow setpoint for the pump. The flow meter on the pumps combined discharge line shall be used to adjust the pump speed to maintain setpoint.

(3) Flow pace with closed loop Option 1 – Duty pump shall start at a speed corresponding to a preset dosing rate (Operator adjustable) and shall be paced as a linear function of flow in the storage cells. Flow to be used shall be based on an operator selection of either the

Flowmeter of Channel No. 1, the Flowmeter of Channel No. 2, or the average of the two Flowmeter readings. An option shall also be configured to use the Level signal available from the Flowmeter instead. Flow corresponding to the level shall be obtained from a historical flow hydraulic table, that shall be made available to the Contractor by the Engineer / Owner.

The flow meter on the pumps combined discharge shall be used as a pump closed loop confirmation.

(4) Flow pace with closed loop Option 2 – Volumetric flow in the storage cells, shall be calculated either from the level in the storage cells (for level above 16 ft -23 ft) and surface area, or inputted into the PLC from the Storage Cells volumetric gallons hydraulic table available. The flow meter on the pumps combined discharge line shall be used as a pump closed loop confirmation.

(5) Flow pace with trim and closed loop mode Option 1 - Duty pump shall start at a preset dosing rate. Flow in the two Channels shall be based on an operator selection of either the Flowmeter of Channel No. 1, the Flowmeter of Channel No. 2, or the average of the two Flowmeter readings. An option shall also be configured to use the Level signal available from the Flowmeter, and correlating with a hydraulic table that shall be made available to correlate a level reading with a historical flow rate. Operator shall enter the chlorine residual setpoint expected at the Effluent. Average TRC value between the two analyzers at the storage cells 7 & 15 shall be used feedback, for trimming. Provisions shall also be made to manually enter the residual chlorine value, based on grab samples, or manually enter trim factor to be used in the chemical feed rate

calculation. If the analyzer fails, the calculation shall use the manually entered trim value if available or fallback to the last set trim factor.

The flow meter on the pumps combined discharge line shall be used as a pump closed loop confirmation.

(6) Flow pace with trim and closed loop mode Option 2 – Volumetric flow in the storage cells, shall be calculated either from the level in the storage cells (for level above 16 ft – 23 ft) and surface area, or inputted into the PLC from the Storage Cells volumetric gallons hydraulic table available.

4) Metering Pumps 2A and 2B Remote-Auto Operation:

a) Request for duty pump to run shall be initiated when a CSO event has been detected at the Diversion Chamber-5 as described in Article CS-02.

b) Various flow control modes shall be programmed. Operator shall choose to run the system in any of the modes.

(1) Flow Mode – Operator shall enter a desired flow setpoint, and the speed of the pump shall be modulated to achieve the setpoint.

(2) Flow with closed loop - Operator shall enter a desired flow setpoint. The flow meter on the pumps combined discharge line shall be used to adjust the pump speed to maintain setpoint.

(3) Flow pace with closed loop – Duty pump shall start at an operator adjustable dosing rate and shall be paced as a linear function of flow. Flow shall be calculated as a combined flow as read by the 3 flow meters (FIT-211,212,213) at DC5. The flow meter on the pumps combined discharge line shall be used as a pump closed loop confirmation.

(4) Flow pace with trim and closed loop mode - Duty pump shall start at an operator adjustable dosing rate.

Combined flow shall be calculated as read by the 3 flowmeters (FIT-220,240,260) at DC5. Operator shall enter the chlorine residual setpoint expected at the Pre-bisulfite analyzer (AIT-305). Trim factor to be used in the chemical feed dosing shall be calculated from TRC value read at FBCSO effluent and Pre-bisulfite dosing location i.e. (delta of (Average TRC value calculated from AIT-114 and 119) and AIT-305). Provisions shall also be made to manually enter the residual chlorine value, based on grab samples, or manually enter trim factor to be used in the chemical feed rate calculation. If the analyzer fails, the calculation shall use the manually entered trim value if available or fallback to the last set trim factor. The flow meter on the pumps combined discharge line shall be used as a pump closed loop confirmation.

c) PLC shall send a pump start signal to the pump starter and confirm pump running status. A high discharge pressure switch shall be used for pump protection such that at high pressure, after a user adjustable time delay, the pump shall automatically stop and display an alarm condition.

5) Configure interlocks to trip the pump regardless of local or remote pump operation:

a) High discharge pressure

b) Pump Fault

c) Hose Leak Detected

F. TI-010 Sodium Bisulfite System (CS-05)

1. Reference Drawing(s): I-302.00, I-303.00

2. Process Overview:

a. The sodium bisulfite storage and feed system are designed to store and dose sodium bisulfite to the CSO at the TI-010 outfall.

b. The sodium bisulfite tanks (2) are provided with level transducers for continuous level measurement.

c. A Fill Station is provided for the two tanks. Manual valves are located on the fill lines to each of the tanks.

d. Two transfer pumps (duty/standby) are provided to recirculate/transfer the tank contents. Motorized valves are provided on the recirculation suction line and discharge line to the tanks.

e. There are three chemical metering pumps (Duty/Standby 1 /Standby 2), to provide dosing at the TI-010 outfall.

f. A reed level switch will be provided under Section 40 79 91 – PMCS Field Instruments to alarm of a high level in the containment sump.

3. Control Descriptions:

a. Sodium Bisulfite Fill Station:

1) PLC shall be programmed to provide tank high level and tank available indications at the fill station. The level transmitters will be provided with two 4-20 mA outputs. One shall be input directly to the SBS-CP PLC, and the second shall be input directly to the Fill Station Panel for display on the local indicator on the face of the panel.

2) Programming shall be provided to place each tank to be In-Service or Out-of-Service. If a tank is Out-of-Service, all alarms associated with the tank shall be suppressed.

3) A tank shall be considered "Available" if the tank is selected to be "In- Service" and level is below the "Tank Low / Ready for Filling" setpoint.

4) The high tank level alarm shall annunciate the horn and strobe light at the fill station. A silence push button shall be provided to reset these alarms.

b. Sodium Bisulfite Transfer Pumps:

1) Local Control:

a) A LOCAL/OFF/REMOTE (L/O/R) selection is available at the Local Control Station of each pump. When in Local, the pump shall be controlled by the start/stop buttons at the LCS. When the LOCAL/REMOTE selector switch is in Remote, the pump shall receive a remote Start/Stop command from the PLC. Normally the L/O/R switch is set to Remote position.

2) Remote Control:

a) While in remote, the transfer pumps and its associated Motorized Valves shall be programmed to run in three basic modes of operation: Manual, Automatic Transfer and Recirculation.

b) Transfer pumps shall operate in Duty/Standby configuration, such that only one pump will be used for the operation.

3) In Remote-Manual Mode:

a) Operators shall be able to control (start/stop) the duty pump manually. Operator shall place the suction and discharge motorized valves on each of the tanks in Open / Close position based on the tank desired to be recirculated.

b) Safety interlocks shall prevent the operation of the pump if a clear flow path is not established (based on the associated motorized valves limit switch position). An indication on the HMI shall inform the operator of an instance of this type is preventing the start of a pump.

c) Manual controls and position indications shall be provided to visualize and manually operate the motorized valves at will from the HMI.

4) In Remote-Automatic Transfer Mode:

a) Operator shall assign the Duty/Standby configuration for the pumps. Operator shall also select the tank that needs to transfer chemical to a subsequent tank. Upon initiation of the mode, the Duty pump shall transfer the stored chemical from one tank to the subsequent tank. The respective discharge and recirculation valve of the tank(s) shall open and close to allow chemical to be pumped in and out as per the selection.

(1) Interlocks shall be configured at the PLC at the receiving tank for a high level alarm based on the tank level transmitter, which shall prevent any more chemical from being transferred to it.

(2) In addition, an interlock shall be configured at the sending tank for a low level alarm based on the tank level transmitter, which shall prevent any more chemical from being transferred from it.

b) Once the transfer cycle has completed, a prompt shall alert the operator of the completion to allow a change to the operation mode.

5) In Remote-Recirculation Mode:

a) Operator shall assign the Duty/Standby configuration for the pumps. Operator shall also select the tank / the order of the tanks to be placed in the recirculation mode. Upon initiation of the mode, the Duty pump shall recirculate/mix the stored chemical in the selected tank. The PLC and HMI shall be configured, such as operators can set the pump operating frequency and duration (based on pump runtime, or on tank volume).

b) Runtime Based: Recirculation duration shall be initially set for 60 min (adjustable).

c) Tank Volume Based: Pump flowrate shall be manually entered and stored in the PLC. There are three tank turnover scenarios that the operator can select at the HMI (half volume, full volume and twice volume). The PLC shall be programmed to calculate the runtime of the pump based on the pump flowrate (manually entered), the calculated volume of chemical in each tank (as measured by respective level instruments) and the operator selected turnover scenario.

d) Frequency operation shall initially be set to reoccur every 24 hours (adjustable). A visual indication on the HMI shall be configured to display the time that has passed since the last recirculation cycle

e) PLC shall be configured to automatically open the suction and discharge valves of the tank being selected for recirculation. Recirc valves of the tanks not in operation shall remain closed. If multiple tanks are selected for the recirc operation, the valves shall be sequentially opened and closed such that only one tank is in operation at a time

f) Logic in the PLC shall be configured to prevent the automatic recirculation of the duty pump in any case where the LSH is active or where level in the tank is below an operator configurable capacity, initially set to 10% (configurable)

g) If the Duty pump fails, Standby pump shall take over operation from the next cycle.

h) PLC shall send a pump start signal to the pump starter and confirm pump running status. A high discharge pressure switch shall be used for pump protection such that at high pressure, after a user

adjustable time delay, the pump shall automatically stop and display an alarm condition.

6) Configure interlocks to trip the pump regardless of local or remote pump operation:

a) High discharge pressure

b) Pump Fault

c) Hose Leak Detected

c. Sodium Bisulfite Metering Pumps:

1) Local Control:

a) A LOCAL/REMOTE (L/O/R) selection is available at the local control station of each pump. When in Local, the pump shall be controlled by the start/stop buttons at the LCS. Speed shall be controlled from the local control station. When the LOCAL/REMOTE selector switch is in Remote, the pump shall receive a remote Start/Stop command and Speed control signal from the PLC. Normally the L/O/R switch is set to Remote position.

2) PLC and HMI Control:

a) In Remote- Manual mode, control is governed by the soft On/Off switch. The operator shall have the ability to run the pumps from the HMI. Operators shall be able to control the Pump Speed via software manual speed setpoint input from the HMI.

b) In Remote-Auto, pumps shall run in the Duty/Standby 1/Standby 2 configuration. Metering Pumps 1-3 are dedicated to the dosing locations before TI-010 outfall.

c) When a pump is called to run in either Remote-Manual or Remote-Auto mode, the pump's suction valve shall be confirmed fully opened prior to start the pump. If suction valve does not open after an operator adjustable time delay, generate an alarm and remove the pump call to run.

d) When the pump is called to stop, the pump shall stop. Then, the suction valve should close. If the valve does not close after an operator adjustable time delay, generate an alarm.

3) Remote-Auto Mode:

a) Upon activation of the CSO wet weather event either at the FB CSO or Diversion Chamber-5, the duty pump shall run at minimum speed for a period of time (operator adjustable) to ensure proper functionality of the Sodium Bisulfite system. This is a permissive to start the sodium hypochlorite system. Then, the pumps shall stop and a time delay start. The time delay shall be an estimate of the combined flows to reach the bisulfite dosing area from Flushing Bay CSO / DC-5. This time delay shall either be manually entered or estimated based on the surface velocity readings recorded by the upstream flowmeters. Once the timer has lapsed, duty pump shall run. Manual initiation of the dosing pumps shall also be made available. This shall override the timer delay.

b) When the CSO wet weather event is deactivated, the sodium hypochlorite system shall continue to run for a period of time that ensure the pipe volume is completely flushed. The following is the flushing sequence:

(1) Stop the duty pump.

(2) Close all tank outlet valves.

(3) Open service water valve.

(4) Start all pumps at 35% speed (operator adjustable) and run them for a period of time that ensure the pipe volume is completely flushed. Totalize the pump flow rate as measured by its flow flow meter until the “Flushing Volume” setpoint is reached (initially 37 gallons).

c) Various flow control modes shall be programmed. Operator shall choose to run the system in any of the modes.

(1) Flow Mode – Operator shall enter a desired flow setpoint, and the speed of the pump shall be modulated to achieve the setpoint.

(2) Flow with closed loop - Operator shall enter a desired flow setpoint. The flow meter on the pumps combined discharge line shall be used to adjust the pump speed to maintain setpoint.

(3) Flow pace with closed loop – Duty pump shall start at an operator adjustable dosing rate and shall be paced as a linear function of flow. Flow shall be calculated as a combined flow as read by the 3 flow meters (FIT-220,240,260) at DC5. The flow meter on the pumps combined discharge line shall be used as a pump closed loop confirmation.

(4) Flow pace with trim and closed loop mode - Duty pump shall start at an operator adjustable dosing rate. Combined flow shall be calculated as read by the 3 flowmeters (FIT-240,260,280) at DC5. Operator shall enter the chlorine residual setpoint expected at the Pre-bisulfite analyzer (AIT-305) and post-bisulfite analyzer (AIT-311), which shall be used as a trim setpoint. Provisions shall also be made to manually enter the residual chlorine value, based on grab samples, or manually enter trim factor to be used in the chemical feed rate calculation. If the analyzer fails, the calculation shall use the manually entered trim value if available or fallback to the last set trim factor. The flow meter on the pumps combined discharge line shall be used as a pump closed loop confirmation.

d) PLC shall send a pump start signal to the pump starter and confirm pump running status. A high discharge pressure switch shall be used for pump protection such that at high pressure, after a user adjustable time delay, the pump shall automatically stop and display an alarm condition.

4) Configure interlocks to trip the pump regardless of local or remote pump operation:

a) High discharge pressure

b) Pump Fault

c) Hose Leak Detected

G. TI-011 – Disinfection and Dechlorination (CS-06):

1. Reference Drawing(s): I-401.00

2. Process Overview:

   a. Combined Sewer enters Regulator TI-R09 and passes through diversion chamber and into an overflow chamber. Two separate barrels leave Regulator TI-R09 and discharges to TI-011 Outfall; the barrels are hydraulically connected with various cross-connections between the two. Flow from a separate sewer line shall also merge with the two separate barrels.

3. Control:

   a. A level sensor with transmitter shall measure the level in the Overflow Chamber. Level transmitter shall be provided with a loss of echo alarm to the MCP-11 PLC.

   b. A chemical feed line shall feed a chemical diffuser that shall be installed in each of the two barrels downstream of Regulator TI-R09, to dose sodium hypochlorite.

   c. When the level in the Overflow Chamber is reading above an operator adjustable “Wet Weather Level Activation” setpoint, and after an operator adjustable time delay (initial 10 seconds), the CSO wet weather event is activated. When the level in the Overload Chamber drops below the “Wet Weather Level Deactivation” setpoint, and after an operator adjustable time delay (initial 10 seconds), the CSO wet weather event is deactivated.

   d. Upon CSO wet weather event activation, the facility shall not initiate sodium hypochlorite dosing until the following permissives have been met:

      1) At least one Sodium Bisulfite pump is in Ready mode: A pump is running at minimum speed and flow meter (FIT-476) is detecting flow based on the operator adjustable “Low Flow” setpoint.

      2) Sample Pump TI-011-SMP-2 is running, flow switch (FSL-414) is detecting flow, and Total Chlorine Residual (TRC) analyzer (AIT-416) is online with no faults.

   e. reaches the “Wet Start dosing setpoint in the overflow chamber, a CSO event shall be triggered. The sodium hypo metering pumps shall be requested to start hypo dosing. CSO wet-weather event trigger shall be removed once the level gets below Stop Dosing setpoint.

   f. Non-contact area-velocity flow meter shall be installed in each of the two sewer barrels, downstream of Regulator TI-R09, upstream of the chemical diffusers. The sensor shall measure level, velocity and surcharge level, surcharge velocity, and master flow. The associated flow transmitter shall calculate the flow passing through

each sewer conduit. Flow meter reading shall be used for chemical dosing as described in CS-7 and CS-8.

1) In the event one of the flowmeters fail, the flow through the pipes shall be assumed to be uniform and the flow reading recorded by the flowmeter in operation shall be used for the dosing calculations in the three pipes. Transmitters shall provide a loss of signal alarm to the PLC.

g. A chemical feed line shall feed a chemical diffuser that shall be installed in each of the two barrels downstream of Regulator TI-R09, closer to the TI-011 outfall to dose sodium bisulfite.

h. Sample Pumps (TI-011-SMP-1 and TI-011-SMP-2) shall draw downstream of Regulator 09 to a Total Chlorine Residual (TCR) Analyzer (AIT-410 & AIT-416) for monitoring of Total Chlorine Residual Pre and Post Bisulfite dosing.

1) The pump controls will be designed with a Local/Off/Remote (L/O/R) selector switch. When the L/O/R selector switch is in local mode, start/stop control of the pump will be accomplished from the pushbuttons located at the Local Control Station (LCS) provided under Division 26. When the L/O/R selector switch is in remote mode, pump control will be based on the control signals received from the PLC.

2) When in remote mode, the operator shall have provisions at the OIT for Automatic/Manual (A/M) control of the pump via soft selector switch. When A/M switch is in manual mode, the pump will be operated from the start/stop soft pushbuttons from the OIT screen. When the A/M switch is in automatic mode, pump will be controlled based on the following logic:

a) When a CSO wet weather event is activated at Regulator 09, the control systems shall energize the pump discharge three-way valve to close the feed line from service water, and open the feed line from the storage cells to allow sample flow to pass through the automatic strainer and then to the TCR Analyzer (AE/AIT-410 & AE/AIT-416).

b) When a CSO wet weather event is deactivated, stop the sample pumps and de-energize, the pump discharge three-way valve to open the feed line from service water and close the feed line from the storage cells to allow service water flow to pass through the TCR Analyzers.

c) PLC shall send a pump start signal to the pump starter and confirm pump running status. A high discharge pressure switch shall be used for pump protection such that at high pressure, after a user adjustable time delay the pump shall automatically stop and display an alarm condition. A low flow switch shall be installed on the discharge of the automatic strainer to alarm if no flow is detected through the strainer while the sample pump is running.

3) Configure interlocks to trip the sample pump regardless of local or remote pump operation:

a) High discharge pressure

b) Pump Fault

c) Pump Emergency Stop Activated

4) The piping between the two TCR Analyzers shall be such that either Sample Pump can pump to either of the two TCR Analyzers based on the position of the interconnection pipe solenoid actuated valve. In normal operation interconnection sample line valves shall be closed and the sample pump will pump flow to its respective TCR Analyzer. If a TCR Analyzer fails, the respective sample pump shall pump flow to the alternate analyzer by first opening the respective solenoid actuated valve.

4. Refer to CS-07 for Sodium Hypochlorite Dosing for the Overflow Chamber.

5. Refer to CS-08 for Sodium Bisulfite Dosing for the two pipes prior to discharge to TI-011 Outfall.

H. TI-011 Sodium Hypochlorite System (CS-07)

1. Reference Drawing(s): I-402.00, I-403.00

2. Process Overview:

a. The sodium hypo storage and feed system are designed to store and dose sodium hypochlorite to the CSO at a location within the sewer barrels downstream of Regulator-09.

b. The sodium hypo tanks (2) are provided with level transducers for continuous level measurement.

c. A Fill Station is provided for the two tanks. Manual valves are located on the fill lines to each of the tanks.

d. Two transfer pumps (duty/standby) are provided to recirculate the tank contents. Motorized valves are provided on the recirculation suction line and discharge line to the tanks.

e. Three chemical metering pumps (Duty/Standby 1 /Standby 2) are used to dose at Regulator-09.

f. A reed level switch will be provided under Section 40 79 91 – PMCS Field Instruments to alarm of a high level in the containment sump.

3. Control Descriptions:

a. Sodium Hypochlorite Fill Station:

1) PLC shall be programmed to provide tank high level and tank available indications at the fill station. The level transmitters will be provided with two 4-20 mA outputs. One shall be input directly to the MCP-11 PLC, and the second shall be input directly to the Fill Station Panel for display on the local indicator on the face of the panel.

2) Programming shall be provided to place each tank to be In-Service or Out-of-Service. If a tank is Out-of-Service, all alarms associated with the tank shall be suppressed.

3) A tank shall be considered “Available” if the tank is selected to be “In- Service” and level is below the “Tank Low / Ready for Filling” setpoint.

4) The high tank level alarm shall annunciate the horn and strobe light at the fill station. A silence push button shall be provided to reset these alarms.

b. Sodium Hypochlorite Transfer Pumps:

1) Local Control:

a) A LOCAL/OFF/REMOTE (L/O/R) selection is available at the Local Control Station of each pump. When in Local, the pump shall be controlled by the start/stop buttons at the LCS. When the LOCAL/REMOTE selector switch is in Remote, the pump shall receive a remote Start/Stop command from the PLC. Normally the L/O/R switch is set to Remote position.

(1) The Operator shall ensure that all isolation valves, and motorized valves on the tanks are in the proper position for the intended operation.

2) Remote Control:

a) While in remote, the transfer pumps and its associated Motorized Valves shall be programmed to run in three basic modes of operation: Manual, Automatic Transfer and Recirculation.

b) Transfer pumps shall operate in Duty/Standby configuration, such that only one pump will be used for the operation.

3) In Remote-Manual Mode:

a) Operators shall be able to control (start/stop) the duty pump manually. Operator shall place the suction and discharge motorized valves on each of the tanks in Open / Close position based on the tank desired to be recirculated.

b) Safety interlocks shall prevent the operation of the pump if a clear flow path is not established (based on the associated motorized valves limit switch position). An indication on the HMI shall inform the operator of an instance of this type is preventing the start of a pump.

c) Manual controls and position indications shall be provided to visualize and manually operate the motorized valves at will from the HMI.

4) In Remote-Automatic Transfer Mode:

a) Operator shall assign the Duty/Standby configuration for the pumps. Operator shall also select the tank that needs to transfer chemical to a subsequent tank. Upon initiation of the mode, the Duty pump shall transfer the stored chemical from one tank to the subsequent tank. The respective discharge and recirculation valve of the tank(s) shall open and close to allow chemical to be pumped in and out as per the selection.

(1) Interlocks shall be configured at the PLC at the receiving tank for a high level alarm based on the tank level transmitter, which shall prevent any more chemical from being transferred to it.

(2) In addition, an interlock shall be configured at the sending tank for a low level alarm based on the tank level transmitter, which shall prevent any more chemical from being transferred from it.

b) Once the transfer cycle has completed, a prompt shall alert the operator of the completion to allow a change to the operation mode.

5) In Remote-Recirculation Mode:

a) Operator shall assign the Duty/Standby configuration for the pumps. Operator shall also select the tank / the order of the tanks to be placed in the recirculation mode. Upon initiation of the mode, the Duty pump shall recirculate/mix the stored chemical in the selected tank. The PLC and HMI shall be configured, such as operators can set the pump operating frequency and duration (based on pump runtime, or on tank volume).

(1) Runtime Based: Recirculation duration shall be initially set for 60 min (adjustable).

(2) Tank Volume Based: Pump flowrate manually shall be entered and stored in the PLC. There are three tank turnover scenarios that the operator can select at the HMI (half volume, full volume and twice volume). The PLC shall be programmed to calculate the runtime of the pump based open the pump based on flowrate (manually entered), the calculated volume of chemical in each tank (as measured by respective level instruments) and the operator selected turnover scenario.

(3) Frequency operation shall initially be set to reoccur every 24 hours (adjustable). A visual indication on the HMI shall be configured to display the time that has passed since the last recirculation cycle.

b) PLC shall be configured to automatically open the suction and discharge valves of the tank being selected for recirculation. Recirc valves of the tanks not in operation shall remain closed. If multiple tanks are selected for the recirc operation, the valves shall be sequentially opened and closed such that only one tank is in operation at a time.

c) Logic in the PLC shall be configured to prevent the automatic recirculation of the duty pump in any case

where the LSH is active or where level in the tank is below an operator configurable capacity, initially set to 10% (configurable).

d) If the Duty pump fails, Standby pump shall take over operation from the next cycle.

e) PLC shall send a pump start signal to the pump starter and confirm pump running status. A high discharge pressure switch shall be used for pump protection such that at high pressure, after a user adjustable time delay, the pump shall automatically stop and display an alarm condition.

6) Configure interlocks to trip the pump regardless of local or remote pump operation:

a) High discharge pressure

b) Pump Fault

c) Hose Leak Detected

c. Sodium Hypochlorite Metering Pumps:

1) Local Control:

a) A LOCAL/REMOTE (L/O/R) selection is available at the local control station of each pump. When in Local, the pump shall be controlled by the start/stop buttons at the LCS. Speed shall be controlled from local control station. When the LOCAL/REMOTE selector switch is in Remote, the pump shall receive a remote Start/Stop command and Speed control signal from the PLC. Normally the L/O/R switch is set to Remote position.

2) PLC and HMI Control:

a) In Remote- Manual mode, control is governed by the soft On/Off switch. The operator shall have the ability to run the pumps from the HMI. Operators shall be able to control the Pump Speed via software manual speed setpoint input from the HMI.

b) In Remote-Auto, pumps shall run in the Duty/Standby 1/Standby 2 configuration. Metering Pumps 1-3 are dedicated to the dosing locations in Regulator 09.

c) When a pump is called to run in either Remote-Manual or Remote-Auto mode, the pump's suction valve shall be confirmed fully opened prior to start the pump. If suction valve does not open after an

operator adjustable time delay, generate an alarm and remove the pump call to run.

d) When the pump is called to stop, the pump shall stop. Then, the suction valve should close. If the valve does not close after an operator adjustable time delay, generate an alarm.

e) Sodium hypochlorite pumps can only be operated in remote/auto mode when a CSO wet weather event has been activated at Regulator 09 and all permissives are met as described in Article CS-06.

f) When the CSO wet weather event is deactivated, the sodium hypochlorite system shall continue to run for a period of time that ensure the pipe volume is completely flushed. The following is the flushing sequence:

(1) Stop the duty pump.

(2) Close all tank outlet valves.

(3) Open service water valve.

(4) Start all pumps at 35% speed (operator adjustable) and run them for a period of time that ensures the pipe volume is completely flushed. Totalize the pump flow rate as measured by its flow meter until the "Flushing Volume" setpoint is reached (Initially 473 gallons).

3) Metering Pumps Remote-Auto Operation:

a) The pump shall operate in either of the flow control modes specified.

(1) Flow Mode – Operator shall enter a desired flow setpoint, and pump speed shall be modulated to achieve the setpoint

(2) Flow with closed loop - Operator shall enter a desired flow setpoint. The flow meter on the pumps combined discharge line shall be used to adjust the pump speed to maintain setpoint.

(3) Flow pace with closed loop – Duty pump shall start at an operator adjustable dosing rate and shall be paced as a linear function of flow. Flow shall be calculated as a combined flow as read by the 2 flow

meters (FIT-404,405) at Regulator 09. The flow meter on the pumps combined discharge line shall be used as a pump closed loop confirmation

(4) Flow pace with trim and closed loop mode - Duty pump shall start at an operator adjustable dosing rate. Combined flow shall be calculated as read by the read by the two flow meters (FIT-405,406) at Regulator 09. Operator shall enter the chlorine residual setpoint expected at the Pre-bisulfite analyzer (AIT-408). Trim factor to be used in the chemical feed dosing shall be calculated from TRC value read at AIT-408. Provisions shall also be made to manually enter the residual chlorine value, based on grab samples, or manually enter trim factor to be used in the chemical feed rate calculation. If the analyzer fails, the calculation shall use the manually entered trim value if available or fallback to the last set trim factor. The flow meter on the pumps combined discharge line shall be used as a pump closed loop confirmation.

b) PLC shall send a pump start signal to the pump starter and confirm pump running status. A high discharge pressure switch shall be used for pump protection such that at high pressure, after a user adjustable time delay, the pump shall automatically stop and display an alarm condition.

4) Configure interlocks to trip the pump regardless of local or remote pump operation:

a) High discharge pressure

b) Pump Fault

c) Hose Leak Detected

I. TI-011 Sodium Bisulfite System (CS-08)

1. Reference Drawing(s): I-501.00, I-502.00

2. Process Overview:

a. The sodium bisulfite storage and feed system are designed to store and dose sodium bisulfite to the CSO at a location in the sewer barrels upstream of the TI-011 outfall.

b. The sodium bisulfite tanks (2) are provided with level transducers for continuous level measurement.

c. A Fill Station is provided for the two tanks. Manual valves are located on the fill lines to each of the tanks.

d. Two transfer pumps (duty/standby) are provided to recirculate the tank contents. Motorized valves are provided on the recirculation suction line and discharge line to the tanks.

e. There are three chemical metering pumps (Duty/Standby 1 /Standby 2), to provide dosing at the TI-011 outfall.

f. A reed level switch will be provided under Section 40 79 91 – PMCS Field Instruments to alarm of a high level in the containment sump.

3. Control Descriptions:

a. Sodium Bisulfite Fill Station:

1) PLC shall be programmed to provide tank level, tank high level and tank available indications at the fill station.

2) Programming shall be provided to place each tank to be In-Service or Out-of-Service. If a tank is Out-of-Service, all alarms associated with the tank shall be suppressed.

3) A tank shall be considered “Available” if the tank is selected to be “In- Service” and level is below the “Tank Low / Ready for Filling” setpoint.

4) The high tank level alarm and chemical leak alarm shall annunciate the horn and strobe light at the fill station. A silence push button shall be provided to reset these alarms.

b. Sodium Bisulfite Transfer Pumps:

1) Local Control:

a) A LOCAL/OFF/REMOTE (L/O/R) selection is available at the Local Control Station of each pump. When in Local, the pump shall be controlled by the start/stop buttons at the LCS. When the LOCAL/REMOTE selector switch is in Remote, the pump shall receive a remote Start/Stop command from the PLC. Normally the L/O/R switch is set to Remote position.

(1) The Operator shall ensure that all isolation valves, and motorized valves on the tanks are in the proper position for the intended operation.

2) Remote Control:

a) While in remote, the transfer pumps and its associated Motorized Valves shall be programmed to run in three basic modes of operation: Manual, Automatic Transfer and Recirculation.

b) Transfer pumps shall operate in Duty/Standby configuration, such that only one pump will be used for the operation.

3) In Remote-Manual Mode:

a) Operators shall be able to control (start/stop) the duty pump manually. Operator shall place the suction and discharge motorized valves on each of the tanks in Open / Close position based on the tank desired to be recirculated.

b) Safety interlocks shall prevent the operation of the pump if a clear flow path is not established (based on the associated motorized valves limit switch position). An indication on the HMI shall inform the operator of an instance of this type is preventing the start of a pump.

c) Manual controls and position indications shall be provided to visualize and manually operate the motorized valves at will from the HMI.

4) In Remote-Automatic Transfer Mode:

a) Operator shall assign the Duty/Standby configuration for the pumps. Operator shall also select the tank that needs to transfer chemical to a subsequent tank. Upon initiation of the mode, the Duty pump shall transfer the stored chemical from one tank to the subsequent tank. The respective discharge and recirculation valve of the tank(s) shall open and close to allow chemical to be pumped in and out as per the selection.

(1) Interlocks shall be configured at the PLC at the receiving tank for a high level alarm based on the tank level transmitter, which shall prevent any more chemical from being transferred to it.

(2) In addition, an interlock shall be configured at the sending tank for a low level alarm based on the tank level transmitter, which shall prevent any more chemical from being transferred from it.

b) Once the transfer cycle has completed, a prompt shall alert the operator of the completion to allow a change to the operation mode.

5) In Remote-Recirculation Mode:

a) Operator shall assign the Duty/Standby configuration for the pumps. Operator shall also select the tank / the order of the tanks to be placed in the recirculation mode. Upon initiation of the mode, the Duty pump shall recirculate/mix the stored chemical in the selected tank. The PLC and HMI shall be configured, such as operators can set the pump operating frequency and duration (based on pump runtime, or on tank volume).

(1) Runtime Based: Recirculation duration shall be initially set for 60 min (adjustable).

(2) Tank Volume Based: Pump flowrate manually entered and stored in the PLC. There are three tank turnover scenarios that the operator can select at the HMI (half volume, full volume and twice volume). The PLC shall be programmed to calculate the runtime of the pump based on the pump flowrate (manually entered), the calculated volume of chemical in the tank (as measured by respective level instruments) and the operator selected turnover scenario.

b) Frequency operation shall initially be set to reoccur every 24 hours (adjustable). A visual indication on the HMI shall be configured to display the time that has passed since the last recirculation cycle.

c) PLC shall be configured to automatically open the suction and discharge valves of the tank being selected for recirculation. Recirculation valves of the tanks not in operation shall remain closed. If multiple tanks are selected for the recirc operation, the valves shall be sequentially opened and closed such that only one tank is in operation at a time.

d) Logic in the PLC shall be configured to prevent the automatic recirculation of the duty pump in any case where the LSH is active or where level in the tank is

below an operator configurable capacity, initially set to 10% (configurable).

e) If the Duty pump fails, Standby pump shall take over operation from the next cycle.

f) PLC shall send a pump start signal to the pump starter and confirm pump running status. A high discharge pressure switch shall be used for pump protection such that at high pressure, after a user adjustable time delay, the pump shall automatically stop and display an alarm condition.

6) Configure interlocks to trip the pump regardless of local or remote pump operation:

a) High discharge pressure

b) Pump Fault

c) Hose Leak Detected

c. Sodium Bisulfite Metering Pumps:

1) Local Control:

a) The pumps can be run locally either from the integral controller at the pump or from the VFD. The operator shall ensure that all valves are in proper position for the intended operation.

2) PLC and HMI Control:

a) In Remote- Manual mode, control is governed by the soft On/Off switch. The operator shall have the ability to run the pumps from the HMI. Operators shall be able to control the Pump Speed via software manual speed setpoint input from the HMI.

b) In Remote-Auto, pumps shall run in the Duty/Standby 1/Standby 2 configuration. Metering Pumps 1-3 are dedicated to the dosing locations before TI-011 outfall.

c) When a pump is called to run in either Remote-Manual or Remote-Auto mode, the pump's suction valve shall be confirmed fully opened prior to start of the pump. If suction valve does not open after an operator adjustable time delay, generate an alarm and remove the pump call to run.

d) When the pump is called to stop, the pump shall stop. Then the suction valve should close. If the valve does

not close after an operator adjustable time delay, generate an alarm.

3) Metering Pumps Remote-Auto Operation:

a) Upon activation of the CSO event at the Regulator-09, the duty pump shall run at minimum speed for a period of time (operator adjustable) to ensure proper functionality of the Sodium Bisulfite system. This is a permissive to start the sodium hypochlorite system. Then the pumps shall stop and a time delay start.. The time delay shall be an estimate of the combined flows to reach the bisulfite dosing area from Regulator-09. This time delay shall either be manually entered or estimated based on the surface velocity readings recorded by the upstream flowmeters. Once the timer has lapsed, duty pump shall run. Manual initiation of the dosing pumps shall also be made available. This shall override the timer delay.

b) When the CSO wet weather event is deactivated, the sodium hypochlorite system shall continue to run for a period of time that ensures the pipe volume is completely flushed. The following is the flushing sequence:

(1) Stop the duty pump.

(2) Close all tank outlet valves.

(3) Open service water valve.

(4) Start all pumps at 35% speed (operator adjustable) and run them for a period of time that ensure the pipe volume is completely flushed. Totalize the pump flow rate as measure by its flow meter until the “Flushing Volume” setpoint is reached (initially 17 gallons).

c) Various flow control modes shall be programmed. Operator shall choose to run the system in any of the modes.

(1) Flow Mode – Operator shall enter a desired flow setpoint, and the speed of the pump shall be modulated to achieve the setpoint.

(2) Flow with closed loop - Operator shall enter a desired flow setpoint. The flow meter on the pumps combined discharge

line shall be used to adjust the pump speed to maintain setpoint.

(3) Flow pace with closed loop – Duty pump shall start at an operator adjustable dosing rate and shall be paced as a linear function of flow. Flow shall be calculated as a combined flow as read by the 2 flow meters (FIT-404,405) at Regulator 09. The flow meter on the pumps combined discharge line shall be used as a pump closed loop confirmation.

(4) Flow pace with trim and closed loop mode - Duty pump shall start at an operator adjustable dosing rate. Combined flow shall be calculated as read by 2 flow meters (FIT-404,406) at Regulator 09. Operator shall enter the chlorine residual setpoint expected at the Pre-bisulfite analyzer (AIT-410) and post-bisulfite analyzer (AIT-416), which shall be used as a trim setpoint. Provisions shall also be made to manually enter the residual chlorine value, based on grab samples, or manually enter trim factor to be used in the chemical feed rate calculation. If the analyzer fails, the calculation shall use the manually entered trim value if available or fallback to the last set trim factor. The flow meter on the pumps combined discharge line shall be used as a pump closed loop confirmation.

d) PLC shall send a pump start signal to the pump starter and confirm pump running status. A high discharge pressure switch shall be used for pump protection such that at high pressure, after a user adjustable time delay, the pump shall automatically stop and display an alarm condition.

4) Configure interlocks to trip the pump regardless of local or remote pump operation:

a) High discharge pressure

b) Pump Fault

c) Hose Leak Detected

J. TI-010 – Auxiliary Systems (CS-09):

1. Reference Drawings: I-304.00
2. Process Overview: N/A
3. Containment Piping Leak Detection and Gas Monitoring:
    a. Low Point Leak Detection for FBCSO TI-011C Containment Piping, and Continuous Leak Detection for DC5, and TI-011D Containment Piping, provided under Section 40 05 32 – Double Containment Chemical Piping shall include a Leak Detection Panel each system. All sensors and transmitters will be included as a packaged system, with a discrete output sent to the respective control panel PLC for a Leak Detected Alarm:
        1) FBCSO Leak Detection Panel shall provide Leak Detected Alarm to MCP-10 PLC.
        2) DC-5 Leak Detection Panel shall provide Leak Detected Alarm to DC5-CP PLC.
        3) TI-010D Leak Detection Panel shall provide Leak Detected Alarm to SBS-CP PLC.
    b. Sulfur Dioxide (SO2) Gas shall be monitored in the TI-010 Sodium Bisulfite Room with dual gas sensors installed in the room, and an analyzer/transmitter located outside of the room which shall output two (2) 4-20 mADC signals to the SBS-CP for the SO2 gas concentration.
    c. A leak detection alarm at TI-010D, or a high gas level alarm shall output a discrete signal to the TI-010 HMCS Panel provided under Section 23 09 00 – Instrumentation and Control for HVAC, which shall trigger the HVAC fan system.
4. Emergency Eyewash/Shower System (Provided under Section 22 11 16 – Domestic Water Piping):
    a. A flow switch provided with each emergency eyewash/shower system, shall be triggered when the respective emergency eyewash system is activated, and shall output a discrete signal to the respective control panel PLC where the eyewash activated. The following locations shall apply:
        1) Five (5) Eyewash/Shower Stations at the TI-010C Chemical Storage Area, which when activated shall send a signal to the MCP-10 PLC.
        2) One (1) Eyewash/Shower Station at the TI-010C Sodium Hypochlorite Fill Station, which when activated shall send a signal to the MCP-10 PLC.
        3) Two (2) Eyewash/Shower Stations at the TI-010D Chemical Room, which when activated shall send a signal to the SBS-CP PLC.

4) One (1) Eyewash/Shower Stations at the Sodium Bisulfite Fill Station, which when activated shall send a signal to the SBS-CP PLC.

5. ATS System:

a. The TI-010C ATS Panel provided under Section 26 36 23 – Automatic Transfer Switches shall provide five (5) discrete signals to the MCP-10 PLC for Utility Source Available, Utility Source Failure, Utility Source Power On, Generator Source Power On, and Generator Source Failure.

b. The TI-010D ATS Panel provided under Section 26 36 23 – Automatic Transfer Switches shall provide five (5) discrete signals to the SBS-CP PLC for Utility Source Available, Utility Source Failure, Utility Source Power On, Generator Source Power On, and Generator Source Failure.

K. TI-011 – Auxiliary Systems (CS-10):

1. Reference Drawings: I-406.00

2. Process Overview: N/A

3. Containment Piping Leak Detection and Gas Monitoring:

a. Containment Piping Continuous Leak Detection System provided under Section 40 05 32 – Double Containment Chemical Piping shall include a Leak Detection Panel for TI-011C and TI-011D. All sensors and transmitters will be included as a packaged system, with a discrete output sent from each panel to the MCP-11 PLC as a discrete input for a Leak Detected Alarm.

b. Chlorine (CL2) Gas shall be monitored in the TI-011 Sodium Hypochlorite Room with dual gas sensors installed in the room, and an analyzer/transmitter located outside of the room which shall output two (2) 4-20 mADC signals to the MCP-11 for the CL2 gas concentration.

c. Sulfur Dioxide (SO2) Gas shall be monitored in the TI-011 Sodium Bisulfite Room with dual gas sensors installed in the room, and an analyzer/transmitter located outside of the room which shall output two (2) 4-20 mADC signals to the MCP-11 for the SO2 gas concentration.

d. A leak detection alarm, or a high gas level alarm shall output a discrete signal to the TI-011 HMCS Panel provided under Section 23 09 00 – Instrumentation and Control for HVAC, which shall trigger the HVAC fan system.

4. Emergency Eyewash/Shower System (Provided under Section 22 11 16):

a. A flow switch provided with each emergency eyewash/shower system, shall be triggered when the respective emergency eyewash

system is activated, and shall output a discrete signal to the MCP-11 for eyewash activated. The following locations shall apply:

1) Two (2) Eyewash/Shower Stations at the TI-011C Chlorination Chemical Room (B04).

2) One (1) Eyewash/Shower Station at the TI-011C Sodium Hypochlorite Fill Station.

3) Two (2) Eyewash/Shower Stations at the TI-011D Dechlorination Chemical Room (B03).

4) One (1) Eyewash/Shower Stations at the Sodium Bisulfite Fill Station.

5. ATS System:

a. The ATS Panel provided under Section 26 36 23 – Automatic Transfer Switches shall provide five (5) discrete signals to the MCP-11 PLC for Utility Source Available, Utility Source Failure, Utility Source Power On, Generator Source Power On, and Generator Source Failure.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Shop Tests

1. Shop Testing shall conform to the requirements of Section 40 80 81 – PMCS Factory Testing.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Not Used

3.03 FIELD TESTING / QUALITY CONTROL

A. Field Testing

1. Field Testing shall conform to the requirements of Section 40 80 82 – PMCS Startup and Field Testing.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

SECTION 40 63 43 – PMCS PROGRAMMABLE LOGIC CONTROLLERS
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment and incidentals as shown, specified, and required to furnish, install, calibrate, test, startup, and place into satisfactory operation PMCS Programmable Logic Controllers (PLCs).

B. The PMCS Supplier shall provide on behalf of the Contractor all configuration and documentation of all PMCS PLCs.

C. The following index of this Section is presented for convenience:

Article	Title	Section Page
PART 1	GENERAL	1

1.04 REFERENCES

A. Definitions

1. Peer-to-Peer - Communication between devices connected to a common channel where each device can control the communication exchange.
2. PID – Proportional, Integral and Derivative, a description of controller action which modifies the response to an input signal and a set point such that the output rapidly and optimally achieves the set point.
3. Section 40 61 13 – PMCS General Requirements defines the terms and abbreviations used in this Section and the PMCS.

B. Reference Standards

1. Section 40 61 13 – PMCS General Requirements lists the standards applicable to this Section and the PMCS.
2. IEEE 37.90.1 – IEEE Standard for Surge Withstand Capability (SWC) Tests for Relays and Relay Systems Associated with Electric Power Apparatus.
3. NEMA ICS 61131-1 – Programmable Controllers Part 1: General Information.
4. NEMA ICS 61131-4 – Programmable Controllers Part 4: User Guidelines.

5. IEC 61131 – Programmable Controllers

1.05 DESCRIPTION

A. Not Used

1.06 QUALITY ASSURANCE

A. The Contractor shall comply with the Quality Assurance requirements listed in Section 40 61 13 – PMCS General Requirements, this Section and the Specifications.

B. All materials and equipment furnished shall be new, free from defects, and of first quality, produced by manufacturers who have been regularly engaged in the manufacture of PLCs.

C. Manufacturers shall have produced PLCs for a minimum of 20 years.

D. Where there is more than one item of similar equipment required under the Contract, all such similar equipment shall be the product of one manufacturer.

E. All material furnished under this Contract shall be determined safe by either Underwriters Laboratories, Inc., or Factory Mutual Engineering Corporation and all material shall be labeled, certified, or listed by the testing agency.

F. Custom made equipment or related installation which are constructed specially for this Project will not be acceptable.

G. Equipment furnished within this Contract shall be standard products furnished by a supplier regularly engaged in the manufacture of such products.

H. The PMCS Supplier shall utilize System and Software engineers who have been factory trained and certified on the respective software packages, to perform all programming functions, develop control strategies, create graphic displays, customize applications, document all work and coordinate the software interface.

I. System and Software engineers shall be intimately familiar with the details of this Plant, instrumentation and control in general and the Contract goals and requirements.

J. System and Software engineers shall have a minimum of 10 years' experience in the PMCS development work required under this Contract.

1.07 SUBMITTALS

A. The Contractor shall comply with submittal requirements listed in Section 40 61 13 – PMCS General Requirements, this Section and the Specifications.

B. The PMCS Supplier shall submit, through the Contractor, the following information for approval prior to beginning of the actual work of developing software for this Contract:

1. Qualifications and certifications of system software engineers.

2. A listing of all proposed software packages indicating quantities and where they will be installed.

3. Preliminary ladder logic for all PLC(s) and general methods of implementing the various control strategies.
4. Preliminary database and I/O listing showing system tag names and references.
5. Preliminary screen display count with general system structure.
6. Preliminary screen display development, general display organization and common components.

C. The PMCS Supplier shall submit all completed items to the Engineer for review and approval. As a minimum, the items to be submitted shall include, but shall not be limited to:

1. PLC ladder logic with full documentation and annotation
2. Full Color copies of all unique Graphic display screens
3. Screen animation and control
4. Databases
5. Alarm and event log lists, formats and messages
6. Working Drawings and Fabrication Drawings which shall include:
    a. Equipment specifications and data sheets identifying all equipment and materials used and methods of fabrication.
    b. Complete assembly and layout drawings with clearly marked dimensions.
    c. Equipment cross sections and mounting details.
    d. Weights of all component parts assembled weight of units and approximate total shipping weights.
    e. Interconnecting wiring diagrams.
    f. List of spare parts.
7. The Control Panel Fabrication Drawings shall include:
    a. Panel layouts
    b. Component placement
    c. Wiring details
    d. Labeling
    e. Assembly instructions
8. Vendor documentation including:
    a. Datasheets
    b. Technical specifications
    c. Certifications

d. Warranties

e. Product manuals

9. Software Documentation including:

a. PLC program code

b. Configuration files

c. Databases

d. Software licenses

e. Network configurations

D. Submittals shall be made at least 60 days in advance of any proposed use by the PMCS Supplier.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall comply with delivery, storage and handling requirements listed in Section 40 61 13 – PMCS General Requirements.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall comply with spare parts, special tools and supplies listed in Section 40 61 13 – PMCS General Requirements, this Section and the Specifications.

B. Spare parts and tools shall be as recommended by the manufacturer and shall as a minimum include the following:

1. Four (4) I/O modules for each type furnished.

2. Two (2) communication modules (Ethernet, Remote I/O, PLC LAN) for each type furnished.

3. Two (2) CPUs of each size and type furnished.

4. One (1) PLC rack of each type and size furnished.

5. Two (2) power supplies of each size furnished.

6. One (1) PLC for each type furnished.

7. All spare parts recommended by manufacturer and listed as recommended spare parts in the manufacturer's submitted O&M Manual.

8. Tools

a. Furnish all tools necessary to service, disassemble, repair, and adjust the equipment.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer’s standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. PMCS Programmable Logic Controllers shall be as manufactured by Schneider Electric, Model Modicon M340 Series. No alternate manufacturers or products will be accepted:

Control Panel Designation	PLC Type
TI-010 Main Control Panel (MCP-10)	Modicon M340 Series X80 Form Factor IO. Use processor Ethernet port for Modbus TCP/IP connection to SCADA network. Separate communication card required for Modbus TCP/IP connection to OIT network.
DC-5 Control Panel (DC5-CP-10)	Modicon M340 Series X80 Form Factor IO
TI-010 Dechlorination Control Panel (SBS-CP-10)	Modicon M340 Series X80 Form Factor IO
TI-011 Main Control Panel (MCP-11)	Modicon M340 Series X80 Form Factor IO. Use processor Ethernet port for Modbus TCP/IP connection to SCADA network. Separate communication card required for Modbus TCP/IP connection to OIT network.

B. PMCS Industrial PC for OITs shall be as manufactured by:

1. Schneider Electric Harmony P6, El Paso, Texas.
2. Arista Panel PC, Fremont, California.
3. AIS Panel PC, Leominster, MA.
4. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. General

1. The PMCS PLCs shall implement and provide the Control Strategies specified in Section 40 61 96 – PMCS Control Strategies.
2. Where shown on the Contract Drawings redundant PLCs configured in hot standby arrangements shall be provided.
3. The PLC shall be configured by the Contractor to perform functions shown and specified. The Contractor shall coordinate and obtain from all equipment suppliers PLC systems of the same manufacturer and series.
4. Functions to be performed by the PLC include but are not necessarily limited to the following:

a. Alarm and status indication.

b. PID control and arithmetic functions.

c. Interlock and sequential logic control of processes and equipment operations.

d. Collection and transmission of data and control parameters to and from other PLCs.

e. Provide a dry contact rated 2 amperes at 120-volt a-c for remote indication of processor failure.

5. The PLC shall be microprocessor type furnished with all necessary relays, timers, counters, and latches as data manipulative functions and arranged into the format required to accomplish the functions shown and specified.

6. The PLC shall be designed and constructed for the demanding requirements of real-time process management and control on a continuous basis for use in a CSO Facility.

7. The manipulative functions shall have the capability of being rearranged into any desired format while the controller is performing other control tasks.

8. Expansion of the controller by the Input/Output points, internal data manipulative functions, and relays, timers and counters shall be accomplished by reprogramming.

9. The control programs and applications memory of the PLC shall be capable of being remotely (off-line) and locally (on-line) monitored, programmed, modified and displayed by use of a personal computer and documentation software which shall be provided as part of this Contract.

10. In addition, the PLC shall be capable of being programmed by an external PC compatible host device via an Ethernet communication port. The host communication interface shall allow controlled access for authorized users via password protection to all registers, I/O system fault status and I/O override.

11. The logic shall be entered and displayed in ladder diagram format.

12. The ladder diagram format shall contain a complete cross reference with each coil referred to in logic and identified as normally open or normally closed.

13. Mnemonic information shall be added to each coil and to both real and internal I/O points. Alphanumeric titles and descriptions shall appear on the screen.

14. Any restructuring of the control logic shall be done at the PLC installation and shall not necessitate any removal components of the PLC to another location.

15. The PLC construction shall be that of a modular type design.
16. All inputs, outputs, and logic control interface units shall be easily removed for ease in replacement or restructuring the hardware arrangement.
17. Shut down of the processor control logic (halting of program scan) shall not occur if I/O or Remote I/O modules are removed.
18. In the event of a power failure or malfunction of the logic hardware, the controller shall provide dry, Form C contact closures for remote and local indication and alarming.
19. A self-diagnostics package to determine proper processor operation shall be included. Diagnostic LED shall be provided in clear view on the front of the PLC enclosure.
20. Changing an on-line control logic process operation shall not necessitate the halting of the processor.
21. Burn-in for all printed circuit boards and modules shall be performed at the factory.
22. Programmable Logic Controllers shall conform to NEMA ICS 61131 – 1 and NEMA ICS 61131 – 4
23. The primary interface to the process equipment and field devices shall be provided by the Input/Output system consisting of I/O modules installed in the PLC backplane, chassis or remote mounting racks.
24. The Input/Output system hardware shall be designed with the following features:
    a. Noise immunity and filtering.
    b. IEEE surge-withstand rating to IEEE 37.90.1
    c. Optical isolation for all inputs and outputs to provide controller logic protection.
    d. No on board pots requiring adjustment or maintenance.
    e. Any card, any slot, plug-in packaging, with locking bars and/or screws to hold I/O modules in place.
    f. 600 volt, screw type, field wiring terminal strips sized to accommodate a minimum of two # 14 AWG wires per terminal within control panels and MCCs.
    g. Terminal strip design shall allow I/O module removal and replacement without disturbing wiring connections.
    h. Front-of-module LED status indicators for each individual I/O point to indicate when power is applied at I/O terminals.
    i. Individually fused output circuits for all output modules.

j. Output fuses shall be capable of being inspected without removal of and replaced without disassembly of the output module.

k. Individually isolated output modules shall be provided with front-of-module blown fuse LED status indicators for each output point.

l. Non-isolated (common output power source) output modules shall be provided with common blown fuse LED status indicators for a maximum of every four points.

m. All outputs for contactors and relays shall be rated for a minimum of 2.0 amps continuous at 120 VAC.

n. Where higher rated outputs are required, interposing relays located inside control panels shall be provided in order to assure that ratings of the PLC output contacts are not exceeded.

o. For outputs to motor contactors and other equipment type load relays, provide transient and inrush surge suppressor connected across the output contact terminal and the neutral common terminal inside the control panel to suppress the switching surge transient to lower than the continuous rating of the output contacts.

p. The maximum number of points per I/O module shall be as follows:

1) Discrete: 16.

2) Analog: 8.

q. The following types of I/O modules shall be provided for use with the supplied PLC System:

1) Analog Inputs (12 bits minimum):

a) 4-20 mA DC (250 ohms maximum impedance).

2) Analog Outputs (12 bits minimum):

a) 4-20 mA DC (load of750 ohms minimum).

3) Register Inputs and Outputs (16 bit):

a) Single BCD.

b) Multiplexed BCD.

4) Discrete Inputs:

a) 24 VDC, in both isolated and common circuit types.

b) TTL Logic.

5) Discrete Outputs:

a) 120 VAC in both isolated and common circuit types.

b) 24 VDC

c) Form C Relay Contacts.

d) TTL Logic.

25. Signal and control circuitry to individual I/O boards shall be arranged such that a board failure shall not disable more than one half of the control loops within any group of controlled equipment (e.g., one pump out of a group of three pumps, two pumps out of four, etc.).

26. Where possible, individual control loops and equipment shall be assigned to individual boards such that failure of the board will disable only one loop or piece of equipment.

B. Required PLC Features:

1. Construction

a. Modular printed circuit boards.

2. Type

a. Electronic components with central processing unit and software reprogramming capabilities.

3. Memory

a. System Memory

1) Electrically Erasable Non-volatile type (EEPROM) or Lithium battery-backed RAM with minimum retention time of 2 years under worst case conditions.

b. Application Memory:

1) Type, Lithium Battery-backed RAM with minimum retention time of 2 years under worst case conditions, or RAM with EEPROM or NOVRAM backup modules.

2) Size, as required for present and dedicated future I/O capacity and for performance of the specified functional requirements plus 25 percent spare capacity as a minimum.

4. Language Format

a. Ladder type diagrams and functional blocks.

5. Provide type and quantity of I/O as required to perform the operational and functional requirements plus 20 percent spare (minimum of one module) for each type of I/O module used.

6. Spare I/O points shall be mounted and wired ready for use and shall require only field wiring connections and software configuration to place the point in service.

7. Internal Functions

a. Relays, timers, counters, latches, internal storage registers, and other functions as required to perform specified functional requirements plus 25 percent spare capacity.

8. Report Generation

   a. Processor shall have the capability to store and automatically communicate up to 198 ASCII status/alarm/diagnostic type messages to a peripheral display device via the RS-232C output port at rates up to 19.2 K bits/second.

9. Security Features

   a. Key switch interlock on PLC and/or security password protection through system programmer terminal to prevent tampering of logic sequences and unauthorized programming.

10. Processor Scan Time

   a. 0.3 to 2 ms per kbytes of memory typical.

   b. No more than one word shall be required for each contact or coil including address, no more than one word for a branch, no words for spaces or connects, and no words shall be required to begin a new rung.

   c. Scan time refers to nominal memory scan time of words of relay ladder logic, with an "immediate I/O" command to operate on instantaneous alarm information.

   d. Unprogrammed memory shall not be scanned.

11. Operating Temperature

   a. 32-degree F to 140-degree F.

12. Storage Temperature

   a. Minus 40-degree F to 160-degree F.

13. Power Supply

   a. 120 VAC, with circuit breaker protection.

   b. Supplies shall be sized for a minimum of 130 percent of maximum simultaneous current draw.

   c. Comply with requirements specified in with Section 40 61 13 – PMCS General Requirements.

14. Data Communications

   a. The PLCs provided shall be capable of Peer-to-Peer communications with other PLCs of the same and different types by means of manufacturer standard data highway system.

   b. Highway system design shall be a token-passing, master less, high-throughput serial communication bus which connects the PLCs by means of intelligent network interface modules at highway drops.

c. Minimum local highway speed shall be 50 Kbaud and highway system design shall be upwardly compatible with the MAP standard.

d. All PLCs shall be provided with Ethernet networking capability using TCP/IP protocol. All modules required shall be supplied.

15. Clock

a. Battery-backed clock with typical variation of ±20 sec. per month.

16. Programming/Documentation Software

a. Provide PLC programming/documentation software package which shall be fully menu-driven and self-prompting.

b. Package shall provide fully integrated ladder diagram programming and documentation.

c. The package shall allow 3 lines of mnemonics per ladder element with 6 characters per line minimum. The package shall also provide for the inclusion of the following documentation information for ladder diagram contacts and coils:

1) Panel I/O wiring list.

2) Rack number.

3) Module position slot number.

4) I/O module type.

5) Terminal number and wire number.

6) Electrical and Mechanical Drawing Reference Number.

7) Description of up to 240 characters in length for each element.

d. The programming/ documentation software displays shall allow the user to flip between documentation and the uncommented rung as it resides in the controller.

e. Software shall also allow selection of single rung and continuous ladder diagram printouts.

17. PLC Configuration

a. PLC types shall be as designated on the PMCS Block Diagram and this Section.

b. Memory and processor shall be adequate for all control functions specified.

18. PLC Minimum Performance Requirements

a. The table below lists the minimum requirements for various sizes of PLC.

PLC Type	Micro	Small	Mid-Size	Large
I/O Discrete Points	14	960	4096	12000
I/O Analog Points	3	96	2048	8000
Memory	3 kB	6 kB	96 kB	440 kB
Scan time	3 ms/kB	2.5 ms/kB	0.3 ms/kB	0.3 ms/k

19. Industrial PC for OITs

a. General: Provide a Panel Mount Industrial PC which shall be utilized as the human machine interface as indicated on the System Architecture. PC shall be password protected for system security and user identification.

b. The Industrial PC shall be a flat screen touchscreen panel.

c. The following features must be met at a minimum:

1) NEMA 4X front panel mounted.

2) 5-wire resistive touch screen technology.

3) CPU: Intel i7-6700T.

4) 32 GB DDR4 Memory.

5) 1 x 2.5” SATA SSD Storage.

6) Aspect Ratio: 4:3.

7) Network (LAN): 2 RJ-45 Ports.

8) Operating System: Latest version of Microsoft Windows Professional (64-Bit).

9) Power: 24 VDC.

10) Display Type: 15” Active Matrix TFT LCD.

11) Resolution: 1024 x 768.

12) Programming software for HMI application shall be loaded into this Panel PC, and shall match the SCADA HMI Software used in the existing Citywide Collection Facilities Integrated SCADA System (CCFISS) network. Contractor shall provide all software and licenses required for OIT.

13) OIT graphic guidelines shall comply with the requirements of Section 40 61 95 – PMCS Monitoring and Control Criteria.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. PMCS PLCs shall confirm to the requirements of Section 40 80 81 – PMCS Factory Testing.

B. PMCS PLC monitoring and control criteria specified under this Section shall be functionally verified during PMCS Factory Testing.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 IMPLEMENTATION

A. Install each item in accordance with manufacturers recommendations and in accordance with the Contract Documents.

B. Configure PLC to prevent erroneous and nuisance alarms by using techniques including time delays and logic such as

1. Inhibit initiation of a seal water failure alarm when pump is not running

2. Provide a time delay on high discharge pressure alarm.

C. Arrange PLC data table. Repeat all status and alarm bits and analog values (including timer and counter presets) into a separate, contiguous block of memory, grouped by type. Provide 25% space in each group to allow for future expansion.

D. Configure operator interface unit using function keys and instructional prompts so that the operators can modify set-points and presets without any special training or knowledge of the PLC program.

E. A modular and structured approach to PLC program development shall be implemented.

F. The programs shall be broken up in logical segments to allow easy debugging in the field.

G. All real world outputs/inputs shall be grouped such that their addresses can be mapped in contiguous registers to allow use of matrix functions for troubleshooting, debugging, and alarming.

H. An alarm segment shall be developed for all real world outputs.

I. The alarm segment shall be separate from the rung logic for real world outputs.

J. For open/close valves, the associated limit switch positions shall be compared with the PLC output.

1. If the output calls for an open valve, the open limit switch should be made and the closed switch should not and vice versa.

2. Any combination other than these two shall cause an alarm.

K. The PLC shall monitor limit switch positions for valves in transition.

1. Valves in transition (between open and close position) shall be displayed on the operator interface with message "In Transition".
2. The Contractor shall submit limit switch development for all valves.

L. For motors, the run output shall be compared to the run status with the appropriate time delays.

1. Any mismatch between RUN output and RUN status shall cause an alarm.

M. Unless waived in writing by the engineer, application programs written for PLCs shall be written using ladder logic, showing discrete references in individual ladder rungs.

N. Each output shall have its own complete set of logic to aid in startup and trouble shooting.

O. Where duplicate or repetitive logic is required, subroutines shall be used to reduce program memory requirements and scan time.

P. The program shall be written in a logical sequence with associated rungs grouped together in a manner to make the system logic clearly evident.

Q. Where multiple rungs use the same constants for associated presets or reference, the constant shall be in the form of a register location and shall be loaded in the beginning of the program each time it is run.

R. All preset register values shall be part of the program and load each time the program is run.

S. Where possible, constants that must be calculated shall have this done in the program.

T. Where values must be input, whether in the program or during operation, software "traps" shall be used to prevent input of values out of range or that will cause improper operation of the system.

3.03 FIELD TESTING / QUALITY CONTROL

A. PMCS PLCs filed testing shall conform to the requirements of Section 40 80 82 – PMCS Startup and Field Testing.

B. PMCS PLCs monitoring and control criteria specified under this Section shall be verified during PMCS Startup and Field Testing.

3.04 STARTUP / DEMONSTRATION

A. Section 40 80 82 – PMCS Startup and Field Testing details the requirements for OAD and PMCS Upset and Recovery Testing.

B. The OAD and the PMCS Upset and Recovery Testing shall serve as the final verification of the correct implementation of the PMCS PLCs specified under this Section.

3.05 ADJUSTING / PROTECTION / CLEANUP

1.04 REFERENCES

A. Not Used

1.05 DESCRIPTION

A. Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish, install, calibrate, test, adjust and place into satisfactory operation the Network Hardware required for Process Monitoring and Control System (PMCS).

B. Provide PMCS network hardware quantities as shown on PMCS network Architecture block diagram, and as required for an implementing a fully functional network.

C. Provide copper Cat6A Ethernet cables with RJ-45 connectors as required to interconnect the network hardware as shown and specified.

D. Provide Fiber Optic patch cables with connectors compatible with network equipment as required to interconnect the network hardware as shown and specified.

E. Coordination:

1. Comply with the requirements of Section 40 61 13, PMCS General Requirements, and the following:

a. Contractor shall be responsible for coordinating installation of all hardware in the network cabinets to ensure that all equipment is installed correctly and in accordance with the manufacturer's recommendations. Actual rack unit size of equipment shown on drawings may vary from equipment furnished.

b. Contractor shall be responsible for coordinating the hardware components of the rack mount servers and workstations interface to provide compatibility with all SCADA hardware as shown and specified.

1.06 QUALITY ASSURANCE

A. Comply with the requirements of Section 40 61 13, PMCS General Requirements.

B. Training:

1. Provide training to City's personnel in the operation, programming and maintenance of the equipment.

2. Comply with the requirements of Section 40 61 26, PMCS Training.

1.07 SUBMITTALS

A. Comply with the requirements of Section 40 61 13, Process Monitoring and Controls System (PMCS) General Requirements, 40 61 26, PMCS Training, and the following:

1. Manufacturer's Certificates of Compliance and Site Visit Reports.

1.08 DELIVERY, STORAGE AND HANDLING

A. Equipment shall be delivered, stored and handled in accordance with Section 40 61 13, PMCS General Requirements, the manufacturer's instructions, and the following:

1. All equipment shall be inspected for shipping damage or loose parts when received. Evidence of water, which may have entered equipment during transit, shall be checked.

2. Equipment shall be stored in a clean, dry, climate-controlled location in which a uniform temperature is maintained. Equipment shall be protected with coverings and maintain air circulation.

3. Where dampness or condensation may be encountered, heaters shall be provided for equipment to prevent moisture damage.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Provide the following spare parts:

1. Panel Ethernet Switch:

a. One switch of each type for every five switches, or portion thereof, provided.

B. Provide special tools necessary for normal operation, maintenance and diagnostic aids.

C. Spare parts shall be packed in sturdy containers with clear indelible identification markings and shall be stored in a dry, warm location until transferred to the City at the conclusion of the Project.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

B. Comply with the requirements of the General Conditions and the following:

1. Contractor shall provide the following product warranties from the date of equipment acceptance by the City:
    a. For Ethernet Switches:
        1) Minimum 3 years warranty.
        2) For all Cisco Network Switches specified in this section, Warranty shall be exclusively through manufacturer, not from PMCS Sub-Contractor. Provide name of Cisco Representative to the City and coordinate the inclusion of the Network Switch under the service contract that the City holds with the manufacturer.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Provide Managed Ethernet Net Switch by CISCO, Model Industrial Ethernet Switch 4000. No alternate manufacturer or product will be accepted.

B. Provide Cellular Router Model IR831 as manufactured by Cisco. No alternate manufacturer or product will be accepted.

2.02 MATERIALS /EQUIPMENT

A. MANAGED ETHERNET SWITCH:

1. General:
    a. Furnish and install modular, managed Ethernet switches for connecting devices on the network. The use of hubs will not be permitted.
    b. Managed type Ethernet switches shall have a full set of management features, including Command Line Interface, SNMP agent, and web interface. In addition, managed switches shall have features to manipulate configurations, such as the ability to display, modify, backup and restore configurations.
    c. Provide equipment to operate on 115 VAC, single phase, 60-hertz electrical service.
    d. Provide all necessary items for installation, including mounting brackets, interconnecting cables, hardware and appurtenances.
    e. Label each switch with the switch name as shown on the Contract Drawings. Label shall be clearly visible and shall be in accordance with Section 40 67 16, PMCS Panels and Enclosures.
    f. Quantities shall be as shown.
    g. Configure switch for Modbus TCP/IP Communication protocol.
2. Features:

a. 10/100/1000 base-T, auto-negotiation 802.3u.

b. Minimum Port count:

1) 4 RJ-45 ports, Fast Ethernet. In addition, provide four (4) ports labeled as spares. Provide POE ports as required to accommodate end devices.

2) 2 fiber Optic ports (Small Form-Factor Pluggable – SFP), (Fiber-Optic LC Connectors)

c. Minimum of two (2) fiber optic ports. Fiber optic ports shall be expanded as needed to interconnect all system components.

d. Layer 2 switching capability.

e. 256 MB Dram with ECC memory

f. IEEE 1588v2 FPGA

g. 64 MB on-board flash memory

h. 1GB removable SD flash memory card

i. Mini-USB connector

j. Alarm I/O: Two alarm inputs to detect dry contact open or close; one alarm output relay.

k. Support for the use of IGMP for multicast traffic.

l. Support for VLAN as defined in IEE802.1Q.

m. Support for the use of SNMP management.

n. LED for indicating port status.

o. Failsafe output relay to indicate malfunction with unit.

p. FCC Part 15, Class A compliant.

q. Provide management software for multilevel security, web-based configuration and remote monitoring.

r. Powered by circuit on Uninterruptible Power Supply.

s. Operating temperature of -20°C to 55 C.

t. Internal Panel mounting kit.

u. Configuration backup capability required.

3. Implementation

a. It is the PMCS Sub-Contractor's responsibility to coordinate with CISCO to ensure that the MODBUS TCP/IP protocol is correctly implemented to affect the communication specified herein and as

depicted on the drawings to provide a satisfactory operating network.

B. CELLULAR ROUTER:

1. General:
   a. Provide a cellular router for industrial applications.
   b. Provide all necessary items for installation, including mounting brackets, hardware, and appurtenances.
   c. Supports VPNs and traffic inspection advanced security features.
2. Features:
   a. Supports the following Protocols E-IGRP, MP-BGP, IPv4 and IPv6 on all interfaces including cellular, IPv4/IPv6 Multicast, Generic Routing Encapsulation (GRE) and multipoint GRE (MGRE), NAT, DNS Proxy and Spoofing, IP SLA and QoS.
3. Cellular Connectivity:
   a. 4G LTE, 3.7G, 3.5G or 3G Cellular WAN Link
   b. External, dual 4G antennas with main and receive diversity
   c. Dual SIM support
4. Ethernet Copper Ports: 4 x 10/100/1000 Mbps; 1 SFP port
5. Support advanced security features such as access control, threat detection & mitigation, device, and platform integrity.
6. Network Interfaces: 1Gbps Ethernet minimum with support for 10/100 Mbps connections.
7. Operating Temperature: -40 to 60C
8. Mounting: Panel/door mount
9. Router Management support:
   a. Web Services Management Agent (WSMA)
   b. Manufacturer Management Suite
   c. SNMPv3 and Syslog
10. Power Supply:
    a. Redundant 100-240 VAC power supplies. Load-sharing power supplies in a dual power supply configuration. The single power supply shall be capable of supporting a fully configured router.
    b. IEC power cord(s).
11. Display:

a. The switch shall have LED indication for: Power status, GE LAN, GE WAN, POE, WLAN, 3G/4G, VPN and Module status

b. The switch shall have LED indication per port for activity and transmission rate.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Contractor shall examine the conditions under which the Work is to be installed and notify the City, in writing, of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. Locate and install components as shown and in accordance with the manufacturer's recommendations. Components installed inside the panels shall not prohibit the panel doors from fully opening or closing.

3.03 FIELD TESTING / QUALITY CONTROL

A. Site Tests:

1. Comply with the requirements of Section 40 80 82, PMCS Startup and Field Testing.

B. Manufacturer's Services:

1. For each of the following equipment, furnish the services of a qualified factory-trained serviceman to assist in the installation of the equipment, check the installation before it is placed into operation, supervise initial operations and instruct plant operators in the care, operation and maintenance of the equipment.

a. Multi-Function Printer.

2. The serviceman shall make not less than one visit to the Site for a period of not less than 8-hours to assist in the installation of the equipment, check the completed installation, perform the required tests, and instruct plant operators in the proper care, operation and maintenance of the equipment.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

END OF SECTION

SECTION 40 67 16 – PMCS PANELS AND ENCLOSURES
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, supervision, materials, equipment and incidentals as shown, as specified and required to furnish, install, calibrate, test, start up, commission, and place into satisfactory operation all control panels and/or equipment enclosures, termination cabinets and all associated equipment, as indicated on the Contract Drawings and as specified in this Section.

B. The following index of this Section is presented for convenience:

Article	Title	Section Page

C. A schedule of system panels is provided in at the end of this Section, for the convenience of the Contractor. The schedule may not indicate all panels and does not indicate all enclosures required for this Contract. The Contractor shall furnish and install all panels and enclosures as required.

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.04 REFERENCES

A. Definitions

1. Section 40 61 13 – PMCS General Requirements defines the terms and abbreviations used in this Section and the PMCS

B. Reference Standards

1. Section 40 61 13 – PMCS General Requirements lists the standards applicable to this Section and the PMCS.

1.05 DESCRIPTION

A. Not Used

1.06 QUALITY ASSURANCE

A. The Contractor shall comply with the Quality Assurance requirements listed in Section 40 61 13 – PMCS General Requirements.

B. All materials and equipment shall be new, and all panels shall be built in an Underwriters Laboratory (UL), Inc. approved panel shop and bear the UL label in accordance with the requirements of UL 508A, the standard for the construction of industrial control panels.

1.07 SUBMITTALS

A. The Contractor shall comply with submittal requirements listed in Section 40 61 13 – PMCS General Requirements.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall comply with delivery, storage and handling requirements listed in Section 40 61 13 – PMCS General Requirements.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall provide spare parts for the equipment provided under this Section.

B. The spare parts shall be listed in an index and packed in containers suitable for long term storage, provided with labels clearly designating the manufacturer's part number with complete information for use and reordering.

C. The Contractor shall provide minimum the following:

1. Ten (10) percent (minimum of 1), spare space heaters of each type and rating.
2. Ten (10) percent (minimum of 1), spare heater thermostats of each type
3. One (1) spare lighting fixture and switch of each type provided.
4. Ten (10) percent (minimum of 2), spare power supply, regulator, power conditioner, etc., of each type and rating provided.
5. Ten (10) percent (minimum of 1), spare thermal control device (fan, air conditioner, heat exchanger, etc.) for each type and rating provided.
6. Ten (10) percent (minimum of 10), spare fuses, circuit breakers, equipment mounting (DIN) rails.
7. Twenty-five (25) percent (minimum of 100) spare terminals of each type provided for the entire project.
8. Spare parts as recommended by the individual equipment manufacturers.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. NEMA 4, 4X and 12 panels and enclosures shall be as manufactured by:
   1. Hoffman, Anoka, MN.
   2. B-Line, Highland, IL.
   3. Or approved equal.

B. Fiberglass or polycarbonate panels and enclosures shall be as manufactured by:
   1. Adalet, Cardington, OH.
   2. Crouse-Hinds, Syracuse, NY.
   3. Or approved equal.

C. Wire troughs and wire management shall be as manufactured by
   1. Panduit, Lockport, IL.
   2. Or approved equal.

D. Circuit breakers shall be as manufactured by:
   1. Siemens Industry, Inc., Washington, DC.
   2. Allen Bradley, by Rockwell Automation, Milwaukee, WI.
   3. Or approved equal.

E. Terminal blocks shall be as manufactured by:
   1. Entrelec, Montgomery AL.
   2. Or approved equal.

F. Fused Terminal blocks shall be as manufactured by:
   1. Allen-Bradley, by Rockwell Automation, Milwaukee, WI.
   2. Phoenix Contact, Middletown, PA.
   3. Or approved equal.

G. Panel or enclosure heaters shall be as manufactured by:
   1. Hoffman (DAH8001B), Anoka, MN.
   2. Or approved equal.

H. Panel or enclosure corrosion inhibitors shall be as manufactured by:
   1. Hoffman (HCI series), Anoka, MN.
   2. Or approved equal.

I. Panel or enclosure heat exchangers shall be as manufactured by:
   1. Hoffman (Spectracool), Anoka, MN.
   2. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Not Used

2.03 FABRICATION / ASSEMBLING / FINISHES

A. General Requirements:

1. Furnish and install panels, boxes and enclosures with a NEMA rating based on the table listed in Appendix A in this Section.
2. Panels and enclosures shall meet or exceed the NEMA and NYCEC requirements for the area in which they are installed.
3. Unless otherwise specified or indicated, panels and enclosures shall have a NEMA 4X rating and shall be fabricated of 316 stainless steel.
4. Panels provided as part of a packaged system, from an equipment vendor, (sump pumps, seal water pumps, VFDs, etc.) shall comply with all requirements specified in this Section.
5. The NEMA rating of panels, enclosure and devices shall be as required in their individual Sections if so specified.
6. The sizes of panels and enclosures shown on the Contract Drawings are estimates.
7. The Contractor shall furnish enclosures of the size required to house all equipment, instruments, front panel mounted devices, power supplies, power distribution panels, wiring, tubing, and other components installed in the enclosures while maintaining adequate free space within the enclosure.
8. Panel, box and enclosure doors shall be continuously hinged and shall be of pan construction. Clamp type closures shall be provided.
9. Adequately support and restrain all devices and components mounted on or within the panel to prevent any movement.
    a. Provide sub-panels for installation of all internally mounted components.
    b. Provide mounting strips for installation of all relays and other components where mounting strips are practical.
    c. Sub-panels shall be pan construction to prevent warping.
10. Devices shall be arranged to allow adequate wiring room for ease of connections and servicing.
11. All panel and enclosure components shall be identified both inside and out with engraved, laminated plastic name plates.
12. Panels shall be provided with an engraved laminated plastic sign inscribed "WARNING – This Device Is Connected to Multiple Sources of Power ". Letters shall be 1/2" high, white on a red background

13. Provide all electrical and/or pneumatic connections, components and devices, support hardware, fasteners, interconnecting wiring and/or piping required to make the control panels complete and operational units.

14. Provide bulkhead fittings for all gas, liquid piping and tubing leaving panels and enclosures.

15. Provide all panel-mounted pilot devices as shown and specified.

16. Locate and install all devices, wiring, and components so that connections can be easily made and there is ample room for servicing each item.

17. Components for installation on panel exterior shall be located as shown on the Contract Drawings or as directed by the engineer.

    a. Layouts shall be submitted for approval.

    b. All exterior panel mounted instruments shall have a NEMA rating equal to or greater than the enclosure.

    c. For panel mounted devices which cannot be obtained with the correct NEMA rating equal to the enclosure, the device shall be mounted behind a transparent viewing window or door, manufactured for the purpose that provides the proper rating.

    d. The viewing window or door shall maintain the NEMA rating of the enclosure and be easily opened for access to the instruments.

18. Where permitted by location and layout as shown on the Contract Drawings, all panels and enclosures shall have full height rear access doors, unless otherwise shown.

19. Where rear doors are not possible, panels shall have full height front access doors.

20. All wiring to panel connections from field instruments, devices, and other panels shall be terminated at master numbered terminal strips, unless otherwise specified.

21. Free standing control panel, enclosure or any panel with a dimension of 36 inches or more shall comply with the following:

    a. Provide at least one 120 VAC, 15 Amp duplex, grounding type receptacle.

    b. At least one 120 VAC LED light fixture complete with a protective plastic shield and capable of generating 25 foot candles on all the components within the enclosure.

    c. One 120 VAC, 15 Amp, snap switch in an outlet box with a cover to turn on the light. The switch shall be located so that it is easily accessible from the door.

    d. The service light with switch and duplex receptacle shall have their own circuit breaker.

e. The bottom 12 inches and top 6 inches of free-standing panels shall be free of all devices, including terminal strips, to provide ease of installation, wiring and testing.

f. In general, panel indication and control devices shall be mounted within a range of 40 to 72 inches above the operating floor but not less than 36 inches nor greater than 78 inches unless otherwise shown on the Contract Drawings.

g. Annunciators or alarm message display devices shall be mounted up to 84 inches above the operating floor.

h. All instrument read-outs and displays shall be in ENGINEERING UNITS of the desired process variable. Percent of scale or digital counts are not acceptable unless approved in writing by the Engineer.

i. Panels shall be constructed with an integral fully enclosed solid bottom section at least 6 inches in height from the bottom of the enclosure to the bottom edge of the enclosure door opening.

j. Free standing enclosures shall be mounted on concrete base pad.

k. Free standing panels installed in areas with raised computer type floors shall be provided with an adjustable, welded steel support frame to support the panel from the building structure.

1) The frame load rating shall have a 50 percent safety factor.

2) The frame shall be coordinated with the flooring being installed and shall be flush with the height of the raised floor.

B. Panel and Enclosure Fabrication:

1. Panels and enclosures shall be fabricated as indicated on the Contract Drawings and as specified in this Section.

a. Control panels and enclosures shall be assembled, wired, and tested in the PMCS Supplier's own or other City/Engineer approved facility.

b. All components and all necessary accessories such as power supplies, power conditioning equipment, mounting hardware, input and output terminal blocks, plug strips, relays, lighting, circuit breakers, fuses, and other components which may be required to complete the system shall be provided.

c. The Contractor is directed to review the area classifications with regards to hazardous atmospheres, as they are defined by the NYCEC and NFPA 820.

1) All equipment, controls, instruments, panels, enclosures, etc., for use in these areas, shall be constructed to meet the area requirements.

d. All control panels and enclosures shall be of formed or welded construction of steel or stainless steel, as required, unless otherwise noted.

e. Panels and enclosures shall be fabricated in accordance with the NEMA ratings as specified, shown, or required.

f. Panels and enclosures shall meet or exceed the requirements of the area in which they are located.

g. As a minimum, a NEMA 12 rating shall be required in all non-corrosive areas and NEMA 4X S/S in outdoor, process, and corrosive areas

h. Where enclosure size or weight requires, provide lifting eye bolts to facilitate handling of the enclosures.

1) All panels or enclosures with any dimension 72 inches or greater or with a weight in excess of 150 pounds, shall be equipped with lifting eyes.

2) Bolt lifting eyes directly through the enclosure structural members.

i. Continuously weld all exterior seams and grind smooth.

j. Reinforce sheet steel with steel angles where necessary to adequately support equipment, ensure rigidity, and preclude distortion and resonant vibrations.

k. Panels and enclosure surfaces shall be flat within 1/16 inch over a 24 inch by 24-inch area, or flat within 1/8 inch for a larger surface.

1) Flatness shall be checked by using a 72-inch-long straight edge.

2) Out-of-flatness shall be gradual, in one direction only, and shall not consist of obvious depressions or a series of wavy sections.

l. Use pan-type construction for doors.

1) Door widths shall not exceed 36 inches.

2) Mount doors with full-length heavy-duty continuous piano hinge with stainless steel hinge pins.

3) Provide handle-operated, oil-tight, key-lockable three-point stainless steel latching system with rollers on latch-rods for easy door closing.

4) Provide oil resistant continuous gasket completely around each door or opening.

m. Provide interior mounting panels and shelves constructed of minimum 12-gauge steel with a white enamel finish.

n. Provide steel print pocket with white enamel finish.

o. Use 304 stainless steel fasteners throughout.

p. Provide Type 316 stainless steel sun shielding for all outdoor panels.

q. Panels and enclosures shall have adequate wiring space provided on the top and bottom.

1) A minimum of six (6) inches of clear space shall be provided between enclosed equipment and the top and the bottom of the enclosure.

2) Additional space shall be provided when a large number of conduits or wires enter the enclosure.

r. Provide enclosure mounting supports or bases as required for floor, frame, or wall mounted enclosures, and for free standing enclosures.

1) For floor mounted enclosures, provide minimum 12-gauge stainless steel floor stand kits bolted to the bottom of the enclosure, sealed and gasketed to maintain the NEMA rating.

2) Floor stand heights shall be coordinated with enclosure sizes and base pads to comply with the general indication and control device mounting height requirements as specified in this Section or as shown on the Contract Drawings.

3) Floor stands shall be mounted on base pads using anchor bolts or expansion anchors.

s. All panels shall have solid bottoms.

1) Removable panels may be provided to ease punching of conduit entries.

2) Panels and enclosures mounted on raised floors may have open bottoms but shall comply with all codes.

t. Provide all necessary holes and cutouts for installation of equipment.

1) Openings shall be punched or saw cut without distorting the face of the panel.

2) Flame cutting is prohibited.

3) All openings shall be ground straight, square, level and smooth.

u. Provide space and clear area for entry of conduit and wire.

v. Cable and piping shall enter the enclosure through the bottom whenever possible.

w. All conduit and piping openings and all conduits shall be sealed watertight and maintain the NEMA rating of the panel.

x. Panels located inside air-conditioned control room areas shall be NEMA 12 rated stainless steel unless otherwise noted.

y. Fabricate enclosures using minimum 14-gauge stainless steel for wall or frame-mounted enclosures and minimum 12-gauge stainless steel for floor mounted and free standing enclosures. Steel shall be free of pitting and surface blemishes.

z. Standard prefabricated enclosures are preferred.

C. Environmental Controls

1. Outdoor Panels:

a. Provide thermostatically controlled heaters to maintain temperature inside each enclosure 10°F above the ambient temperature, above 40°F., or that required for component operation (whichever is greater), and to prevent interior condensation over an outside ambient temperature range of -20°F through 120°F.

b. Provide automatically controlled closed-loop heat exchangers or closed loop air conditioners with filtered air louvers when required to maintain temperature inside each enclosure below the maximum operating temperature rating of the components inside the enclosure.

c. Provide internal corrosion inhibitor devices for corrosion control inside of each enclosure.

d. Outdoor panels shall be designed to withstand wind driven rain and snow without any moisture entry. The panel shall not be damaged by the buildup of ice or snow.

D. Indoor Panels:

1. Provide automatically controlled heaters as required to maintain temperature approximately 10°F above ambient for condensation prevention inside panels.

a. Panel heaters shall be thermostatically controlled, fan-driven heaters, with all components mounted in an anodized aluminum housing for sub-panel mounting.

b. The heaters shall be powered from 115 VAC from a dedicated circuit breaker and separate panel power feed.

2. Provide automatically controlled closed loop heat exchangers or closed loop air conditioners with filtered air louvers if required to maintain temperature inside each enclosure below the maximum operating temperature rating of the components inside the enclosure.
    a. Heat exchangers and air conditioners shall be of a dual loop design to isolate panel interior air from exterior air.
    b. The units shall be thermostatically controlled and shall be powered at 115 VAC from a dedicated circuit breaker and separate panel power feed.
3. The NEMA Rating shall be maintained for all cooling and heating components.
4. Provide detailed calculations justifying the sizing of any heating or cooling device. This requirement includes providing panel heat rise calculations for cooling devices. Provide a minimum of 25% spare cooling capacity.
5. Provide documentation if any of the above is deemed unnecessary.
6. Air conditioning units shall not be powered from the UPSs. A separate power source shall be provided for each air conditioner unit.
7. Air conditioner shall be mounted in the side of the enclosure. Provisions shall be made to route condensate to the nearest drain, including all work required to implement.
8. Provide internal corrosion inhibitor devices, Hoffman HCI Series or equal, for corrosion control inside of each enclosure.

E. Electrical
1. General:
    a. Control panel power supply source type, voltage, number of circuits and circuit ratings shall be as shown on the Contract Drawings and as required by the equipment.
    b. Unless otherwise noted, power supply to all panels shall be 120VAC 60 Hz.
    c. Surge and lightning protection shall be provided for all electronic equipment. Surge and lightning protection shall comply with the requirements of Section 26 43 13 – Low-Voltage Surge Protective Devices.
    d. Uninterruptible Power Supply (UPS) units shall be provided to power panels as indicated on the Contract Drawings.
        1) As a minimum, a UPS shall be provided for all panels and enclosures containing network, PLC, etc. equipment. UPS units shall be furnished and installed as specified.

e. The panels and enclosures shall be provided with internal 120 VAC, 20-amp DIN rail mounted circuit breakers sized as required to distribute power to the panel components and field instruments.

f. Provide quantity of circuits shall include 25 percent spares.

g. Provide a durable legend mounted near the circuit breakers in each panel, which lists the circuit breaker numbers and circuit descriptions.

h. Provide circuit breakers to protect each circuit, with no more than six instruments on a single circuit.

i. Provide DC power supplies of quantities and sizes as required for powering DC signal and control loops.

j. Where wires pass through adjacent panel walls, provide suitable grommets or bushings to prevent cutting or damage of insulation.

k. When DC power and/or low voltage AC power is required, provide and install the necessary power supplies, transformers, regulators and fuses in the panel.

l. All spare field and panel wires, within each panel or enclosure, shall be tagged as spare and labeled and marked as per specifications with “As-Builts” showing their source and destination.

m. Provide complete approved schematic and wiring diagram including spare wiring, showing "As-Built" circuitry.

n. In addition to required submittals, the final approved "As-Built" diagram shall be enclosed in transparent plastic and placed in an easily accessible drawing pocket built in the panel or enclosure door.

2. Electrical Wiring and Accessories:

a. Unless otherwise specified, internal wiring shall be Type MTW stranded copper wire with thermoplastic insulation rated for 600 Volts at 85°C for single conductors.

b. Wiring shall be color coded and labeled with wire identification.

c. For DC signal wiring, use No. 16 minimum AWG twisted tinned copper pairs with overall braided copper shield and drain wire.

d. For AC power wiring, use No. 12 minimum AWG. For AC and DC control use No.14 AWG wiring. For wiring carrying 10 Amps or more, use sizes required by NEC and JIC standards.

e. Install wiring runs in ventilated wire troughs along horizontal or vertical routes to present a neat appearance.

1) Wire trough shall be filled to no more than 40 percent capacity. Angled runs are not acceptable.

2) Separate and shield DC signal wiring from power and control wiring by a minimum of 4 inches, using separate wire troughs.

3) Separate troughs shall be provided for field wiring.

4) Where practical, in the panels and enclosures, route the low voltage DC signal wiring along the left side of the enclosure sub-panel(s) and route the AC power and control wiring to the right side of the sub-panel(s), with the incoming power and distribution circuit breakers located to the upper right.

f. Group or bundle parallel runs of wire using covered troughs. Maximum bundle size to be 1 inch. Troughs shall have 60 percent spare capacity. Adequately support and restrain all wiring runs to prevent sagging or other movement.

g. In panels controlling and monitoring equipment operating or fed at voltages above 600, wiring used for AC or DC, control, control power, metering, indication, etc. shall be No.14 AWG type SIS (switchboard) wire.

h. Wiring for current transformer (C.T.) circuits shall be minimum #10 AWG type SIS and shall be color coded yellow. Connections shall be by ring type solderless compression terminals.

i. Where wiring runs across a door or panel hinge, the bundle shall be run along the hinge as far as possible and anchored at both ends to distribute the torque along the greatest wire length.

j. Wire bundles running within a panel or onto the door, shall have at least 20 percent spare wires included.

k. The Contractor shall provide circuit breakers to protect each circuit, with no more than six instruments on a single circuit.

l. The Contractor shall provide a complete wiring diagram showing "as-built" circuitry. Diagram shall be enclosed in transparent plastic and placed in easily accessible pocket built into panel door.

m. Wire Color Coding: Wires shall be color coded as follows:

DESCRIPTION	COLOR
110 VAC panel power before fuses or breakers	Black
Controlled 110 VAC power (e.g., after relay contacts, selector switch contacts, and similar equipment)	Red
110 VAC power source from devices external to panel	Yellow
110 VAC neutral	White
24 VDC positive power from power supplies	Brown
24 VDC negative power from power supplies	Brown and White Trace
Controlled 24 VDC power (e.g., after PLC output contacts, relay contacts, and similar)	Blue

24 VDC positive power from devices external to panel	Orange
24 VDC negative power from devices external to panel	Orange with White Trace
24 VDC 4-20 mADC signal cable	Grey with Red Positive, Clear – Negative
Grounding wire	Green

3. Power Conditioning and Surge Protection:

   a. General:

      1) Surge protection shall be provided to protect the electronic instrumentation system from surges propagating along the signal and power supply lines.

   b. Power Conditioners:

      1) Voltage Input: The unit shall accept single-phase input voltages of 120 volts alternating current (VAC), 208 VAC, or 240 VAC as shown on Contract Drawings.

      2) Line Regulation: Shall provide regulated voltage output within +/- 3% tolerance, even when input varies within +10% to -20% of nominal input rating.

      3) Output Harmonic Distortion: The total root mean square (RMS) content of harmonic distortion at full load is limited to a maximum of 3%.

      4) Voltage Tolerance: The unit shall tolerate a temporary voltage surge or sags within +20% to -35% of the input voltage.

      5) Noise Attenuation: Provide 120 decibels (dB) of common mode noise attenuation and 60 dB of transverse mode noise attenuation.

      6) Surge Suppression: Shall be tested to comply with ANSI/IEEE C63.41 Class A & B waveform standards with a let-through of less than 0.2%.

      7) UL Listing: The unit shall be UL Listed.

      8) Mean Time Between Failures (MTBF): The expected MTBF shall be 25 years.

      9) Efficiency: Shall achieve 90% efficiency at full load.

      10) Operating Temperature: -20 to 50 degrees C.

      11) Wiring Type: Hardwired.

      12) Overload Protection: Shall activate at 1.65 times the rated current at nominal input voltage.

      13) Audible Noise: Shall be maximum of 65 dB.

      14) Manufacturer/Model: Sola/Hevi-Duty MCR series or equal.

c. The protection systems shall be such that the protection level shall not interfere with normal operation but shall be lower than the instrument surge withstand level and be maintenance free and self-restoring.

d. Instruments shall be installed in suitable metallic cases, properly grounded. Ground wires for all surge protectors shall be connected to a good earth ground and where practical each ground wire run individually and insulated from each other. These protectors shall be mounted within the instrument enclosure, or a separate junction box coupled to the enclosure. Surge protectors shall be as manufactured by Sola/Hevi-duty, Joslyn or equal.

e. Indicating Lights: Lights shall be color coded as follows:

1) RED = ON or ENERGIZED

2) GREEN = STOPPED or DEENERGIZED

3) WHITE = POWER ON

4) AMBER = ALARM

5) BLUE = REMOTE or AUTOMATIC

4. Terminal Blocks:

a. Terminate all field wiring and internal panel wiring at 600 Volt barrier type terminal blocks.

b. Panel wiring shall be kept to one side of the strip leaving the other side for field wire termination.

c. Jumpers needed to provide common connections between terminals shall be provided on the panel side of the strip.

d. Terminal blocks shall be tubular screw type with pressure plate capable of accepting #22 through #8 wires and shall be mounted on rigid steel rail.

e. All wiring terminations, both field and panel shall be made with forked tongue solderless crimp type connectors. Field wiring terminals shall have a minimum of a # 8 screw or stud.

f. Heavy duty end anchors shall be provided on both ends of all terminal strips to firmly anchor the terminal blocks to the mounting rail and insulating end barriers shall be provided on one end of the terminal strip as necessary.

g. Terminal blocks shall have a unique identifier for each block and for each terminal on that block (i.e. TB7-25) where the terminal number shall be the unique wire number shown on the approved drawings.

h. No more than two wires shall be terminated at any single screw.

i. Provide jumpers as required to join adjacent terminal blocks for additional wiring connection points. Jumpers shall only be installed on the panel side of the terminal block.

j. All terminal blocks shall be labeled with permanently affixed numeric identifiers on each block.

k. Identifiers shall be self-stick plastic strips with permanent, machine printed numbers.

l. Provide a separate terminal block for landing analog signal cable shield, and separate terminal strips for DC signal and AC power wiring. A separate terminal shall be provided for landing shield wiring.

m. Provide separate terminal blocks for C.T wiring. Terminal blocks for C.T. wiring shall be equipped with shorting bars and screws to selectively short an individual C.T. circuit for maintenance purposes.

n. Provide spare terminal blocks equal in number to 20 percent of the terminals used for each type of wiring (i.e., DC signal and AC power).

o. Terminal blocks shall be copper-nickel alloy terminal strips and screws.

p. Terminal blocks shall have minimum clearance of 5 inch on each side of each strip.

5. Fused Terminal Blocks:

a. Provide fused terminal blocks for all wiring powered from within panels or enclosures to devices located outside the panel or enclosure, as required.

b. Fused terminal blocks shall be UL approved, 600 Volts, capable of accepting #22 through #10 wires, and shall be mounted on rigid steel rail. Fuses shall be dead front and shall have safety pull out feature.

c. Heavy-duty end anchors shall be provided on both ends of all terminal strips to firmly anchor the terminal blocks to the mounting rail and insulating end barriers shall be provided on one end of the terminal strip as necessary.

d. Provide fuses (sized as required) and fuse pullers for all fused terminal blocks.

e. Provide 20 percent spare fused terminal blocks rail mounted within each panel or enclosure.

f. Terminal blocks shall be copper-nickel alloy terminal strips and screws.

6. Wire Markers:
   a. All panel wires and field wires shall have an alphanumeric identification tag at each point of termination.
   b. Wire numbers shall be unique.
   c. Wire numbers shall be grouped and spaces allowed for additions to each group.
   d. Where wire numbers change, the appropriate drawings shall include both wire numbers, clearly indicated, at the point of transition.
   e. Each wire number shall be solid, machine printed, and not pieced from other single and/or double digit tags. Wire markers shall be heat, oil, water, tear and solvent resistant, vinyl, tube type markers.
   f. All wire labels shall be clearly visible and not hidden by wire duct or other components in the enclosures. All wiring shall be installed such that if wires are removed from any one device, power will not be disrupted to any other device.
7. Grounding / Bonding:
   a. All equipment and components mounted in or on control panels and enclosures, shall be bonded to the equipment grounding system.
   b. Provide 1-inch-wide by 1/4 inch thick copper grounding bar in each panel or enclosure containing equipment, instruments or controls.
   c. The bar shall be as long as needed for the required number of connections, plus 25% future connections (6 inch minimum).
   d. Ground bars shall be installed on insulated "standoffs" (1-inch clearance from grounded surfaces), and shall have a braided #6 AWG bonding jumper.
   e. Separate buses shall be provided for grounding of AC equipment and for shield grounds.
   f. The AC ground bus shall be bonded to the panel frame and system ground.
   g. Shield grounds shall be completely isolated from the enclosure and instrument power/equipment grounds.
   h. Insulated ground wires shall be run with all control power circuits within the panel to all equipment.
   i. Equipment mounting sub-panels (plates) shall be bonded to the frame of the enclosure with a No. 10 AWG braided bonding jumper.

8. Lighting and Convenience Receptacles:

   a. Provide lighting fixture with LED lamps in each panel for proper illumination to facilitate servicing. Include convenience receptacles not to be powered from the UPS.

F. Finishes

1. Steel Panels

   a. Panels located in control rooms, electrical equipment (switchgear, MCCs) rooms, and office areas, may be carbon steel with a finish as follows:

      1) Completely clean all interior and exterior surfaces so they are free of corrosive or oily residue, oil, grease, and dirt.

      2) All interior and exterior surfaces shall be phosphatized for corrosion protection for non-stainless steel enclosures.

      3) One coat of primer shall be applied to all interior and exterior surfaces immediately, except for stainless steel enclosures.

      4) Surfaces shall be electrostatically coated with a polyester urethane powder or epoxy powder coating.

      5) Exterior surfaces shall be ANSI- 61 gray, interior surfaces shall be ANSI-61 gray or gloss white.

      6) Equipment mounting sub-panels shall be given a gloss white melamine enamel coating. A Grade 1 finish shall be produced on the finish coat.

2. Stainless Steel Panels

   a. Panels and enclosures located outdoors, in damp or corrosive areas, tunnels or galleries or in any process areas shall be fabricated of type 316 or 304 Stainless Steel per the manufacturers published recommendations for chemical resistance and service.

   b. Stainless steel panel finish shall be brushed or satin and shall be free from blemishes and machine marks.

   c. All mounting, anchoring and accessory hardware shall be stainless steel.

3. PVC Coated Panels

   a. In hazardous areas, subject to frequent moisture and corrosive elements, panels shall be PVC coated.

   b. In areas where the conduit and raceway system, is required to be PVC coated, all panels, control stations and enclosures shall be PVC coated. Colors shall match the conduit system.

c. PVC coating shall be a minimum of 40 Mil. and shall cover all exposed surfaces.

d. All mounting and accessory hardware shall be type 316 stainless.

4. Panel in Highly Corrosive Areas

a. Unless otherwise noted, in areas designated as highly corrosive or where sodium hypochlorite is handled, pumped, metered or stored, panels and enclosures shall be fabricated of molded fiberglass, fiberglass reinforced polyester, or polycarbonate and recommended for the service.

b. Panels shall be finished smooth or finished with gel coat and epoxy.

c. Glass fiber strands shall be neither exposed nor visible.

d. Panels shall be chemical, sunlight and UV resistant.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Shop Tests

1. Shop and Testing shall conform to the requirements of Section 40 80 81 – PMCS Factory Testing.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used.

3.02 INSTALLATION

A. The Contractor shall install panels in conformance with National Electric Code (NEC) and the Contract Drawings.

B. All panels and enclosures shall be mounted straight, level and parallel to building surfaces.

C. Wall mounted panels and enclosures shall be securely mounted to walls or columns as required. They shall be spaced a minimum of 3/4" from the structure using strut or plates.

D. Stand mounted panels or stations shall be supported using 6-inch epoxy powder coated steel channel securely mounted to the floor with a minimum of three 1/2" stainless steel bolts and leveling nuts.

1. Stand bases shall be grouted for added rigidity.

2. Stands shall be secure and level, shall easily support the mounted equipment and shall hold the equipment rigidly. Multiple stands or fabricated frames shall be used for larger or heavy panels.

E. All freestanding control panels shall be installed on a 6-inch-wide and 4 inch high reinforced concrete curb or 4 inch pad.

1. Pad shall have 1-inch chamfer on all corners.
2. Pad shall extend one (1) inch minimum (plus chamfer) past panel exterior.

F. When panels or enclosures are installed on raised computer type floors, additional supports and bracing shall be provided under the floor as required to prevent the floor from being overloaded.

1. Large and/or heavy panels having any dimension larger than 36 inches or weighing 150 lbs. or more or where the weight of the completed panel exceeds 80% of the specified live load bearing capacity of the flooring, shall be supported from the structural sub floor independently of the raised floor.
2. Provide a welded steel, adjustable support framework the size of the unit footprint capable of rigidly supporting the weight of the entire panel with a 50% safety factor. The frame shall be installed flush and level with the floor.
3. Load and bracing calculations shall be submitted for review.
4. It shall be the responsibility of this Contractor to coordinate raised and finished floor installation requirements with the flooring supplier and installer.
5. In areas where floor modifications are required, and the floor has already been installed, the contractor shall retain the services of an approved flooring contractor to make the appropriate modifications at no additional cost to the City.

G. Panels, and the equipment enclosed, shall be protected from damage during and after installation. If in the opinion of the Contractor or the Engineer, the area is not suitable for electronic equipment or panels, the equipment shall be removed or protected until the area has been secured.

H. Unless otherwise noted, the Contractor shall install indoor panels on 4-inch concrete pad.

I. Extend concrete pad 4 inches beyond outside dimensions of the base, on all sides.

J. Lay grout after panel sills have been securely fastened down.

K. Unless otherwise noted, install outdoor NEMA 4X panels on a reinforced concrete pedestal:

1. Minimum thickness shall be 8 inches with No. 4 steel reinforcing bars at 12 inches on centers, each way.
2. Minimum size shall be 12 inches larger than outer dimensions of base, on all sides.
3. Lay grout after panel sills have been securely fastened down.

L. The Contractor shall provide excavation and backfill work in conformance with Section 31 23 16 – Excavation and Section 31 23 23 - Fill.

M. The Contractor shall provide concrete work in conformance with Section 03 30 00 – Cast-in-Place Concrete.

N. The Contractor shall install anchor bolts and anchor in accordance with Section 05 05 23.02 – Miscellaneous Metal Fastenings.

O. The Contractor shall install and interconnect all equipment, devices, electrical hardware, instrumentation and controls and process controller components into and out of and among the enclosures as indicated on the Contract Drawings.

3.03 FIELD TESTING / QUALITY CONTROL

A. Field Testing

1. Field Testing shall conform to the requirements of Section 40 80 82 – PMCS Startup and Field Testing.

3.04 STARTUP / DEMONSTRATION

A. The Contractor shall perform system testing and make any necessary adjustments in accordance with this Section and the following Sections:

1. Section 40 61 13 – PMCS General Requirements.
2. Section 40 80 81 – PMCS Factory Testing.
3. Section 40 80 82 – PMCS Startup and Field Testing.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified and required to furnish, install, and test all gages, complete and operational.

B. The following index of this Section is presented for convenience:

1.04 REFERENCES

A. Abbreviations and Acronyms:

1. w.g. Water Gauge (Water Column)
2. PTFE Polytetrafluoroethylene

B. Definitions:

1. $NaHSO_3$ Sodium bisulfite
2. NaOCl Sodium hypochlorite

C. Reference Standards:

1. ANSI/ASME B40.1 Gages, Pressure Indicating Dial Type, Elastic Element.

1.05 DESCRIPTION

A. Gages as specified herein shall include pressure, vacuum, and compound gages.

1. Pressure gages shall be designed to indicate pressures above atmospheric pressure.
2. Vacuum gages shall be designed to indicate pressures below atmospheric pressure only.
3. Compound gages shall be designed to indicate pressures above and below atmospheric pressure.
4. The scale range shall be approximately twice the normal operating pressure of the equipment or process pipe line to which the gage is connected.

B. All gauges shall be of the dial-indicating helical bourdon tube type.

C. Small gages that are integral components of specified instrument and equipment assemblies are not included in this Section.

1.06 QUALITY ASSURANCE

A. Performance Requirements:

1. Grades of accuracy shall conform to the requirement of ANSI/ASME B40.1.

a. Pressure, vacuum, and compound gages shall have an accuracy meeting Grade '2A' standards, with an error not exceeding 0.5 % of full scale range.

b. Diaphragm protected gages shall have a combined accuracy (gage and seal) of Grade 'A' standards, with an error not exceeding 1% of scale range between 25% and 75% of scale and 2%for the remainder of the scale.

2. Each gage will require that laboratory tests be certified by an independent testing agency as to accuracy.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

a. Catalogs, drawings, and reference materials.

b. Maintenance manuals.

c. Chemical compatibility for gauges with wetted surfaces in contact with chemical solutions or gasses other than air.

B. Information Submittals:

1. Independent testing agency certification indicating that the gages provided meet the specified accuracy requirements.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall provide spare parts and special tools necessary to service, disassemble, repair, and adjust the equipment provided under this Section, as per the requirements of the Contract Documents and/or as recommended by the manufacturer. In addition:

1. For gages other than diaphragm protected gages, provide 20% spare gages (with a minimum of one) of each range used.

2. For diaphragm protected gages, provide 20% percent spare gages (with a minimum of one) of each range used, complete with diaphragm seals, filled and ready for use.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Gages:

1. Pressure Gauges shall be as manufactured by:

a. Weiss, Holtsville, NY .

b. Ametek/U.S. Gauge, Feasterville-Tervose, PA .

c. Ashcroft, Stratford, CT

d. Or approved equal.

B. In-Line Diaphragm Seals:

1. In-Line Diaphragm seals for diaphragm protected gages and process isolation shall be as manufactured by:

a. 3D Instruments, LP, Anaheim, CA.

b. Ametek®, Inc., Berwyn, PA.

c. Ashcroft, Inc., Stratford, CT.

d. Helicoid

e. Red Valve, Carnegie, PA

f. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. General:

1. Pressure, vacuum and compound gages shall be of the indicating dial type utilizing a Bourdon tube for confining the pressure medium.

2. Where shown, specified, or where the possibility of clogging or contaminating the Bourdon tube exists, a flexible diaphragm seal shall be provided between the Bourdon tube and the medium to be measured.

3. Dials Size: 4½-in. nominal diameter.

B. Materials and Construction:

1. Gages shall be weatherproof.

2. Gages shall be designed and constructed to meet all requirements for satisfactory operation in the environment in which they are installed. Pressure, vacuum and compound gages shall be constructed of sound, durable material free from all defects and imperfections that in any way may affect the accuracy and serviceability of the gages.

3. Case:

   a. The gage cases shall be of the blow-out protected type where the rear plate is removable.

   b. The gage cases shall be free from warpage, checks and other defects with surfaces smooth and free from chips, cracks and blisters.

   c. Gage cases shall be constructed of phenolic or high impact polypropylene.

4. Connection: ¼-in. NPT male thread.

5. Dials and Appurtenances:

   a. Dials shall be white laminated plastic with standard graduations and numbers permanently marked on the dials in black.

   b. Scale:

      1) Scale shall extend over an arc not less than 270°.

      2) Subdivisions of the scale shall conform to the requirements of ANSI/ASME B40.1 for Grade '2A' gages.

      3) Units of measure shall be distinctly and permanently marked on the dial or on laminated plastic nameplates cemented to the dial.

   c. Glass windows shall be ⅛-in. thick clear glass tightly seated on durable gasket material so as to be fume proof and waterproof.

   d. Bourdon tubes shall be phosphor bronze silver-soldered or brazed to its brass socket; the assembly shall be tested carefully, over-pressured and stress relieved.

   e. Socket stem shall extend at least 1¼-in. below the gage case and shall have large wrench flats.

   f. Movement components for geared type gages shall be of stainless steel of the rotary gear or helical roller type, constructed so as to minimize wear and meet and maintain accuracy requirements specified. Movements shall have suitable corrosion-resistant bushings and wearing surfaces.

6. Glass: Clear, blemish free, shatter-proof

7. Bourdon tube:

   a. Helical Type: Inconel® X-750

8. Socket: Brass forging
9. Movement: Stainless steel

C. Adjustment:

1. Gages shall have provision for adjustment of the zero reading.
2. All calibration adjusting screws must be accessible from the rear without having to dismantle the gage.

D. Gage Gradations and Ranges:

1. Gages shall be graduated:
   a. Pressure gages shall be graduated in psig (unless ft w.g. are shown on the Contract Drawings or specified).
   b. Vacuum gages shall be graduated in inches Hg;
   c. Compound gages shall be graduated in inches of Hg to 0 to psig (unless ft w.g. are shown on the Contract Drawings or specified).
2. Gage Ranges:
   a. Vacuum gages shall have scale readings of 30 inches Hg to 0.
   b. Pressure gages for the equipment shall be provided as listed in Section 40 61 94 – PMCS Instrument Index.

E. Diaphragm Protected Gages:

1. General:
   a. The Contractor shall provide diaphragm seals or chemical gages as shown on the Contract Drawings, specified, or required to prevent the fluid to be measured from clogging or corroding the Bourdon tube of pressure, vacuum, and/or compound gages.
   b. Diaphragm seals shall be suitable for the gage furnished. Gages to be used with diaphragm seals shall be ANSI/ASME B40.1 Grade '2A' gages conforming to the requirements specified herein.
   c. Chemical gages shall have the diaphragm seal as an integral part and shall conform to the applicable requirements specified herein. Overall accuracy for chemical gages shall be ANSI/ASME B40.1 Grade 'A'.
   d. Diaphragm protected gages shall be factory filled and calibrated by the gage manufacturer. Diaphragm protected gages shall be provided with pulsation dampening. Integral or internal snubbers in the gage socket shall not be accepted.
   e. Required Features:
      1) Provide fill/bleed screw to permit filling of instrument and diaphragm seal.

2) Instrument Connection: 1/4-in. NPT

3) Process Connection: 1/2-in. NPT

4) Working Pressure Rating: Equal to or greater than the attached pressure sensing device operating pressure, or the pipeline working pressure rating where specified, whichever is greater.

5) Flushing connection: 1/4-in. NPT

6) Provide a clean-out ring which holds the diaphragm captive in the upper housing to allow the upper housing assembly to be removed for recalibration or cleaning of the process side housing without the loss of filling liquid or change in calibration.

2. Construction Materials:

a. Material Compatibility:

1) The components in contact with the fluid to be measured (i.e., the wetted materials) shall be fully compatible chemically with the fluid to be measured.

a) The material chemical compatibility shall be the highest (e.g., 'excellent', etc.) rating used by the chemical compatibility chart.

2) In the event of a conflict between the default gage materials specified in this Section and materials required to achieve the highest level of chemical compatibility (as described hereinabove), gages with materials that achieve the highest level of compatibility shall be furnished.

3) All bolts shall be corrosion-resistant to the process fluid as well.

b. Top and bottom housings, bolts, and interconnecting sensing lines shall be PVC or CPVC (as per Section 40 05 31, Thermoplastic Process Pipe) to match non-metallic piping, or as listed in Table 40 70 01-3, below.

Table 40 70 01-3
Top And Bottom Housings, Bolts, and Sensing Line Materials

Process Fluid:	Housing:	Bolts:	Lines:
$NaHSO_3$	Titanium	Titanium	Titanium
NaOCl	Titanium	Titanium	Titanium
All Other(s)	316SS	316SS	316SS

c. Diaphragms, O-rings and Gaskets shall be as listed in Table 40 70 01-4, below.

Table 40 70 01-3
Diaphragm, O-Ring, and Gasket Materials

Process Fluid:	Diaphragm:	O-Ring:	Gasket:
$NaHSO_3$	Titanium	Viton	PTFE
NaOCl	Titanium	Viton	PTFE
All Other(s)	316SS	Buna-N	Buna-S

d. Fill Fluid shall be as listed in Table 40 70 01-5, below.

Table 40 70 01-5
Fill Fluid

Process Fluid:	Fill Fluid:
$NaHSO_3$	Fluorolube®
NaOCl	Fluorolube®
All Other	Silicone

F. Gage Protection:

1. Pressure gages shall have under pressure protection and vacuum gages shall have overpressure protection.

   a. For helical roller type pressure gages, the gage shall have a left-hand movement for under pressure protection; for all other gages, under pressure protection stops shall be provided.

   b. For vacuum gages with helical roller movement, gages shall have right hand movement for overpressure protection; all other gages shall have suitable overpressure protection stops.

G. Gage Accessories:

1. Pulsation Dampeners:

   a. All pressure, vacuum, and compound gages shall be provided with pulsation dampeners suitable for the intended service and environment.

2. Brass Coil Pipe Siphons:

   a. All gages on steam lines shall be provided with suitable brass coil pipe siphons to prevent live steam from entering the gages.

3. Shutoff Cocks:

a. Gages (other than diaphragm protected gages) shall be provided with shut-off cocks furnished by the gage manufacturer.

b. Where shown or required, three-way cocks shall be provided at gage connections.

c. Shut-off cocks shall be suitable for the service and environment intended.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Manufacturer shall be responsible for assuring that fill volumes and sensitivities of the supplied seals and diaphragms are suitable to provide the required gage, switch or transmitter accuracy over the specified measurement range or at switch setpoints.

B. Diaphragm Assembly and Calibration:

1. The complete in-line diaphragm seal assembly, including gage, switch or transmitter, shall be factory assembled, filled and calibrated to the ranges and switch setpoints specified prior to shipment.

2. Field filling shall not be accepted.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Locations:

1. Gages shall be provided where shown on the Contract Drawings, specified, and/or as required for a complete installation.

a. Indicating Bourdon tube gages shall be provided downstream of each pressure regulating valve, on each hydro-pneumatic (air-water) or hydraulic fluid (air-oil) pressure tank, on each air and gas receiver tank, on the discharge of each air compressor and on both the suction and discharge of each pump or gas compressor.

b. Gages shall be located in a well-illuminated area clearly visible from work areas or operating stations.

2. Location and orientation of the gages, switches and seal assemblies shall be coordinated with the actual piping and equipment installations so that gages and indicators shall be easily read during operation, and easily accessed for maintenance by plant personnel.

3. Where field mounting and orientation conflicts arise due to incomplete coordination with field changes in the process piping and equipment

installation, assemblies shall be relocated, re-oriented, re-assembled and recalibrated as directed by Engineer.

B. Mounting and Connections:

1. Unless otherwise shown on the Contract Drawings or specified, pressure, vacuum, and compound gages shall have bottom 1/4-inch NPT male connections.

2. Gages shall be wall, pipe, or flush mounted as shown or specified.

3. Diaphragm protected gages shall be connected to equipment as shown on the Contract Drawings, specified, or as required for an approved installation.

a. Only one pressure sensing element shall be mounted to a diaphragm seal.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

END OF SECTION

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment and incidentals as shown, specified, and required to furnish, install calibrate, test, startup, and place into satisfactory operation PMCS Panel Mounted Instruments and Devices as described herein and as indicated on the Contract Drawings.

B. The provisions of this Section apply to instruments and devices provided as a part of packaged systems specified elsewhere in this Contract, including but not limited to, function, quality, spare parts, tools, testing, training, documentation and installation.

C. The following index of this Section is presented for convenience:

Article	Title	Section Page

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.04 REFERENCES

A. Definitions

1. Section 40 61 13 – PMCS General Requirements defines the terms and abbreviations used in this Section and the PMCS.
2. PMID - Panel Mounted Instruments and Devices.

B. Reference Standards

1. Section 40 61 13 – PMCS General Requirements lists the standards applicable to this Section and the PMCS.

1.05 DESCRIPTION

A. PMIDs and controls shall be provided with all associated services and appurtenant equipment.

B. The Contract Drawings and Specifications illustrate and specify general functional, environmental and construction requirements of PMIDs, and do not necessarily show or specify all components, wiring, piping and accessories required by specific manufacturers, to provide a completely integrated system.

C. The Contractor shall provide all additional components, piping, wiring, accessories, services, labor, etc. required to furnish and install PMIDs and accessories to provide a complete and properly functioning integrated system.

D. The PMCS Supplier acting through the Contractor shall:

1. Provide all labor, materials, equipment and incidentals as shown, specified and required to furnish, install, calibrate, test, adjust and place into satisfactory operation, all PMIDs specified or required under this Section.
2. Retain the services of each equipment manufacturer to properly select, apply, size and locate each PMID they are to provide.
3. Also, the manufacturer's services shall be provided to setup, commission and fine tune all instruments provided.
4. Provide application and design engineering services to properly select, apply, and install; provide detailed design, location, and mounting drawings and to test, calibrate and commission, PMIDs provided herein.
5. Coordinate the installation of all items specified herein and required to ensure the complete and proper operation and interfacing of all the components and systems.

1.06 QUALITY ASSURANCE

A. The Contractor shall comply with the Quality Assurance requirements listed in Section 40 61 13 – PMCS General Requirements, this Section and the Specifications.

B. All materials and equipment furnished shall be new, free from defects, and of first quality, produced by manufacturers who have been regularly engaged in the manufacture of PMIDs.

C. Manufacturers shall have produced PMIDs for a minimum of 20 years

D. Where there is more than one item of similar equipment required under the Contract, all such similar equipment shall be the product of one manufacturer.

E. All material furnished under this Contract shall be determined safe by UL and all material shall be labeled, certified, or listed by the testing agency.

F. Custom made equipment or related installations which are constructed specially for this Contract will not be acceptable.

G. Equipment furnished within this Contract shall be standard products furnished by a supplier regularly engaged in the manufacture of such products.

1.07 SUBMITTALS

A. The Contractor shall comply with submittal requirements listed in Section 40 61 13 – PMCS General Requirements, this Section and the Specifications.

B. Contractor shall submit PMIDs and schedules for the approval of the Engineer.

C. The Contractor is solely responsible for the timing of PMID submittals to enable approval by the Engineer and subsequent use by the PMCS Supplier.

D. The Contractor shall create, maintain and submit for review, an updated index of PMIDs.

E. Submittals shall be made at least 60 days in advance of any proposed use by the PMCS Supplier.

F. The manufacturer's calculations, assumptions and application details, and recommendations shall be submitted to the Engineer for review and approval.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall comply with delivery, storage and handling requirements listed in Section 40 61 13 – PMCS General Requirements.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall comply with spare parts, special tools and supplies listed in Section 40 61 13 – PMCS General Requirements, this Section and the Specifications.

B. Spare parts and tools shall be as recommended by the manufacturer and shall as a minimum include the following:

1. One PMID for every five (5) PMID of a given model furnished, minimum of one.

2. One (1) communication card for every five (5) of each type furnished, minimum of one.

3. One (1) power supply for every (5) of each size furnished, minimum of one.

4. All spare parts recommended by the manufacturer and listed as recommended spare parts in the approved manufacturer's O&M Manual.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Loop Power Supplies shall be as manufactured by:

1. Acopian, Easton, PA.

2. Acromag Inc., Wixom, MI.

3. Or approved equal.

B. Signal Splitters shall be as manufactured by:

1. Phoenix Contact, Middletown, PA.

2. Moore Industries, North Hill, CA.

3. Or approved equal.

C. Control Relay shall be as manufactured by:
   1. Idec, East Dundee, IL.
   2. Square D, Andover, MA.
   3. Allen-Bradley, Milwaukee, WI.
   4. Siemens, Washington, DC.
   5. Or approved equal.

D. Control panel Pilot Devices shall be as manufactured by:
   1. Allen-Bradley, Milwaukee, WI.
   2. Square D, Andover, MA.
   3. Siemens, Washington, DC.
   4. Or approved equal.

E. Electronic Horn shall be as manufactured by:
   1. Panalarm, Berwyn, PA.
   2. Federal Signal, Oak Brook, IL.
   3. Or approved equal.

F. DC Power Supplies shall be as manufactured by:
   1. Weidmuller, Richmond, VA.
   2. Phoenix Contact, Middletown, PA.
   3. Allen-Bradley, Milwaukee, WI.
   4. Siemens, Washington, DC.
   5. Or approved equal.

G. Terminals shall be as manufactured by:
   1. Weidmuller, Richmond, VA.
   2. Phoenix Contact, Middletown, PA.

H. Panel Interior Light shall be as manufactured by:
   1. Hoffman, San Jose, CA.
   2. Hammond, Cheektowaga, NY.
   3. Or approved equal.

I. Transient Voltage Surge Suppressor for Control Power shall be as manufactured by:
   1. Cutler Hammer, Pittsburgh, PA.
   2. Siemens, Washington, DC.

3. Or approved equal.

J. Uninterruptible Power Supply (UPS) shall be as manufactured by:

1. Tripp Lite, Chicago, IL.
2. APC South Kingstown, RI.
3. Or approved equal.

K. Strobe Light shall be as manufactured by:

1. Federal Signal, Oak Brook, IL.
2. Edwards Signaling, Mebane, NC.
3. Eaton, Beachwood, OH.
4. Or approved equal.

L. Digital Indicator shall be as manufactured by:

1. Precision Digital, Hopkinton, MA.
2. Newport Electronics, Santa Ana, CA.
3. Or approved equal.

M. Panel Intrusion Switch / Door Contact shall be as manufactured by:

1. Security Equipment Supply (SES), Earth City, MO.
2. Newark Electronics, Irvine, CA.
3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Loop Power Supply (Single Loop)

1. Design:
    a. Provide DC power for 4-20 mA current loops and as shown on the Contract Drawing.
    b. Type: A single output, regulated, plug-in type 24 VDC power supply.
2. Construction Features:
    a. Housing: All components shall be enclosed.
    b. Mounting: Power supply to plug into the octagonal socket with numbered, screw-type terminals. Provide mounting bracket to secure power supply module in the octagonal base.
3. Performance:
    a. Temperature: Operational from -10 to 65 C.

b. Output: 24 VDC, 200 mA.

c. Power Requirements: 120 VAC, 60 Hz, single phase.

d. Regulations: ±0.5 percent.

e. Ripple: 0.5 mV RMS.

f. Protection: Overvoltage protection.

g. Approval: U.L. recognized.

B. SIGNAL SPLITTERS

1. General: The signal splitter shall be capable of accepting a voltage or amperage input and delivering two electrically isolated 4-20 mA DC outputs. Provide isolation according to European Standard EN 61010.

2. Performance Requirements:

a. Max. transmission error: less than 0.1% of final value.

b. Response delay setting: 0 to 10 sec, adjustable.

c. Signal input: accept 0-10 VDC or 0-20 mA signal, configurable range via software.

d. Isolation: Three-way isolation rated at 3 kV.

3. Construction Features:

a. Configuration: Configure device through DIP switches or software through a connection to a laptop. Provide all software and programming cables as necessary for configuration.

b. Pluggable screw connection terminals for ease of access to the terminations without removing device from DIN rail. Terminals accept 12 – 24 American Wire Gauge (AWG) wire.

c. Mounting: DIN-rail mountable.

d. Operating Temperature: -40°C to 70°C.

e. Power Supply: Nominal of 24 VDC, range of 9.6 VDC – 30 VDC. Device can be powered directly through screw connections on device or through a Power Terminal Block via DIN rail connector.

4. Accessories:

a. DIN rail connector for connecting devices. Provide one for every two devices in the panel.

b. Power Terminal Block for distributing power to the device through the DIN rail connector. Provide a minimum of one (1) per panel or as required for number of devices.

C. CONTROL RELAYS

1. Design:

a. Type: General purpose, plug-in type rated for continuous duty.

2. Construction Features:

a. Coil Voltage: 24 VDC or 120 VAC as required.

b. Contact Configuration: Number and arrangement as required to perform the intended functions, plus a minimum of one spare SPDT contact per relay function.

c. Contact Material and Rating:

1) General Use: Silver or silver cadmium oxide contacts rated for 10 Amps minimum at 120 VAC.

2) Low Power Switching: Fine silver, gold flashed contacts specifically designed for low power switching, rated for 2 Amps minimum at 30 VDC.

d. Mounting: Pin or blade mount in sockets for sub-panel mounting on DIN rail. Sockets shall have screw terminals for wiring connections, which shall accept a minimum of two #14 AWG wires.

e. Cover: Clear plastic dust cover.

f. Indication: Indicator light.

g. Accessories: Hold-down spring, push-button test.

h. Approvals: UL recognized.

D. CONTROL PANEL PILOT DEVICES

1. Design:

a. Provide selector switches, pushbuttons and indicating lights as specified and shown. All components shall be of the full size, heavy-duty, oil-tight, round type, with modular contacts and NEMA rating equal to that of the enclosure on which devices are installed.

b. Provide individual legend plates for indication of switch, push-button, and light functions (e.g. Open, Closed, Hand-Off-Auto). Legend plates shall conform to the requirements of this Section.

c. Start pushbuttons shall have a flush button, while stop pushbuttons shall have raised pushbuttons.

d. Where noted on the Contract Drawing, pushbuttons and selector switches shall be illuminated type and use the color code as shown.

e. Units shall be Heavy Duty, 30.5 mm, oil tight, and shall maintain the NEMA rating of the panel or enclosure. Corrosion resistant devices shall be provided on NEMA 4 and 4X panels and enclosures.

f. Extra-large, engraved, laminated name plates and function indicator escutcheon.

2. Construction Features:

a. Selector Switch:

1) Two (2), three (3), four (4) and (X) position as shown and required.

2) Maintained or spring return position; maintained contacts; number and arrangement as required to perform intended functions specified but not less than one double pole, double throw, double break contact per switch. Contact rating shall be compatible with AC or DC throughput current of devices simultaneously operated by the switch contacts but not less than 10 Amperes resistive at 120 Volts AC or DC continuous.

3) Heavy Duty, gloved hand operator, extra-large, engraved position indicator.

b. Push-button:

1) Maintained or momentary as required and as shown on the Contract Drawing.

2) Contacts shall comply with requirements specified for selector switches above.

3) Provide extended head push-button for all stop functions, two inch-push/pull the mushroom head and maintained contacts for emergency stop functions, and flush head pushbuttons for all other functions. Emergency stop push buttons shall have padlock attachment.

c. Indicating Lights:

1) Integral transformer type.

2) Low voltage, long life L.E.D. lamps (6 Volts).

3) 0.6 Watts maximum.

4) Integral push-to-test required.

5) Lens colors shall be as follows:

a) Run or Open: Red

b) Off or Closed: Green

c) Alarm or Malfunction: Amber

d) Electrical Control Power On: White

e) In Remote: Blue

E. ELECTRONIC HORN

1. General: The horn shall be of the multi-tone electronic audible type.

2. Required Features:

a. Internal volume control.

b. Field selection of up to 16 different tones.

c. Power: 120 VAC or 24 VDC (provide power supply as required).

d. Operating Temperature: 32 to 120°F.

e. Enclosure Rating: NEMA 4X.

F. DC POWER SUPPLIES

1. Provide 24 VDC power supplies in each control panel to power field instruments, panel devices etc., as required. Equip each power supply with a power on/off circuit breaker.

2. Where DC power sources are required, each shall be a system comprised of:

a. Two (2) identical supplies.

b. Each supply shall be able to supply at least 150% of the connected load.

c. Paralleling rated.

d. Each supply connected to 1 input of a redundancy module.

e. Redundancy module to have at least 1 status output to be monitored by the SCADA system. Output shall indicate the status of the redundancy.

f. Power supplies and redundancy modules all to be from the same manufacturer, and from the same product family from that manufacturer.

3. The 24 VDC power supply shall meet the following requirements:

a. Input Power: 120 VAC, +/-10%, 60 Hertz (Hz).

b. Output Voltage: 24 VDC

c. Output Voltage Adjustment: 5%

d. Line Regulation: 0.05 percent for 10 V line change.

e. Load regulation: 0.15% no load to full load.

f. Ripple: 3 millivolts (mV) root mean square (RMS).

g. Operating temperature: Full output current between -32 to 140 degrees Fahrenheit.

h. DIN rail mounting.

i. Integrated Selective Fused Breaking.

j. Local and remote (dry contact) fail indication.

4. Size the 24VDC power supply to accommodate the design load plus a minimum 30 percent spare capacity. Provide load calculation with control panel submittal.

5. Provide output overvoltage and overcurrent protective devices with the power supply to protect instruments from damage due to power supply failure and to protect the power supply from damage due to external failure.

6. Mount the 24 VDC power supply such that dissipated heat does not adversely affect other panel components.

7. Provide current blocking diodes built-in power supplies for redundancy.

G. TERMINALS

1. Fused Terminals complete with light indicator.

2. Double stack terminals will not be permitted unless written approval is obtained from the Engineer.

3. Provide tension clamp terminals.

a. Number indicated plus 20% spare.

b. Terminals to be rated for connected load.

H. PANEL INTERIOR LIGHT

1. 120 VAC supply.

2. Comes with fluorescent or LED light source.

3. Equipped with a diffuser to protect the light source.

4. Switch: Integral or door-actuated.

5. Width: Spans 75% or more of the width of the roof of the panel.

I. TRANSIENT VOLTAGE SURGE SUPPRESSOR – CONTROL POWER

1. UL1449 2nd Edition rated using metal oxide varistors.

2. 120 V, 15 A, 2-wire grounded input.
3. Maximum Continuous Operating Voltage: 150 V.
4. Surge Current: 45 kA per phase.
5. 3 modes of protection.
6. Filtering Bandwidth: 10 kHz to 100 MHz.
7. Noise Attenuation: Normal Mode 75 decibels (dB) at 100 kHz, Common mode 50 dB at 5 MHz.
8. Let Through Voltage: 6 V A3 Ringwave, 9.6 V B3 Ringwave, 70 V, B3/C1 impulse.

J. UNINTERRUPTIBLE POWER SUPPLY (UPS)

1. Free-Standing Uninterruptible Power Supply (UPS) shall be furnished and installed in all Control Panels as indicated on the System Architecture Drawings to provide a reliable source of uninterruptible power with no break in AC output power during a complete or partial interruption of incoming line power. UPS shall include audio/visual alarms. UPS shall be UL-Listed.
2. Rating: Provide uninterrupted conditioned power, fully loaded conditions for 75 minutes. Furnish all calculations supporting UPS sizing based on all connected loads.
3. Description: Smart Online single-phase input/output. Coordinate KVA with equipment supplied. Insulated-gate bipolar transistor (IGBT) technology and zero (0 ms) transfer time. Continuous operation through blackouts, voltage fluctuations and surges at zero transfer time shall be provided.
4. Required Features:
    a. Quantity: 1 for each panel specified above.
    b. Display: Multi-function LCD status, alarms and control console.
    c. Panel AC Input: 120 VAC.
    d. AC Output: 120 VAC.
    e. Output Power Capacity: Adequate Capacity based on load of each panel (with supporting calculations to be provided for review).
    f. Input / Output Connections: Hardwire.
    g. Frequency Compatibility: 60 Hz.
    h. Output AC Waveform (AC / Battery Mode): Pure sine wave.

i. Primary Form-Factor/Mounting: Free-Standing.

j. Bypass Switch: Functionality to include manual bypass switch integral with UPS and automatic bypass function ensuring 100% availability during UPS Maintenance.

k. Battery Access: Front panel internal battery.

l. Battery Replacement Property: Hot-swappable, replaceable batteries.

m. Battery Recharge Rate: 2-4 hours from 10% to 90%.

n. Operating Temperature: 32 deg F to 104 deg F.

o. Provide dry contact outputs for Remote Alarm of UPS Low Battery and UPS Fault as indicated in the I/O List.

p. Certifications: Compliance to UPS Certifications.

q. Product Warranty: Minimum 1-year limited warranty.

K. STROBE LIGHT

1. General: Strobe light shall be a pulsating, illuminating type. The light shall provide a visual warning in the area where a potential hazard may occur.

2. Features:

a. Strobe Light: Rotating 360 degrees; 300 effective candlepower, 80 flashes per minute.

b. Lens Color: Amber.

c. Enclosure Rating: NEMA 4X or NEMA7 in classified areas.

d. Power: 120 VAC.

L. DIGITAL INDICATOR

1. General: The digital indicator shall accept an analog input and convert it to scaled numerical characters for digital display and also provide up to two alarm outputs.

2. Required Features:

a. Display Height: 0.56-inch.

b. Display Capacity: Four digits with decimal point position jumper selectable.

c. Display Type: Seven segment, red LED.

d. Accuracy: ± 0.05 percent.

e. Analog Input: 4 to 20 mADC.

f. Excitation Output: 15 VDC for powering transmitter.

g. Analog Output: Proportional 4 to 20 mADC.

h. Alarm Output: Dual with two 2 A relays.

i. Temperature Range: 0°C to 60°C.

j. Power: 120 VAC, + 10 to -15 percent, 5 watts (W).

k. Enclosure: NEMA 4 splash proof.

M. PANEL INTRUSION SWITCH / DOOR CONTACT

1. General: The door contact shall provide a discrete output to the panel programmable logic controller (PLC) when the panel door is opened.

2. Contact Rating: SPDT Contacts rated for 0.5A at 50 VDC.

3. Rated for Control Panel installation.

4. UL Listed.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. PMCS PMIDs shall confirm to the requirements of Section 40 80 81 – PMCS Factory Testing.

B. PMCS OITs PLC monitoring and control criteria specified under this Section shall be functionally verified during PMCS Factory Testing.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Contractor shall install each PMID in accordance with manufacturer's recommendations, this Section and the Contract Documents.

B. Panels into which these PMIDs are to be mounted shall provide rigid structural support for the PMIDs and shall allow necessary access and working space to permit maintenance of the PMID while installed.

C. Additional strengthening and/or bracing required for a sound installation shall be provided as part of this contract.

D. Contractor shall provide all supports, bracing, wiring, and incidental hardware.

E. All software required for the PMIDs shall be loaded, configured and fully tested as part of this contract.

F. Contractor shall configure the OITs using function keys and instructional prompts so that operators can operate equipment, modify set points and presets and

monitor the system without any special training or knowledge of the PMIDs with which the OIT interfaces.

3.03 FIELD TESTING / QUALITY CONTROL

A. PMIDs Field Testing shall conform to the requirements of Section 40 80 82 – PMCS Startup and Field Testing.

B. Section 40 80 82 details how PMIDs specified under this Section shall be verified during Field Testing.

3.04 STARTUP / DEMONSTRATION

A. Section 40 80 82 – PMCS Startup and Field Testing details the requirements for OAD and PMCS Upset and Recovery Testing.

The OAD and the PMCS Upset and Recovery Testing shall serve as the final verification of the correct functioning of all PMIDs.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

END OF SECTION

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall retain the PMCS Supplier to provide all labor, materials, equipment and incidentals as shown, specified, and required to furnish, install calibrate, test, adjust, startup, and place into satisfactory operation PMCS Field Mounted Instruments and Devices as described herein and as indicated on the Contract Drawings.

B. The provisions of this Section apply to PMCS Field Mounted Instruments and Devices provided as a part of packaged systems specified elsewhere in this Contract including but not limited to, function, quality, spare parts, tools, testing, training, documentation and installation.

C. The following index of this Section is presented for convenience:

Article	Title	Section Page

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

1.04 REFERENCES

A. Definitions

1. Section 40 61 13 – PMCS General Requirements defines the terms and abbreviations used in this Section and the PMCS
2. FMID Field Mounted Instrument and Devices, including all field mounted primary sensors and transmitters.

B. Reference Standards

1. Section 40 61 13 – PMCS General Requirements lists the standards applicable to this Section and the PMCS.

1.05 DESCRIPTION

A. FMIDs and controls shall be provided with all associated services and accessory equipment.

B. The Contract Drawings and Specifications illustrate and specify general functional, environmental and construction requirements of FMIDs, and do not necessarily show or specify all components, wiring, piping and accessories required by specific FMIDs or specific manufacturers, to provide a completely integrated system.

C. The Contractor shall provide all additional components, piping, wiring, accessories, services, labor, etc. required to furnish and install FMIDs and accessories to provide a complete and properly functioning integrated system.

D. The PMCS Supplier acting through the Contractor shall:

1. Provide all labor, materials, equipment and incidentals as shown, specified and required to furnish, install, calibrate, test, adjust and place into satisfactory operation, all FMIDs specified or required under this Section.
2. Retain the services of each equipment manufacturer to properly select, apply, size and locate each FMID they are to provide.
3. Retain the manufacturer's services to setup, commission and fine tune all FMIDs provided.
4. Provide application and design, engineering and services to properly select, apply, and install, provide detailed design, location, and mounting drawings and to test, calibrate and commission, FMIDs provided herein.
5. Coordinate the installation of all items specified herein and required to ensure the complete and proper operation and interfacing of all the components and systems.

1.06 QUALITY ASSURANCE

A. The Contractor shall comply with the Quality Assurance requirements listed in Section 40 61 13 – PMCS General Requirements, this Section and the Specifications.

B. All materials and equipment furnished shall be new, free from defects, and of first quality, produced by manufacturers who have been regularly engaged in the manufacture of FMIDs.

C. Manufacturers

1. FMIDs of the named manufacturers shall be furnished.
2. Or equal FMIDS shall be approved by the Engineer before being furnished.
3. FMIDs that are specified in this Section have been selected to establish the standard of quality and performance of the equipment to be supplied.
4. Manufacturers shall have produced the required FMIDs for a minimum of 10 years.
5. Where there is more than one item of similar equipment required under the Contract, all such similar equipment shall be the product of one manufacturer.
6. Select and manufacture the primary process measurement devices in accordance with the applicable general design requirements specified in Section 40 61 13 – PMCS General Requirements.
7. Field supervision, inspection, startup, commissioning, and training shall be in accordance with the requirements of Section 01 79 05 – Equipment Start-Up and Training, Section 40 61 26 – PMCS Training, and Section 40 80 82 – PMCS Startup and Field Testing.

D. All FMIDs furnished under this Section shall UL listed.

E. Custom made equipment or related installation which are constructed specially for this Contract will not be acceptable.

1.07 SUBMITTALS

A. The Contractor shall comply with submittal requirements listed in Section 40 61 13 – PMCS General Requirements, this Section and the Specifications.

B. Contractor shall submit FMIDs and schedules for the approval of the Engineer.

C. The Contractor is solely responsible for the timing of FMID submittals to enable approval by the Engineer and subsequent use by the PMCS Supplier.

D. The Contractor shall create, maintain and submit for review, an updated index of FMIDs.

E. Submittals shall be made at least 90 days in advance of any proposed use by the PMCS Supplier.

F. The manufacturer's calculations, assumptions and application details, and recommendations shall be submitted to the Engineer for review and approval.

G. Reports

1. A Factory Certified Calibration certificate shall be furnished for each FMID furnished under this Contract.

   a. At least 60 days before the anticipated initiation of installation testing, the Contractor shall submit three copies to the Engineer of the detailed description of the installation tests to be conducted to demonstrate the correct operation of the FMIDs supplied under this Section.

   b. The Contractor shall submit proposal calibration sheets for various types of instruments for the Engineer's approval prior to the start of calibration.

   c. Calibration sheets shall include but be limited to date, instrument tag numbers, calibration data for the various procedures described herein, name of person performing the calibration, a listing of the published specified accuracy, permissible tolerance at each point of calibration, calibration reading as finally adjusted within tolerance, defect noted, corrective action required and corrections made.

H. O & M Manuals

1. O&M Manuals shall be submitted for each FMID

2. O&M Manuals shall comply with Section 40 61 13 – PMCS General Requirements.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall comply with delivery, storage and handling requirements listed in Section 40 61 13 – PMCS General Requirements.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall comply with spare parts, special tools and supplies listed in Section 40 61 13 – PMCS General Requirements, this Section and the Specifications.

B. Spare Parts

1. The Contractor shall furnish and deliver the spare parts and test equipment as outlined below.

2. Spare parts shall be identical and directly interchangeable with similar parts of FMIDS furnished under this Section.

3. Spare parts shall be packed in containers suitable for long term storage, bearing labels clearly designating the contents and the pieces of equipment for which they are intended.

4. Spare parts and tools shall be as recommended by the manufacturer and shall as a minimum include the following:

a. One FMID for every five (5) FMID of a given model furnished, minimum of one.

b. One (1) communication card for every five (5) of each type furnished, minimum of one.

c. One (1) power supply for every (5) of each size furnished, minimum of one.

d. All spare parts recommended by manufacturer and listed as recommended spare parts in the manufacturer's submitted O&M Manual.

C. Special Tools

1. Special tools, other than those normally found in a Service Technician's toolbox, required to test, diagnose, calibrate, install, wire, connect, disconnect, assemble and disassemble any FMIDs, for service and maintenance shall be provided.

2. Tools and test equipment shall be provided, together with items such as instruction manuals, carrying/storage cases, unit battery charger where applicable, special tools, calibration fixtures, cord extenders, patch cords and test leads, which are not specified but are necessary for checking FMIDs under this Contract.

3. The following test equipment shall also be provided:

a. Portable Calibrators

1) Furnish Two (2) of Portable calibrators capable of measuring DC volts, mV, mA, ohms, frequency, T/C, RTD, peak detect and trip detect on its input and simultaneously generate on its output all of the preceding signals plus two-wire

simulation, ramp functions, up/down stepping and 10 point programmability.

2) Each calibrator shall be furnished complete with 24 VDC integral battery pack 120 VAC power adapter, spare battery pack, test leads, external charger, fuse pack, carrying case and appurtenances.

3) Basic accuracy for DC voltages and currents shall be

a) ±0.025%; Resistance

b) ±0.035% for input and ±0.05% for output

c) Frequency: ±0.01%.

d) Two (2) portable calibrators shall be furnished.

e) NIST traceable Certificates of Calibration shall be furnished for all calibrators.

4) Portable Calibrators shall be Rochester Instrument System Accupro Diamond or approved equal.

b. Portable Gage and Differential Pressure Calibrator

1) Furnish one portable microprocessor-based, with 8K of memory gage and differential pressure calibration system.

2) The calibration system shall include the following items:

a) Integral 115 VAC/DC battery power supply with charger, battery indicator and two sets of NI-CAD batteries

b) Two (2) Pump modules each with coarse and fine adjustment with the following ranges.

(1) 0-100 psig max air type

(2) 0-500 psi max hydraulic type

c) Four pressure modules with the following ranges capabilities:

(1) 0-10 inches WC

(2) 0-30 psi

(3) 0-100 psi

(4) 0-300 psi).

3) All accessories, including manuals, tubing connectors and appurtenances shall be furnished for the unit, complete with weather resistant carrying case.

4) Portable Gage and Differential Pressure Calibrator shall be BETA Model 320 (Dual Sensor) or approved equal.

c. Multimeter

1) One (1) Portable digital multimeter (DMM) with rechargeable battery and test leads, and carrying case.

2) Meter shall be furnished with NIST Traceable certificate of calibration

3) Multimeter shall be Fluke Model 8060A or approved equal.

d. Hand Tools

1) A complete set of standard hand tools shall be furnished with the equipment.

2) The set shall include approximately 100 tools and shall be supplied in a durable aluminum case.

3) Tool set shall be Jensen Model JTK-17 or approved equal.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Shut-off valves shall be as manufactured by:

1. Swagelok Company, Solon, OH.
2. Anderson Greenwood-Emerson, Anaheim, CA.
3. Tylok, Euclid, OH.
4. Or approved equal.

B. Heated enclosures for outdoor FMIDs shall be a manufactured by

1. O'Brien, St Louis, MO
2. Or approved Equal

C. Manifolds shall be as manufactured by:

1. Swagelok Company, Solon, OH.
2. Anderson Greenwood-Emerson, Anaheim, CA.
3. Tylok, Euclid, OH.
4. Or approved equal.

D. Signal Splitters shall be as manufactured by:

1. Moore Industries, North Hill, CA.

2. Or approved equal.

E. Colorimetric Chlorine Analyzer shall be as manufactured by:

1. Hach, Loveland, CO.
2. No substitution allowed..

F. Non-Contact Flow Sensor shall be as manufactured by:

1. Teledyne ISCO, Lincoln, NE.
2. Hach Flo-Dar, Loveland, CO.
3. Or approved equal.

G. Swinging Vane (Paddle-Type) Flow Switch shall be as manufactured by:

1. Dwyer, Michigan City, IN.
2. Kobold USA, Pittsburg, PA.
3. Or approved equal.

H. Rotameter shall be as manufactured by:

1. Evoqua (Wallace & Tiernan), Pittsburg, PA.
2. Yokogawa, Houston, TX.
3. Kobold USA, Pittsburg, PA.
4. Or approved equal.

I. Radar Level Transmitter shall be as manufactured by:

1. Rosemount, Shakopee, MN.
2. ABB, Cary, NC.
3. Vega, Mason, OH.
4. Or approved equal.

J. Ultrasonic Level Transmitter shall be as manufactured by:

1. Siemens, Saint Paul, MN.
2. Endress and Hauser, Greenwood, IN.
3. Or approved equal.

K. Float Level Switch shall be as manufactured by:

1. GEMS Sensors, Plainville, CT.
2. Xylem Flygt, Washington, DC.
3. WIKA, Columbus, OH.
4. Or approved equal.

L. Reed Level Switch shall be as manufactured by:

1. GEMS Sensors, Plainville, CT.

2. Kobold USA, Pittsburg, PA.
3. WIKA, Columbus, OH.
4. Or approved equal.

M. Pressure Switch shall be as manufactured by:
1. Ashcroft, Stratford, CT.
2. Automatic Switch Company (ASCO), Madison, NJ.
3. United Electric, Watertown, MA
4. Or approved equal.

N. Pressure (Level) Transmitter shall be as manufactured by:
1. Emerson Rosemount, Shakopee, MN.
2. ABB, Cary, NC.
3. Endress and Hauser, Greenwood, IN
4. Or approved equal.

O. Magnetic Flow Meter shall be as manufactured by:
1. Emerson Rosemount, Shakopee, MN.
2. ABB, Cary, NC.
3. Endress and Hauser, Greenwood, IN.
4. Or approved equal.

P. Gas Monitoring Analyzer shall be as manufactured by:
1. MSA Safety, North Reading, MA.
2. Sensidyne, St. Petersburg, FL.
3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. General Features
1. All FMIDs supplied shall be the manufacturer's latest design.
2. Unless otherwise specified, FMIDs shall be solid state, electronic, using enclosures to suit specified environmental conditions.
3. Microprocessor-based FMIDs equipment shall be supplied unless otherwise specified.
4. All FMIDs shall be provided with mounting hardware and floor stands, wall brackets, or instrument racks as shown on the Contract Drawings, or as required.
5. Equipment installed in a hazardous area shall meet Class, Group, and Division requirements as shown on the Contract Drawings.

6. All FMIDs for outdoor service shall be furnished in the specified enclosures and or installed in field panels in accordance with Section 40 67 16 – PMCS Panels and Enclosures.
7. It shall not be necessary to provide the manufacturer's NEMA 4 or 4X enclosures for FMIDs which will be subsequently mounted in separate in field panels.
8. All field mounted transmitters mounted outdoors shall be factory installed in thermostatically controlled electrically heated enclosures.
9. Heated enclosures shall be O'Brien VIPAK series or approved equal.
10. Unless otherwise shown or specified, local indicators shall be provided for all FMIDs
11. Where FMIDs are located in inaccessible locations, local indicators shall be provided and shall be mounted as specified in this Section.
12. All indicator readouts shall be linear in process units. Readouts of 0-100% shall not be acceptable (except for speed and valve position).
13. Unless otherwise specified, FMIDs and power supply enclosures shall be 316 stainless steel, fiberglass or PVC coated copper free cast aluminum NEMA 4X construction.
14. Where separate sensors and transmitters are required, they shall be fully matched, and unless otherwise noted, transmitters installed adjacent to the sensor.
    a. Special cables or equipment shall be supplied by the associated equipment manufacturer.
15. Electronic equipment shall utilize printed circuitry and shall be coated (tropicalized) to prevent contamination by dust, moisture and fungus.
16. Solid-state components shall be conservatively rated for long-term performance and dependability over ambient atmosphere fluctuations.
17. FMIDs and system components shall be designed for installation in dusty, humid, and corrosive service condition.
18. The PMCS shall contain products of a single manufacturer, insofar as possible, and shall consist of equipment models which are currently in production.
19. All equipment provided, where applicable, shall be of modular construction and shall be capable of field expansion.
20. All non-loop-powered instruments and equipment shall be designed to operate on a 60 Hz alternating current power source at a nominal 1115 V, plus or minus 10 percent, except where specifically noted.
21. All regulators and power supplies required for compliance with the above shall be provided.

22. Where equipment requires voltage regulation, power conditioners shall be supplied.

23. All analog transmitter and controller outputs shall be isolated, 4-20 milliamps into a load of 0-750 ohms, unless specifically noted otherwise.

B. Pressure Sensing Lines and Accessories for Flow and Pressure Transmitters

1. Construction:

a. Material: Type 316 stainless steel tubing; .035-inch wall thickness.

b. Pressure Rating: 150 psi.

c. Size: 1/2-inch outside diameter.

d. Connections: Type 316 stainless steel compression type. "Swagelok," provide isolation valves at process tap

C. Shut-off and Isolation Valves:

1. Construction:

a. Type: Ball.

b. Pressure Rating: 150 psi.

c. Body, Ball, and Stem: Type 316 stainless steel.

d. Packing: High Density TFE.

e. Handle Stainless Steel with metal travel stops.

f. Support Rings: Stainless steel.

g. End Connections: 1/2-inch NPTF (minimum) w/ Removable "Swagelok" connectors.

D. Manifolds:

1. Construction:

a. Type: 5-valve and 3-valve meter manifolds.

b. Materials: Type 316 stainless steel body, bonnets, stems, and hardware; Delrin seats; Teflon packing.

c. Connections: 1/2-inch NPTF with Type 316 stainless steel compression type. "Swagelok" connectors.

E. Pressure Tap Sensing Lines and Accessories for Pressure Gauges and Pressure Switches:

1. For Process Sensing Taps in Ductile Iron, Steel, and Stainless Steel Piping Systems:

a. Material and Fittings: Type 304 stainless steel pipe (ASTM A 312) shall be used, along with threaded fittings and adapters (ASTM A 403).

b. Sizes: The main sensing piping shall have a minimum size of 1-inch gauge and switch connections shall be a minimum of 3/4-inch.

c. Pressure Rating: Equal to or greater than the applicable system test pressure.

d. Accessories:

1) For applications not requiring diaphragm seals, provide separate Type 316 stainless steel threaded ball valve for each gauge and switch.

2) For applications requiring diaphragm seals, provide a separate threaded Type 316 stainless steel ball valve for seal process side shutoff.

2. For Process Sensing Taps in Copper and Thermoplastic Piping Systems:

a. Pipe Material and Fittings: Use same type of pipe material and fittings as used in the process piping system.

b. Sizes: The main process sensing piping shall have a minimum size of 3/4-inch, and gauge and switch connections shall be a minimum of 1/2-inch.

c. Pressure Rating: Equal to or greater than the applicable system test pressure.

d. Accessories:

1) For copper piping system taps with or without seals, provide a separate 3/4-inch minimum threaded brass or bronze ball valve for each gauge and switch.

2) For PVC piping systems with or without diaphragm seals, provide a separate 3/4-inch threaded ball valve for process sensing line shutoff.

F. Colorimetric Chlorine Analyzer:

1. General: Unit shall use colorimetric analysis to analyze and indicate total chlorine residual in a sample piped to the unit.

2. Performance Requirements:

a. Type: Colorimetric.

b. Output: 4 to 20 mA for Total Chlorine Residual via Hach SC4500 Controller.

c. Power: 120 VAC.

d. Range: 0 to 10 mg/L (ppm) Total Chlorine Residual.

e. Accuracy: +/- Five percent of reading or +/- 0.04 mg/L (ppm), whichever is greater from 0 to 5 mg/L as CL2; +/- 10% from 5 to 10 mg/L as CL2.

f. Precision: 5% of reading or +/- 0.01 mg/L (ppm), whichever is greater.

g. Lower Limit of Detection (LOD): 0.03 mg/L (ppm).

h. Resolution: 0.01 mg/L (ppm).

i. Repeatability: 5% of reading or 0.01 mg/L (ppm), whichever is greater.

j. Cycle Time: 2.5 minutes.

3. Construction Features:

a. Sensor/Analyzer:

1) Analyzer shall be housed in an IP66-rated enclosure.

2) Capable of measuring total chlorine residual by changing the tubing and indicator and buffer solutions.

3) Measurements are taken every 2.5 minutes and results are displayed on a controller display in the range of 0 to 10 mg/L.

4) Utilizes a built-in flow meter.

5) Real-time flow rate is measured when sample is flowing through the analyzer and results are displayed on a controller display in mL/min.

6) Connects to Hach SC4500 Controller, which controls and provides power to the analyzer.

7) Performs a blank reference measurement check between analysis points to compensate for sample color, turbidity, and changes in light intensity due to voltage fluctuations or light source aging.

8) Operates with an LED light source at a peak wavelength of 510 nm.

9) Capable of operating unattended for 30 days between chemical reagent changes and measurement cell cleaning.

10) Utilizes a three-color status light to indicate operating status.

11) Utilizes three measurement cycle indicator lights to display the phase of the measurement cycle being performed.

12) Has a colorimeter measurement cell window for viewing samples inside cells.

13) Provide step-by-step, on-screen instructions for all routine maintenance activities, including reagent changes, tubing changes, and cell cleanings.

b. Transmitter:

1) Microprocessor-based solid-state circuitry designed for measurement of free residual chlorine and transmission of proportional output signal linear to total chlorine residual.

2) Built-in simulator used in conjunction with front panel controls and display to verify calibration, proper internal functioning of the analog-to-digital conversion, processing, outputs, and setting up alarms.

3) Front of panel membrane sealed keypad for display control and transmitter function control testing and calibration. Front panel switch shall also allow alternate display of readouts for free residual chlorine, and mA outputs.

4) Built-in Self Diagnostics: Transmitter shall include capability to actively monitor all internal components and present diagnostics on the overall health of connected sensors and time to next required maintenance. Display shall notify of upcoming and past due maintenance.

5) Indicator: 3.5-inch TFT color display with capacitive touchpad.

6) Inputs: Dual-Channel (Two Digital Sensor Inputs)

7) Outputs:

a) One 4 to 20 mADC output. Individually programmable, insulated, direct acting into 0 to 600 ohms for output of free residual chlorine signal.

b) Alarm Outputs:

(1) Two Relays with SPDT Form C Contacts.

(2) Five Amps at 120 VAC

8) Housing: NEMA 4X metal enclosure with corrosion-resistant finish, mounting bracket, and brackets to allow for handrail, surface mounting, pipe stand mounting.

9) Power Supply: 120 VAC +/- 10 percent, 50/60 Hz, 10 Watts.

10) Memory Backup: All configuration data shall be stored in non-volatile EEPROM.

4. Environmental Requirements:

a. Operational Criteria:

1) Sample Flow Rate: 60 to 200 mL/minute through the analyzer.

2) Sample Filtration: Y-Strainer with 40-mesh screen or higher.

3) Inlet Pressure: 4.5 to 75 psig supplied to Y-Strainer; 1.5 to 5 psig supplied to analyzer.

4) Sample Temperature: 41 to 104 degrees F.

5) Operating Temperature: 41 to 104 degrees F.

6) Operating Humidity: 0 to 90% non-condensing relative humidity.

5. Accessories:

a. Instrument Options: Provide standpipe installation kit.

b. Provide appurtenances required by manufacturer for installation, including y-strainer, pressure regulator, valves, fittings, tubing, and standpipe installation kit. Provide rotameters as specified in this Section.

c. Provide all mounting hardware required for wall mount installation.

d. Include sufficient quantities of reagents and expendables for one year of operation.

e. Piping Connections:

1) 1/4-inch sample inlet, quick-disconnect fitting.

2) 1/2-inch sample outlet flexible tubing.

3) 1/2-inch overflow drain flexible tubing.

6. Installation, Start-Up and Training:

a. Contractor shall install the analyzer in strict accordance with the manufacturer's instructions and recommendation.

b. Manufacturer's representative shall include three (3), 8-hour days of services by a factory-trained technician for installation and start up each analyzer being installed.

c. Contractor shall include the manufacturer's services to perform startup on instrument to include basic operational training and certification of performance of the instrument. Refer to Section 01 79 05 – Equipment Start-Up and Training for additional requirements.

d. All manufacturer's services shall be performed by factory-trained service personnel. Field service and factory repair by personnel not trained or certified by the manufacturer is not allowed.

e. Use of the manufacturer's service parts and reagents is required. Third party parts and reagents are not approved for use.

G. Non-Contact Flow Sensor:

1. General: The unit shall remotely measure the flow in an open channel with non-contact laser or radar Velocity technology and non-contact Ultrasonic Level technology.

2. Performance Requirements:

a. Type: Laser / Radar Doppler Velocity Sensor and Ultrasonic Level Sensor.

b. Output: Six (6) 4-20 mA for Level, Master Flow, Surcharge Level, Velocity, and Surcharge Velocity via Transmitter. Provide required add-on cards for the required outputs.

c. Power: 120 VAC.

d. Laser Velocity Measurement Range: 0 to 15 ft/s (0 to 4.6 m/s).

e. Ultrasonic Level Measurement Range: 0 to 10 ft (0 to 3 m)

f. Ultrasonic Sensor Beam Angle: 10 degrees.

g. Accuracy: +/- 4% of reading.

h. Provide redundant flow measurement via submerged continuous wave ultrasonic Doppler Velocity measurement option.

i. Operating Temperature: 14 to 140 degrees F (-10 to 60 degrees C).

3. Construction Features:

a. Sensor:

1) Sensor shall be constructed of conductive carbon filled ABS plastic, SST, conductive Kynar (ultrasonic sensor), anodized aluminum (ultrasonic housing), and UV-rated PVC (cable jacket).

2) Enclosure shall be rated IP68, and certified Class 1, Division 1.

3) Provide cable length from sensor to transmitter with minimum 5 feet of slack.

4) Input voltage supplied by the transmitter shall be 24 VDC.

5) Provide stainless steel mounting hardware for physical installation.

6) Provide sensor retrieval tool with maximum extension of 23 feet.

7) Provide required intrinsically safe barrier for wiring from sensor located in the hazardous location to the transmitter located in the non-hazardous location. Follow all manufacturer requirements for barrier wiring interface with sensor and transmitter.

b. Transmitter:

1) Flow meter electronics and connections will be housed in a PPO Polyphenylene Oxide Noryl, NEMA 4X, lockable enclosure suitable for conduit connection.

2) Basic construction will consist of a two-piece electronics enclosure, front panel, and door.

3) The enclosure door will have a clear polycarbonate window for viewing the LCD, mechanical totalizer, and LED indicator without opening the door.

4) Flow meter shall include a stainless-steel bracket for wall mounting.

5) Flow meter will have a two-color LED indicator next to the display to indicate alarms/events.

6) Power: 120 VAC.

7) Communication and User Interface:

a) Primary programming will be directly through the tactile keypad and programming menus on the front panel of the flow meter.

b) Alarm status/events shall be indicated by the LED next to the display. Detailed information about the alarm/event(s) indicated will be accessed by pressing a key on the keypad.

c) Direct serial connection to a computer or USB flash drive will be through a micro A/B USB port located on the front panel of the flow meter.

4. The manufacturer shall be present for installation, and start-up of the instrument and shall provide support for field related issues up until Substantial Completion.

5. For DC-5 location, the transmitters shall be installed inside of the DC-5 Control Panel along with intrinsically safe barriers, following all manufacturer recommendations.

6. For Regulator 9, the transmitters shall be installed inside the existing Regulator 9 Control Panel, that is provided under the Floatables Contract. Contractor shall coordinate with the City to complete this installation along with the intrinsically safe barriers, following all manufacturer recommendations.

H. Swinging Vane (Paddle-Type) Flow Switch:

1. Type: The flow indicating switch shall be swinging vane, paddle-type suitable for the applications shown.

2. Required Features:

a. NEMA 4X housing and control box.

b. Type 316 stainless steel internal moving parts.

c. Line size and connection ends as shown.

d. Dual switches, each SPDT, minimum rating five amp at 120 VAC.

e. Field adjustable switch setting.

f. Switch accuracy and deadband shall be five percent of full range.

I. Rotameter:

1. Type: Low-Flow Variable-area Flow meter:

a. Provide fine control needle valve and check valve.

b. Range and Scale: Direct reading in ccm, gph or scfh as required.

c. Accuracy: ± Two percent of maximum capacity; ± ten percent of full scale for extra low capacity meters.

d. Construction:

1) Frame: Type 302 stainless steel.

2) End Fittings: Type 316 stainless steel.

3) Tube: Borosilicate Glass.

4) Float: Type 316 stainless steel, black glass or tantalum as required.

5) O-rings: Buna-N or Viton.

6) Tube Retainer: Kynar.

7) Tube Shield: Polycarbonate.

8) Check and Needle Valves: Type 316 stainless steel.

9) Adapters and Plugs: Type 316 stainless steel.

J. Radar Level Transmitter:

1. Type: Microprocessor based, non-contacting, radar type continuous liquid level measuring system consisting of an antenna with attached transmitter. The radar liquid level measuring system shall produce an output signal linear with level.

2. Performance Requirements:

a. Measuring Principle: Radar.

b. Measuring Range: As specified in the Instrument Index.

c. Accuracy: 0.1 percent of range.

d. Reaction Time: One second, minimum.

e. Power: 24 VDC loop power.

f. Output: 4 to 20 mADC.

3. Construction Features:

a. Enclosure: NEMA 4X, powder coated aluminum.

b. Electrical Connection: 1/2-inch NPT.

c. Mounting: Flange to match mating flange conditions at the Overflow Chamber.

4. Accessories:

a. Mounting Hardware: Six-inch flange with Type 316 stainless steel hardware.

b. Antenna Extension: Sized as required to allow antenna to clear the end of floor pipe or nozzle.

c. Weather shield/protective cover.

K. Level Transmitter Ultrasonic Type

1. Type:

a. Non-contact, ultrasonic level transducer.

b. Function/Performance

1) Measuring Range: Transducer range shall be suitable for the installation indicated on the Drawings, up to 50 ft. (15m).

2) Temperature Range: –20 to 60 degrees C.

3) Relative Humidity: Zero to 100 percent.

4) Temperature Compensation: Transducers shall be provided with integral temperature sensors for temperature compensation at temperature ranges from -50° to 150° C.

2. Physical:

a. Transducers shall be potted/encapsulated in a Kynar or other chemical and corrosion-resistant housing. Where indicated on the Drawings, transducers shall be approved for installation in Class I, Division 1, Groups C and D (Zone 0) environments.

b. The surface of transducers shall be Teflon-coated where mounted on chemical tanks and exposed to vapors in the tanks that are not compatible with the transducer material.

c. Transducers shall be capable of being completely submerged without damage.

d. Transducers shall be suitable for the surface, pipe, or flange mounting as indicated on the Drawings. Appropriate mounting hardwired shall be provided. Flange shall be six inches and be resistant to attack by the medium being metered or, where required, shall be protected by corrosion- resistant coatings and facings.

3. Options/Accessories Required:

a. Transducers located in areas where freezing condensation may occur shall be provided with special heaters or another type of transducer protection designed to prevent sensor icing.

b. A signal cable as recommended by the manufacturer, for installation between the transducer(s) and the transmitter. Length, up to 1200 feet, shall be as required by installation indicated on the Drawings.

4. Transmitter/Converter:

a. Type:

1) Microprocessor based compatible with the transducer(s) provided.

2) Functional/Performance:

a) Resolution (including transducer): Plus or minus 0.1 percent of range or 0.08 inches, whichever is greater.

b) Accuracy (including transducer): Plus or minus 0.25 percent of range or 0.24 inches.

c) Range: As required by installation indicated on the drawings and instrument index.

d) Temperature Range: -20 to 50 degrees C.

e) Output: Two isolated 4-20 mA output and one, three, or six alarm contacts adjustable to trip at any point in the instrument range. Output contacts shall be rated 5 A at 230 VAC.

f) Temperature Compensation: Compensation over the temperature range of the sensor.

g) Display: Digital indicator displaying level/differential level or volume in engineering units.

h) Diagnostics: On-screen instructions and display of self- diagnostics.

i) Loss of Signal: Transmitter shall ignore the momentary loss of echo signals and shall indicate loss of echo on the transmitter unit.

j) Configuration Protection: Programmable parameters shall be protected using E2PROM. Battery backup protection is not acceptable.

b. Physical:

1) The transmitter shall be suitable for surface or pipe stand mounting.

2) The enclosure shall be NEMA 4X.

c. Accessories Required:

1) Hand-held programmer where required for configuration and calibration of the instrument.

L. Float Level Switch:

1. Design:

a. Type: Direct acting, pear shaped, eccentrically weighted displacement type, liquid level sensor.

b. Float Body: Hollow hermetically sealed, rigidly molded of polypropylene containing switch and eccentric metal weight.

c. Switch: Hermetically Sealed SPDT switch rated 8 Amps AC, 5 Amps DC, cushioned and mounted along the main axis at about 65-degree inclination. No mercury permitted.

d. For multiple floats provide 316 stainless steel mounting rod and all required mounting hardware per manufacturer's recommendation.

e. Weight: Weight to cause the sensor to hang straight down from cable when not immersed and only allow the float to pivot when immersed in liquid.

f. Electrical Cable:

1) Heavy duty, three conductors, flexible and submersible cable, sheathed in PVC and connected to float and switch with a watertight seal.

2) Cable length shall be sufficient to extend to the control panel box.

M. Reed Level Switch:

1. Type: A magnetic float moves with liquid level to actuate a hermetically sealed, magnetic reed switch within the unit stem.

2. Required Features:

a. SPST control switch – open when level is detected. Electrical rating: 24 VDC, 0.3 amps.

b. Material to be compatible with Sodium Hypochlorite and Sodium Bisulfite.

c. Float Overtravel: 1/8-inch.

d. Operating Temperature: 0 to 180 degrees F.

e. Cable and packaging assembly shall withstand submergence. Cable length as required.

f. Provide mounting brackets.

N. Pressure Switch:

1. Type: Switch assembly with diaphragm/piston pressure sensor.
2. Function: Sense gauge or absolute pressure and open or close a contact when the pressure reaches the specified trip point.
3. Performance Requirements:
    a. Operating Range: As indicated in PMCS Instrument Index.
    b. Setpoint: As indicated in PMCS Instrument Index.
    c. Setpoint Repeatability: +/- One percent of range.
    d. Output: Snap action switch, SPDT rated not less than ten amp resistive at 120 VAC and 1/2-Amp resistive at 125 VDC.
    e. Switch and Reset Action: Adjustable Deadband.
    f. Ambient Temperature Limits: -4 degrees F to 140 degrees F.
4. Construction Features:
    a. Pressure Transducer Housing and Diaphragm Material shall be compatible with Sodium Hypochlorite and Sodium Bisulfite. Provide in-line flanged diaphragm seal.
    b. Set and Reset Point Adjustments: Adjustable external adjusting nuts and pressure setting scales in psi.
    c. Process Connection: 1/4-inch NPT.
    d. Housing: Copper-free die cast aluminum NEMA 4X.
    e. External Mounting Lugs.
    f. Adjusting Nuts Metal Cover with Gasket.
    g. Electrical Connection: 3/4-inch NPT.

O. Pressure (Level) Transmitter:

1. Type: Solid State two-wire differential capacitance or resonant wire type transmitter with remote pressure diaphragm seals for measurement of liquid level. For non-pressurized tanks, only one (high-side) remote seal shall be required with the low side open to atmospheric pressure.
2. Function: Measure level as shown and as specified in the Instrument Index. The transmitter shall display the monitored level value and shall output a 4 to 20 mADC signal proportional to the monitored level.
3. Performance Requirements:
    a. Range: As specified in the Instrument Index.
    b. Positive Over Range Protection: At least 1.25 times the maximum span limit.
    c. Local Indication: As specified in the Instrument Index.

d. Transmitter Accuracy (includes linearity, repeatability and hysteresis): ±0.25 percent of calibrated span.

e. Linearity: ±.1 percent of calibrated span.

f. Repeatability: 0.05 percent of calibrated span.

g. Hysteresis: 0.05 percent of calibrated span.

h. Stability over 6-month period: ±0.25 percent of maximum span.

i. Supply Voltage Effect: Output change of less than .005 percent of calibrated output span per one-volt change in supply voltage.

j. Combined Process and Ambient Temperature Effect: Less than 8-inches water change per 100 degrees F average (combined) temperature change, plus 2.5-inches water per additional five feet of capillary (when used with DC 200 silicone fill).

k. Output:

1) Isolated direct acting 4 to 20 mADC.

2) Digital process variable signal superimposed on 4 to 20 mADC signal without compromising loop integrity.

4. Construction Features:

a. Measuring elements protected by sealing diaphragm.

b. Calibration Adjustments:

1) Zero: Adjustable in electronics compartment.

2) Span: Coarse and fine adjustments in electronics compartment.

c. Zero Elevation and Suppression: The extent that the amount of suppression plus the calibrated span does no exceed the upper range limits of the sensor.

d. Damping: Internal adjustable.

e. Built-in electrical surge and RFI protection.

f. Remote Pressure Diaphragm Seals:

1) Size and Type: Three-inch ANSI Class 150 flanged with flush diaphragm.

2) Diaphragm Seal (Process Wetted) Materials: See Diaphragm Seal specification included in this Section.

3) Diaphragm Seal Housing, Flanges and Bolting (non-process wetted) Materials: See Diaphragm Seal specification included in this Section..

4) Capillary Tubing:

a) Material: Armored Type 316 stainless steel.

b) Length: As required to extend from remote seal to transmitter (five feet minimum; 25 feet maximum).

g. Fill Fluids:

1) Remote Seal and Capillary: See Article 1.8.

2) Transmitter Sensor Cell: See Article 1.8.

h. Transmitter Sensor Diaphragms and Process Wetted Parts: Type 316 stainless steel.

i. Transmitter Sensor Non-Process Wetted Parts:

1) Sensor Body and Bolting Materials: Type 316 stainless steel.

2) O-rings Seals: Viton.

j. Transmitter Electronics Housing: NEMA 4X rated and Buna-N O-rings sealed threaded cover constructed of die-cast, low-copper aluminum finished with an epoxy paint system.

k. Indicator: Provide integral indicator with range in engineering units.

l. Electrical Conduit Connection: 1/2-inch NPT.

m. Process Connections: 1/4-inch NPT with adapters for connection to remote seals via capillary tubing.

n. Type 316 stainless steel mounting bracket and fastening hardware suitable for mounting transmitter on flat vertical surface or 2-inch diameter pipe.

o. Hand held interface with keyboard and LED display capable for easily configuring and testing the transmitter.

P. Magnetic Flow Meter:

1. Type: Flowtube with pulsed DC Magnetic Flow Transmitter.

2. Function: Monitor liquid flows as shown. The transmitter shall display the monitored flow value and shall output a 4 to 20 mADC signal proportional to the monitored flow.

3. Performance Requirements:

a. Range: As indicated in PMCS Instrument Index.

b. Accuracy (with analog output):

1) ±0.5 percent of flow rate, or better, over a range from 1 fps to 31 fps.

2) ±0.005 fps, or better, at flows below 1 fps.

3) Accuracy unaffected by changes in fluid velocity, density, pressure, temperature, or conductivity (above minimum conductivity limits).

4) System accuracy shall be proven by submittal of flow test curves of the actual meters being furnished.

a) Test curves shall show a minimum of ten equally spaced flow points. Tests shall be performed using water and a weight or volume tank. A "master meter" used as a reference standard is not acceptable. The test setup shall be submitted and approved prior to testing.

c. Repeatability: ±0.15 percent of flow rate, or ±0.0015 fps, whichever is greater.

d. Drift: Complete zero stability.

e. Minimum Fluid Conductivity Limit: Five micro siemens per centimeter or less.

f. Minimum Pre-amp Input Impedance: 1012 ohms.

g. Power:

1) 120 VAC ± 10 percent, 60 Hz, ±3 Hz power supply.

2) Power Consumption shall not exceed 50 watts for flow tube and transmitter combined.

h. Output:

1) 4 to 20 mADC, direct acting and isolated, into 0 to 1000 ohms.

2) High accuracy, field adjustable scaled pulse output (0.1 to 10 Hz or greater) to drive local totalizer.

i. Operating Temperature: Suitable for operation with process fluid temperature from 0° to 140°F.

4. Construction Features

a. 1. Flow Tube:

1) Type: Lined metal flow tubes.

2) Interchangeability: Ratio of flow velocity to voltage reference signals generated identical for all meter sizes to permit interchangeability with transmitter without requiring circuit modifications.

3) Tube Material: Type 304 stainless steel.

4) Electrode:

a) Conical or elliptical shaped.

b) Material: To be compatible with Sodium Hypochlorite and Sodium Bisulfite.

5) Lining: To be compatible with Sodium Hypochlorite and Sodium Bisulfite.

b. Enclosure:

1) Materials and Rating:

a) Cast low-copper aluminum alloy or fabricated sheet steel.

b) NEMA 6 rated.

c) Capable of withstanding accidental submergence in 30 feet of water for 48 hours.

2) Finish: Finish exterior, except for flange faces, with a high build epoxy paint.

3) End Connections: ANSI Class 150 suitable for mating with pipe specified.

4) Electrical Connections: 3/4-inch NPT tapped holes for power conduit fitting and signal conduit fittings.

c. Pulsed DC Magnetic Flow Transmitter:

1) Materials and Rating:

a) Die cast, low-copper aluminum alloy.

b) NEMA 4X rated.

2) Solid state construction.

3) Local Indication:

a) 3-1/2-digit minimum LCD meter with field selectable engineering units.

b) Seven-digit electromechanical totalizer or eight digit electronic LCD totalizer with reset and lithium battery backup. Totalizer shall be integral with transmitter and visible through viewing window, or shall be externally mounted in a separate NEMA 4X enclosure or condulet with viewing window and installed adjacent to the transmitter.

4) Pulse and analog outputs galvanically isolated from input and earth ground.

5) Automatic zeroing feature making it unnecessary to zero the instrument before or after placing it in operation.

6) Pre-calibrated span adjustment providing continuous span adjustment over entire range.

7) Range Adjustment: Direct reading thumbwheel switches or calibrated potentiometer, continuously adjustable for full scale settings from 1 to 31 feet per second.

8) Signal Conditioning: Adjustable damping circuit with response times of 1 to 25 seconds minimum.

9) Low Flow Cutoff: Provide automatic low flow cutoff circuitry to stop pulse output and local totalization when flow drops below 0.5 percent ± 0.2 percent of the calibrated upper range valve.

5. Accessories:

a. Mounting:

1) Provide complete Type 316 stainless steel mounting hardware.

2) All transmitter and driver electronics shall be remotely mounted from the flow tubes at locations shown.

3) Type of mounting (wall, support frame or pipe stand) as required.

b. Shielded cable assemblies of sufficient length for connection between Flowtube and transmitter electronics.

c. Type 316 stainless steel grounding rings for flow tubes.

d. Type 316 stainless steel grounding straps.

e. NEMA 4X rated 120 VAC power on-off selector switch.

f. A spool piece for replacement of each different size flow tube where no bypass piping is provided.

g. One calibrator suitable to calibrate all flow tubes provided.

Q. Gas Monitoring Analyzer:

1. Type: Gas Monitoring System in a self-contained package that features audible and visible signaling. Dual sensing design shall enable remote sensing in a toxic environment, with monitoring system located outside of the toxic environment.

2. Provide CL2 Gas Monitoring System for the TI-011 Sodium Hypochlorite Room, and a SO2 Gas Monitoring System for the TI-010D Sodium Bisulfite Room and TI-011 Sodium Bisulfite Room. Gas Monitoring System shall include one analyzer/transmitter and dual sensors of the respective gas for each area, as indicated in the Instrument Index and Contract Drawings.

3. Performance Requirements:

a. Analyzer Output: One (1) 4-20 mADC.

b. Sensor Location: Two (2) remote sensors located inside of the chemical room (refer to electrical drawings).

c. Transmitter/Analyzer Location: One (1) transmitter/analyzer located outside of the chemical room paired with the dual sensors, for each system (refer to electrical drawings).

d. Relays: Two DPDT Contacts.

e. Transmitter Housing Material: General-purpose polycarbonate enclosure.

f. Power Input: 120 VAC.

g. Alarm Type: Piezo horn with horn silence button built-in to the analyzer.

h. Sensor for SO2 Gas: Total quantity of 4 sensors.

i. Sensor for CL2 Gas: Total quantity of 2 sensors.

j. Integrated alarm light on the analyzer front.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. FMIDs shall confirm to the requirements of Section 40 80 81 – PMCS Factory Testing.

B. FMIDs monitoring and control criteria specified under this Section shall be functionally verified during PMCS Factory Testing.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Contractor shall install each FMID in accordance with manufacturer's recommendations, this Section, and the Contract Documents.

B. Equipment shall be located so that it is accessible for operation and maintenance.

C. The PMCS Supplier shall examine the Contract Drawings and Shop Drawings for various items of equipment in order to determine the best arrangement for the work as a whole, and shall supervise the installation of process instrumentation supplied under this Section.

D. Electrical work shall be performed in compliance with NYCEC.

E. Equipment Mounting and Support

1. Field equipment shall be mounted on prefabricated pipe stands or metal framing unless shown adjacent to a wall or otherwise noted.

2. FMIDs attached directly to concrete shall be spaced from the mounting surface not less than 1/2-inch by use of phenolic spacers.

3. Expansion shields in walls shall be used for securing equipment or wall supports to concrete surfaces.

4. Unless otherwise noted, field instruments shall be mounted between 48 and 60 inches above the floor or work platform.

5. Embedded pipe supports and sleeves shall be schedule 40, 316 stainless steel pipes, with stainless steel blind flange for equipment mounting as shown on the Contract Drawings.

6. Materials for miscellaneous mounting brackets and supports shall be 316 stainless steel construction.

7. Pipe stands, miscellaneous mounting brackets and supports shall comply with the requirements of Division 5 and the Division 40 pipe support Sections of the specifications.

8. Where transmitters are supported from process piping, leveling saddles shall be provided.

9. Transmitters shall be oriented such that output indicators are readily visible.

F. Panels into which FMIDs are to be mounted shall provide rigid structural support for the FMIDs and shall allow necessary access and working space to permit maintenance of the FMID while installed.

G. Additional strengthening and/or bracing required for a sound installation shall be provided as part of this contract.

H. Contractor shall provide all supports, bracing, wiring, and incidental hardware.

I. All software required for the FMIDs shall be loaded, configured, and fully tested as part of this contract.

J. Contractor shall configure the FMIDs using function keys and instructional prompts so that operators can operate equipment, modify set points and presets, and monitor the FMIDs without any special training or knowledge of the controller with which the FMIDs interfaces.

K. Identification Tags

1. All FMIDs shall have an identification tag meeting the following requirements:

a. Tag numbers for FMIDs shall be as listed on the Contract Drawings and Instrument Index attached.

b. The six-digit prefix shall be included with the ISA tag number.

c. The identifying tag number shall be permanently etched or embossed onto a stainless-steel tag which shall be fastened to the device housing with stainless steel rivets or self-tapping screws of appropriate size.

d. Where neither of the above fastenings can be accomplished, tags shall be permanently attached to the device by a circlet of 1/16-inch diameter stainless steel wire rope.

e. All FMIDs mounted on or within panels shall have the stainless-steel identification tag installed so that the numbers are easily visible to service and maintenance personnel.

3.03 FIELD TESTING / QUALITY CONTROL

A. FMIDs Field Testing shall conform to the requirements of Section 40 80 82 – PMCS Startup and Field Testing.

B. Section 40 80 82 details how FMIDs specified under this Section shall be verified during Field Testing.

C. The Engineer, or his designated representative(s), reserve the right to witness any test, inspection, calibration or start-up activity.

D. Acceptance by the Engineer of any plan, report or documentation relating to any testing or commissioning activity specified herein shall not relieve the Contractor of his responsibility for meeting all specified requirements.

E. The PMCS Supplier shall provide the services of factory trained technicians, tools and equipment to field calibrate, test, inspect and adjust each instrument to its specified performance requirement in accordance with manufacturer's specifications and instructions.

F. Any instrument which fails to meet any contract requirements, or any published manufacturer performance specification for functional and operational parameters, shall be repaired or replaced, at the discretion of the Engineer, at no cost to the City.

G. The Contractor shall bear all costs and provide all personnel, equipment, and materials necessary to implement all installation tests and inspection activities for equipment specified herein.

H. Field Instrument Calibration Requirements:

1. Each FMID shall be calibrated at 0, 25, 50,75 and 100 percent of span using test instruments to simulate inputs and read outputs.

2. Test instruments shall be rated to an accuracy of at least five (5) times greater than the specified accuracy of the instrument being calibrated.

3. If doubt exists as to the correct method for calibrating or checking the calibration of an FMID, the manufacturer’s recommendations shall be used as an acceptable standard, subject to the approval of the Engineer.

4. Upon completion of calibration, FMIDs calibrated hereunder shall not be subjected to sudden movements, accelerations, or shocks, and shall be installed in permanent protected positions not subject to moisture, dirt, and excessive temperature variations.

5. Caution shall be exercised to prevent such FMIDs from being subjected to overvoltages, incorrect voltages, overpressure, or incorrect air.

6. Damaged FMIDs shall be replaced and recalibrated at no cost to the City.

7. After completion of FMID installation, the PMCS Supplier shall perform a loop check.

8. The Contractor shall submit final loop test results with all FMIDs listed in the loop.

9. Loop test results shall be signed by all Contractor representatives involved for each loop test.

10. Where applicable, test instruments shall have accuracies as set forth by NIST.

I. Calibration Reports

1. The PMCS Supplier shall provide a written calibration sheet to the Engineer for each instrument, certifying that it has been calibrated to its published specified accuracy.

3.04 STARTUP / DEMONSTRATION

A. Section 40 80 82 – PMCS Startup and Field Testing details the requirements for OAD and PMCS Upset and Recovery Testing.

B. The OAD and the PMCS Upset and Recovery Testing shall serve as the final verification of the correct functioning of all FMIDs.

C. Refer to Section 01 79 05 – Equipment Start-Up and Training for additional requirements.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

SECTION 40 80 81 – PMCS FACTORY TESTING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified and required to perform Witnessed Factory Acceptance Testing of all equipment and components of the PMCS, at the manufacturer's facility.

B. Witnessed Factory Acceptance Testing shall verify that the PMCS, its components and associated equipment functions properly both as units and as an integrated system and that the functional and performance requirements of the Contract Documents are met.

C. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1. Costs under this Section shall include travel, transport, board and lodging for two representatives of the City or the Engineer to attend all PMCS

WFAT at the PMCS manufacturer's facility or approved test facility, in accordance with Section 01 43 15 – Witness Shop Testing.

2. If PMCS equipment and associated components or part thereof require retesting and witnessing is required the Contractor shall be responsible for the associated cost in addition to the travel, transport, board, lodging, and time cost of the witnesses.

1.04 REFERENCES

A. Definitions

1. WFAT - Witnessed Factory Acceptance Tests
2. Section 40 61 13 – PMCS General Requirements defines the terms and abbreviations used in this Section and the PMCS.

B. Reference Standards

1. Section 40 61 13 – PMCS General Requirements lists the standards applicable to this Section and the PMCS.

1.05 DESCRIPTION

A. General

1. The intent of the WFAT is to ensure that all equipment and components of the PMCS and peripherals to be supplied by the Contractor and intended for operation in the Contract Facility and as defined in the Contract documents

demonstrate their performance over their design ranges as individual units and an as integrated system.

2. All the Control Strategy submittals which have been approved for integration into the PMCS and associated equipment shall be demonstrated over the full range of their designed operation.

3. Every attempt shall be made during the WFAT to resolve any issues arising.

4. No issue observed during the WFAT shall be left for resolution during Field Testing unless approved by the Engineer.

5. The Contractor shall provide all necessary supervision, personnel, materials, fluids, facilities, temporary test setups, test fixtures, test equipment, and simulation where approved to perform satisfactory and complete testing.

6. The City representative, Engineer and the Contractor's representative shall be present for all WFATs.

7. Presence of the City and the Engineer at the WFAT does not relieve the Contractor from conforming to the requirements of the Contract Documents.

8. Presence of the City and the Engineer at the WFAT shall in no way imply Acceptance of the PMCS equipment or its components.

B. HMIs

1. Prior to the staging and testing of the system, all display environments shall have been configured per the agreed upon display structure, loaded and data base parameters linked to the specified fields.

C. Notifications and Scheduling

1. The WFAT shall not be scheduled or begun, until all related PMCS Shop Drawings, Test Procedures, Test Documentation and Schedules have been submitted and approved.

2. Integrated PMCS WFAT shall only be scheduled after the PMCS supplier has conducted a non-witnessed factory test and certified that the complete PMCS and associated equipment are ready for a WFAT.

3. The Contractor shall notify the Engineer in writing 90 days before expected initiation of the WFAT.

1.06 QUALITY ASSURANCE

A. The Contractor shall comply with the Quality Assurance requirements listed in Section 40 61 13 – PMCS General Requirements, this Section, and the Specifications.

B. All PMCS components and associated equipment shall be inspected.

1. Inspection shall include but not be limited to the following:

2. Nameplates and tags
3. Wire sizes and color coding
4. Annunciator and terminal block spares
5. Proper wiring practices and grounding
6. Enclosure flatness, finish and color.

1.07 SUBMITTALS

A. The Contractor shall comply with submittal requirements listed in Section 40 61 13 – PMCS General Requirements, this Section, and the Specifications.

B. Contractor shall submit information on factory testing procedures and schedules to verify that testing shall fulfill the requirements specified in this Section and the Specifications.

C. Submittal shall be made at least 90 days months in advance of any scheduled testing and shall include dates of scheduled tests.

D. All panels provided under this Division, and as referred to this Division from other sections shall be factory tested.

E. The procedures for WFATs detailed in this Section shall be submitted for approval by the Engineer.

F. The details of panel simulation software which will be used in conjunction with the PMCS equipment shall submitted for to the Engineer for approval.

G. Working Drawings: The Contractor shall submit for approval working drawings to substantiate conformance with the requirements set forth on the Contract Drawings and in these specifications. All working drawings shall include but not be limited to:

1. Equipment specifications and data sheets identifying all equipment and materials used.
2. Complete assembly and layout drawings with clearly marked dimensions.
3. Factory Acceptance Test (FAT) Procedure and Time Estimates for completion.
4. Interconnecting wiring diagrams.

H. Reports

1. A report on the WFATs completed shall be submitted to the Engineer for approval.
2. Factory test reports shall include the following information:
   a. List of tests performed.
   b. Certified check lists or documentation verifying all I/O has been tested, as specified in this Section.

c. Document verifying all panel wiring has been checked and conforms to the approved submittals with any correction made during the testing.

d. List of all modifications or corrections identified during the WFAT and corrective action taken.

e. Equipment shall not be shipped from the factory until certified factory test reports indicating satisfactory performance have been submitted and approved by the Engineer.

I. Include the following:

1. Calibration Certificates for sensors, instruments, and measurement devices used in the system.

2. Test Report submittals which also should include objective evidence of the system's compliance with specified requirements and performance standards; test procedures, outcomes, deviations, observations, and corrective actions taken.

3. Factory Inspections Records: To validate the manufacturing processes and ensure quality.

4. Certificate of Compliance with relevant industry standards, etc.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall comply with delivery, storage and handling requirements listed in Section 40 61 13 – PMCS General Requirements.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Factory Testing shall be as implemented by the PMCS Supplier.

2.02 MATERIALS / EQUIPMENT

A. Not Used

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. HMIs and Printers

1. The overall display structure shall be demonstrated, including environment configurations, passwords, security, etc.

2. The display contents of memos shall be reviewed to demonstrate how an operator navigates within the overall display structure.

3. The assignment of displays to annunciator keys shall also be demonstrated.

4. Each graphic display shall be reviewed for correctness in terms of the layout, symbols, color scheme, etc.

5. The operation of standard alarm management displays (Current Alarm Display. Alarm History, etc.) shall also be demonstrated.

6. A demonstration of each type of report specified shall be performed.

   a. Printing shall be an integral part of the report demonstration.

B. PMCS Hardware Operational Testing

1. All Input/Output devices and components shall be tested to verify operability and basic calibration.

2. All PMCS hardware components and associated equipment shall be tested to verify proper operation of the equipment as standalone units. Test shall include, but not be limited to, the following:

   a. AC/DC power checks

   b. Power fail/restart tests

   c. Diagnostics checks

   d. Test demonstrating that all specified equipment functional capabilities are working properly.

3. All system components shall be tested to verify that communication between units is working properly.

4. An integrated PMCS test with all system equipment connected (excluding field sensors and instruments) shall be performed to verify that all equipment is performing properly as an integrated system.

5. All field sensors and instruments shall be simulated over their operating ranges inclusive of major set points.

C. PMCS Software Demonstration

1. Contractor shall demonstrate all system software utility and security programs incorporated into the PMCS to illustrate the various functions and capabilities specified.

2. Contractor shall demonstrate the operation and display of all software based on a simulation of 20 percent of total Input/Output count, both analog and discrete, as selected by the manufacturer.

3. The City/Engineer shall also randomly select, at the time of the test, additional Input/Output to be simulated in an amount approximately equal to 10 percent of total Input/Output count.

4. Demonstration shall show that the monitoring and control application software associated with the Input/Output points performs the functions intended, and as specified in Section 40 61 96, PMCS Control Strategies.

D. System performance shall be tested using a fully integrated system, including all software and hardware if applicable.

1. To achieve this, the entire control system, including all the peripheral devices and all interconnecting cables, shall be assembled on the factory test floor and simulated inputs applied.

2. Every device shall have nameplate with description and device's P&ID tag number.

3. Nameplates shall be removable and interchangeable for multiple use during the test.

4. Simulated inputs/outputs shall at minimum include:

a. Toggle switches to simulate field or other input contacts

b. Indicating lights to simulate outputs from tested panels

c. Control relays to simulate MCC coil inputs

d. Time relays to simulate position switches

e. Indications (mA) to indicate every 4-20 mA output from tested panel

f. Potentiometers to simulate 4-20 mA inputs to tested panel

5. The Contractor shall carry out a full system test, during which the entire system shall operate continuously without failure in accordance with the requirements of the Specifications and Drawings

6. Demonstration of communication between PLC's or to remote I/O's shall be included in the Test Procedure where applicable. At least one representative from the City and the Engineer shall be present for the PLC Function Testing. All Input/Output points shall be tested to ensure they are functional. The PLC test shall provide simulation of equipment to ensure that the System functions properly as programmed in order to avert unanticipated field test failures.

7. New Operator Interface Terminals: Prior to the staging and testing of the system, the display environments shall have been configured per the agreed upon display structure, loaded, and data base parameters linked to the specified fields. During this phase of the factory acceptance test, the overall display structure shall be demonstrated, including graphic configuration, passwords, security, etc. The memo display contents shall be reviewed to demonstrate how an operator navigates within the overall display structure. The assignment of displays to annunciator keys shall also be demonstrated. Each graphic display shall be reviewed for correctness in terms of the layout, symbols, color scheme, etc. The operation of standard alarm

management displays (Current Alarm Display, Alarm History, etc.) shall also be demonstrated.

E. Contractor Responsibilities:

1. For factory tests of equipment and systems, the Contractor shall furnish all labor, fuel, power, water, materials, plant and instrument air, instruments, equipment, hardware, and software etc., needed for the tests.

2. The Contractor shall furnish all labor necessary for supervision, adjustment and tuning of equipment as well as materials, instruments, equipment, etc., and any additional labor for testing not furnished by the City.

3. The Contractor shall include the costs for two representatives of the City and two representatives of the Engineer to witness factory test in the lump sum bid for this Contract. See Witness Shop Testing – 01 43 15.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

END OF SECTION

SECTION 40 80 82 – PMCS STARTUP AND FIELD TESTING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all supervision, labor, materials, equipment and incidentals as shown, specified and required to furnish and install all equipment and coordinate all activities necessary to perform check out, start up and field testing of the PMCS and all associated equipment.

B. The Contractor shall retain the services of the Supplier(s) to supervise and/or perform check-out and startup of all system components. As part of these services, the Supplier(s) shall include for those equipment items not manufactured by him or her the services of an authorized manufacturer's representative to check the equipment installation and place the equipment in operation. The manufacturer's representative shall be thoroughly knowledgeable about the installation, operation, and maintenance of the equipment.

C. The Contractor shall supply provisions for video recording of the training specified under this Section.

D. The following index of this Section is presented for convenience:

5. Section 40 61 13 – PMCS General Requirements defines the terms and abbreviations used in this Section and the PMCS

B. Reference Standards

1. Section 40 61 13 – PMCS General Requirements lists the standards applicable to this Section and the PMCS.

1.05 DESCRIPTION

A. Start-up and Field Testing of the PMCS and associated equipment shall include but not be limited to the following:

1. Check Out, Start up and Initial Operation of Equipment.
    a. Instrument calibration and operation
    b. Cable and wire testing
    c. Instrument Loop testing
    d. Control panel installation test
    e. Local control of equipment
    f. PLC and I/O operation
    g. I/O loop testing
2. Final Field-testing of Equipment
    a. Control panel operational testing
    b. Instrument full operation testing
    c. Verification of local and remote control of individual equipment
    d. Execution of control strategies for individual equipment
3. Check Out, Start up and Initial Operation of System Equipment
    a. Process control panel local system operation
    b. Preliminary loop tuning
    c. Remote control of systems
    d. Individual and system loop operation
    e. Network and communication link testing
    f. Network and communication performance testing
    g. Execution of local system logic and control
4. Final Field-testing of Systems
    a. Execution of control strategies for equipment systems
    b. Network and communication optimization

B. Integrated System Field Test

C. Operational Availability Demonstration

D. PMCS Upset Testing

1.06 QUALITY ASSURANCE

A. The Contractor shall comply with the Quality Assurance requirements listed in Section 40 61 13 – PMCS General Requirements, this Section and the Specifications.

B. The Contractor shall retain the services of the PMCS Supplier to supervise, coordinate and perform check-out and start-up of all PMCS components and associated equipment.

C. All I/O points, loops, and functions including spares shall be fully operational and undergo Start up and Field Testing.

D. Start up and Field Testing shall be conducted on all PMCS and associated equipment including those for which Factory Testing has been completed.

E. As part of these services, the PMCS Supplier shall include for those equipment items not manufactured by him, the services of an authorized manufacturer's representative to check and certify the equipment installation and place the equipment in operation.

F. Each manufacturer's representative shall be thoroughly knowledgeable about the specific installation, and factory certified in the installation, operation, and maintenance of the equipment.

G. Start-up and Field Testing shall include but not be limited to, field and panel devices, hardware, software, communications, and programming.

H. Simulators and test equipment may be used for the following test phases:

1. Check-out, Start-up and Initial Operation of all equipment and systems

I. Actual field conditions, process variables and process fluids shall be used for the following test phases:

1. Final Tests
2. Integrated System Field Test
3. Operational Availability Demonstration
4. PMCS URT

J. The PMCS Supplier's personnel shall be present for and participate in all phases of the testing of the entire PMCS including all process equipment and systems monitored and controlled by PMCS.

K. Strat-up and Field Testing shall only be considered complete upon the successful performance of all specified functions.

L. Acceptance of PMCS and all associated equipment by the City is contingent upon the approval by the Engineer of all Test Reports.

1.07 SUBMITTALS

A. The Contractor shall comply with submittal requirements listed in Section 40 61 13 – PMCS General Requirements, this Section and the Specifications.

B. Contractor shall submit information on all SFT procedures and schedules for the approval of the Engineer, to verify that testing shall fulfill the requirements specified in this Section and the Specifications.

C. Submittal shall be made at least 90 days in advance of any scheduled testing and shall include dates of scheduled tests.

D. The details of simulation panel and simulation software which will be used in conjunction with the PMCS equipment shall be submitted to the Engineer for approval

E. Complete and detailed information, shall include but not be limited to:

1. Test Flow Charts outlining both the testing and responsibilities of all parties.

2. Proposed log sheets showing what, when and how all test parameters will be recorded and by whom.

3. Proposed reporting formats listing all the information to be recorded for each test

F. Test Reports

1. A report on the each SFT activity completed shall be submitted to the Engineer for approval.

2. Reports shall include the following information:

a. List of tests performed.

b. All raw field test data, test personnel notes, witness comments

c. Certified check lists or documentation verifying all I/O has been tested, as specified in this Section.

d. Test documentation demonstrating that all digital and analog points of the PMCS residing in all controllers and databases have been conformed to be accurately linked to their respective instrument tag names, database tags and assigned names real or virtual.

e. Document verifying all panel wiring has been checked and conforms to the approved submittals with any correction made during the testing.

f. Confirmation that all modifications or corrections identified during the WFAT have been incorporated into the build of the PMCS an associated equipment tested.

g. Confirmation that all modifications or corrections identified during the SFT have been incorporated into the SFT documentation marked up corrective actions taken.

G. Each major phase of test, such as OAD, shall not commence until certified test reports indicating satisfactory performance of prior major phases have been submitted and approved by the Engineer.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall comply with delivery, storage and handling requirements listed in Section 40 61 13 – PMCS General Requirements.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. PMCS Start-up and Field Testing shall be as implemented by the PMCS Supplier.

2.02 MATERIALS / EQUIPMENT

A. Not Used

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. PMCS Factory Testing shall conform to the requirements of Section 40 80 81 – PMCS Factory Testing.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Not Used

3.03 FIELD TESTING / QUALITY CONTROL

A. Equipment/System Check Out, Start-up and Initial Operation

1. The Contractor, under the supervision of the PMCS supplier, and other instrument suppliers as applicable, shall perform the following:

   a. Check and approve the installation of all PMCS components and all cable and wiring connections between the various system components prior to testing the various processes and equipment.

   b. Conduct a visual inspection to verify that all components are properly installed, connected, and labeled as per the specifications.

   c. Conduct a complete system checkout and adjustment, including calibration of all instruments, tuning of control loops, checking operation functions, and testing of final control actions. Provide Instrument Calibration certificates for all instruments provided in the contract.

d. Communication Testing: Test communication links between PLCs, HMIs, field devices, etc. Ensure data transmission, network integrity, and protocol compatibility.

e. Loop Checks: Conduct loop checks to verify the integrity and performance of control loops; adjust tuning parameters as needed to optimize control response.

f. Conduct a Functional testing of individual components and subsystems, test of Input/Output signals, control logic, alarms, interlocks, and other functions.

g. Software Verification including Test logic sequences, alarm handling, setpoint adjustments, and operator interactions.

h. Where future operational functions are included in this work, they shall be included in the check-out.

i. All problems encountered shall be promptly corrected to prevent any delays in start-up of the various unit processes.

2. The Contractor shall provide all test equipment necessary to perform the testing during system checkout and start-up.

3. The Contractor and PMCS Supplier shall be responsible for initial operation of system and shall make any required changes, adjustments or replacements for operation, monitoring and control of the various processes and equipment necessary to perform the functions intended.

4. The Contractor shall furnish to the Engineer certified calibration reports for all field instruments and devices specified in Section 40 79 91 – PMCS Field Instruments and Section 40 78 90 - PMCS Panel Mounted Instruments and Devices, as soon as calibrations are completed.

5. The Contractor shall furnish the Engineer an installation inspection report certifying that all equipment has been installed correctly and is operating properly.

6. The report shall be signed by authorized representatives of both the Contractor and the PMCS Supplier.

B. Integrated System Field Test

1. Following the PMCS and associated equipment checkout and initial operation, the Contractor, under the supervision of the PMCS Supplier, shall perform a complete system test to verify that all equipment and programmed software is operating properly as a fully integrated system, and that the intended monitoring and control functions are fully implemented and operational.

2. Provide Functional Testing and Optimization (comprehensive functional testing, and optimization of control parameters, setpoints, and alarm thresholds for performance and efficiency.

3. Provide Performance Verification: Measure response times, accuracy, stability, and reliability under varying operating conditions.

4. Any defects or problems found during the test shall be corrected by the Contractor and then re-tested to demonstrate proper operation.

5. The PMCS including field sensors/transducers and instruments shall be running and fully operational for a continuous 72 hour period.

6. The City and the Engineer shall agree that the Integrated System Field Test has successfully concluded with no issues to be resolved at the end of the 72 hour period.

3.04 STARTUP / DEMONSTRATION

A. Operational Availability Demonstration

1. The OAD shall commence upon approval by the Engineer after the Integrated System Field Test has been accepted by the City and the Engineer.

2. The OAD shall run continuously from initiation, for 60 days, during which time the PMCS and all associated equipment (hardware and software) shall achieve a minimum of a 99.9% or better availability with no system failures.

3. Any system failures which occur after the initiation of the OAD shall cause the current 60 day period to be terminated and a new 60 day period started after the correction of the failure.

4. During the OAD the PMCS and associated equipment shall be available to plant operating personnel for use in normal operation of the Plant.

5. For the purpose of the OAD the system will be defined as consisting of the following systems and components:

   a. All operator interfaces

   b. All Local Control Panels

   c. All Local Control Stations

   d. All PLCs residing in equipment controlled by the PMCS.

6. The conditions listed below shall constitute system failures which count towards the termination of the OAD:

   a. Failure to repair a hardware or software problem within 120 consecutive hours from the time of notification of a system failure.

   b. If the same hardware or software problem occurs three times or more times.

   c. Software problem causing a processor to halt execution.

7. The following conditions shall constitute a system failure in determining the system availability based on the equation specified in this Section:

a. Failure of any non-redundant operator interface or PLC.

b. Loss of communications between devices on the communications network.

c. Failure of one or more Input/Output components.

d. Failure of any type affecting ten or more Input/Output points simultaneously.

e. Failure of any type affecting one or more regulatory control loops or sequential control strategies thereby causing a loss of the automatic control of the process variable or process sequence operation.

f. Failure of power supply. Where redundant power supplies are provided, failure of one power supply shall not constitute a system failure provided the backup power supply operates properly and maintains supply power.

g. Failure of the backup supply to operate properly and maintain supply power shall constitute a system failure.

h. Failure of three or more primary sensors/transducers or field instruments simultaneously.

B. The system availability shall be calculated based on the following equation:

1. A = ((TTO)/(TTO+TTR)) x 100% where

a. A = system availability in percent

b. TTO = total time in operation

c. TTR = total time to repair

d. Time to repair shall be the period between the time that Contractor is notified of a system failure and the time that the system has been restored to proper operation in terms of hours with an allowance for the following dead times which shall not be counted as part of the time to repair period.

1) Actual travel time for service personnel to get to the plant site up to 6 hours per incident from the time the Contractor is notified of a system failure.

2) Time for receipt of spare parts to the plant site once requested up to 24 hours per incident.

3) No work shall be done on the system while waiting for delivery of spare parts.

4) Dead time shall not be counted as part of the system available period.

5) The dead time shall be logged and the duration of the OAD extended for an amount of time equal to the total dead time.

C. All parts and maintenance materials required to repair the system prior to completion of the OAD shall be supplied by the Contractor at no additional cost to the City.

D. If parts are obtained from the required plant spare parts inventory, they shall be replaced to provide a full complement of parts as specified.

E. A Plant Monitoring and Control System Malfunction/Repair Reporting Form shall be completed by the plant personnel and the Engineer to document system failures, notifications to the Contractor, arrival and repair times and the Contractor repair actions. Format of the form shall be developed and agreed upon prior to the start of the OAD.

F. PMCS Upset and Recovery Testing.

1. The Contractor shall conduct Upset and Recovery Testing of the entire PMCS provided under this contract and all equipment monitored or controlled by the System.
2. URT shall prove the fault tolerance and failure response across the entire PMCS.
3. URT shall be performed after the OAD and shall be imitated from a steady state condition of the PMCS
4. URT shall continue for three consecutive workdays (24 hours).
5. URT shall consist of intentional, non-destructive shutdown and failure of portions of the PMCS equipment, and systems.
6. The Engineer and the City shall randomly pick individual pieces of operating equipment such as Pumps, valves, instruments, controls, etc. to be disabled or tripped and process variables and set points to be modified.
7. The PMCS and associated equipment shall respond as specified to the upset.
8. PMCS and associated equipment responses shall be monitored and recorded.
9. Various failure modes and conditions shall be tried on all equipment.
10. Failure modes to be tested shall include but not be limited to:
    a. closing valves
    b. stopping flows
    c. tripping pumps
    d. emergency stops
    e. set point changes
    f. simulated scenarios

g. the system bypasses, etc.

h. Multiple failure scenarios shall also be tried.

i. Full manual and semiautomatic back up modes shall also be tested

j. UPS run times shall be tested and several PMCS equipment "black starts" shall be attempted to test PMCS restart capability after a prolonged power outage.

k. OITs, PLCs, and software shall be stopped; portions of the entire network shall be disabled.

11. PMCS URT Responses

a. The PMCS must respond immediately by

b. generating the proper alarms

c. starting backup or sequential equipment

d. shutting down remaining affected equipment in accordance with the Control Strategies, programmed sequences, and safety and interlock logic.

e. All equipment and controls shall respond per design.

f. Each PLC must continue to control properly, monitor and alarm the equipment that it operates while disconnected from the PMCS.

g. Portions of the PMCS which have been stopped shall not cause usable portions of PMCS to stop running.

12. PMCS URT Recording

a. Status of the PMCS shall be recorded and monitored.

13. Unexpected or undesirable results, or failure of PMCS to correctly respond to an upset, shall result in stopping the test, making repairs or changes, retesting the changes and then restarting the test.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

SECTION 41 22 23.19 – MONORAIL HOISTS
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified and required, to furnish, install, and test all monorail hoisting equipment, complete and operational, including but not limited to: monorails, trolleys, hoists, motors, electrical supply and control systems.

B. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. The hoisting equipment systems shall consist essentially of hoist, trolley, motors and push-button control stations.

1. All equipment furnished under this Section shall be from a single hoisting equipment manufacturer or supplier.

B. The hoisting equipment manufacturer shall design, furnish, shop test, and supervise the installation of instrumentation and controls, coordinated to function as a system,

providing and accepting appropriate signals to start and stop the hoisting equipment as required for safe, trouble-free operation.

1.06 QUALITY ASSURANCE

A. Manufacturer Qualifications:

1. Manufacturer shall be a member of at least two (2) of the following institutions:

a. CMAA; or

b. The HMI; or

c. The MHI; or

d. The MMA; or

e. Approved equal.

2. The manufacturer shall have a minimum of five (5) years experience in the design and manufacture of equipment of the specified size and type.

B. Equipment furnished under this Section shall be a standard product of the manufacturer and shall conform to all recommendations of the HMI, unless otherwise specified.

C. All equipment provided under this Section shall be obtained from a supplier or manufacturer who shall assume full responsibility for the completeness of the system.

1. The supplier shall be the source of information on all equipment furnished regardless of the manufacturing source of that equipment.

D. See Section 2.04 for QA requirements.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

a. Proof of membership in the HMI and MMA, or demonstration that the standards and experience required for membership are possessed.

b. Equipment specifications and data sheets identifying all operating information, materials used, and methods of fabrication.

c. Complete assembly, layout, and installation drawings with clearly marked dimensions, anchor bolts, and grouting requirements.

d. Weights of all component parts and assembled unit weights.

e. Operating loads.

f. Example equipment nameplate data sheet.

g. Schematic diagrams for electric and control systems showing wiring for individual equipment items and interconnecting wiring diagrams.

h. List of recommended lubricants and lubricant specifications.

i. Shop and field testing procedures.

j. Deviations from the Contract Documents.

k. Wiring diagrams with numbered terminal blocks for all external connections.

l. Description of control system.

m. Motor Tests and Data: For each motor submit a certified motor test data sheet or a certified motor data sheet from an electrically duplicate motor, in accordance with Section 26 05 91, Low Voltage Electric Motors.

n. Operation and Maintenance Manuals in accordance with the requirements of the Contract Documents.

o. Comprehensive schematic diagrams showing wiring for each individual item of electrical equipment and all interconnecting wiring; the latter to be clearly indicated as to be furnished and installed by others, if such is applicable.

2. Information Submittals:

a. Recommended spare parts other than those specified.

b. Recommendations for short and long term storage.

c. Reports:

1) All shop test and field test reports and certificates.

2) All manufacturer's site visit reports.

d. The manufacturer's instructions on installation procedures.

e. Calculations for sizing of all beams including supports, sealed and signed by a New York registered Professional Engineer.

f. Certification by a registered Professional Engineer stating that the design of each hoist system conforms to the applicable standards and codes and is as specified.

g. Approximate shipping weights.

h. Submit proof of manufacturer’s membership in the required associations or demonstrate that the standards and experience required for membership are possessed, all to the satisfaction of Engineer.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. Deliver materials to the site to ensure uninterrupted progress of the Work.

2. Major structural components shall be prepared for shipment in accordance with the carrier's specifications. All other components, push-button control stations and loose pieces shall be skidded, crated, or palleted to the carrier's specifications.

3. All skids, carriers, and pallets shall be enclosed in water-tight plastic wrapping, 6 mil minimum thickness.

4. Master shipping list shall be supplied showing the quantity of each section, subassembly, or piece, the piece number and the drawing on which each subassembly or piece is detailed.

B. Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. All equipment shall be prominently marked for identification in assembly:

a. The part identification shall be stenciled conspicuously on large pieces of equipment.

b. Small parts shall have a metal tag wired in place with identification stamped or etched.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Contractor shall provide spare parts and special tools necessary to service, disassemble, repair and adjust the equipment provided under this Section, and as per the requirements of the Contract Documents.

B. In addition, provide the following spare parts for each monorail hoisting system:

1. One replacement parts kit and one operating coil for each monorail hoist installed.

2. One complete set of linings for each type and size of brake.

3. One replacement set of all collector shoes.

4. One complete replacement wire rope, complete with swaged end fittings for each hoist.

5. Pendant plus cable assembly for each hoist, packed in a portable and lockable steel or fiberglass container.

6. One complete set of push-button inserts for each push-button station.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer’s standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Hoists and Trolleys:

1. Yale Hoists, as manufactured by Columbus McKinnon Corp., Getzville NY.
2. ACCO Material Handling Solutions, York, PA.
3. Sissco Hoist & Crane, Division of Permadur Industries, Inc., Hillsborough, NJ.
4. Or approved equal.

B. Monorail Track:

1. TC/American Monorail, Inc., Saint Michael, MN.
2. Cleveland Tramrail, as manufactured by Gorbel, Inc., Fishers, NY.
3. Or approved equal.

C. Electrification:

1. Electromotive Systems Inc.- Magnetek Inc., Menomonee Falls, WI.
2. Conductix - Wampfler Inc., Omaha, NE.
3. Duct-O-Wire Company, Oconomowoc, WI.
4. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. General:

1. Hoisting equipment shall comply with the safety and specification standards of ASME B30.11, ASME B30.16, and ASME HST-4.
2. Hoists and trolleys shall be specially designed, constructed and installed for the service intended. All features necessary for satisfactory operation and functioning of the hoisting equipment shall be provided, whether or not they are described in these Sections. Hoists and trolleys shall meet the specific requirements of Schedules 41 22 23.19-1, located after the "End of Section" designation.
3. All parts of the mechanisms shall be amply designed and constructed for the maximum stresses occurring during fabrication, installation and continuous operation. All materials shall be new. All parts of duplicate equipment shall be interchangeable without modification, and all parts subject to wear shall be of standard pattern and easily replaceable without the necessity of special cutting and fitting.
4. The equipment shall be designed and manufactured in accordance with the codes and standards listed herein. They shall be considered an integral part

of this Section and shall govern the design, fabrication, testing and inspection of equipment, except as otherwise shown or specified herein.

B. Motor Drives:

1. Motors shall conform to the requirements of Section 26 05 91, Low Voltage Electric Motors, and the following additional requirements:

a. Enclosure shall be TEFC.

b. Insulation: Class F.

c. Service Factor: 1.15. Motors shall be non-overloading at rated crane capacity.

d. Power Supply: As specified in Schedule 41 22 23.19-1, located after the "End of Section" designation.

e. Provide winding thermostats for overcurrent protection.

f. Bearings: Anti-friction, L-10: 100,000 hours, lifetime pre-lubricated and sealed.

2. Gear Reducers:

a. General:

1) Close coupled to electric motor.

2) Provide gear reducers conforming to AGMA Standards.

3) Minimum Service Factor Based On Maximum Motor Nameplate Horsepower: 1.5.

4) Thermal Rating: 160 degree F maximum under full load continuous operation.

5) Minimum Efficiency: 95 percent.

6) Size: Based on nameplate motor horsepower times service factor of reducer.

b. Gearing:

1) Type: Spur, helical or combination helical and worm gears.

2) AGMA Quality: 5 or better.

3) Provide gears hobbed and ground smooth.

c. Shafts: Alloy steel

d. Enclosure: Manufacturer's standard. Provide inspection cover, oil fill and drain connections and means for inspection of oil level.

e. Lubrication: Oil

f. Bearings: Antifriction type with a minimum L-10 life of 5,000 hours, lifetime pre-lubricated and sealed.

C. Motor-Driven Trolleys:

1. General:
   a. Motor-driven trolleys shall be compatible with the hoist assembly and of the type specified herein.
   b. The trolley wheels shall be compatible with the furnished monorails and shall be supplied by the monorail manufacturer.
   c. Trolley shall conform to the requirements of HMI-100.
2. Construction:
   a. Trolley shall be fabricated from standard structural steel plates, channels and angles. Frame shall be adequately braced to resist deflection under all dead, live and impact loads in all directions.
   b. Frame shall be precision machined to accept the hoist and traverse mechanism without shimming or selective fitting.
   c. Provide restraining lugs on trolley to limit drop of the trolley to 1 inch or less and preventing rotational movement in all three axes.
   d. Attach load bars to yokes in such a manner that all wheels will stay in contact with the operating flange at all times.
   e. Wheels:
      1) Trolleys for hoists rated 2-ton capacity or less shall have a minimum of 4 wheels. Trolleys for hoists rated higher than 2-ton capacity shall have a minimum of 6 wheels.
      2) Each wheel shall be removable without removing the trolley from the track.
      3) Wheels shall have hardened treads, minimum Brinell Hardness of 400 to 450.
      4) Wheel bearings shall be precision ball or tapered roller bearings with minimum L-10 life of 10,000 hours and permanently grease lubricated.
      5) Wheels shall be true and concentric to within 0.005-inch runout.
      6) Drive wheels shall be matched in diameter to within 0.001-inch per inch diameter, or 0.01-inch, whichever is less.
3. Trolley Drives:
   a. Motorized trolley drives shall be as specified in Schedule 41 22 23.19-1, located after the "End of Section" designation.
   b. Brake shall be magnetic release disc type as follows:
      1) Adjustable and self-compensating for wear.
      2) Integrally mounted to the motor.

3) Set at 50% of rated drive torque.

D. Electric Hoists:

1. General:

a. Hoists shall be suitable for the application and for the trolleys and monorails as specified.

b. Hoist drive shall include a direct-coupled motor, solenoid brake, geared train with inherent load brake, motor brake, built-in load limiter, hook, wire rope, bottom block, load sheave, adjustable limit stop and drum.

c. Lift: As required to meet the clearances shown and indicated in Schedule 41 22 23.19-1.

d. Hoist Lifting Speed: As specified in Schedule 41 22 23.19-1.

2. Construction:

a. Type: Electric wire rope hoists.

b. Duty Class: H-3 HMI-100.

c. Motor size shall be as specified in Schedule 41 22 23.19-1.

d. Gear Train:

1) Conform to applicable AGMA Standards.

2) Provide oil sight gauge on the housing for visual inspection of oil level.

e. Drum:

1) Material: Carbon Steel

2) Diameter; 19X rope diameter, minimum

3) Provide drum so that two (2) full turns of the rope remain in the grooves when hook is at the lowest position and rope does not overlap when the hook is at highest position.

4) Grooves: Machined, not less than half the nominal rope diameter in depth.

5) Provide large flanges on each end, closely seated within the hoist frame, to prevent rope bind or pinch.

f. Wire Rope:

1) Material: Type 316 stainless steel

2) Strength: The rated load divided by the number of parts of the rope shall not exceed 20 percent of the nominal breaking strength.

g. Motor Brake:

1) D.C. rectified disc type, or AC multiple disc type, self-adjusting and rated for 250% of motor torque.

2) Provide motor brake separate from the gear housing for rapid cooling.

3) Enclosure: Totally enclosed, dust-proof, weather resistant.

h. Mechanical Load Brake:

1) The mechanical load brake shall be capable of holding the full load independent of the magnetic load brake.

2) Type: Automatic Weston-type multiple disc.

3) The mechanical load brake shall control the load acceleration while being lowered.

4) Wear compensation adjustment shall not be required on the brake.

5) Lubrication: Oil bath.

6) The mechanical load brake shall be mounted on a separate gear train shaft.

i. Hook Block:

1) Hook shall be standard design, forged steel, with safety latch, sufficient for the rated load.

2) Hook shall be supported on an anti-friction thrust bearing allowing 360-degree rotation of the load.

3) Sheaves shall be forged steel, supported by medium duty, permanently lubricated and sealed roller bearings. Minimum sheave diameter shall be 20 times the rope diameter.

3. Protective Devices:

a. Overload Cut-off: Provide overload cut-off to protect the hoist against lifting heavier than rated load. The cut-off device shall interrupt the raising circuit to the hoist motor and reset automatically when the overload is removed.

b. Limit Switches:

1) Provide geared upper and lower limit switches for each hoist.

2) Provide a back-up weight activated upper limit switch.

E. Electrification:

1. General:

a. Provide system with all necessary junction boxes, trolleys, festoon track, bends, brackets, joint kits, two arm kits, stops, supports and mounting hardware required for a complete installation.

b. Power supply shall be provided by NEC Type SO cable.

c. Starters and variable frequency drives, where required, shall be supplied with the hoisting equipment and mounted locally. Starters, VFDs and enclosures shall conform to the Contract Documents.

d. Provide a suitable number of conductors for power, control and grounding; sized to carry the required current to all connected motors when operated at rated conditions.

e. Give special consideration to clearance, headroom and load approach requirements in designing layout of electrification. System layout shall permit full travel of the equipment.

f. Cables shall not interfere with the operating equipment.

g. Electrification equipment shall be as required by Schedule 41 22 23.19-1.

2. Festoon System for Electrification:

a. Festoon system shall consist of neoprene-jacketed, multi-conductor flat cables with separate control and power conductors. Cables shall be suspended from trolleys mounted on a heavy-duty C-track parallel to the hoist monorail. Track and trolleys shall be non-sparking construction.

b. Provide cable lengths equal to 110 percent of the required length in order to avoid over-stressing.

c. Multi-conductor cables shall be minimum No. 16 and be stranded for flexing operation. Include minimum 10 percent spare wires in each cable.

d. Cable: UL Listed flat cables rated for 85 amps at 40 degrees C, minimum.

e. Loop Length: 5'-0" max.; storage: 4'-0", max.

f. Provide all assembly and mounting hardware of Type 316 stainless steel.

g. Festoon cable shall be comparable to Types ST and STO flexible cords for insulation and rating.

h. Trolleys: Provide one towing trolley and standard trolleys as required:

1)	Body:	Fiberglass reinforced polyamide
2)	Rollers:	Non-ferrous bronze
3)	Ball Bearings:	Dustproof and waterproof, sealed for life

4) Bumpers: Rubber.

i. Tow cables:

1) Festoon cable trolleys shall be connected by tow cables whose length shall be slightly shorter than the electric cable length between trolleys.

2) Provide a strain relief cable between the first trolley and the adjacent wall

3) Tow cables, strain relief cables and components shall be stainless steel.

j. Track:

1) Provide Type 316 stainless steel 'C'-track of suitable size and strength for support of the cable and trolleys.

2) Provide arm and tow rope assembly for proper spacing of trolleys. Tow rope assembly shall include polyamide rope, thimbles and rope clamps.

3) Provide adequate track length for bunched trolleys on service end.

k. End Clamps: Provide fixed end clamps with outrigger arms where required.

l. Provide all wire, cable, connectors, junction boxes, supports, special tooling and incidentals as required for power and control hookups.

3. Cable Reel Electrification:

a. Provide cable reel system consisting of multi-conductor power and control cable and cable reel to maintain a consistent pull on the cable to prevent sagging.

b. Cable reels shall be weather-resistant, self-winding, spring operated, and explosion proof construction.

c. Cable reels shall have swivel bases.

d. Cable reels shall have roller outlets.

e. Hardware shall be Type 316 stainless steel.

F. Controls:

1. Hoist Limit Control:

a. Provide upper and lower limit switches.

1) The upper limit switch shall stop the hoist motor and activate the holding brake when the load hook reaches its upper limit.

2) The lower limit switch shall activate the holding brake when the load hook reaches its lower limit.

2. Contactors:

   a. Each control shall have magnetic contactors sized for the specified class of service.

   b. Reversing contactors shall be mechanically and electrically interlocked to prevent line-to-line faults and shall be provided with automatic reset thermal overloads for the hoist motor.

3. Pendant Control Station:

   a. The motion control pushbutton actuators shall spring return to off.

   b. Pendant control station shall be mechanically supported to protect the electrical conductors against strain.

   c. Provide sufficient cable for the pendant control station to reach within 4 feet of the operating floor.

   d. The function of each push-button actuator shall be clearly marked and shall indicate the direction of resultant motion.

   e. The maximum voltage in the pendant control station shall be 40 VAC.

   f. Push buttons shall be arranged in multiples as follows:

      1) Start-Stop

      2) Raise-Lower

      3) Forward-Reverse

   g. The pendant control station shall also include an Emergency Stop pushbutton.

4. Enclosures: All enclosures shall match the service conditions for the respective monorail hoist system specified in Schedule 41 22 23.19-1, located after the "End of Section" designation.

G. Monorails:

1. The monorail beam(s) shall be as shown on the Contract Drawings, meet the requirements of CMAA Specification Standards, and shall be provided with all necessary supports and appurtenances.

2. Design requirements:

   a. Maximum Allowable Stress: 20 percent of ultimate strength.

   b. Impact Factor: 25 percent of rated load.

   c. Maximum Deflection: Span/600.

   d. Maximum ratio of span to width of top flange: 50 to 1.

   e. Minimum width of bottom flange: 4.5-inch.

   f. Position loads for worst case loadings for stress and deflection analysis.

g. Bottom tee of monorail track:

1) Tensile Strength: 115,000/125,000 psi

2) Brinell Hardness: 210/230

3. Monorail track shall be high carbon steel, raised tread, patented track.

4. Tracks shall be straight with continuously welded sections and factory prepared ends. Welding shall be continuous submerged arc.

5. End stops shall be bolted and moveable. End stops shall be capable of withstanding the impact of a fully loaded hoist traveling at maximum speed.

6. Holes for splices shall be factory drilled.

7. Tripping bars for limit switches shall be Type 316 stainless steel and shall be attached with Type 316 stainless steel hardware.

8. Provide a suspension system connected to the building structure as shown on the Contract Drawings. Suspension system shall provide suitable support and bracing for all live, dead and impact loads.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Anchorage Devices:

1. Provide anchorage devices in accordance with Section 05 05 23, Metal Fastenings and as shown on the Contract Drawings.

2. Contractor shall furnish anchor bolts and nuts of Type 316 stainless steel, of ample size and strength for the purpose intended, sized by the equipment manufacturer. Anchor bolts shall be straight with double nuts and ¼-in. plate washers cast into concrete and provided for direct embedment during placement of concrete.

3. All hardware for mounting of motor drives and control panels shall be Type 316 stainless steel.

B. Identification:

1. Each unit of hoisting equipment and monorail shall bear an inscription, easily readable from the operating floor, showing the rated capacity of the equipment (in tons or pounds) and control identification.

2. Provide brass or stainless steel nameplates for all systems and component subassemblies in accordance with Section 40 05 97, Identification for Process Equipment. Include, at a minimum, the following information:

a. Manufacturer and model number.

b. Date of manufacture with all pertinent ratings and operation information.

c. Certification stamp or label for all applicable codes.

C. Health and Safety: Provide all appurtenances, caution markers, and appliances necessary to satisfy applicable safety laws and codes shall be provided.

D. Shop Painting:

1. Clean and prime coat ferrous metal surfaces of equipment in the shop in accordance with the requirements of Section 09 91 00, Painting.

2. Finish paint ferrous metal surfaces in the shop using the manufacturer's approved standard finish system. Finish system shall be compatible with the primer specified in Section 09 91 00, Painting and herein in this Section. Motors shall be painted in accordance with Section 26 05 91, Low Voltage Electric Motors.

3. Coat machined, polished, and non-ferrous metal surfaces and similar un-painted surfaces with corrosion prevention compound which shall be maintained during storage and until equipment begins operation.

4. Stainless Steel: Do not paint stainless steel.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Certified shop test the hoisting equipment for static and dynamic loads in accordance with manufacturer's approved testing protocol.

B. Shop tests shall be performed in accordance with the requirements of ASME B30.11.

C. Certified shop tests for electric motors furnished under this Section shall be performed in accordance with the requirements of Section 26 05 91, Low Voltage Electric Motors.

D. Certified shop tests for instrumentation and control system items furnished under this Section shall be performed in accordance with the requirements of Section 40 80 81 - PMCS Factory Testing .

E. Shop load test certificates shall be submitted prior to equipment delivery.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Install monorail hoist equipment in complete accordance with the manufacturer's printed instructions and the approved shop drawings.

B. Provide all required lubricants for initial operation.

3.03 FIELD TESTING / QUALITY CONTROL

A. Furnish the services of a qualified manufacturer's representative to check and approve all installations before operation as well as conduct field testing, in accordance with the requirements of the Contract documents. In addition:

1. Contractor shall verify that all work furnished and installed conforms to the requirements the Contract Documents.

2. Reports: Submit a report from the manufacturer of each visit to the site. Reports shall provide complete information on time, schedule, tasks performed, persons contacted, problems corrected, test results, training, instruction and all other pertinent information.

B. Preliminary Field Test:

1. After Contractor and Engineer have mutually agreed that the equipment installation is complete and ready for continuous operation, Contractor and a qualified field service representative of the manufacturer shall conduct a running test of the hoist and its controls in the presence of Engineer to demonstrate that the hoist and its controls will function correctly.

2. Field test the hoist unit together with its controls. Tests shall demonstrate that each part and all parts together function in the manner intended.

3. Prior to applying electrical power to any motor driven equipment, the drive motor shall be rotated by an external source to demonstrate free operation of all mechanical parts.

C. Final Field Tests: After successful completion of the preliminary field tests, perform load tests in accordance with CMAA standards and the NYC Building Code requirements.

1. Contractor shall provide all necessary instruments, labor, tools, and materials to conduct the field tests.

D. In the event that the Contractor is unable to demonstrate that the equipment meets the requirements of the above described field tests, the deficient equipment will be rejected and Contractor shall adjust and/or modify and retest the equipment as often as necessary to meet the specified requirements.

E. At a minimum, the services of the manufacturer's representative shall be provided as indicated below. The number of visits and person-days per visit, indicated below, shall be understood as referring to the total required services for the lot of equipment provided under this Section.

Visit:	Purpose:	No. of Visits:	Person-days per visit:
1	Installation Checkout	2	1
2	Field Testing	-2	1

3.04 STARTUP / DEMONSTRATION

A. Furnish the service of a qualified manufacturer representative to assist in the start-up of the equipment and train the plant operations and maintenance staff in the care, operation, and maintenance of the equipment in accordance with the requirements of the Contract Documents. In addition:

1. Contractor shall make all adjustments required to place Work in proper operating condition.
2. Contractor shall include in training of plant personnel instruction on care and maintenance of the materials and equipment.
3. In the event of trouble with the equipment during startup / initial operation, the manufacturer's representative shall revisit the site as often as required until all troubles are corrected and the installation is entirely satisfactory.

B. At a minimum, the services of the manufacturer's representative shall be provided as indicated, below. The number of visits and person-days per visit indicated, below, shall be understood as referring to the total required services for the lot of equipment provided under this Section.

Visit:	Purpose:	No. of Visits:	Person-days per visit:
3	Startup / Initial Operation	2	1
4	Training	1	1

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Provide field touch up painting of scratched or damaged surfaces, using primer, intermediate and finish paints provided by the manufacturer, in accordance with the requirements of this Section and Section 09 91 00 - Painting.

SECTION 43 05 21 – COMMON WORK RESULTS FOR PUMPING UNITS CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified and required, to furnish, install, and test all Pumping Units, complete and operational.

B. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. The scope of this Section includes requirements common to all Pumping Units, except where requirements for Pumping Units are shown or specified elsewhere in the Contract Documents. In addition:

1. Each Pumping Unit shall be furnished complete with drive motor and all other components necessary and required for a complete and operational unit.

a. Each Pumping Unit shall be furnished complete with machine guards.

2. The Contractor shall be entirely responsible for the compatibility between all components of the Pumping Unit(s) furnished.

3. If the Pumping Unit requirements of this Section and Pumping Unit requirements specified elsewhere are in conflict, the more stringent provision shall apply.

B. Coordination of Pumping Units with Contract Drawings:

1. The Contract Drawings only show a general arrangement of Pumping Units, unless otherwise indicated.

a. Pumping Units shown are generic and do not necessarily reflect the details of any Pumping Unit manufacturer.

b. Structural supports, foundations, equipment pads, as well as connected piping and/or valves, in part or in whole, may have to be modified from the arrangement(s) shown, in order to accommodate the specific Pumping Unit(s) furnished.

c. The Contractor shall be responsible for identifying any and all modifications to the design required by the Pumping Unit(s) furnished, and submitting those modifications to the Engineer as specified herein.

d. The pump suction and discharge nozzles shown (or, if not shown, as indicated by the connected pipe size shown) on the Contract Drawings shall be considered minimum sizes, unless otherwise specified.

C. The electric motor furnished with each Pumping Unit shall comply with the requirements of Section 26 05 91 – Low Voltage Electric Motors

1.06 QUALITY ASSURANCE

A. Qualifications of Manufacturer:

1. All Pumping Units shall be of approved design and make and products of manufacturers who have built equipment of similar type, size, and capacity for at least five (5) years.

a. The manufacturer shall have, in the opinion of the Engineer, sufficient experimental and test data to cover the design of the equipment specified.

2. All Pumping Units shall be of manufacturers who possess at least two (2) installations that were designed in accordance with United States industrial standards (ANSI, ASTM, ASME, etc.), and are of design, capacity, and service similar to the equipment proposed to be furnished. Both these installations shall have been in continuous, successful operation for a period of at least four (4) years.

3. All Pumping Units shall be the products of manufacturers who can produce evidence of their ability to promptly furnish any and all interchangeable replacement parts as such may be needed at any time within the expected life of the pumps.

4. All Pumping Units shall be of manufacturers in possession of a factory equipped with the necessary machinery, jigs, fixtures, and gages to assure the tolerances and finishes shown on the submitted shop drawings permit such interchangeability.

5. The pump manufacturer must possess, or have readily available, access to suitable testing facilities adequate for performing the shop tests required or specified and by the provisions of the Contract requirements.

   a. Testing facility shall be ISO certified.

6. Poor performance of similar pumping equipment now in operation under the specified conditions of service and pump rating constitute grounds for disqualification of the pump manufacturer, supplier, or both, unless such poor performance has been corrected.

B. Supply and Compatibility:

1. Traceability to original heat numbers shall be maintained for all major components including wear rings, shafts, shaft sleeves and impellers.

2. The equivalent parts of identical Pumping Units shall be inter-changeable.

   a. All parts and components of all Pumping Units shall be designed and built for interchangeability so that replacement parts may be installed without any additional fitting or machining.

C. Regulatory Requirements:

1. If the Pumping Unit requirements of this Section and referenced standards or manufacturer requirements are in conflict, the more stringent provision shall apply.

1.07 SUBMITTALS

A. Coordination of Pumping Unit Submittals:

1. Except for characteristic curves, all information required for each Pumping Unit (or group of identical Pumping Units) shall be submitted at one time.

   a. Partial submission of the following information will not be acted upon -- partial submissions shall be returned with a disposition of 'Rejected' for noncompliance with the requirements of the Contract Documents until the receipt of all required information has been submitted.

2. No pump will be deemed approved until all specified or requested information thereon is approved.

3. Pumping Unit submittals shall be submitted under the specification section number corresponding to the type of Pumping Unit.

B. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

a. Quality Assurance Requirements:

1) The Contractor shall submit all information necessary and required to substantiate approval of a Pumping Unit manufacturer in accordance with the quality assurance requirements of this Section.

b. Schedule of deviations for all Pumping Units.

c. Characteristic Pump Curves:

1) Characteristic curves shall not be submitted for positive displacement pumps.

2) The following characteristic curves shall be shown as ordinates, plotted against the rate of flow as abscissae, for the complete range of flow of the pump:

a) Outlet Total Head

b) Net Positive Suction Head *

c) Pump Power Output

d) Driver Power Input*

e) Pump Efficiency

f) Overall Efficiency *

* Submit only if a value (or range of values) is specified for the identified performance criteria in the individual Pumping Unit specification Section(s).

3) Characteristic curve values shall be defined as per ANSI/HI 14.6, regardless of type of Pumping Unit.

4) Curves shall be plotted in the following units:

a) Flow shall be in the flow units specified for the pump.

b) Head shall be in feet.

c) Power shall be in horsepower

5) Curves not submitted in the correct units shall result in the entire submittal being rejected.

6) The operable range of flow shall be shown on all curves, if specified.

7) For multi-speed Pumping Units:

a) All characteristic curves shall be shown for both the maximum and for the minimum speeds specified.

b) Both maximum and minimum curves shall be shown on the same page.

8) Each page of the characteristic curves shall include the Pumping Unit tag number(s).

9) A single set of characteristic pump curves may be submitted for identical Pumping Units.

a) All Pumping Unit tag numbers to which the set of characteristic curves belong shall be noted.

d. General Arrangement Drawings:

1) Pump tag number(s).

2) Connected piping and valves.

3) Pump drip and bearing cooling water drainage piping.

4) Electrical connections.

5) Starting, speed regulating, and protective equipment.

6) Auxiliary equipment.

e. Detail Drawings and Catalog Cuts:

1) Dimensioned assembly outline drawing(s) of the complete Pumping Unit, drive, and all associated equipment furnished.

a) Drawing(s) shall show plan, elevation and any other views or sections specified under the specification section corresponding to the type of Pumping Unit.

2) A dimensioned cross-sectional drawing of the assembled Pumping Unit.

a) Drawing shall show full details and associated materials of construction.

3) For Pumping Units powered by motors rated at 20 hp or less, catalog cuts may be submitted to supplement the outline and cross-sectional drawings specified.

4) Submit detailed dimensioned drawings for all Pumping Unit steel base plates, subbases, and similar components, if furnished as part of the Pumping Unit, and as applicable.

5) Submit details of the fabrication, materials, and construction of the shaft coupling machine guards.

f. Foundation Bolt Drawings:

1) Drawings showing location, size, and full details of foundation bolts for all Pumping Unit components.

a) All weights and forces on foundation, motor support and bearing supports shall be clearly shown.

(1) Such forces shall be the maximum possible under any conditions (except those caused by water hammer in the connected piping).

(2) Such forces shall include hydraulic, static, and dynamic forces set up in any manner including the failure of any component or combination of components, such as impeller and shafting.

2) All additional drawings and information necessary and required for the final design of foundations and structural supports.

g. Detailed Drainage Piping Drawings:

1) All pump drip and bearing cooling water drainage piping shop drawings.

h. Motor Data:

1) Submit in accordance with the submittal requirements of Section 26 05 91 – Low Voltage Electric Motors, or Section 26 05 92 – Medium Voltage Electric Motors, as applicable.

i. Test Reports:

1) In addition to the submittal requirements of the Contract Documents, submit the following test reports for all Pumping Units:

a) Test reports for all shop tests, regardless of whether said test was witnessed.

b) Electric motor shop tests in accordance with the requirements of Division 26, Electrical.

j. Spare Parts and Special Tools:

1) List of spare parts being furnished.

2) List of special tools being furnished.

k. Operation and Maintenance Manuals.

2. Information Submittals:

a. Quality Assurance:

1) Submit a signed statement from each manufacturer stating that all Pumping Units furnished comply with the quality assurance requirements specified herein.

b. Recommended Lubricants:

1) Submit list of recommended lubricants and quantities being furnished.

c. Contact Information:

1) Submit the following information on suppliers of all castings and other major components:

a) Name and address of the company.

b) Contact name.

c) Phone number.

d. Forge Lot Numbers:

1) Submit the lot number for pump parts which are shown, specified, and/or required to be forged.

e. Certified Material Test Reports:

1) Certified reports indicating physical, chemical, and mechanical properties, as well as heat treatment (as applicable), shall be furnished for the following parts:

a) Wear rings.

b) Shafts.

c) Shaft sleeves.

d) Impellers.

e) Cast iron parts, such as front and back heads, volutes, frames, covers, and bearing housings.

2) Certified material test reports on shafts shall indicate Jominy end-quench hardenability data.

3) Certified material test reports on impellers shall indicate tensile strength.

f. Description of Manufacturer's Testing Facilities:

1) Description shall include including hydraulic, mechanical, electrical, and instrumentation elements.

2) The description should cover initial and periodical calibration provisions for all instruments.

3) The descriptive matter shall contain illustrative photographs, drawings, and such other matter as may be required to demonstrate compliance with the Contract Documents.

g. For performance tests of centrifugal pumps that were not witnessed by DEP personnel:

1) A notarized certificate executed by a company official, stating that no contact between pump rings occurs over the full range of pump performance operation.

3. Closeout Submittals:

a. Manufacturer's Certification:

1) As a condition necessary to acceptance by the City of any Pumping Unit with a drive unit rated at five (5) horsepower or more, the Contractor shall deliver to the Engineer a certificate from the manufacturer, stating that:

a) The installation of the Pumping Unit is satisfactory.

b) Unit is ready for operation.

c) Operating personnel have been suitably instructed in the operation, lubrication and care of the unit.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall furnish spare parts and special tools necessary to service, disassemble, repair, and adjust all Pumping Units, and as per the requirements of the Contract Documents. In addition, the Contractor shall furnish the following:

1. Spare Parts:

a. For each Pumping Unit, the Contractor shall furnish:

1) Two (2) sets of all eyebolts.

2. Special Tools:

a. For each Pumping Unit, or for each group of identical Pumping Units, the Contractor shall furnish:

1) All special tools made specifically for the Pumping Unit.

2) Gages and fixtures which are required to operate, disassemble, and maintain each type of Pumping Unit.

b. All special tools shall be furnished in neat special steel cases fitted with locks and keys.

3. Supplies:

a. Where oil lubricated equipment is used, sufficient oil, of types approved by the equipment manufacturer, shall be supplied for one (1) year of operation.

b. For grease lubricated bearings sufficient grease shall be supplied for one year's operation.

B. The Contractor shall furnish spare parts for the Pumping Unit electric motors in accordance with the requirements of Section 26 05 91 – Low Voltage Electric Motors

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer’s standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. General:

1. All related components for each Pumping Unit shall also be furnished by the corresponding manufacturer of that Pumping Unit.

2. Only standard parts of the specified manufacturer shall be used, unless otherwise approved by the Engineer.

3. Should any standard part fail to satisfy the requirements of the Contract Documents, with the explicit approval of the Engineer, the Contractor shall supply parts of approved special design to suit the requirements.

B. Threaded joints shall be made up with:

1. Permatex® joint compound, as manufactured by Permatex, Inc., Solon, OH.

2. Or approved equal.

C. Ball and Roller Bearings (if applicable):

1. ALEMITE Model No. 54278, as manufactured by SKF Group, Gothenburg, Sweden.
2. Lincoln Industrial Model No. 5580, as manufactured by SKF Group, Gothenburg, Sweden.
3. Or approved equal.

D. Button Head Grease Fittings (if applicable):

1. Alemite Model No. A-1184, as manufactured by SKF Group, Gothenburg, Sweden.
2. Lincoln Model No. 5700, as manufactured by SKF Group, Gothenburg, Sweden.
3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. General:

1. All Pumping Units shall be designed and built for twenty-four (24) hour continuous service at any and all points within the specified range of operation, without overheating, without cavitation, without excessive vibration or strain, and requiring only that degree of maintenance generally accepted as normal with the specific type of pump required, unless otherwise specified in the Pumping Unit specification sections.

B. Material Compatibility:

1. All Pumping Unit materials shall be of a type and quality to withstand the hostile environment and stresses to which the Pumping Units and components may be subjected.

C. Connections:

1. Inlet and Discharge:

a. Inlet and discharge connections shall be flanged or threaded, as shown or specified in the individual Pumping Unit specification section(s).

1) For flanged openings: Flanges shall meet ANSI/ASME B16.1 Class 125 standards.

2) For threaded openings: Threads shall meet American standard taper pipe threads complying with ANSI/ASME B1.20.1.

D. Anchor Bolts:

1. All Pumping Unit anchor bolts shall comply with the requirements of Section 05 05 23.02 – Miscellaneous Metal Fastenings.

a. Pumping Unit anchor bolts shall be Type 316 stainless steel with nitronic-60 nuts, unless otherwise shown or specified in the Pumping Unit specification section(s).

b. Expansion bolts shall not be used, unless otherwise shown or specified in the Pumping Unit specification sections.

2. The Contractor shall furnish anchor bolts in conformance with the pump manufacturer's requirements and shall install them in accordance with the manufacturer's instructions.

3. Concrete foundation anchor bolts shall be set in steel pipe sleeves for the full length of the bolts.

4. Approved special washers and nuts shall be furnished and installed on the lower ends of bolts unless pockets are provided for access to the nuts. Bolts or studs engaging tapped holes in pump components shall be of silicon bronze.

E. Concrete Pads:

1. The Contractor shall coordinate concrete pads with the Pumping Unit manufacturer and provide concrete pads as shown and specified.

F. Drainage Piping:

1. Drainage piping shall be furnished for each Pumping Unit.

2. Drainage piping shall be of the minimum size specified and shall be provided with approved cleanout plugs.

3. Drip piping from pump to floor or floor drain shall include a plugged cross at the first drop and a screw union located between the cross and the pump.

G. Lubrication:

1. All oil pumps, oil or grease piping, oil tanks, oil filters, grease storage and grease feeding apparatus necessary for supplying lubrication to the Pumping Units shall be provided if necessary for a complete working installation.

2. Where water-cooled bearings are specified, an approved type of flow meter and a differential pressure switch shall be provided in the cooling water line. Pressure switches shall shut down the Pumping Unit in the event of low water flow.

3. All ball and roller bearings designed for grease lubrication shall be furnished with a safety vent type bushing of suitable size.

4. Ball and roller bearing lubricating greases shall be as recommended by the pump manufacturer.

H. Gages:

1. Gages shall comply with Section 40 70 01 – Measurement, unless otherwise specified.

2. All gages shall be graduated in feet of water for positive pressures, unless otherwise specified.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Identification:

1. Provide in accordance with Section 40 05 97 – Identification for Process Equipment.

2. Each unit of equipment shall be identified with the equipment item numbers shown on the Contract Drawings.

3. A corrosion resistant tag and nameplate, securely affixed in a conspicuous place on each unit shall give the equipment item number, manufacturer's name or trademark and such other information as the manufacturer may consider necessary, or as specified, to complete identification.

B. Pump Piping, Fittings and Valves:

1. Piping, fittings, and valves furnished with the Pumping Units shall comply with:

a. Section 40 05 06 – Couplings, Adapters, and Specials for Process Piping

b. Section 40 05 56 – Process Valves, Smaller than Four-Inch Diameter

C. Painting:

1. All work shall be painted in conformity with the requirements of Section 09 91 00 – Painting.

D. Direction of Rotation:

1. The direction of pump rotation shall be shown on the Pumping Unit.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Shop tests shall be performed and certified at the factory for all Pumping Units in accordance with the requirements of the Contract Documents.

B. Witnessing of shop tests:

1. For all Pumping Units with a drive motor (or engine) rated less than 125 hp:

a. Shop tests shall be witnessed by representatives of the DEP if specified in the Pumping Unit specification sections:

2. Electric drive motors shall be shop tested as required by Section 26 05 91 – Low Voltage Electric Motors.

C. Hydrostatic Shop Test:

1. General:

a. All Pumping Units shall undergo a certified hydrostatic shop test.

b. If required by the Pumping Unit specification sections, hydrostatic tests on pumps shall be made concurrently with the performance tests.

2. Test Procedure:

a. Test pressure:

1) For centrifugal, vortex, and turbine type Pumping Units: the test pressure shall be ≥ 150% of the shutoff head as shown on the approved characteristic curve. The test pressure shall be held for a duration of time according to ANSI/HI 14.6.

2) For positive displacement Pumping Units: The test pressure shall be ≥ 150% of the maximum head specified. The test pressure shall be held for a duration of time according to the applicable ANSI/HI standard governing that type of pump.

D. Performance Shop Tests:

1. General:

a. All Pumping Units shall undergo a certified performance test.

1) For all dry and wet pit submersible pumps:

a) The performance shop test shall include (but not be limited to) testing the pump in the configuration shown on the Contract Drawings (i.e., all dry pit submersible pumps shall be tested in dry pit, all wet pit submersible pumps shall be tested submerged.)

(1) Wet pit submersible pumps shall be tested submerged in clean water.

2) All performance shop tests shall be conducted at the point of manufacture for the pump, or a manufacturer testing facility within the same State, if domestic, or Country of Origin is nondomestic.

b. The performance shop test shall:

1) Show that the pump has the general characteristics of head, efficiency, horsepower and such other properties as appear on the approved pump curves submittals.

2) Prove the specified head, efficiencies, horsepower and other properties at the rating point.

3) Establish that the pump is free from overheating, cavitation, and excessive vibration over the specified range of the rate of flow.

c. Vibration displacement, velocity and/or acceleration readings shall be taken if specified or required at a witnessed test and the results shall be recorded. Tests at lower than maximum speed will not be required except for positive displacement plunger pumps, where runs at all speeds are required.

d. All electrical starting and other control equipment necessary for testing shall be furnished by the pump manufacturer and shall be present at the test.

2. Procedure:

a. For centrifugal pumps:

1) The Pumping Unit shall be run at normal rated speed over the specified range of flow and then held at shutoff head for at least 1 min.

b. For positive displacement pumps:

1) The Pumping Unit shall be run for at least 30 min at each speed and capacity specified.

2) During part of a run at maximum head and flow rate specified, a plug valve on the pump discharge shall be rapidly operated (opened and closed) manually several cycles without causing any damage to the pump as evidenced by a trouble free resumption of pumping at the same head and delivery.

c. For duplicate pumps with motors rated at < 5 hp:

1) Check tests against complete performance tests of pumps of exactly the same model, speed, head and capacity rating shall be acceptable.

3. Results:

a. For all centrifugal Pumping Units:

1) The Pumping Unit shall conform to the criteria of ANSI/HI 14.6 Acceptance Grade 1U for all applicable performance

criteria specified. Pumping units that do not conform to Acceptance Grade 1U may be subjected to rejection by the Engineer.

2) At no point over the performance test range shall contact between the impeller ring and casing ring be permitted.

3) The manufacturer shall demonstrate evidence of no contact.

a) For witnessed performance tests:

(1) The manufacturer, immediately after the pump testing, shall have the pump disassembled and shall facilitate the visual inspection of the pump rings by the official witness.

b) For pumps which are not witnessed shop tested:

(1) The manufacturer shall submit, along with the shop test results, a notarized certificate executed by a company official, stating that no contact between pump rings occurs over the full range of pump performance operation.

4) Contact between the impeller and casing rings over the operating range shall constitute grounds for rejection of the pumps.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Inspection:

1. The Contractor shall not install damaged items until repairs or replacements are made in accordance with manufacturer's written instructions and approval by Engineer.

a. Only minor repair work will be permitted in the field.

b. All damaged items requiring remedial work shall be returned to the manufacturer for repair or replacement at no additional cost to DEP.

B. Base Installation:

1. Equipment bases and grouting shall be installed as follows:

a. Leveling wedges or metal supports shall be installed beneath the base at each foundation bolt.

b. Grout allowance of ¾ to 1½ in. shall be provided between the base and the top of the foundation or equipment pad.

c. The Pumping Unit shall be aligned to the connecting piping.

d. Drive and driven equipment alignment shall be checked.

e. Piping shall not be connected until after the grout has cured.

f. Leveling wedges or metal supports shall be adjusted to level the unit.

g. Foundation bolts shall be tightened evenly but not too firmly.

h. Horizontal shaft units shall be leveled to within 0.005 in./ft and the driven equipment shaft of vertical units shall be plumb to within 0.002 in./ft.

i. Equipment bases shall be filled with grout. Grout shall be worked to release any entrained air in the grout or base cavities.

j. Foundation bolts shall be fully tightened only after the grout has cured.

C. Footing Adjustment:

1. The following procedure shall be used for any driver or driven equipment having four (4) or more individual support feet:

a. All mounting bolts shall be checked for tightness before proceeding.

b. A dial indicator shall be set on the equipment base next to the foot being checked.

c. The dial indicator on the foot being checked shall be zeroed.

d. The mounting bolt on the foot being checked shall be loosened and the indicator deflection shall be noted. A maximum deflection of 0.002 in. shall be permitted.

e. The mounting bolt shall be retightened and the procedure shall be repeated for all feet.

f. Any footing condition that exceeds the 0.002-in. limit shall be corrected.

1) The driver and driven equipment alignment shall be verified after making any corrections.

3.02 INSTALLATION

A. Install all Pumping Units in complete accordance with the manufacturer's printed instructions and the approved shop drawings.

B. Manufacturer's Representative during Installation

1. For all Pumping Units powered by drive units rated at ≥ 5 hp:
   a. The Contractor shall furnish the services of accredited representatives of the pump manufacturer who shall supervise the installation, adjustment and field tests of each Pumping Unit and give instructions to designated DEP operating personnel.
   b. The services of the manufacturer's representative shall be furnished for at least the number of days stipulated in the associated Pumping Unit Specification sections.
   c. Should additional days of service be necessary for a successful installation, such services shall be provided by the Contractor at no additional cost to the City.
2. For all Pumping Units powered by drive units rated at < 5 hp:
   a. The Contractor shall furnish the services of accredited representatives of the pump manufacturer only when, in the opinion of the Engineer, there is some evident malfunction or over-heating.

C. Alignment of Pump Components and Pumping Units

1. Proper alignment of pump components and Pumping Units shall be maintained by shouldered fits of mating parts where such construction is at all possible and in accordance with best practice, or where the nature of such components obviates the use of shouldered fits, by dowels or turned bolts in reamed holes fitted after final alignment of parts is approved.
2. Assemblies of components for which alignment depends upon friction between mating parts or gaskets are unacceptable, except for the use of set screws, taper pins, certain screw threads and only those other elements for which specific approval is given by the Engineer or specified.
3. Shaft components transmitting torque from the shaft shall be keyed to the shaft.
   a. Set-screws or pins shall not be used in lieu of a key unless specifically approved by the Engineer.
4. Where the associated Pumping Units specification Sections identify model or catalog numbers for pumps, the equipment shall comply with the foregoing requirements of this Section, even though modifications of the manufacturer's standard product shall be necessary.
5. Sufficient metal shall be provided on all components for field dowelling or pinning, where such is specified after final field alignment.
6. Mating shafts on Pumping Unit components connected by couplings shall be aligned and the components shall then be dowelled or pinned.

a. Alignment shall be made only after complete piping and electric conduit connections have been made and all required grouting has set.

b. Alignment shall be made with an approved fixture which shall have two (2) components:

1) Each component shall be securely clamped to one of the mating shaft ends.

2) Two dial indicators shall be mounted on one of the two components.

a) One dial indicator shall be so mounted as to indicate the parallel misalignment of the two shafts;

b) the other dial indicator shall be so mounted as to give a measurable indication of angular misalignment.

c. The Pumping Unit components shall be so adjusted and shimmed, that, before and after dowelling, the maximum variations in the reading of each of the two (2) dial indicators shall not exceed 0.001 in. per in. of minimum connected shaft diameter in one revolution of the coupling.

1) Such alignment shall be demonstrated to the Engineer.

7. Where rigid vertical line shafting is required between a pump and its driving unit, alignment and concentricity of the line shafting shall be accomplished as follows:

a. The pump shall be completely connected to the piping, shall be levelled with a machinist's level, and bolted and grouted to the foundation.

1) Prior to grouting, the seal ring clearance shall be checked out within the manufacturer's limits.

2) After grout has set, seal ring clearances shall be rechecked at four quadrants.

b. The drive unit shaft shall be located concentrically by plumb bob; the drive unit shall be subsequently dowelled and bolted in final position.

c. Special fixtures shall then be attached to the pump shaft and drive shafts.

1) Fixtures shall accommodate a suitable taut wire, concentric with both shafts, and so arranged that the wire may be placed under controlled tension by attached weighting. Taut wire shall be passed through each intermediate bearing.

d. Each bearing and bearing mounting components shall be so adjusted so that bearings are concentric with the wire within ±0.002-in..

e. Bearing mounting components shall then be completely dowelled so that all connections of bearings through all components are made by metal to metal fit, without reliance upon friction between mating parts.

f. Line shafting shall be concentric and each shaft section shall be dial indicated at a point midway between fixed bearings, and shall be so demonstrated to the Engineer.

g. An eccentricity of not more than 0.001-in. per in. of shaft diameter shall be permissible after pump, drive unit and all line shaft components are installed, grouted and dowelled and ready to run.

8. All shim stock used shall be of Type 316 stainless steel, unless otherwise shown or specified for specific Pumping Unit(s).

D. Drainage Piping Installation:

1. Drainage piping shall be installed and connected to each Pumping Unit, to convey the stuffing box or mechanical seal drippings and bearing cooling water to the nearest sump, gutter, floor drainage pipe or outlet.

a. Such drainage piping shall be as shown, as specified, and/or as necessary and required to remove the drippings and/or cooling water from the Pumping Units without spilling on any floor area unless otherwise expressly stated or shown on the Contract Drawings.

2. Drainage piping shall be installed in accordance with the requirements of Section 40 05 05 – Exposed Piping Installation. In addition:

a. Drainage piping from the pump to the point of disposal shall be run below the floor surface.

b. Drainage piping shall not be run along the surface of a floor area, unless the space directly above or below the drainage piping is blocked by other piping shown on the Contract Drawings.

c. For existing work and for new work where pump drainage piping was not installed before the floor structure was installed, chases shall be cut for the pump drainage piping and the floor finish shall be restored.

E. Piping and Equipment Identification

1. The Contractor shall furnish and install identification signs for all Pumping Units, valves and piping in accordance with the requirements of Section 40 05 97 – Identification for Process Equipment.

F. Refer to the associated Pumping Unit specification Sections for additional installation requirements.

3.03 FIELD TESTING / QUALITY CONTROL

A. Furnish the services of a qualified manufacturer's representative to check and approve all installations before operation in accordance with the requirements of the Contract documents. In addition:

1. The Contractor shall verify that all work furnished and installed conforms to the requirements of the Contract Documents.

B. The Contractor shall provide the services of the manufacturer's representative at such times and for such durations of time as are needed to perform the tasks required of the representative.

1. The services of the manufacturer's representative shall be provided as indicated for each type of Pumping Unit as indicated in the associated Pumping Unit specification section(s).

2. The number of visits and person-days per visit indicated in the associated Pumping Unit specification section(s) shall be understood as referring to the total required services for the lot of equipment provided under this Specification.

3. The Engineer reserves the right to require that any unused person-days from any visit be applied to any other specified visit.

4. Person-days shall be understood only as days spent on-Site (not in transit).

5. Unless otherwise authorized by Engineer, the manufacturer's representative shall be a direct employee of the equipment manufacturer, with at least three (3) years' experience in the installation, testing and start-up of equipment of the type provided under this Specification. The manufacturer's sales and marketing personnel will not be accepted as manufacturer's representatives.

6. The manufacturer's representative shall sign in and out at the office of the Engineer each day they are at the Site.

C. Field Tolerance Check:

1. When tolerances on pump shaft alignment, pump line shaft alignment and eccentricity, and on bearing alignment are herein specified (or specified in an associated Pumping Unit specification Section), such tolerances shall be checked and demonstrated to the Engineer to be within the limits permitted.

D. Field Performance Tests

1. For centrifugal Pumping Units ≥ 5 hp:

a. Each Pumping Unit shall be run at maximum rated speed for at least three (3) rates of flow, corresponding to:

1) The specified minimum rate of flow;

2) The specified design or operating rate of flow, as directed by the Engineer; and

3) The specified maximum rate of flow.

b. Record the total dynamic head at each of the three rates of flow.

1) Total dynamic head shall be read from the pump pressure gages.

c. The flow rates shall be verified using a calibrated flow meter during the test.

1) If a flow meter is not installed or available for testing, the rate of flow shall be set by achieving the corresponding, specified total dynamic head.

2) Variation of the rate of flow shall be made by throttling the discharge valve.

d. Simultaneous ammeter readings shall be taken at each of the three flow rates.

1) The rated motor nameplate current and power shall not be exceeded at any rate of flow within the specified range.

2. Pumps with drive motors rated at less than five (5) horsepower shall only be tested for excess current or power when overheating or other malfunction becomes evident in general testing.

E. Field Vibration Tests:

1. The vibration shall be measured for each and all Pumping Units across the full operating range specified in the associated Pumping Unit specification Section(s).

a. Measurement of vibration for all Pumping Units shall be witnessed by the Engineer.

b. The operating range shall exclude the shut-off point as specified in the associated Pumping Unit specification Section(s).

2. Vibration measurements shall include overall unfiltered vibration amplitude and vibration signatures.

a. The signatures shall be plots of filtered vibration velocity in in./s versus vibration frequency for a range of 100 to 60,000 cycles per min.

3. Locations of Measurement:

a. For vertical Pumping Units with open type shafting:

1) Measurements shall be taken at locations near:

a) The two (2) motor bearings;

b) The intermediate shaft bearings (if any); and

c) At the lower pump bearing.

b. For vertical Pumping Units supporting drive motors:

1) Measurements need be taken only at:

a) The lower pump bearings.

c. For horizontal type Pumping Units:

1) Measurements shall be taken at locations near:

a) The two (2) motor bearings; and

b) At the inboard pump bearing.

4. An approved type of instrument, calibrated by an approved laboratory just prior to and after the test, shall be used.

a. Certification of such calibration shall be submitted to the City as part of the field testing submittal in accordance with the requirements of the Contract Documents.

5. Vibration in excess of ANSI S2.41 shall not be acceptable and shall be judged as presumptive evidence of defective construction, including but not limited to: unbalanced construction; flimsy construction of the base or mounting structure; and/or misalignment of parts of the Pumping Units.

a. The Contractor shall take all measures to remedy the condition of excessive vibration to the satisfaction of the Engineer at no additional cost to the City.

1) The field vibration test shall be repeated after remedial measures are taken.

F. Refer to the associated Pumping Unit specifications for additional field testing requirements.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Provide field touch up painting in accordance with the requirements of Section 09 91 00 – Painting.

B. Provide identification accordance with the requirements of Section 40 05 97 – Identification for Process Equipment.

END OF SECTION

SECTION 43 22 39 – LIQUID CHEMICAL DIFFUSERS
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, as shown, specified and required, to furnish and install all liquid chemical diffusers and appurtenances. Liquid chemical diffusers shall be as specified herein and as shown on the Contract Drawings

B. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Not Used

1.04 REFERENCES

A. Not Used

1.05 DESCRIPTION

A. Service Description:

1. Liquid Chemical Diffusers shall be open channel diffuser type that are specifically designed for the following chemical solutions specified herein:

a. Sodium hypochlorite, up to 15% solution.

b. Sodium bisulfite, up to 38% solution.

B. Design Requirements:

1. Refer to the Contract Drawings for diffuser size, width, and quantity of nozzles.

1.06 QUALITY ASSURANCE

A. Qualifications of Manufacturer:

1. The manufacturer shall have a minimum of five (5) years of experience in the design and fabrication of liquid chemical diffusers, fittings, appurtenances, and specials of similar size, capacity, and type to those shown on the Contract Drawings and specified in the Contract Documents and shall show evidence of at least five (5) substantially similar installations in satisfactory operation.

B. Supply and Compatibility:

1. All liquid chemical diffusers, appurtenances, and specials included in this section shall be provided by the Contractor through a single, qualified liquid chemical diffuser manufacturer.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

a. Shop Drawings:

1) Layout drawings showing the size, width, and nozzle spacing of each liquid chemical diffuser.

2) Catalog cuts and data sheets, including but not limited to

a) Specifications for all components of the liquid chemical diffuser.

b) illustrations in sufficient detail to serve as a guide for assembly and disassembly.

c) Details on joining methods.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Liquid Chemical Diffusers:

1. Saf-t-Flo, Anaheim, CA.
2. Hydro Instruments, Telford, PA.
3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Liquid Chemical Diffusers:

1. Liquid chemical diffusers shall be provided with end studs to allow for installation to mounting flanges on each end of the open channel.
2. Mounting flanges shall be provided by the manufacturer.
3. Material: Hastelloy C, or per manufacturer recommendations.
4. Liquid chemical diffusers shall be provided with elastomeric tips at each port to prevent sedimentation inside the diffuser piping.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Damaged liquid chemical diffusers will be rejected and shall be replaced at the Contractor's expense.

3.02 INSTALLATION

A. All liquid chemical diffusers shall be installed in accordance with all of the following:

1. The manufacturer's printed instructions and recommendations.
2. The approved shop drawings.
3. As specified in the Contract Documents.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Cleaning:

1. During construction, all liquid chemical diffusers shall be thoroughly cleaned before placement and the lines kept free from foreign matter of whatever origin. The pipes shall be left thoroughly clean to the satisfaction of the Engineer.
2. Flush all process and potable water piping with clean water.

END OF SECTION

SECTION 43 23 31.03 – VERTICAL CENTRIFUGAL PUMPING UNITS (WET PIT SUMP SERVICE)
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install vertical centrifugal Pumping Units and appurtenances, complete and operational. This Section describes the specific requirements for vertical centrifugal Pumping Units for wet pit sump service, specifically for chemical containment applications, and supplements Section 43 05 21 – Common Work Results for Pumping Units. Pumping Units shall be as specified herein and in the Contract Documents and as shown on the Contract Drawings.

B. The following index of this Section is presented for convenience:

A. The following schedule, attached after the End of Section designation, is a part of this Section:

1. Schedule 43 23 31.03-1, Vertical Centrifugal Pumping Units (Wet Pit Pump Service) Characteristics

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 26 05 91 – Low Voltage Electric Motors

B. Section 40 67 16 – PMCS Panels and Enclosures

C. Section 40 78 90 – PMCS Panel Mounted Instruments and Devices

D. Section 43 05 21 – Common Work Results for Pumping Units

1.04 REFERENCES

A. ASTM A276 – Stainless and Heat-Resisting Steel Bars and Shapes

B. ASTM A536 – Ductile Iron Castings

C. ASTM E10 – Standard Test Method for Brinell Hardness of Metallic Materials

1.05 DESCRIPTION

A. Service Description

1. In sump pump service, the liquid pumped will be sodium hypochlorite, 15% solution or sodium bisulfite, 38% solution or washdown water.

2. Pumping Units, when specified in the Contract Documents for wet pit sump pump service, shall be installed in duplex (pairs).

3. Pumping Units shall be suitable for the wet pit sump service specified.

B. Pump Type:

1. Single stage, vertical shaft, non-clogging, bottom inlet, side discharge, centrifugal type.

C. Pump Support:

1. Pump and discharge pipe shall be supported by a pump suspension plat, which shall be supported by a FRP support system. Both the pump suspension plate and FRP support system shall be provided by the pump manufacturer.

D. Drive Unit:

1. Electric drive motor supported on the pump suspension plate above the top of the chemical containment area.

E. Design Requirements

1. Schedule 43 23 31.03-1, Vertical Centrifugal Pumping Units (Wet Pit Pump Service) Characteristics.

1.06 QUALITY ASSURANCE

A. In addition to the requirements under Section 43 05 21 – Common Work Results for Pumping Units:

1. Supply and Compatibility:

a. All vertical centrifugal pumping units (wet pit sump service), appurtenances, and specials included in this section shall be provided by the Contractor through a single, qualified pump manufacturer.

B. Quality Assurance Inspections:

1. Quality Assurance inspections may be made by NYC DEP Bureau of Engineering Design and Construction, Quality Assurance Section or its representative at the manufacturer's facility.

2. Quality Assurance inspections shall be in accordance with the requirements of the Contract Documents.

3. Submit copies of Manufacturer Certificates of Conformance

1.07 .SUBMITTALS

A. In addition to the submittals to be made under Section 43 05 21 – Common Work Results for Pumping Units, the following submittals are required for approval by the Engineer:

1. Informational Submittals:

a. Certificate of chemical compatibility from the manufacturer.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery, storage, and handling shall comply with the requirements of Section 43 05 21 - Common Work Results for Pumping Units.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Provide spare parts, special tools, and supplies in accordance with the requirements of Section 43 05 21 - Common Work Results for Pumping Units. In addition, the Contractor shall provide the following:

1. One (1) complete rotor, including impeller, shaft, shaft sleeve, keys, set-screws, complete coupling and any and all other rotating parts except the drive unit, for each five (5) pumps or less of the same type and size furnished.

2. One (1) complete set of pump and intermediate line shaft bearings and shaft seals for each five (5) pumps or less of the same type and size furnished.

3. One (1) complete set of gaskets for each and every pump furnished.

4. Spare parts for motors as required by Sections 26 05 91 – Low Voltage Electric Motors.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. TI-010C Chlorination Facility

1. Vertical Centrifugal Pumping Units (Wet Pit Pump Service) for diluted chemicals:

a. Series 6000 (Fybroc 6308) as manufactured by Fybroc Division, CECO Environmental., Telford, PA.

b. NM 3171 as manufactured by ITT Goulds Pumps, Seneca Falls NY 13148

c. Or approved equal.

B. TI-010D Dechlorination Facility & TI-011 Disinfection Facility

1. Vertical Centrifugal Pumping Units (Wet Pit Pump Service) for diluted chemicals:

a. Series 6000 as manufactured by Fybroc Division, CECO Environmental., Telford, PA.

b. NM 3171 as manufactured by ITT Goulds Pumps, Seneca Falls NY 13148

c. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Pumping Unit Components

1. General:

a. Design requirements are outlined in Schedule 43 23 31.03-1, Vertical Centrifugal Pumping Units (Wet Pit Pump Service) Characteristics.

2. Materials:

a. All materials shall be of a quality to withstand the hostile environment and stresses to which the Pumping Units and components may be subjected. Wetted materials shall be chemically compatible with the chemical.

b. Pump Support System: FRP

c. Suspension Plate/Cover: FRP

d. Motor Support Plate: Cast iron.

e. Casing: Vinyl ester resin FRP

f. Impeller: Vinyl ester resin FRP

g. Shaft: Titanium

h. Column Pipe Assembly: Vinyl ester resin FRP

i. Suction Strainer: Polyester or CPVC.

j. Discharge Pipe Assembly: Vinyl ester resin FRP

k. O-Rings: Viton

B. Pump Supports

1. Each pump shall be suspended by means of a drive shaft enclosing, cylindrical column whose upper end shall be bolted to the suspension plate. The pump discharge piping shall also be bolted to the suspension plate to avoid strain on the pump casings.

2. Suspension plates shall in turn be bolted to a support system which shall be sufficiently heavy and rugged to support all components of the Pumping Units without undue strain.

3. Suspension plates shall be sized and shaped to fit each sump.

C. Drive Unit Support

1. The electric drive motors and motor support brackets shall be bolted to the topside of the pump suspension plates.

2. The motor bracket shall provide easy access to the shaft coupling and shall support the motor approximately one foot above the top of the chemical containment area unless otherwise indicated on the Contract Drawings.

D. Impellers

1. Impellers shall be of the recessed vortex design and shall be keyed to the motor shaft. Impellers shall be statically balanced and shall contain no thrust balancing holes.

a. Impellers shall be built to pass sand, grit, solids, trash, rags, condoms, sticks and stringy material with maximum freedom from clogging. Vanes shall have well rounded entrances.

b. The waterways through the impellers shall have smooth contours and shall be free from sharp edges.

c. Impellers shall be statically and dynamically balanced after assembly to the rotor as covered in the Contract Documents.

2. Impellers shall be key seated and securely held to the shaft by a key and a streamlined silicon bronze nut or by a specifically approved equal method.

The arrangement shall be such that the impeller cannot unscrew or be loosened by torque from either forward or reverse rotation. Designs based on threaded connection between pump shaft and impeller will not be considered.

3. The use of wearing rings or surfaces located on the upper side of impellers and casings, with or without the use of flush or pressure water as a means of balancing hydraulic thrust, will not be considered, unless expressly specified.

E. Pump Shafts

1. Pump shafts shall be sufficiently large in diameter to safely transmit the maximum torque developed by the drive unit and, where axial pump thrust is transmitted through the pump shaft, to simultaneously transmit such thrust.

2. Shaft couplings shall be keyed or splined to the shaft. Set screws or pins shall not be used to transmit torque or thrust from shafts to couplings or other shaft mounted components.

3. Where shafts pass through stuffing boxes or where exposed directly to sewage, they shall be protected by readily renewable, snug fitting wearing sleeves, internally ground to approved tolerances and positively secured to the shaft so as to prevent relative rotation. Passage of water from pump casing between shaft and sleeve shall be prevented by "O" ring packing or other approved means.

4. All shafts shall be furnished with approved all bronze or bronze and plastic water slingers of approved construction.

5. After assembly of shaft, sleeve and impeller, the rotor assembly shall be statically and dynamically balanced.

F. Pump Bearings

1. The weight of the pump shaft and impeller and impeller thrust shall be carried by an anti-friction thrust bearing mounted in an oil-tight housing equipped with an approved shaft seal ring.

2. The thrust bearing shall be located at, or preferably above, the suspension plate level.

3. The thrust bearing shall be greased for life.

G. Suction Bell and Strainer

1. Provide a suction bell and strainer on the inlet of each pump.

H. Discharge Pipe Assembly

1. Discharge pipe shall be supported by the pump suspension plate.

2. Discharge pipe shall terminate with a 150-lb flange located above the pump suspension plate.

I. Pump Drive Motors

1. Pump drive motors shall be as required by the provisions of these Sections, the Contract Documents and Sections 26 05 91 – Low Voltage Electric Motors, except as otherwise specified herein.

2. The pump drive motors shall be vertical, squirrel cage induction type with grease lubricated ball bearings; the motors shall be totally enclosed and shall be of sufficient capacity to operate the driven equipment from shut-off head to the maximum rate of flow specified without loading beyond their rated nameplate current or power.

3. The pump drive motors shall operate within rated temperature limits with thirty (30) starts per hour.

J. Controls (TI-010C Chlorination Facility Only):

1. Pumping units shall be provided with float-level control switches and a dedicated sump pump control panel. Control panel shall house the motor starter for each pump.

2. Floats Switches:

a. Provide four float switches:

1) High Water Alarm

2) Lag Pump On

3) Lead Pump On

4) Pumps Off

b. The float switches shall be of the mercury free, mechanically actuated type; the housing shall be NEMA type 4X watertight construction and shall be supported at a convenient height by a pipe stanchion mounted on the pump suspension plate.

c. The float switches shall be of polyurethane construction with PVC-coated suspension wires.

3. Control Panel:

a. General:

1) Tag No.: HYPO-SCP-10

2) Control Panel and panel-mounted components shall conform to the requirements of Section 40 67 16 – PMCS Panels and Enclosures and Section 40 78 90 – PMCS Panel Mounted Instruments and Devices.

b. Main Power Supply: 480 volt, 3 phase, 60 Hz

c. Control Power Transformer: 480 VAC to 120 VAC and for any other voltage conversions necessary to power system components.

d. Pump Starters: Combination-type magnetic starter with overload reset and low voltage protection.

e. Enclosure:

1) NEMA 4X stainless steel.

2) Maximum Dimensions: 36” W x 48” H x 12” D

f. Inputs and Outputs: The Control Panel shall be capable of accepting and providing the following inputs and outputs:

1) Inputs:

a) Pump No. 1 Running Status

b) Pump No. 1 Fault Status

c) Pump No. 1 Not In Auto

d) Pump No. 2 Running Status

e) Pump No. 2 Fault Status

f) Pump No. 2 Not In Auto

g) Level Hi-Hi (From level float switch)

h) Level High (From level float switch)

i) Level Intermediate (From level float switch)

j) Level Low (From level float switch)

2) Outputs:

a) High Level Alarm

b) System Running

c) System Fault

g. Door Mounted Items:

1) Power On Pilot Light.

2) Three-way Lead Pump Selector Switch for Pump No. 1, Alternate, and Pump No. 2.

3) Hand/Off/Auto Selector Switch, for each Pumping Unit

4) Run Indication Light, for each Pumping Unit.

5) Seal Failure Pilot Light, for each Pumping Unit.

6) Pump Failure Alarm Pilot Light, for each Pumping Unit.

7) Pump Failure Reset Pushbutton, for each Pumping Unit.

8) High Level Alarm Pilot Light.

9) High Level Alarm Audible Horn.

10) High Level Alarm Silence Pushbutton.

11) High Level Alarm Reset Pushbutton.

h. Colors for all panel indicating lights shall be in conformance with the requirements of Section 40 78 90, PMCS Panel Mounted Instruments and Devices.

4. Sequence of Operations:

a. HAND: When the pump selector switch is in HAND position, the Pumping Unit will run.

b. OFF: When the pump selector switch is in OFF position, the Pumping Unit will not run

c. When the pump selector switch is in the AUTO position, the Pumping Unit HYPO-SCP-10 based on the float switches as follows:

1) "High Water Alarm" float actuates high sump level alarm on float rise and de-energizes alarm on drop in liquid level in sump.

2) "Lag Pump On" float starts second pump of duplex set upon rise of liquid level in sump for two-pump operation.

3) "Lead Pump On" float switch starts lead pump of duplex set through electric alternator in control panel upon rise of liquid level in sump.

4) "Pumps Off" float switch de-energizes all pumps on drop of liquid level in the sump and closes control holding circuit upon rise in liquid level in the sump.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. In addition to the tests to be performed under Section 43 05 21– Common Work Results for Pumping Units, the following tests are required.

1. Tensile and chemical analysis tests shall be made for each impeller for centrifugal or mixed flow pumps.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Inspection, installation of equipment and piping, and piping and equipment identification shall be in accordance with Section 43 05 21 - Common Work Results for Pumping Units.

3.02 INSTALLATION

A. Install all Pumping Units in accordance with the requirements of Section 43 05 21 - Common Work Results for Pumping Units.

B. Manufacturer's Representative:

1. The Contractor shall furnish the services of accredited representatives of the Pumping Unit manufacturer to supervise the installation, adjustment, and field tests of the equipment and to provide training for DEP operating personnel.

2. The services of the manufacturer's representative shall be furnished for installation supervision for at least the following number of days:

Visit:	Purpose:	Number of Visits:	Person-days per Visit:
No. 1	Installation Supervision	3	1

3. Should additional days of service be necessary for a successful installation, such services shall be provided by the Contractor at no additional cost to the City.

3.03 FIELD TESTING / QUALITY CONTROL

A. Perform field testing in accordance with Section 43 05 21 - Common Work Results for Pumping Units. In addition:

1. Measure the bearing temperature:

a. Temperature readings in excess of 135° F shall be deemed presumptive evidence that the operating internal temperature of the bearings exceed 180 °F, unless the Contractor can conclusively prove otherwise to the satisfaction of the Engineer.

1) In the absence of such proof, it shall be incumbent on the Contractor to take such steps as may be required to reduce the temperature to ≤ 135 °F with no additional cost to the City.

B. The Contractor shall provide the services of the Pumping Unit manufacturer's representative at such times and for such durations of time as are needed to perform the field testing tasks required of the representative.

1. The services of a manufacturer's representative shall be furnished for field testing for at least the following number of days:

Visit	Purpose:	Number of Visits:	Person-days per Visit:
No. 2	Field Testing	3	1

3.04 STARTUP / DEMONSTRATION

A. Furnish the services of a qualified Pumping Unit manufacturer's representative to assist in the start-up of the equipment and train DEP operations and maintenance staff in the care, operation, and maintenance of the equipment in accordance with the requirements of the Contract Documents. In addition:

1. Contractor shall make all adjustments required to place Work in proper operating condition.

2. Contractor shall include in training of DEP personnel instruction on care and maintenance of the materials and equipment.

3. In the event of trouble with the equipment during startup / initial operation, the manufacturer's representative shall revisit the Site as often as required until all troubles are corrected and the installation is entirely satisfactory.

B. At a minimum, the services of the Pumping Unit manufacturer's representative shall be provided as indicated, below. The number of visits and person-days per visit indicated, below, shall be understood as referring to the total required services for the lot of equipment provided under this Section.

Visit:	Purpose:	Number of Visits:	Person-days per visit:
No. 3	Startup / Initial Operation	3	1
No. 4	Training	3	1

SECTION 43 26 13 – SUBMERSIBLE GRINDER PUMPS
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Contractor shall provide all labor, materials, tools, equipment, and incidentals as shown, specified, and required to furnish, install, adjust, and test submersible grinder pumps as shown on the Contract Drawings and as described in these Specifications.

B. Pump manufacturer scope of supply:

1. Submersible grinder pump motors
2. Power and sensor cable
3. Bearings
4. Mechanical seals
5. Volutes
6. Impellers
7. Pump shafts
8. Axial cutter
9. Cutter plate
10. Other pump component parts
11. Spare parts
12. Extra materials as specified
13. Technical services

C. Contractor scope of supply: Provide materials, equipment, appurtenances, and services not supplied as part of the system, including but not limited to

1. Unloading, storing, and protecting equipment at the site in accordance with supplier's recommendations.
2.

1.05 DESCRIPTION

A. Service Conditions:

1. The pumps shall be submersible end suction centrifugal grinder type, installed in wet pit submersible installation. The pump will be suitable for submergence up to a depth of 66 ft.

a. The pumps shall be provided with a permanently installed "c"-channel guide rail system, with a sliding movable fitting that automatically connects to the discharge piping when lowered into place. The moveable fitting shall be equipped with a check valve, including integrated anti-siphon..

b. The pumps shall be installed on a pump support stand that is fabricated of 300 series stainless steel with rubberized pads on the feet, fixing the pump at the required distance to provide adequate suction clearance. The pumps shall be equipped with a 1.25-inch NPT or BSP discharge fitting which includes a check valve and integrated anti-siphon.

2. A centrifugal submersible grinder pump designed to reduce all material found in normal domestic and light industrial sewage, including plastics, rubber, sanitary napkins, and disposable diapers into a finely ground slurry. The resultant slurry is then pumped through small diameter piping into a facility. The temperature limitation of the liquid being pumped is 104°F/40°C continuous, 160°F/70°C intermittent and the submersible motor shall be capable of running dry for extended periods.

3. Each pump will be capable of the following performance:

	T-10-SMP-1 & 2; T-10-SMP-1 & 2 (four total)	Units
Primary Flow	20	US GPM
Primary Head	20	TDH - psi
Discharge Size	1.25	In
Motor Speed	3450	RPM
Motor HP	2	HP
Frequency	60	Hz
Voltage and Phase	1 ph - 208- 3 ph - 208	V and ph
Motor Service Factor	1.0	SF

1.06 QUALITY ASSURANCE

A. In addition to the requirements under Section 43 05 21 – Common Work Results for Pumping Units:

1. Supply and Compatibility:

a. All submersible grinder pumps shall be provided by a single manufacturer.

B. Manufacturer Qualifications

1. Pump(s) shall be manufactured by a company regularly engaged in the manufacture and assembly of similar units for a minimum of (5) years.

2. Manufacturer shall be certified to ISO 9001 and shall provide a valid certificate upon request.

C. Quality Assurance Inspections

1. Quality Assurance inspections may be made by NYC DEP Bureau of Engineering Design and Construction, Quality Assurance Section or its representative at the manufacturer's facility.

2. Quality Assurance inspections shall be in accordance with the requirements of the Contract Documents.

3. Submit copies of Manufacturer Certificates of Conformance.

1.07 SUBMITTALS

A. In addition to the submittals to be made under Section 43 05 21 – Common Work Results for Pumping Units, the following submittals are required for approval by the Engineer:

B. Action Submittals:

1. The manufacturer will supply the standard submittal, consisting of:

a. Pump Catalog Data, including a certified performance curve and pump dimensional drawing

b. Materials of construction list

c. Mounting Accessory details

d. Moveable fitting data

e. Typical installation drawing

f. Electrical schematics and diagrams, including control panel data and panel wiring schematic

g. Accessory data

h. Certified copies of test data from factory testing when specified, only after pumps have been ordered and manufactured.

C. Informational Submittals:

1. Descriptive information on material and equipment furnished

2. Anchorage requirements

3. Installation instructions

4. Manufacturer’s certificate of acceptance of installation and testing

5. List of manufacturer's recommended spare parts
6. Installation & Operation Manual with parts list
7. Warranty documents
8. Name and address of factory authorized service facility
9. Contractor shall provide DEP with location and description of manufacturer's Service Centers and spare parts stock.

D. Closeout Submittals:

1. Project record documents: Record actual locations of pumps and appurtenances on the contract drawing, reflecting all post-bid changes.
2. Operations and Maintenance Data: Submit maintenance instructions for equipment and accessories.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery, storage, and handling for all Pumping Units shall comply with the requirements of Section 43 05 21 - Common Work Results for Pumping Units.

1. List the special storage and handling requirements for the products specified, including location and environmental conditions to protect from damage.
2. Store materials to permit easy access for inspection and identification. Keep all material off the ground, using pallets, platforms, or other supports. Protect steel members and packaged materials from corrosion and deterioration.
3. All parts shall be properly protected so that no damage or deterioration will occur during a prolonged delay from the time of shipment until installation is completed and the unit and equipment are ready for operation.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Spare Parts

1. One spare full diameter impeller for each pump model
2. One spare cutter assembly set
3. All gaskets
4. All o-rings
5. Spare set of starting components

1.10 WARRANTY

A. Warranty

1. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Submersible Grinder Pumps:

1. Barnes RAZOR submersible grinder pump model XZOGP
2. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Component Material

Volute	ASTM A48 Class 30 Cast Iron
Impellers	85-5-5-5 Bronze
Axial Cutter	ASTM A276 440C Stainless Steel, Heat Treated to a minimum Rockwell C55
Cutter plate	ASTM A276 440C Stainless Steel, Heat Treated to a minimum Rockwell C55
Motor Housing	ASTM A48 Class 30 Cast Iron
Seal Plates	ASTM A48 Class 30 Cast Iron
External Hardware	300 Stainless Steel
Lifting Bail	300 Stainless Steel
Shaft	416 Stainless Steel
Tandem Mechanical Seals	Silicon carbide for the rotating face and silicon carbide for the stationary face
Coating	The pump (s) shall be powder coated with an epoxy primer and polyester top coat
Gaskets	Buna-N
O-Rings	Buna-N
Motor Rotor Bars	Die Cast Aluminum
Elastomeric plug holding plate	ASTM A48 Class 30 Cast Iron
Cable Entry Housing	ASTM A48 Class 30 Cast Iron
Nameplate	304 Stainless Steel

B. Pump Components

1. The volute will be ASTM A48 Class 30 Cast Iron. All exposed hardware shall be 300 series stainless steel. The volute shall be a single piece non-concentric design, with smooth passages. The volute shall have two stages connected by a cutwater passage, positioned 180 degrees from the discharge for balance. The discharge connection shall be a standard 1.25-inch NPT in the vertical position using a threaded bolt on discharge flange. A movable fitting with C-Channel connection or a breakaway fitting are also acceptable.
2. The pump shall include two impellers. The impellers shall be of the recessed vortex design. Pumps with standard centrifugal semi-open impeller designs

shall not be acceptable. The impellers shall be of 85-5-5-5 Bronze construction and machined such that the upper and lower impeller are locked for positive rotation by a shaft key. Both impellers are dynamically balanced to ISO G6.3. Progressive cavity pumps shall not be acceptable.

3. The grinder mechanism shall be specifically designed for use in a grinder pump. The mechanism shall consist of an axial cutter that is locked for rotation by a shaft key. The cutter is fixed axially by a socket head cap screw. The cutter plate is held in place by a press fit. The entire cutting mechanism shall be recessed, protecting the mechanism. All grinding mechanism components, including both the cutter plate and radial cutter shall be constructed of 440C stainless steel hardened to a minimum Rockwell C55 and shall have a ground finish for a fine cutting edge. The grinder shall be placed immediately below the pumping elements and shall be direct-driven by a single, one-piece, stainless steel motor shaft. The grinding assembly shall operate without objectionable noise or vibration over the entire range of recommended operating pressures. The grinder shall be constructed so as to eliminate clogging and jamming under all normal operating conditions including starting. In order to demonstrate adequate flow velocity and grinding capability, the grinder pump shall be capable of passing a series of stringy type solids (diapers, rags, feminine products, etc.) through the pump without roping or winding the material in or immediately below the pump suction. The pump shall be certified to NSF46 standards.

4. The pump and motor shaft will be a solid, continuous piece of 416 stainless steel. Shafts utilizing a coupling or other attachment method will not be acceptable. The shaft will have a maximum allowable deflection of 0.002 inches at the lower mechanical seal during operation.

5. The mechanical seals will be a double mechanical seal system, consisting of two independent mechanical seals, each with its own single spring system acting in a common direction. The upper seal will have a silicon carbide rotating face and a silicon carbide stationary face and will be located between the seal chamber and the motor housing. The lower seal will have a silicon carbide rotating face and a silicon carbide stationary face. Both seals will have 300 series stainless steel hardware and Buna-N elastomers.

6. Seals must operate in an oil filled chamber which shall provide superior heat transfer & seal cooling. Seal faces shall be lapped and polished to a tolerance of one light band. The seals must not require routine maintenance or adjustment. The seal shall be commercially available and not a pump manufacturer’s proprietary design.

7. The common pump and motor shaft shall rotate on two bearings. These bearings shall be high quality and commercially available. The bearings shall be of the self-lubricated design, with grease for superior lubrication, cooling, and life. The pump shall be a two-bearing design consisting of an upper ball bearing carrying the thrust loads, and lower ball bearing for the purpose of carrying the thrust loads and radial loads. Sleeve bearings will

not be considered equal. The lower bearing shall be of the single row ball type, locked in position to accept radial and axial thrust loads and the upper bearing shall be of the single ball type for radial loads as needed to provide a minimum L10 Life of 50,000 hours at -50% to +50% of BEP.

8. Gaskets except for seal gland and bearing retainer shall be of the angular gland compression O-ring type eliminating critical slip fits and the possibility of damage during service associated with sliding O-ring sealing arrangements. Mating surfaces where watertight sealing is required shall be machined and fitted with O-rings.

9. The exterior of the pump liquid end shall be coated per Article 2.03.

10. The pump shall be equipped with a stainless-steel nameplate, located in an easily accessible location. The following data will be included on the nameplate:

    a. Manufacturer's Name

    b. Pump Part Number, Model Number and Serial Number

    c. Motor Horsepower Rating

    d. Voltage, Phase, and Frequency

    e. Motor Speed

    f. Motor Full Load Amps

    g. Ambient Temperature Rating

    h. Code Letter

    i. Impeller Diameter

    j. Motor Insulation Class

C. Motor Components

1. The major driver components will be ASTM A48 Class 30 Cast Iron. The motor shaft shall be of 416 stainless steel.

2. The motor shall be a squirrel cage induction type and shall be dielectric oil filled for optimal thermal management and maximum bearing life. The pump shall be capable of operating in a totally, partially, or non-submerged condition for extended periods of time without damage due to heat being generated. Oil used must be able to be disposed of as nonhazardous waste. Air-filled motors shall not be acceptable. The motor shall be NEMA Type B. The stator windings shall be insulated with moisture resistant and spike resistant Class F varnish and magnet wire insulation, rated for 155°C (311°F). The motor shall be designed to run continuously in a 40° (104°F) ambient environment.

3. Single Phase motors shall be of the capacitor start, capacitor run design. Start and run components will be provided by the pump manufacturer and shall be installed in the control panel.

4. The stator shall be pressed into the motor housing and shall be secured via bolts to the bearing retainer and lower seal chamber.

5. The motor shall have a minimum 1.0 service factor. The motor shall be designed for usage in submersible applications only. The motor horsepower shall be non-overloading of the nameplate rating throughout the entire pump performance curve. The motor shall meet the performance requirements of a NEMA L speed torque curve.

6. The rotor bars shall be die cast aluminum.

7. The motor will be capable of operating continuously at a maximum submergence depth of 20 ft.

8. The motor will be capable of 11.5 starts per hour with a minimum rest time of 77 seconds between starts without overheating.

9. Motor shall be CSA Listed to the CSA 108 / UL 778 harmonized standard and to CSA 145 / UL 674 harmonized standard for use in Class 1, Division 1 hazardous locations.

D. Sensors

1. Motors shall have built-in thermal overload protection.

   a. For single phase pumps, an automatically resetting, heat sensing thermal device that interrupts current flow if excessive temperature and/or current is detected shall provide protection against excessive temperature.

   b. For three phase pumps, Protection against excessive temperature shall be provided by heat sensor thermostat attached to the stator windings and connected in series with the contactor coil in the control panel.

2. The moisture sensor detection system shall consist of a dual probe system in the seal chamber. The probes shall monitor conductivity of the oil. It is recommended to use a pump monitor relay (PMR) installed inside the control panel which will trigger a warning light and shut down the pump when pumped fluid is detected.

E. Power Cord

1. The pumps shall be equipped with 50ft. of type SOW power cord. The power and sensor cords and motor shall be connected via quick disconnect pin terminals located within the motor housing. Pin receptacles shall be molded in an elastomeric puck. The power and sensor cord cables will be connected via male receptacle pins, and potted in place. A neoprene grommet will provide strain relief, secured by a stainless-steel washer and gland nut. The plug shall be secured with a stainless-steel compression plate to prevent water from entering the motor housing at the point of cord entry. A Valox® 457 terminal block with brass pin inserts shall connect the power cord leads with motor leads. The ground pin shall be longer than the other

pins such that the ground connection is the first connection made and the last connection broken when the plug is inserted and removed, respectively. A Buna-N O-ring shall provide isolation sealing between terminal block and the motor housing. The cord assembly shall be guaranteed by the manufacturer to meet UL approval for submersion.

2. The pumps shall be capable of being easily removed and replaced without the removal of the pump power cord from the electrical conduit.

F. Accessories

1. The pump shall be supplied with a "C" channel rail assembly to facilitate removal of the pump(s) from ground level. The "c"-channel guide rail assembly is made of 300 series stainless steel. The guide rail mounts to the upper and lower horizontal brackets attached to the basin wall. The wait also rests on the basin floor. The stainless steel guide rail supports the pump the required distance from the basin floor. Guide brackets are attached to the pump from positioning of the unit on the guide rail during installation and removal. The stationary fitting of the hydraulically sealed discharge is powder coated machined cast iron, with an 85-5-5-5 bronze, non-sparking sliding fixture. The stationary fitting has a fiber reinforced neoprene diaphragm clamped between the stainless steel rail and the stationary pressure vessel. The moveable fitting is held against the stationary fitting by the construction of the stainless steel rail, aligning the moveable fitting to the flexible diaphragm for proper sealing of the two surfaces.

2. The pumps shall be installed on a pump support stand that is fabricated of 300 series stainless steel with rubberized pads on the feet, fixing the pump at the required distance to provide adequate suction clearance. The pumps shall be equipped with a 1.25-inch NPT or BSP discharge fitting which includes a check valve and integrated anti-siphon.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. The pump (s) shall be powder coated with an epoxy primer and polyester top coat.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Factory Tests:

1. The pump manufacturer shall perform a pump performance test to verify hydraulic performance as standard. The pump shall be completely submerged and run to determine that the unit meets three pre-determined hydraulic performance points.

2. If certified testing is required, the manufacturer shall offer to perform tests in accordance with Grades B, E, or U of Hydraulic Institute standards 11.6 and 14.6.

3. A check of the motor voltage and frequency shall be made as shown on the name plate.

4. A motor and cable insulation test for moisture content or insulation defects, in accordance with CSA criteria.
5. Each motor shall be dielectric tested to verify the motor insulation integrity.
6. Contact the manufacturer for tests not listed here.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Install in accordance with manufacturer's printed instructions.

1. The pump shall be capable of operating continuously in a vertical submerged condition.
2. Contractor shall complete all piping and supports, make all electrical power and control connections, and install all safety devices and instrumentation prior to equipment start-up.
3. All anchor bolts, nuts, washers, and sleeves shall be Type 316 stainless steel furnished by the contractor and shall be of ample size and strength for the purpose intended.

3.03 FIELD TESTING / QUALITY CONTROL

A. Field Tests:

1. After installation, the pumping system shall be field tested using potable water for a minimum of 30 minutes and check for correct direction of rotation in the presence of the manufacturer's representative and the Engineer. Contractor shall be responsible for providing water and for conveying the water to the site and providing required meter and back-flow prevention check valve assembly. Each pump shall be cycled through the sequence of operation "pump on" as the level rises in the wet well and then "pump off" during draw down. Once each pump has been tested separately, the pumps will be operated in parallel.
2. Each pump shall operate over its intended operating range without undue noise, vibration, or cavitation. Contractor shall monitor and record vibration at three symmetrically located points on each pump at maximum and minimum speed and supply data to DEP.

B. Inspections

1. Upon completion of the installation and on-site testing, and before acceptance by DEP, the Pump Manufacturer or the authorized Pump Manufacturer's Representative shall submit a written statement that the pump installation has been inspected and is completed in accordance with the manufacturer's recommendations.

C. Manufacturer's Representative

1. The Contractor shall furnish the services of accredited representatives of the Pumping Unit manufacturer to supervise the installation, adjustment, and field tests of the equipment and to provide training for DEP operating personnel.

2. The representative shall inspect the equipment, carry out the equipment start-up procedures, and provide training to the operators in how to effectively operate and maintain the equipment. The manufacturer's representative may be an employee of the manufacturer's distributor.

3. Prior to Operational Testing, Contractor shall have the manufacturer's representative perform the following:

   a. Megger test the stator and power cables.

   b. Check proper rotation.

   c. Check power supply voltage.

   d. Measure motor operating load and no-load current.

   e. Check level control operation and sequence.

4. During Final Acceptance Testing, the manufacturer's service representative shall review recommended operation and maintenance procedures with the DEP's personnel.

5. The manufacturer's representative shall be present for a period of not less than one (1) day to complete the following:

   a. Inspect completed installation

   b. Observe equipment testing

   c. Observe equipment start-up

   d. Instruct operational personnel on equipment operation and maintenance.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjust parts for smooth, uniform operation.

B. Clean as recommended by manufacturer. Do not use materials or methods which may damage finish (surface) or surrounding construction.

END OF SECTION

SECTION 43 33 44 – PERISTALTIC HOSE PUMPING UNITS
CONTRACT CSO-FC-D

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, as shown, specified and required, to furnish and install all peristaltic hose pumping units and appurtenances, complete and operation. Peristaltic Hose Pumping Units shall be as specified herein and as shown on the Contract Drawings.

B. The following index of this Section is presented for convenience:

Article	Title	Section Page

C. The following schedules, attached after the End of Section designation, is a part of this Section:

1. Schedule 43 33 44-1, Peristaltic Hose Pumping Units – Metering Pump Schedule.
2. Schedule 43 33 44-2, Peristaltic Hose Pumping Units – Transfer Pump Schedule.
3. Schedule 43 33 44-3, Peristaltic Hose Pumping Units – Sample Pump Schedule.

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 09 91 00 – Painting.

B. Section 26 29 23 – Variable-Frequency Motor Controllers.

C. Section 40 05 56 – Process Valves, Smaller than Four-Inch Diameter

D. Section 40 79 91 – PMCS Field Instruments

E. Section 43 05 21 – Common Work Results for Pumping Units

1.04 REFERENCES

A. AGMA 2000-A88 – Gear Classification and Inspection Handbook

B. ASTM A48 – Standard Specification for Gray Iron Castings

C. ASTM A1011 / A1011M – F Standard Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, and Ultra-High Strength

D. ASME/ANSI B16.5 – Pipe Flanges and Flanged Fittings

1.05 DESCRIPTION

A. Peristaltic Hose Pumping Units shall be self-priming peristaltic hose type pumps that are specifically designed for pumping the following chemical solutions specified herein.

B. Service Description:

1. Pump Units shall be for the following chemical services:

a. Sodium hypochlorite, up to 15-percent solution.

b. Sodium bisulfite, up to 38-percent solution.

C. Design Requirements:

1. Refer to Schedule 43 33 44-1, Peristaltic Hose Pumping Units – Metering Pump Schedule, Schedule 43 33 44-2, Peristaltic Hose Pumping Units – Transfer Pump Schedule, and Schedule 43 33 44-1, Peristaltic Hose Pumping Units – Sample Pump Schedule located after the "End of Section" designation.

1.06 QUALITY ASSURANCE

A. Quality assurance for all Peristaltic Hose Pumping Units shall comply with the requirements of Section 43 05 21 - Common Work Results for Pumping Units

B. Qualifications of Manufacturer:

1. The manufacturer shall have a minimum of twenty (20) years of experience in the design and fabrication of liquid chemical diffusers, fittings, appurtenances, and specials of similar size, capacity, and type to those shown on the Contract Drawings and specified in the Contract Documents and shall show evidence of at least fifty (50) substantially similar installations in satisfactory operation.

C. Supply and Compatibility:

1. All peristaltic tube pumps, appurtenances, and specials included in this section shall be provided by the Contractor through a single, qualified peristaltic tube pump manufacturer.

a. Pump manufacturer must provide pumps and accessories, which are integral to pump operation, and specified herein as a coordinated package, regardless of manufacturer. This includes pumps, gear reducers, motors, leak detectors, control panels/drives and other such accessories specified under this section as the responsibility of the pump supplier. Equipment specified herein that is not supplied by the pump manufacturer, as an integrated package will be rejected.

2. Pumps are to be manufacturer's standard catalog product.

D. Quality Assurance Inspections

1. Quality Assurance inspections may be made by NYC DEP Bureau of Engineering Design and Construction, Quality Assurance Section or its representative at the manufacturer's facility.

2. Quality Assurance inspections shall be in accordance with the requirements of the Contract Documents.

3. Submit copies of Manufacturer Certificates of Conformance.

1.07 SUBMITTALS

A. Submittals for all Peristaltic Hose Pumping Units shall comply with the requirements of Section 43 05 21 - Common Work Results for Pumping Units. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

a. Shop Drawings

1) Manufacturer’s standard overhaul instruction for motors.

2) Catalog information for all components, materials lists, and additional information describing the conformance of the proposed equipment with design and operating requirements of this Section.

3) System layouts and/or schematics.

4) Elementary and connection wiring diagrams clearly showing external connections to other equipment.

b. Operation and Maintenance manuals, in accordance with the requirements of the Contract Documents.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery, storage, and handling for all Peristaltic Hose Pumping Units shall comply with the requirements of Section 43 05 21 - Common Work Results for Pumping Units.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Provide spare parts, special tools, and supplies in accordance with the requirements of Section 43 05 21 - Common Work Results for Pumping Units. In addition, the Contractor shall provide the following:

1. Two (2) replacement hoses of each size provided.
2. Two (2) hose lubricant refills.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Peristaltic hose pumps shall be:

1. Watson-Marlow Bredel Series.
2. Vederflex VF Series.
3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Design Criteria:

1. Refer to Schedule 43 33 44-1, Peristaltic Hose Pumping Units – Metering Pump Schedule, Schedule 43 33 44-2, Peristaltic Hose Pumping Units – Transfer Pump Schedule and Schedule 43 33 44-3, Peristaltic Hose Pumping Units – Sample Pump Schedule located after the "End of Section" designation.
2. Pump shall be horizontal, positive displacement, peristaltic type.
3. Pump shall be capable of operating in either direction without flow variation.
4. Pump shall be capable of running dry without damage to pump or hose.
5. Pump shall be capable of pulling 95 percent of full vacuum.

6. Repeatability: + 1% accuracy.

7. Valveless/glandless design with no dynamic seals in contact with the pumped media.

8. Pump shall be capable of being rotated in 90-degree increments for four (4) different port-mounting configurations.

9. Direct coupled gear drive arrangement as specified herein.

B. Hose and Lubricant:

1. Hose shall be manufactured of three-layer elastomer with an extruded inner wetted layer compatible with the process fluid, four layers of nylon reinforcement, and an EPDM or natural rubber outer layer. Hose outside diameter shall be machined to maintain a wall thickness within + 0.25 mm tolerance. The hose external surface shall have surface average roughness of Ra 8+4µ. Hoses that do not meet these minimum requirements are not acceptable.

2. Minimum Static Burst Pressure rating of 800 psi.

3. Hose hardness rating shall be 53-68 shore A durometer.

4. Hose must be replaceable without cover or pump removal.

5. Pump housing shall contain a NSF-listed food-grade glycerin-based hose lubricant blended to provide a medium for cooling and lubrication.

6. Provide a threaded drain plug at the lowest point of the pumping chamber to allow the complete drainage of lubricant.

C. Pump Housing with Internal Bearing Frame:

1. Pump housing shall be constructed of Cast Iron ASTM A48 Class 25 and shall be either supplied with an internally mounted bearing hub and rotor assembly or use the bearing system of the gear reducer to support the load of the rotor within the pump. Gear unit shall be direct coupled to the back of the pump housing and shall be completely isolated from the process fluid and pump lubricant through the sealed bearing hub.

2. Rotor shall be constructed of Cast Iron ASTM A48 Class 25 with two pressing shoes mounted 180 degrees apart. Shoes shall be constructed of epoxy or extruded aluminum as recommended by the manufacturer and shall be adjustable for varying degrees of compression via flat shims constructed of 316 Stainless Steel or aluminum. Rotors incorporating rollers or fixed occlusion shoes are unacceptable.

3. Pump rotor shall be independently supported on its own set of ball bearings such that the bearings are located directly under the rotor's load. Bearings shall be supported by the bearing hub located within the pump housing and shall be sealed via a dynamic seal constructed of Buna-N. Bearings shall be sealed and greased for life. Pumps which use pump lubricant to lubricate

the bearings or external bearing frames which allow overhung loading and require long coupling configurations are not acceptable.

4. Pumphead rotor shall be driven and connected to the gearing via a splined shaft or keyed shaft. Rotor or shaft construction shall be constructed with shear points to allow disengagement from the drive, which shall prevent pump or gearing damage in the event of overtorque caused by a locked rotor.

5. Pump construction shall include a buffer zone between the gearing and pumphead to prevent gearbox contamination in the event of a hose lubricant seal failure. The internal pump bearing hub shall be vented through the rear of the pump housing to allow visual detection in the event of a hose lubricant seal failure.

D. Connectors:

1. Supply pump with flanged inlet and outlet to ASME/ANSI B16.5 Class 150 standards. Flanges and brackets (if provided) shall be constructed of galvanized steel galvanized to 15 microns minimum and shall be provided with PVC wetted inserts or other material compatible with the process fluid as indicated in the Operating Requirements.

2. Pump hose shall extend from the pumping chamber to allow visual confirmation of hose/flange insert connection. Flange insert shall be secured to the pump hose via a single band clamp or compression fitting. Securing the hose using multiple clamps is not acceptable.

3. Flange supports shall be one piece and constructed of galvanized steel galvanized to 15 microns minimum and shall be secured to the pump housing via four hex head bolts for the 1.5-inch to 4.0-inch pumps and two bolts for 1-inch to 1.25-inch pumps. Flange supports shall maintain a compression seal between the pump housing and hose

E. Pump Cover:

1. For 1-inch and 1.25-inch pumps, cover shall be constructed of Cast Iron ASTM A48 Class 25 or Carbon Steel ASTM A1011 / A1011M – 10 GR36 and shall be fitted with a fixed window constructed of PMMA. The cover shall be retained to the housing by no more than four hex head bolts and shall be equipped with two hand grips to allow quick and easy removal for replacement of the pressing shoes or shim adjustment.

2. For 1.5-inch to 4.0-inch pumps, cover shall be constructed of Carbon Steel ASTM A1011 / A1011M – 10 GR36 with a removable clear viewing inspection window constructed of PMMA and sufficiently large enough to replace pressing shoes and allow shim adjustment without removing pump cover.

3. The window shall be sufficiently sized to view direction of rotation of the pump and shall be marked with a minimum lubricant registration mark for proper indication of lubricant level when the pump is stationary.

4. Pump cover shall be sealed to the pumphead via a captive Buna-N quadring seal.

5. Pump hardware shall be stainless steel.

F. Frame:

1. Support frame shall be torsion free and constructed of formed hot dipped galvanized steel with a coating thickness of 15 microns or powder coated carbon steel. Welded steel or modular adjustable frames are not acceptable.

G. Leak Detector:

1. Leak detector to be one of the following:

a. A float type magnetic reed switch located near the top of the pump to detect leakage of pumped product into the pump housing. Mount the sensor on the rear of the pump housing. Switch shall be rated to the following maxima: Vmax = 240VAC, Imax = 1 Amp, Pmax = 50VA.

b. A pressure-sensing device to detect high pressure above the normal lubricant level that would be indicative of leakage of pumped product into the pump housing for indication of hose failure. Device shall have a 100V power supply.

2. Supply sensor Normally Closed with the ability for field adjustment to Normally Open

3. Pump manufacturer to supply switch only. Contractor is responsible for alarm and relay to turn pump off unless otherwise specified herein.

H. Gearing:

1. Provide gearing with direct-coupled mounting to the pump housing.

2. For 1- to 1.25-inch pumps, provide foot mounted helical gearbox with direct-coupled mounting face. Helical gearing shall be 2 or 3 stage with gear reducer housing constructed of cast iron.

3. For 4- to 10-inch pumps, provide planetary gearing with direct coupled mounting face. Gear planetary drive shall be of a modular construction, 1, 2 or 3 stages as required with each module consisting of an internal gear meshing with 3 planetary gears mounted on the planet carrier which shall also engage with the sun pinion. Construct gears and shafts of alloy steel, planet carriers in modular cast iron or steel, and housing of cast iron.

4. Design gear reduction to match output speed requirement of the pump using two or three-stage gearing and matching torque rating of pumping equipment. Gearing shall be classified for continuous heavy shock duty, AGMA Class II, 24 hr duty with a minimum of 1.4 service factor.

I. Motors:

1. Electric motors shall be inverter duty and conform to the requirements of Section 26 05 91, Low Voltage Electric Motors.

J. Variable Frequency Drives:

1. Contractor shall provide variable frequency drives, where indicated, in accordance with Section 26 29 23 – Variable-Frequency Motor Controllers.

K. Accessories:

1. All components that come in contact with the specified chemicals shall be compatible with those chemicals.

2. All components and hardware that do not come in contact with the specified chemical are to be type 316 stainless steel. Control panel mounting hardware shall be type 316 stainless steel.

3. Anchor Bolts: Type 316 stainless steel, sized by equipment manufacturer, 1/2-inch minimum diameter.

4. Gauge Connections: Tapped and plugged suction and discharge gauge connections on piping headers adjacent to pumps.

5. Pressure Relief Valve: Provide one pressure relief valve per pump. Pressure relief valve shall be non-metallic, suitable for use with fluid being pumps and as specified in Section 40 05 56, Process Valves, Smaller than Four-Inch Diameter.

6. Pressure Switch: Provide one pressure switch per pump. Pressure switch shall shut-down pump at the pressure shown on the drawings. Pressure switch shall be as specified in Section 40 61 96 - PMCS Control Strategies.

7. Pulsation Dampener: Provide a pulsation dampener sized to dampen 90% of the pulsation caused by the pumps. The volume of the dampener should be a minimum of 9 times the volume displaced by one hose compression release. Dampeners shall have PVC Inserts and EPDM Hose. The dampener should be sized to match the size of the hose of each respective pump.

L. Revolution Sensor:

1. A revolution sensor shall be provided and installed on the pump and locally displayed.

M. Flexible Hose:

1. Provide flexible hose on the suction and discharge sides of the pumps as shown on the drawings. Contractor to provide all couplings to connect to pump discharge and suction as well as upstream/downstream PVC piping. Hose to be a reinforced synthetic rubber, with spiral-plied synthetic fabric with double wire helix reinforcement and a synthetic rubber cover. Pressure resistance up to 150 PSI working pressure at 70 degrees F and minimum temperature range -25 to 150 degrees F. Hose to be chemically compatible with the fluid being pumped for continuous use. Hose to be Goodyear Brown Flexwing or equal. Flexible hose shall be supported per the requirements of Section 40 05 07, Hangers and Supports for Process Piping.

N. Back-Pressure Sustaining Valve: Provide one back-pressure sustaining valve per pump. Back-pressure sustaining valve switch shall be set to the pressure described above and shall be non-metallic, suitable for use with fluid being pumps. Pressure switch shall be as specified in Section 40 79 91, PMCS Field Instruments.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Shop Coatings:

1. Equipment shall be shop primed prior to shipment from the factory with a primer compatible with the coating system in Section 09 91 00 – Painting.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Performance Shop Test:

1. Perform non-witnessed inlet vacuum testing as follows:

a. Test assembled pump running on air.

b. Run test for a minimum of 30 seconds and record vacuum reading which must meet or exceed 28" Hg vacuum.

c. In the event that specified tests indicate that the pump does not meet specifications, Engineer has the right to require complete tests for the pump at no additional cost to DEP.

d. Correct or replace promptly all defects or defective equipment revealed by or noted during tests at no additional cost to DEP.

e. Repeat tests until specified results are obtained.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Inspection, installation of equipment and piping, and piping and equipment identification shall be in accordance with Section 43 05 21 - Common Work Results for Pumping Units.

3.02 INSTALLATION

A. Install all Pumping Units in accordance with the requirements of Section 43 05 21 - Common Work Results for Pumping Units and the manufacturer’s written recommendations.

B. Install pumping equipment on a concrete pad and make final alignments thereon.

C. Ensure the pumps’ suction and discharge port connections to process lines are nonleaking and made in a free supported state without need to apply vertical or horizontal pressure to align piping with pump nozzles.

D. Manufacturer's Representative:

1. The Contractor shall furnish the services of accredited representatives of the Pumping Unit manufacturer to supervise the installation, adjustment, and

field tests of the equipment and to provide training for DEP operating personnel.

2. The services of the manufacturer's representative shall be furnished for installation supervision for at least the following number of days:

Visit:	Purpose:	Number of Visits:	Person-days per Visit:
No. 1	Installation Supervision	6	1

3. Should additional days of service be necessary for a successful installation, such services shall be provided by the Contractor at no additional cost to the City.

3.03 FIELD TESTING / QUALITY CONTROL

A. In addition to the field tests to be performed under Section 43 05 21 – Common Work Results for Pumping Units, the following tests are required.

1. Performance Test - Conduct tunning test for each pump to determine its ability to operate within the performance limits specified and to deliver its rated capacity within the pressure requirements specified.

B. The Contractor shall provide the services of the Pumping Unit manufacturer's representative at such times and for such durations of time as are needed to perform the field testing tasks required of the representative.

1. The services of a manufacturer's representative shall be furnished for field testing for at least the following number of days:

Visit	Purpose:	Number of Visits:	Person-days per Visit:
No. 2	Field Testing	6	1

3.04 STARTUP / DEMONSTRATION

A. Furnish the services of a qualified Pumping Unit manufacturer's representative to assist in the start-up of the equipment and train DEP operations and maintenance staff in the care, operation, and maintenance of the equipment in accordance with the requirements of the Contract Documents. In addition:

1. Contractor shall make all adjustments required to place Work in proper operating condition.

2. Contractor shall include in training of DEP personnel instruction on care and maintenance of the materials and equipment.

3. In the event of trouble with the equipment during startup / initial operation, the manufacturer's representative shall revisit the Site as often as required until all troubles are corrected and the installation is entirely satisfactory.

B. At a minimum, the services of the Pumping Unit manufacturer's representative shall be provided as indicated, below. The number of visits and person-days per visit indicated, below, shall be understood as referring to the total required services for the lot of equipment provided under this Section.

Visit:	Purpose:	Number of Visits:	Person-days per visit:
No. 3	Startup / Initial Operation	6	1
No. 4	Training	2	1

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjusting, protection, and cleanup shall comply with the requirements of Section 43 05 21, Common Work Results for Pumping Units.

SECTION 43 33 54 – PERISTALTIC TUBE PUMPING UNITS
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, as shown, specified and required, to furnish and install all peristaltic tube pumping units and appurtenances, complete and operation. Peristaltic Tube Pumping Units shall be as specified herein and as shown on the Contract Drawings.

B. The following index of this Section is presented for convenience:

Article	Title	Section Page

C. The following schedules, attached after the End of Section designation, is a part of this Section:

1. Schedule 43 33 54-1, Peristaltic Tube Pumping Units Schedule.

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Not Used

1.04 REFERENCES

A. Not Used

1.05 DESCRIPTION

A. Peristaltic Tube Pumping Units shall be positive displacement type complete with replaceable cartridge, style peristaltic pumphead technology and self-contained variable speed drive.

B. Service Description:

1. Pump Units shall be for the following chemical services:

a. Sodium bisulfite, up to 22-percent solution.

C. Design Requirements:

1. Refer to Schedule 43 33 54-1, Peristaltic Tube Pumping Units Schedule, located after the "End of Section" designation.

2. Pumps shall be self-priming, and shall have a maximum suction lift capability of up to 30' vertical water column.

3. Discharge Pressure Rating: up to 36 psi.

4. Pumps shall be capable of pumping both liquids and gases without vapor locking.

5. Pumps shall be rated for continuous duty.

6. Pump shall not require the use of back pressure valves, suction foot valves, strainers, pulsation dampeners, or auto degassing valves and shall not require dynamic seals in contact with the pumped fluid. Process fluid shall be contained within pump tubing and shall not directly contact any rotary or metallic components during operation. Upon failure, the process fluid shall be completely contained within the pump head to prevent hazardous exposure to operators. Manufacturers that do not offer a completely contained pump head are not acceptable.

1.06 QUALITY ASSURANCE

A. Quality assurance for all Peristaltic Hose Pumping Units shall comply with the requirements of Section 43 05 - Common Work Results for Pumping Units

B. Qualifications of Manufacturer:

1. The manufacturer shall have a minimum of twenty (20) years of experience in the design and fabrication of liquid chemical diffusers, fittings, appurtenances, and specials of similar size, capacity, and type to those shown on the Contract Drawings and specified in the Contract Documents and shall show evidence of at least fifty (50) substantially similar installations in satisfactory operation.

C. Supply and Compatibility:

1. All peristaltic tube pumps, appurtenances, and specials included in this section shall be provided by the Contractor through a single, qualified peristaltic tube pump manufacturer.

a. Pump manufacturer must provide pumps and accessories, which are integral to pump operation, and specified herein as a coordinated package, regardless of manufacturer. This includes pumps, gear reducers, motors, leak detectors, control panels/drives and other such accessories specified under this section as the responsibility of the pump supplier. Equipment specified herein that is not supplied by the pump manufacturer, as an integrated package will be rejected.

2. To ensure proper function and quality, pumphead, tubing, and drive shall be manufactured by the same company. Tubing purchased by the pump manufacturer from a third party is not acceptable.

3. Pumps are to be manufacturer's standard catalog product.

D. For quality assurance, pumps shall be supplied and labeled by the original manufacturer. Relabeled products, even under license by manufacturer, shall not be acceptable.

E. Pumps shall be manufactured in compliance with ISO 9001-2015 standards.

F. Pumps shall be meet CE, NSF 61 and applicable electrical standards.

G. Quality Assurance Inspections:

1. Quality Assurance inspections may be made by NYC DEP Bureau of Engineering Design and Construction, Quality Assurance Section or its representative at the manufacturer's facility.

2. Quality Assurance inspections shall be in accordance with the requirements of the Contract Documents.

3. Submit copies of Manufacturer Certificates of Conformance.

1.07 SUBMITTALS

A. Submittals for all Peristaltic Tube Pumping Units shall comply with the requirements of Section 43 05 21 - Common Work Results for Pumping Units. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

a. Shop Drawings

1) Manufacturer’s standard overhaul instruction for motors.

2) Catalog information for all components, materials lists, and additional information describing the conformance of the proposed equipment with design and operating requirements of this Section.

3) System layouts and/or schematics.

4) Tool-free pumphead replacement instructions.

5) Manufacturer's certification that pumphead, drive, and tubing are all manufactured by the same manufacturer.

6) Elementary and connection wiring diagrams clearly showing external connections to other equipment.

b. Operation and Maintenance manuals, in accordance with the requirements of the Contract Documents.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery, storage, and handling for all Peristaltic Hose Pumping Units shall comply with the requirements of Section 43 05 21 - Common Work Results for Pumping Units.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Spares:

1. Provide one (1) spare pumphead per pump supplied.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Peristaltic Tube Pumps:

1. Watson-Marlow, Inc.

2. Verder Inc.

3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Pumphead

1. Technology: Provide tool-free ReNu cartridge-style peristaltic pumphead technology. For operator safety, pumphead shall be serviceable as a single replaceable component. Pumps that require an operator to open the pumphead for tube replacement, cleaning, or rebuilding or that require tools for maintenance are unacceptable.

2. Max rating: Qdos 600, with Santoprene pumphead – 158.5 GPH and 36 psi of discharge pressure.

3. Housing construction: corrosion resistant and high impact resistant glass filled PPS or PPE/PS.

4. Geometry: Pumphead shall consist of sealed track housing with in-line porting. Suction and discharge ports shall be 180 degrees apart with bottom suction and top discharge.

5. Rotor: Pumphead rotor shall be constructed of glass filled Nylon, sealed within the track housing, and supported by its own bearings. Peristaltic occlusion level shall be factory set to ensure flow accuracy of +/- 1% and repeatability performance of +/- 0.5% and shall not require any field adjustment.

6. Contact Materials: All pumphead components in the fluid path shall be NSF61 listed and shall be of materials specified by the manufacturer as compatible with the process fluid.

7. Leak containment/detection: In the event of peristaltic element failure, the leak sensor shall shut the pump down immediately with all process fluid contained within the sealed pumphead.

   a. Sensor type: Utilize non-contacting optical sensor. Sensor shall not come in contact with the process fluid, shall contain no moving parts, shall not depend on the capacitance of the process fluid, shall not require fluid to leak out of the pump housing for engagement, nor shall require any sensitivity or calibration adjustment.

   b. Alarm: Sensor shall shut down the pump, give a visual indication on the drive controller, and if specified shall provide an output general alarm signal.

   c. For operator and environmental safety, pumps which do not have leak containment, leak sensor, and shutdown are not acceptable. For additional overpressure safety, sealed pumphead shall have a controlled drain-to-waste port.

8. Port connections: Pumphead shall utilize polypropylene compression fittings which shall mate to 10mm ID reinforced, transparent PVC interface hose. Provide polypropylene compression by ½" NPT adaptors for connecting interface hose to process line.

B. Drive

1. Rating: Continuous 24 hour operation, 45° C ambient.

2. Voltage: Drive shall be suitable for 100-240VAC, 50-60Hz, 1-Phase with an internal switch-mode power supply. Supply nine-foot length mains power cord with standard 115VAC three-prong plug.

3. Max drive power consumption: 190VA.

4. Enclosure: NEMA 4X constructed out of corrosion and impact resistant engineering plastic, 20% Glass filled PPE/PS. By nature of the

environmental conditions, painted or unpainted metallic housing including 316SS are not acceptable. Enclosure shall house the drive motor and all control circuitry in one integrated unit. Separate VFDs and motors are not acceptable.

5. Direct coupled pumphead with fully protected drive

   a. Pumphead shall direct couple mount to the controller via a splined drive shaft and shall be locked in place by two tool-free thumbscrews or lever mechanism.

   b. Pumphead shall be fully sealed to prevent any contamination of the controller or drive shaft by process fluid.

   c. Pumphead shall contain its own rotor bearings and not impart an overhung load on the pump shaft.

   d. Pumpheads shall be supplied mounted to the left or right side of the drive enclosure as specified in the drawings. If not specified, pumpheads shall mount to right side of the enclosure.

   e. Drive shall stop shaft rotation and give visual alarm in the event the pumphead is removed.

   f. Drive motor: brushless DC motor with integral gearbox and closed loop tachometer feedback.

6. Circuitry complete with temperature and load compensation and protection.

C. Human-Machine Interface (HMI) and Control

1. Remote Control I/O

   a. Speed Control Input: Analog 4-20mA speed input with 1,600:1 turndown with incremental steps of 10 microamps. Signal shall be trimmable and speed scaleable over any part of the drive speed range. Pump shall be programmable to either increase pump speed or decrease pump speed against an increasing Analog 4-20 mA signal.

   b. Run/Stop Input: Either 5-24V industrial logic, dry contact or powered 110 VAC contacts as shown per the process and instrumentation drawings.

   c. Run/Stop & General Alarm Status Outputs: Either 24VDC Open Collector, 24VDC Status relay, or 110VAC Status Relay

2. HMI, analog connections, and mains power shall be accessible from the front or side of the enclosure.

3. Minimum requirements: Pumps that do not meet the minimum manual and automatic control requirements as specified above are not acceptable.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

B. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

1.2 INSTALLATION

A. Contractor shall install items in accordance with manufacturer's printed instructions and as indicated and specified.

B. Contractor shall supply shielded signal wiring for wiring of the required remote input and output to the connectors.

C. Manufacturer's Representative:

1. The Contractor shall furnish the services of accredited representatives of the Pumping Unit manufacturer to supervise the installation, adjustment, and field tests of the equipment and to provide training for DEP operating personnel.

2. The services of the manufacturer's representative shall be furnished for installation supervision for at least the following number of days:

Visit:	Purpose:	Number of Visits:	Person-days per Visit:
No. 1	Installation Supervision	1	1

3. Should additional days of service be necessary for a successful installation, such services shall be provided by the Contractor at no additional cost to the City.

3.02 FIELD TESTING / QUALITY CONTROL

A. In addition to the field tests to be performed under Section 43 05 21 – Common Work Results for Pumping Units, the following tests are required.

1. Performance Test - Conduct tunning test for each pump to determine its ability to operate within the performance limits specified and to deliver its rated capacity within the pressure requirements specified.

B. The Contractor shall provide the services of the Pumping Unit manufacturer's representative at such times and for such durations of time as are needed to perform the field testing tasks required of the representative.

1. The services of a manufacturer's representative shall be furnished for field testing for at least the following number of days:

Visit	Purpose:	Number of Visits:	Person-days per Visit:
No. 2	Field Testing	1	1

3.03 STARTUP / DEMONSTRATION

A. Furnish the services of a qualified Pumping Unit manufacturer's representative to assist in the start-up of the equipment and train DEP operations and maintenance staff in the care, operation, and maintenance of the equipment in accordance with the requirements of the Contract Documents. In addition:

1. Contractor shall make all adjustments required to place Work in proper operating condition.

2. Contractor shall include in training of DEP personnel instruction on care and maintenance of the materials and equipment.

3. In the event of trouble with the equipment during startup / initial operation, the manufacturer's representative shall revisit the Site as often as required until all troubles are corrected and the installation is entirely satisfactory.

B. At a minimum, the services of the Pumping Unit manufacturer's representative shall be provided as indicated below. The number of visits and person-days per visit indicated, below, shall be understood as referring to the total required services for the lot of equipment provided under this Section.

Visit:	Purpose:	Number of Visits:	Person-days per visit:
No. 3	Startup / Initial Operation	2	1
No. 4	Training	1	1

3.04 ADJUSTING / PROTECTION / CLEANUP

A. Adjusting, protection, and cleanup shall comply with the requirements of Section 43 05 21, Common Work Results for Pumping Units.

1.05 DESCRIPTION

A. This Section includes requirements for providing tanks made of FRP built in accordance with the applicable standards and regulations.

1. The tanks will be used for the storage of chemical solutions that will be pumped into the tanks from tanker trucks and pumped out of the tanks by chemical metering pumps or chemical transfer pumps.

2. Project specific requirements can be found in Schedule 43 41 45-1, Fiber-Reinforced Plastic Tank Schedule, located after the "End of Section" designation.

B. All FRP tanks and appurtenances shall be provided by one (1) manufacturer with sole responsibility for the satisfactory manufacture, delivery, installation supervision, compatibility, and performance of the items furnished.

C. The FRP tanks shall be furnished complete with liquid level gages, all accessories, special tools, spare parts, base attachments, mountings, anchor bolts and other appurtenances as specified or as may be required for a satisfactory installation. All components provided shall be compatible for use with the chemical being stored.

1.06 QUALITY ASSURANCE

A. Manufacturers shall have a minimum of ten (10) years' experience in the design and fabrication of FRP tanks of similar size, capacity, and type to those shown and specified herein, and who have in the opinion of the Engineer sufficient experimental and test data to confirm the design of the specified FRP tanks.

B. Manufacturers that have previously provided FRP tanks on DEP projects that have had Non Conformance Reports issued for use of unapproved materials and/or poor construction-related issues may, at the Engineers option, be rejected as a supplier.

C. All equipment provided under this Section shall be obtained from a supplier or manufacturer who shall assume full responsibility for the completeness of the system.

1. The supplier shall be the source of information on all equipment furnished regardless of the manufacturing source of that equipment.

2. The tank manufacturer shall not subcontract the fabrication of any of the component parts of the tanks, except for the instrumentation and controls specified herein. Subcontracted components (with the exception of instrumentation) shall be rejected by the Engineer.

D. Structural design computations shall be performed by a registered Professional Engineer licensed in the State of New York that is experienced in the design of ASME RTP-1 vessels. All design calculations shall be made specific for the tank(s) being provided herein. Reuse of calculations from prior tank designs of similar size and applications is expressly prohibited herein.

E. The Contractor shall supply only tanks manufactured by a manufacturer who is certified by ASME in the design and fabrication of ASME RTP-1 tanks. The tank manufacturer's quality control procedures shall conform to the requirements of ASME RTP-1 and shall confirm that all fabrication complies with the specified requirements and that all laminates are at least equal to the reference samples in laminate quality.

F. At a minimum, the following shop inspection operations shall be conducted by the Engineer:

1. Inspection at the shop is intended as a means of facilitating the work and avoiding errors, but is expressly understood that it will in no way relieve the Contractor from any responsibility for meeting the requirements of the Contract Documents.
2. Prefabrication Meeting:
    a. The manufacturer shall schedule a pre-fabrication meeting before the start of work with the Engineer to ensure that all equipment, materials, skilled labor, and conditions are in place that are necessary to adequately perform the work and to establish all applicable inspection witness points.
3. Notice:
    a. The Contractor shall give a minimum 45 days' notice to the Engineer prior to the beginning of any work so that inspection may be provided.
4. The Contractor shall furnish all facilities for the inspection of materials and workmanship in the shop and the Engineer shall be allowed free access to the necessary parts of the work.

1.07 SUBMITTALS

A. Submittals shall include, but not be limited to:
    1. Action Submittals:
        a. All shop drawings and design calculations shall be coordinated with ASME RTP-1 requirements.
        b. Suitable evidence of manufacturer experience in the design, fabrication, and successful operation in other facilities of FRP tanks similar to that specified herein.
        c. Shop drawings and catalog data, including but not limited to:
            1) Dimensions of tanks, fittings, attachments, and anchor bolt locations.
            2) Wall thicknesses (shell, top, and bottom).
            3) Location of all fittings, attachments, and joints.
            4) Shop drawings shall have a table illustrating all connection scenarios of secondary bonds attached to primary bonds detailing laminate resin-glass sequences and their respective development lengths, widths, and thickness.
        d. Data sheets identifying all materials used and methods of fabrication, including but not limited to:
            1) Description of fabrication.

2) Complete description of chemical resistance for all materials that will come in contact with the materials stored, including a certification from the manufacturer that the various materials, including resins and veils, used are suitable for the intended application (including maximum rated chemical concentrations and temperature).

a) This certification shall state that the resins used in the fabrication of the laminates have been evaluated in accordance with ASTM C581 for chemical resistance for a service comparable to the intended service and that the resin is recommended by the resin manufacturer for the intended service.

3) Before the resin is ordered by the tank manufacturer, the Contractor shall submit certification in writing from the resin and veil manufacturers that the resins and veils to be provided are suitable for use with the specified chemicals to be stored in each tank under the specified conditions of service.

e. Calculations:

1) Structural design computations for each FRP tank signed and sealed by a New York State Professional Engineer.

2) Calculations on tank hold-down lugs/anchor bolts to demonstrate they will hold the tank in place when an empty tank is subjected to buoyant forces created by a 2.25-foot depth (relative to tank bottom) of the stored liquid contained outside the tanks. These calculations shall include pre-tension and torque values for hold-down lugs and anchor bolts.

3) Calculations for each secondary bonds attached to primary bonds.

4) Laminate specifications including resin and reinforcing materials required, layer (laminate sequence) construction and thickness, glass data and specifications, resin properties, resin curing processes, post cure processes, and any and all catalysts used.

f. Complete assembly, layout required clearances, and installation drawings with clearly marked dimensions.

g. Weights of all component parts, assembled weight of units, and approximate total shipping weight.

h. Description of the Service conditions.

i. Shop and field testing procedures.

j. Example Quality Control Documentation Data Package that will be provided for each finished FRP Vessel.

1) This data package shall identify the DEP Contract No., Specification Section, Equipment Description, Fabricator, and Equipment Serial Number.

2) The data package shall include, at a minimum:

a) Equipment Inspection Requirements Checklist.

b) Resin/Reinforcement Log Sheets, Component Data Sheets, and Nozzle Fabrication Reports (that applicable material certifications will be attached to).

c) Cutout Thickness Reports.

d) Glass Content Test Reports.

e) Post Cure Hardness and Acetone Sensitivity Reports.

f) Hydrostatic Test Reports.

g) Final Visual Inspection Checklists.

h) Final Dimension and Orientation Check Sheets.

k. After Fabrication, Contractor shall submit Quality Control Documentation Data Package for each finished FRP Vessel listed in Schedule 43-41-15-1, as described above.

l. Certified copies of all factory test results, including but not limited to:

1) Certified Material Test Reports (CMTRs) shall be provided for the proposed laminate sequence. Test reports shall include test results for flexural strength, flexural modulus, tensile strength, tensile modulus, and glass content of the structural and corrosion layers.

m. Instructions for handling, storage, loading and unloading, and installation of tanks. These instructions shall include bolt torque values and detailed instructions for pipe connections.

n. A list of manufacturer's recommended special tools and spare parts to be supplied.

o. Operation and Maintenance manuals, in accordance with the requirements of the Contract Documents.

p. Deviations from the Contract Documents.

q. Samples:

1) Representative laminate samples of both the cylindrical shells and the tops shall be submitted.

a) These samples shall be from plant production and shall be representative of actual construction, workmanship, appearance and surface hardness of tanks to be furnished.

b) Any furnished tank which later does not meet the standard of the representative samples will be rejected by the Engineer.

2) After fabrication, submit cutouts and retain cutout samples of the laminate for each tank for assessment of laminate properties and laminate construction by the Engineer.

a) Cutouts and cutout samples shall be labeled with unique numbers traceable to data sheets and to each other.

b) If the sizes of the cutouts are insufficient, an extension to the shell of suitable size, as approved by the Engineer, shall be added for testing purposes.

2. Information Submittals:

a. Tank label information.

b. An officer of the manufacturer shall submit an affidavit certifying to the Engineer that all fabrication, assembly, and curing was performed indoors and in a climate-controlled atmosphere.

c. Affidavits from the manufacturer stating that:

1) The FRP tanks will meet the specified performance requirements with the contained liquids specified herein. The design and the fabrication of the tanks are in accordance with the requirements of:

a) This Section, and

b) ASME RTP-1.

2) The tanks are designed for a useful life of thirty (30) years minimum, in accordance with 6NYCRR Part 599.8 (b).

3) Prior to the beginning of the shop performance tests, submit manufacturer's Certification of Compliance with the approved laminate schedule.

d. After fabrication, submit post cure time/temperature charts.

e. Material certifications shall be submitted for the FRP components at the time of specified quality assurance shop inspection by representatives of the DEP. The material certifications shall include, as a minimum:

1) laminate reinforcing material used.

2) resin and cure system used for the structural layer.

3) resin and cure system used for the corrosion resistant barrier.

4) fire retardant additives.

5) other additives.

6) gasket materials.

3. Submit a description of the proposed testing facilities and procedures prior to the commencement of shop tests.

4. The Contractor shall submit a report from the manufacturer for each visit to the Site of the manufacturer's representative.

a. The report shall provide complete information regarding the visit, including, but not limited to, dates, times, subject equipment, tasks performed, persons contacted, problem corrected, test results, training provided, and other pertinent information.

b. The report shall be certified by the equipment manufacturer, documenting the findings of the authorized person(s).

c. Reports of field tests shall be in accordance with the 6NYCRR Part 599 standards.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. Mount tanks on padded cradles if shipped horizontally or on a suitable skid if shipped vertically.

2. Protect all flanged nozzles with wooden blinds bolted to the flange and having a diameter of 2-inches greater than the outside diameter of the flange.

3. For all un-flanged connections, provide either threaded or rigid plugs inside the ends to prevent deflection.

4. Brace the open ends of tanks with a suitable stiffening member to prevent deflection.

5. Do not ship components or other pieces loose inside the tanks.

6. Load tanks with at least 2 inches clearance between the tank (including fittings) and the bulkheads or bed of the vehicle.

7. Regardless of the mode of transportation, firmly fasten and pad all components to prevent shifting of the load or flexing of components while in transit.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. Tanks shall be unloaded with care and tanks and appurtenances shall be stored in a location where they will be free from damage and deterioration.
2. Components for site fabricated tanks shall be prepared and protected for shipment, unloading and storage with the same care as the fabricated tanks.
3. The Contractor shall provide the services of person(s) authorized by the manufacturer to witness the unloading at the Site of the equipment provided, and to ascertain the condition of said equipment.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall provide spare parts and special tools, necessary to service, disassemble, repair, and adjust the equipment provided under this Section, and as per the requirements of the Contract Documents. In addition:

1. Top and side access covers shall be provided only where these covers are shown on the Contract Drawings.
2. Provide the following spare parts for each FRP tank listed in Schedule 43 41 45-1:
    a. Provide one (1) top access cover gasket and set of bolts, nuts, and washers.
    b. Provide one (1) side access cover gasket and set of bolts, nuts, and washers.
    c. Additional spare parts as may be shown or specified.
3. Provide one (1) set of all special tools required for maintenance. All such tools shall be furnished in a suitable steel tool chest complete with lock and duplicate keys.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. FRP Tanks:

1. Belco Manufacturing, Belton, TX.
2. RL Industries, Fairfield, OH.
3. Composites USA, North East, MD
4. Troy Dualam Inc., Brockville, ON, CA.
5. Augusta Fiberglass, Blackville, SC.
6. Or approved equal.

B. Resins and Veils:

1. Ashland Inc., Dublin, OH.
2. Dow, Midland, MI.
3. AOC, Collierville, TN.
4. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Regulatory Requirements:

1. All tanks shall be designed for a useful life of thirty (30) years minimum, as per 6NYCRR Part 599.8 (b).
2. Tanks shall be designed and constructed in accordance with ASME RPT-1. Tanks do not require ASME RTP-1 Stamp.
3. Corrosion resistant barrier shall be Type I or Type II laminate. Structural layer shall only be constructed using Type II laminate.
    a. The use of a manual chopper gun shall not be permitted.
    b. Semi-automatic or automatic chopper guns shall be permitted only with the approval of the Engineer.
4. Shell joints and secondary bond overlays for vessel penetrations shall be in accordance with ASME RTP-1, Section 4-300 or Section 4-400, except that each successive overlay ply shall overlap the preceding ply by 1-inch minimum on each side.
5. Tanks shall have an ASTM E84 Flame Spread Rating of less than 25 achieved by fabricating the outermost three (3) mat layers and outer surface veil layer from the halogenated resin with additional antimony pentoxide and cure system specified. The entire corrosion barrier and structural laminate shall be fabricated using the corrosion resistant resin and cure system specified.

B. General Design Requirements:

1. All material shall be new and both workmanship and materials shall be of the very best quality, entirely suitable for the liquids which the FRP tanks are to contain and shall conform to all applicable requirements specified herein.
2. The tanks shall be designed for a seismic zone rating of 2A.
3. FRP tanks shall be designed to adequately support all static and dynamic loads imposed on the tank surfaces.
4. Unless otherwise indicated in Schedule 43 41 45-1, the tanks shall be designed as atmospheric tanks vented directly to the atmosphere. For other types of tanks, Schedule 43 41 45-1 indicates:
    a. Design pressure/vacuum.

5. Operating pressure/vacuum. Each tank fill nozzle shall include a modified drop tube of the same diameter as the nozzle.

   a. The drop tubes shall extend 6 inches vertically down from the top shell, and then turn 45 degrees toward the tank vertical wall. Drop tubes shall be terminated 2 inches from the tank wall. The tank wall shall be reinforced with a resin rich impingement plate at point of fluid contact over a 6-inch by 6-inch area. The end of the drop tube shall be supported with a structural fiberglass strut permanently attached to the tank wall to prevent vibration of the assembly.

6. The tanks shall be provided with lifting lugs and designed such that they can be handled by crane and transported intact to their installation locations through building/structure openings and access ways shown on the Contract Drawings.

7. No cutting of the tanks will be allowed. The tanks shall be suitable for transport into and installation in the buildings/structures after these buildings/structures have been completely constructed.

8. Unless otherwise specified in the Schedule 43 41 45-1, tanks shall be designed for a contained liquid temperature of up to 150 degrees F.

9. Tanks shall be designed for a maximum fill rate of 200 gpm.

C. FRP Tank Materials:

1. General: The materials used for fabrication shall be clean, consistent in quality and in conformance with these specifications and the manufacturer's specifications for the materials.

   a. All batches of resin that have been modified by the addition of additives (such as promoters or accelerators) shall be tested for gel time and proper cure characteristics.

   b. The laminate surface and materials temperatures shall be as specified by the resin manufacturer. A minimum 5 degree F spread between the atmospheric wet bulb (higher) and the laminate surface temperatures shall be maintained at all times during fabrication.

   c. All fiberglass reinforcements, catalysts, cure-control additives and paraffinic waxes used shall be as recommended by the resin manufacturer, in writing, as consistently giving the best results with the resin being used. Resin binders in chopped strand mats shall be suitable for fabrication of the corrosion barrier.

2. Resins: Resins shall be suitable for the liquid to be contained in the FRP tanks.

   a. Resin for the corrosion barrier and structural layer shall be a Bisphenol A Epoxy Vinyl Ester Resin compatible with the material stored.

b. Resins for the outer fire retardant layer shall have a flame spread rating of 25 or less based on ASTM E84 with the addition of antimony pentoxide.

c. Resins used in the corrosion barrier and resin-rich inner liner and structural layers shall not have any fire retardant agents or antimony compounds and shall be cured using Benzoyl Peroxide (BPO) catalyst and a Dimethylaniline (DMA) promoter cure system.

d. No thixotropic agent shall be added to resins used for the resin-rich inner liner, corrosion barrier, or structural layer. Up to 2 percent by weight of thixotropic agent may be added for viscosity control of resins not used for a corrosion barrier and resin-rich inner liner. The quantity of thixotropic agent added, however, shall not interfere with visual inspection of the laminate. No other fillers to the resin, including pigments, dyes and colorants, shall be permitted, unless approved in writing by the Engineer.

e. An ultraviolet adsorption agent shall be added to the resin throughout the outer layer beyond the structural layer.

3. Reinforcement: Glass reinforcement shall be Type E, electrical glass, unless otherwise specified in Schedule 43 41 45-1.

a. Surfacing Veil:

1) Protective veils for exterior surfaces shall be Type C glass surfacing mat. The thickness of the surfacing veil shall be 10 to 20 mils for all applications.

2) Surfacing veils for interior surface applications where the glass may be attacked by compounds in the process shall be a suitable spun-laced synthetic organic entangled fiber fabric not less than 20 mils in thickness, consisting of two plies of 10 mils each with each ply separately gelled prior to application of the subsequent ply, all backed by chopped strand in resin.

b. Chopped strand mat shall be Type E glass, 1½ oz./sq ft.

c. Continuous roving used in chopper guns for spray-up shall be Type E glass with coupling agent.

d. Woven roving shall be Type E glass, 24 oz./sq. yd, 4 x 5 weave.

e. Woven cloth shall be Type E glass.

4. Miscellaneous:

a. Lifting and hold down lugs, nuts, bolts, washers and miscellaneous fabricated parts shall be titanium.

b. Gaskets shall be suitable for the liquid contained in the FRP tanks.

D. Laminate Construction:

1. The structural laminate thickness of the tanks and components shall be ½-inch minimum, or double the calculated design thickness, whichever is greater.

2. The corrosion barrier shall consist of Type I Laminate and shall contain two (2) resin rich veil layers (saturated with catalyzed resin) followed by three (3) layers of chopped strand mat (saturated with catalyzed resin).

   a. The total thickness of the resin rich veil layer shall be 20 to 30 mil (0.02 to 0.03-inch). These first layers consisting of veil and resin shall contain 90 percent resin and 10 percent veil material by weight.

   b. Each layer of chopped strand mat (saturated with catalyzed resin) shall have a thickness of 43 mils. The chopped strand mat layers in the finished corrosion barrier laminate shall be 70-80 percent resin and 20-30 percent glass by weight.

   c. The inner corrosion barrier plus the three mat layers shall total 0.149-inches minimum thickness and constitute the inner lining. The entire lining shall reach complete cure before the structural layers are applied. The corrosion barrier thickness shall not be included in the structural laminate thickness calculations.

3. The structural layer shall consist of a Type II laminate saturated with catalyzed resin. The structural layer shall be placed over the corrosion barrier within 12 hours after the corrosion barrier has cured, otherwise the surface of the corrosion barrier must be completely ground to assure adequate bonding with the structural layer being applied. The structural layer shall have an average glass content of at least 35 percent by weight per ASTM D2584.

4. The outer fire retardant exterior layer shall consist of three (3) mat layers and an outer surface C-Veil layer saturated with catalyzed halogenated resin with added Antimony Pentoxide. The outer fire retardant layer shall have an average glass content of at 25-30 percent by weight per ASTM D2584. The fire retardant exterior layer thickness shall not be included in the structural laminate thickness calculations.

E. The post-cure process shall be a heat post cure utilizing a forced hot air heating system or an oven curing system.

1. If a forced hot air heating system is used for the heat post-cure, as per the resin manufacturer's recommendations, the manufacturer shall utilize a forced hot air heating system that induces the heat on the interior and forces the heat through the wall to the exterior. An optimum cure is achieved when the temperature normalizes on the tank exterior.

   a. Post-curing may also be conducted in a hot air convection curing oven such that both the interior and exterior laminate surfaces are exposed to the same hot air temperatures.

b. Post-curing ovens/structures shall be equipped with time/temperature recording devices such that the temperatures are logged. A continuous record or chart or curing air temperatures shall be made available for review by the Engineer prior to shipment of the tanks.

c. Manufacturer shall post-cure the equipment at a minimum of 180 degrees F. Post-cure temperature shall not exceed the Heat Distortion Temperature of the resin.

d. The post-cure hold period shall be a minimum of 4 hours. The duration of the hold period shall be engineered based upon laminate volume. Laminate volume calculations shall be made available for review by the Engineer along with the post curing temperature charts specified above.

e. The post-cure temperature shall be ramped up to and down from the hold period temperature to avoid thermal shock to the laminates being cured. The post-cure period, including ramping and holding time shall be a minimum of 6 hours and shall be engineered based upon laminate volume plus laminated thermal properties. The calculations shall be made available for review by the Engineer along with the previously specified calculations.

f. Any cracking that results from the post-cure process shall meet RTP-1 visual inspection acceptance criteria, Table 6-1.

g. The equipment must be properly supported to minimize dimensional changes, such as warping and shrinking that may result from the process. Dimensional changes are limited to the dimensional tolerances specified.

h. All FRP covers and blinds shall be removed from the tanks during post-cure; however, all FRP accessories such as the manway covers and blinds shall be post-cured.

i. All shop repairs or rework shall be performed prior to post-cure.

j. Tanks shall not be moved until they are cured as determined by the Barcol hardness test per ASTM D2583 and Acetone sensitivity test per ASTM C581.

F. Liquid Level Gages:

1. General: Liquid level gages the glass gage type shall be furnished in accordance with the details shown on the Contract Drawings or as specified in Schedule 43 41 45-1.

2. Glass Liquid Level Gage: Glass liquid level gage shall be furnished with upper and lower valves, glass tube, guard rods and all required supports. All components of the gage shall be resistant to the chemicals being stored.

a. Valves shall be of plastic or stainless steel, furnished with internal ball checks in case of glass tube breakage and provided with ¾-in. NPT male threads to fit the threaded outlet fitting on the tank. Materials of construction to be compatible with the stored chemical.

b. Glass gage shall be installed so that the full capacity of the tank shall be measured. Tubes shall be ¾-inch diameter and shall be graduated to indicate gallons or feet of liquid remaining in the tank.

c. Four guard rods with a minimum diameter of $^{3}/_{16}$-inch shall be provided.

G. Concrete Pads:

1. All tanks shall be mounted on concrete pads only when demonstrated to be fully cured, including after protective coating is applied, cured and accepted, if applicable. The finished surface of each tank bottom shall be sufficiently flat, smooth, and free of irregularities, to prevent the possibility of tank failure from point loads or other sources.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Closed Top Vertical FRP Tanks:

1. The Contractor shall furnish, deliver, install, test and place in satisfactory operation the closed top vertical FRP tanks of the dimensions and number called for in Schedule 43 41 45-1, or as shown on the Contract Drawings.

2. The FRP tanks shall be vertical cylindrical units with internally sloped flat bottom and dome top. Manholes shall be provided as shown on the Contract Drawings or as specified in Schedule 43 41 45-1.

3. FRP tanks shall be furnished with lifting and hold down lugs, ladder clips (per OSHA requirements), manholes, calibration markings, nozzles, drains, vents, mounting hardware and other appurtenances as specified in Schedule 43 41 45-1, or as shown on the Contract Drawings.

B. Vessel Connections: All connections shall be of the number and dimensions shown on the Contract Drawings and as specified in the Contract Documents.

1. Gaskets shall be ⅛-inch thick full-face elastomeric material, Shore A60, suitable for the intended service.

2. Flanged nozzles shall be rated at 25 psig with dimensions appropriate for this pressure rating, unless otherwise required by the Contract Documents.

3. The back face of all flanges to be spot-faced, flat and parallel to the flange face. Flanges shall be of sufficient diameter to accept a metal washer under the bolt head or nut.

C. Calibration Strips: Translucent calibration (gallonage) strips shall be 6-inches wide. Calibration numbers shall be in the multiples of 200 gallons or less and shall have gallonage stenciled in 2-inch high numerals.

D. Miscellaneous Tank Requirements:

1. The outer surface of the fabricated product shall be relatively smooth and shall have no glass fibers exposed.

2. All edges of reinforcement material shall be lapped 1 inch minimum format and 2 inches minimum for woven roving. Lapped edges of adjacent layers shall be staggered.

3. All cut edges on parts which will make up a secondary joint or be incorporated into a finished product shall first be sealed with at least two coats of lay-up resin.

E. Anchor Bolts and Anchors:

1. Anchor bolts, nuts and washers shall be titanium and shall be sized by the tank manufacturer and provided by the Contractor, and shall be of the size and diameter required for anchoring the tank(s) to the foundation and meet all applicable codes and specified standards.

F. Tank Labels:

1. Tank Labels shall be in compliance with all applicable Federal, State, and local codes and regulations including but not limited to OSHA, FDNY, NFPA, and NYC Right-to-Know Requirements.

2. Tank Label: Provide permanent FRP laminated labels as per paragraph 1-530 of ASME RTP-1 and as required by 6 NYCRR Part 596 containing the following minimum information:

a. Tank Equipment Number.

b. Tank name.

c. Manufacturer.

d. Model number.

e. Manufacturer's serial number and purchase order number.

f. Total (nominal) capacity in gallons.

g. Working (usable) volume in gallons.

h. Chemical name of liquid contained and the Chemical Abstract Service (CAS) No.

i. Maximum allowable specific gravity of stored material.

j. Date of fabrication.

k. Design pressure and temperature.

l. Resin name and manufacturer's specific product identification for resin and cure system used for each laminate layer.

m. Laminate sequence for each laminate layer.

G. Chemical Labels:

1. Provide designation of chemical conforming to the specifications contained in the NFPA 704. Hazardous materials classification shall include rating for health, flammability, reactivity, specific hazard, contents, viscosity, and hazard number:

a. The sign shall be non-metallic and mounted on equipment at a height and location clearly visible for all personnel. The sign shall be located near the liquid level gauges, as shown on the Contract Drawings.

b. Provide a minimum of 2 signs per tank that are shop fastened and readily visible when tanks are installed.

2. Warning labels as required by 6 NYCRR Part 596.2(h) (4).

3. Size of labels shall be 18-in. x 18-in., unless a larger size is shown on the Contract Drawings or required by the Contract Documents.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. At a minimum, the following vessel inspection operations shall be conducted:

1. Measurement of Tolerances:

a. Tolerances for laminate thickness shall comply with ASME RTP-1, paragraph 6-920 (f) (2).

b. Tolerances for average spot thickness shall comply with ASME RTP-1, Sub-part 2C-110.

c. Tolerances for average thickness of a major part shall comply with ASME RTP-1, Sub-part 2C-120.

d. Any component of the FRP tanks which does not satisfy the tolerances specified will be cause for rejecting the tanks.

2. The minimum acceptable level for workmanship, finish and appearance shall conform to the requirements of ASME RTP-1. The finished product shall conform to Table 6-1, RTP-1 Visual Inspection Acceptance Criteria. Level of acceptance shall be as specified in ASME RTP-1 Section 1.08, Shop Tests, unless specified otherwise in the Contract Documents.

3. Visual defects shall be classified in accordance with Table 6-1, ASME RTP-1 Visual Inspection Acceptance Criteria and RTP-1 Section 6-940, Laminate Imperfections – Visual Inspection.

B. Shop Tests:

1. Shop Hydrostatic Testing:

a. Preliminary Inspection: Prior to hydrostatic testing of any vessel, that vessel shall be made available indoors for the Engineers and the City's inspection, which will include but not be limited to following:

1) Vessel size, dimensions and fabrication tolerances.

2) Proper nozzle and appurtenance placement per fabrication drawings.

3) Minimum design thicknesses.

4) Minimum structural joint widths and thicknesses.

5) Inner seam integrity and continuity.

b. General:

1) All materials, labor and equipment for all tests and retests shall be furnished by Contractor.

a) This will not relieve Contractor from repairing leaks that may appear when vessels are filled for testing.

c. Blind flange, seal, or plug all openings in the FRP tanks, as required for testing.

d. Procedure: Fill with water to the top of the straight side shell. Each tank shall remain full for a period of 24 hrs.

e. There shall be no leakage from the tanks, however small.

f. Repair:

1) Any leak shall be repaired by a manufacturer's factory-trained serviceman with reinforcing and resin to match tank.

2) Repaired surface shall be equal in strength and corrosion resistance to original tank material.

2. After final curing, the interior of all tanks shall additionally be shop tested for Acetone Sensitivity in accordance with ASTM C582, paragraph 9.2.2.

3. Barcol hardness readings of all tanks are required and shall be performed in accordance with ASTM D2583, paragraph 12 and in accordance with ASME RTP-1, sub-part 6-910. Barcol hardness shall be taken at various areas inside and outside of FRP vessels and recorded. As a minimum one set of readings for the top, two sets of readings for the vertical straight shell and one set of readings for the bottom. Submit Barcol hardness readings to Engineer.

4. Shop tests shall include a final inspection after hydrostatic testing by the manufacturer and a written record of this final inspection shall be provided. This final inspection shall be in accordance with 6 NYCRR Part 599.11 and ASME RTP-1, sub-part 6-910. Final inspections shall include but not be limited to a check of: punctures, scrapes of corrosion barrier, cracks, structural damage, resin cure, dimensions, laminate thickness, physical properties, reinforcing content of the corrosion barrier and structural layers of all major components, pressure tests and visual inspections for laminate imperfections.

a. The resin-rich interior surface consisting of the synthetic Nexus veil and the corrosion barrier consisting of the three (3) mat layers shall be visually inspected to ensure that imperfections in this laminate are within the tolerances of ASME RTP-1. The interior surface and corrosion barrier shall have no more visual defects allowed other than what is permitted under Table 6-1, ASME RTP-1 Visual Inspection Acceptance Criteria Level 1. Gaseous bubbles or blisters shall be limited in quantity to four (4) per square inch. The maximum percent repairs allowed shall be limited to 1.5% of the components total surface area.

b. The structural layer of each tank shall be visually inspected to ensure that imperfections in this laminate are within the tolerances of ASME RTP-1. The structural layer shall have no more visual defects allowed other than what is permitted under Table 6-1, ASME RTP-1 Visual Inspection Acceptance Criteria Level 1. Gaseous bubbles or blisters shall be limited in quantity to ten (10) per square inch up to $^{1}/_{16}$–inch in diameter and four (4) per square inch from $^{1}/_{16}$–inch to $^{3}/_{16}$-inch in diameter. The maximum percent repairs allowed shall be limited to 3% of the components total surface area.

c. The outer exterior layer consisting of three (3) mat layers of fire retardant resin and surfacing veil shall be visually inspected to ensure that imperfections in this laminate are within the tolerances of ASME RTP-1. The structural layer shall have no more visual defects allowed other than what is permitted under Table 6-1, ASME RTP-1 Visual Inspection Acceptance Criteria Level 2. Gaseous bubbles or blisters shall be limited in quantity to ten (10) per square inch up to $^{1}/_{16}$-inch in diameter and four (4) per square inch from $^{1}/_{16}$-inch to ¼-inch in diameter. The maximum percent repairs allowed shall be limited to 10% of the components total surface area.

5. All visual inspections shall be made before the exterior finish gel coating is applied to the tank.

6. Shop test reports shall include the following information:

   a. Hydrostatic test report as described herein

   b. Acetone sensitivity test results for all components

   c. Barcol hardness test reading for all components

   d. Provide glass content rest results in accordance with ASTM D2584 of both the corrosion layer and the structural layer of the laminate cutouts and other components.

   e. Thickness measurements of the corrosion barrier, structural layer and outermost fire retardant layer of all components

f. Measurements showing compliance with dimensions and tolerance in diameters, lengths, squareness of ends, angle of fittings and flanges and flatness of flanges.

g. Provide Tensile Test results of the structural layer of laminate cutouts per ASTM D638, if applicable.

h. Provide Flexural Test results of the structural layer of laminate cutouts per ASTM D790, if applicable.

i. Certification of compliance of visual acceptance criteria of laminate quality for presence of pits, foreign inclusions, dry spots, air bubbles, pinholes, pimples, delamination, etc., as required above.

7. Certified shop tests shall be performed for all equipment provided.

C. Shop inspections shall be made by NYC DEP representatives only for equipment listed in the Contract Documents as being subject to Witness Shop Testing and Quality Assurance Inspection. If the equipment is listed in the Contract Documents as being subject to Witness Shop Testing and Quality Assurance Inspection:

1. The Contractor shall give ample notice to the Engineer prior to the beginning of any work so that inspections may be performed. Shop Quality Assurance Inspections will be performed in accordance with the requirements of Contract Documents.

2. As a minimum, the Division of Design Services, Quality Assurance Section shall conduct the following Quality Assurance Inspection operations at the manufacturer's facility(ies):

a. Review and obtain material certifications and/or Certified Material Test Reports for all specified items.

b. Witness mixing of resins and obtain copies of Resin Mix Data Sheets for all resins mixed and used.

c. Only new resin shall be used for NYC DEP Contracts. Resin manufacturer's shelf life shall not be exceeded. Opened resin containers shall be dated and labeled to indicate all components added by percentage weight.

d. Witness lay-up and fabrication to ensure compliance with the approved laminate sequence.

e. Review and obtain copies of Component Data Sheets for all vessel subsections fabricated.

f. Witness removal of cutouts and retain cutout samples of the laminate for assessment of laminate properties and laminate construction.

g. Witness wall thickness and other dimensional inspections, including measurement of both corrosion and structural layers.

h. Witness glass content test of corrosion layer & structural layer in accordance with the contract specifications and ASTM D2584 and ASME RTP-1.

i. Perform inspection for quality and workmanship of completed and in-progress work as per ASME RTP-1, Table 6.1, as applicable.

j. Witness Barcol Hardness measurements per ASTM D2583 and ASME RTP-1 and Acetone Sensitivity tests per ASTM C582 on the inside and outside of the FRP tanks, after post-cure.

k. Perform final visual and dimensional inspection.

l. Inspect accessories and spare parts.

m. Obtain representative samples of fasteners to verify material conformance.

n. Witness hydrostatic pressure shop test.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Prior to final inspection of FRP tanks, all surfaces shall be made clean by brushing, wiping, or with a compressed air blast as required to remove all loose foreign materials.

B. Upon delivery of the FRP tanks to the site, a thorough examination shall be performed. Particular areas to be inspected for damage are as follows:

1. Top of load (tank).
2. Widest part of load (tank).
3. At cradles or straps holding load (tank).
4. For open top tanks: check location of spiders supporting open end and tank flange.
5. End blocking.
6. All nozzles and manways for cracking/separation.
7. Rotation of tank during transit.

C. Engineer reserves right to reject any and all FRP tanks found to have following: blisters, chips, crazing, exposed glass, dry cracks, burned areas, dry spots, foreign matter, or entrapped air at the laminate surfaces which do not satisfy the tolerances specified in ASME RTP-1, Table 6-1, visual acceptance levels as hereinbefore stated for inside and outside surfaces. If upon inspection more than 5% of the total aggregate area of the FRP tank is found to have a combination of the above listed shortcomings the vessel shall be deemed not acceptable. In the event the tanks are found to be damaged and dependent upon the extent of the damage, the Engineer may:

1. Reject the tanks; or
2. Require the manufacturer to provide the personnel, materials, and equipment to perform the necessary repairs.

3.02 INSTALLATION

A. Installation of the FRP tanks shall be in complete accordance with the manufacturer's printed instructions and the approved shop drawings.

B. Install FRP tanks in the locations shown on the Contract Drawings.

C. Tanks shall be installed in such a manner that connecting piping will not impose any strain on the tank connections.

D. All tanks shall be installed on equipment pads.

1. Equipment pads shall have grooves provided as shown on the contract drawings to visually determine if the bottom of the tank is leaking.
2. The reinforced concrete support base surface shall be free of cracks, depressions and vertical projections.
3. Surface should be trowel finished to American Concrete Institute Specifications (ACI 301, "Trowel Finish").
    a. Flatness shall be determined using the manual straightedge method per ACI 117.
    b. The maximum allowable gap shall be $^{1}/_{16}$-inch.
    c. Levelness shall not exceed 0.1%.
4. Examine equipment pads for:
    a. Proper anchor bolt locations.
    b. Unevenness, irregularities, and incorrect dimensions.
5. Vertical vessels should be set on a cushioning pad to minimize stresses caused by seams, shrinkage distortion, and bottom head and/or support base irregularities.
    a. A minimum of two layers of 30 lb. roofing felt equal in diameter to the outside diameter of the equipment plus 2 inches (O.D. + 2 inch), shall be laid directly on the surface of the support base.
    b. The center of the pad shall be built up by the addition of two layers of the same material, one equal to ½ the diameter of the vessel and the other equal to ¼ the diameter of the vessel.
    c. A suitable pad sheet material of proper environmental resistance material can be substituted for the roofing felt.
6. Where a vessel has a bottom drain, provisions shall be made in the base pad with minimum of 1½-inch clearance so that contact will not occur between the pad, the nozzles, or nozzle flange. Where a trench in a base pad is

required to accommodate bottom discharge piping, a structural trench cover shall be installed flush with the top of the base pad to minimize the unsupported area of the tank. All flat bottom equipment should be secured in place by bolting to the base pad through hold down lugs to minimize the chance of equipment damage at nozzle locations and area of other attachments due to movement of the unit.

E. Hold down lugs shall be bolted to the pad using titanium anchor bolts, at least ½-inch in diameter. Hold down lugs and anchor bolts shall be sized by the tank manufacturer and provided by the Contractor.

F. Any visual abrasions to the vessel shall be sealed with a resin compatible with the original resin in accordance with the manufacturer's recommendations and repair procedures approved by Engineer.

3.03 FIELD TESTING / QUALITY CONTROL

A. After installing the FRP tank, all openings in the tank shall be plugged and tank shall be filled with water to the top of the straight shell. Over a period of twenty-four (24) hours, there shall be no leakage from the tank. In the event of leakage, the tank shall be considered damaged and, as per Article 3.01, the Engineer may:

1. Reject the tanks; or

2. Require the manufacturer to provide the personnel, materials, and equipment to perform the necessary repairs.

B. Leakage tests shall be repeated for any replaced or repaired tank. Tank will not be accepted unless it passes the leakage test.

C. No additional payments will be made for tests or retests.

D. Passage of the leakage test does not relieve the Contractor from repairing leaks that may appear when the tanks are filled with the service liquid.

3.04 STARTUP / DEMONSTRATION

A. Furnish the services of a qualified manufacturer's representative to check and approve all installations before operation as well as conduct field testing, in accordance with the requirements of the Contract documents. In addition, the manufacturer representative shall:

1. Assist in the installation of the equipment;

2. Check the installation before the equipment is placed into operation;

3. Assist in the performance of field tests;

4. Assist in the start-up of the equipment; and

5. Train the plant operations and maintenance staff in the care, operation, and maintenance of the equipment.

6. Verify that all work furnished and installed conforms to the requirements the Contract Documents.

B. At a minimum, the services of the manufacturer's representative shall be provided as indicated, below. The time per tank and person-days per visit indicated below shall be understood as referring to the total required services for each individual tank provided under this Specification.

Visit	Purpose:	No. of Visits	Person-days per visit
1	Installation Checkout	2	1
2	Field Testing	2	1
3	Startup	2	1
4	Training	1	1

C. The services provided shall be in accordance with the requirements of the Contract Documents. In addition:

1. Regardless of the time per tank and person-days per visit indicated, above, the Contractor shall provide the services of the manufacturer's representative at such times and for such durations of time as needed to perform the tasks required of the representative as specified.
2. The Engineer reserves the right to require that any unused person-days from any visit will be applied to any other specified visit.
3. Person-days shall be understood only as days spent on-Site (not in transit).
4. Unless otherwise authorized by the Engineer, the manufacturer's representative shall be a direct employee of the equipment manufacturer, with at least 3 year experience in the installation, testing, and start-up of equipment of the type provided under this Specification. The manufacturer's sales and marketing personnel will not be accepted as manufacturer's representatives.
5. The manufacturer's representative shall sign in and out at the office of the Engineer each day they are at the Site.
6. Reports: The Contractor shall submit reports from the manufacturer for each visit to the Site of the manufacturer's representative as per the requirements specified herein.
7. In addition, Manufacturer shall furnish the services of person(s) authorized by manufacturer to witness the unloading at the site of FRP tanks. Manufacturer's sales and marketing personnel may be accepted as authorized person(s) to perform these specific tasks.

SECTION 43 41 45.01 – MODIFICATIONS TO FIBER-REINFORCED PLASTIC TANKS

CONTRACT WP-169 CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified and required, to modify the existing fiberglass reinforced plastic (FRP) tanks, complete and operational.

B. The following index of this Section is presented for convenience:

Article	Title	Section Page
PART 1	GENERAL	1

1.05 DESCRIPTION

A. This Section includes requirements for modifying the existing FRP tanks at the FBCSO Facility. The existing tanks are empty.

1. The tanks will be used for the storage of chemical solutions that will be pumped into the tanks from tanker trucks and pumped out of the tanks by chemical metering pumps or chemical transfer pumps.

2. The existing tank information and project specific requirements can be found in Schedule 43 41 45.01-1, Existing Fiber-Reinforced Plastic Tank Details, located after the "End of Section" designation and the Contract Drawings. Interior inspections of the tanks have been performed and are attached as Attachment 1 for reference.

3. The modifications to the each of the existing FRP tanks listed in Schedule 43 41 45.01-1, consist of the following:

a. Replacement of all tank gaskets.

b. Interior cleaning of the tanks using potable water.

c. Installation of side access manway.

d. Replacement of the liquid level sight gages.

e. Installation of dip pipe for new transfer pump connection.

f. Installation of tank liner.

g. Installation of additional tank labels.

h. Installation of additional chemical labels.

i. For Tank No. FB4215-07, the lower end of the existing interior fill header/agitator shall be placed back in the tank support bracket. Refer to the Tank Inspection Reports included as Attachment No. 1 at the end of this Section for details and photos.

j. Provision of new mounting hardware, including titanium nuts, bolts, and washers for existing tank top access manway covers. There are two access manway covers on each tank. The hardware shall be as specified for manway access covers on the new Side Manways specified herein.

B. All components provided shall be compatible for use with up to 15-percet sodium hypochlorite solution.

1.06 QUALITY ASSURANCE

A. Manufacturer of the side manways shall have a minimum of ten (10) years' experience in the design and fabrication of FRP nozzles of similar size and type to those shown and specified herein, and who have in the opinion of the Engineer sufficient experimental and test data to confirm the design of the specified FRP side manways.

B. Side Manways Installer Qualifications:

1. Engage a single Installer skilled, trained and with successful experience in the field service modifications of existing FRP tanks and who agrees to employ only tradesmen with specific skill and successful experience in this type of Work. Installer shall have a minimum of five (5) years of experience, should work for a fiberglass fabrication company and be able to submit evidence of a minimum of three other successful modifications to existing FRP tanks of similar size and nature.

C. Manufacturers of the tank liner material shall have a minimum of five (5) years' experience in the design, manufacture, and installation of this product.

D. Tank Liner Installer Qualifications:

1. Engage a single Liner Installer skilled, trained and with successful experience in the installation of the flexible tank liner inside each tank. Liner Contractor shall have a minimum of five (5) years of experience, should work for a fiberglass fabrication company and be able to submit evidence of a minimum of three other installations to existing FRP tanks of similar size and nature.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

a. Quality Assurance Requirements

1) Side Manway Installer: Submit Installer's record of experience in work similar to that required under this Section.

2) Liner Installer: Submit Installer's record of experience in work similar to that required under this Section.

b. Shop Drawings:

1) Side Manways:

a) Description of fabrication of the side manways, identifying all materials used and methods of fabrication, including but not limited to:

(1) Complete assembly, layout showing the layups and reinforcement around the openings and the required clearances, and installation drawings with clearly marked dimensions for side manways to be installed.

(2) Complete description of chemical resistance for all materials that will come in contact with the materials stored, including a certification from the manufacturer that the various materials, including resins and veils, used are suitable for the intended application (including maximum rated chemical concentrations and temperature).

(3) Laminate specifications including resin and reinforcing materials required, layer (laminate sequence) construction and thickness, glass data and specifications, resin properties, resin curing processes, post cure processes, and any and all catalysts used. All design calculations shall be coordinated with ASME RTP-1 requirements.

(4) All shop drawings and design calculations for the side manway access shall be coordinated with ASME RTP-1 requirements.

2) Dip Pipes:

   a) Complete product data sheet(s) for dip pipe and dimensional drawings for installation.

3) Gaskets:

   a) Complete product data sheet(s) for gaskets. The size(s) submitted for approval shall be specifically identified on the product data sheet(s).

4) Sight Level Gauges:

   a) Complete product data sheet(s) for sight level gauges. The size(s) submitted for approval shall be specifically identified on the product data sheet(s).

5) Tank Liners:

   a) Complete product data sheet (s) for the liner material such as linear composition and chemical compatibility information, strength and elasticity data and temperature ratings.

   b) Complete product data sheet (s) for the liner support structure.

   c) Site-specific liner installation details for all nozzle connections.

   d) Site-specific liner installation details for the interior support structure, including number of support rings and spacing.

   e) Site-specific liner installation procedures.

   f) Installation, maintenance and cleaning instructions.

6) Tank Labels:

   a) Complete product data sheet(s) for tank labels and tank label information.

7) Manway Access Cover Mounting Hardware:

   a) Complete product data sheet(s) for bolts, nuts, and washers required to secure access covers for all manways, new or existing.

c. Calculations:

1) Side Manways:

a) Structural design computations for each FRP manway signed and sealed by a New York State Professional Engineer. Calculations shall include at a minimum, details of reinforcement around side manways and thickness of the manways.

d. Test Reports.

1) Side Manways:

a) Documentation of construction procedure.

b) Inspection tests such as Barcol Hardness Test, RTP-1 Level 2 Visual Inspection and Acetone Sensitivity Test

2) Tank Liners:

a) Provide Liner Installer's Certificate of Proper Installation for each liner after the installation is complete, but not prior to testing.

b) Provide leakage test results.

2. Information Submittals:

a. Materials Compatibility Certification:

1) Certificate of chemical resistance for the following materials:

a) laminate reinforcing material used.

b) resin and cure system used for the structural layer.

c) resin and cure system used for the corrosion resistant barrier.

d) fire retardant additives.

e) other additives.

f) gasket materials.

g) tank liners.

2) For laminates, resins, and other FRP additives, this certification shall state that the resins used in the fabrication of the laminates have been evaluated in accordance with ASTM C581 for chemical resistance for a service comparable to the intended service and that the resin is recommended by the resin manufacturer for the intended service.

3) For Tank Liners and Gaskets, provide certification from the manufacturer of each that the material used will provide chemical resistance for a service comparable to the intended service.

b. Warranty certificates.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall provide spare parts and special tools, necessary to service, disassemble, repair, and adjust the equipment provided under this Section, and as per the requirements of the Contract Documents. In addition:

1. Provide the following spare parts for each FRP tank listed in Schedule 43 41 45.01-1:

a. Provide one (1) side manway gasket and set of titanium bolts, nuts, and washers for the manway access cover.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer’s standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Side Manways:

1. Composites USA, North East, MD
2. Troy Dualam Inc., Brockville, ON, CA.
3. Augusta Fiberglass, Blackville, SC.
4. Belco Manufacturing, Belton, TX.
5. RL Industries, Fairfield, OH.
6. Or approved equal.

B. Resins and Veils:

1. Ashland Inc., Dublin, OH.
2. Dow, Midland, MI.
3. AOC, Collierville, TN.
4. Or approved equal.

C. Tank Liners:

1. Flexi-Liner Corporation, Chino, CA
2. No alternate manufacturer or product will be accepted.

2.02 MATERIALS / EQUIPMENT

A. Regulatory Requirements:

1. Tank components shall be designed and constructed in accordance with ASME RTP-1. Tank components do not require ASME RTP-1 Stamp.
2. Laminate construction shall be ASME Type I or Type II except as modified herein.
   a. The use of a manual chopper gun shall not be permitted.
   b. Semi-automatic or automatic chopper guns shall be permitted only with the approval of the Engineer.
3. Shell joints and secondary bond overlays for vessel penetrations shall be in accordance with ASME RTP-1, Section 4-300 or Section 4-400, except that each successive overlay ply shall overlap the preceding ply by 1-inch minimum on each side.
4. FRP components shall have an ASTM E84 Flame Spread Rating of less than 25 achieved by fabricating the outermost three (3) mat layers and outer surface veil layer from the halogenated resin with additional antimony pentoxide and cure system specified. The entire corrosion

barrier and structural laminate shall be fabricated using the corrosion resistant resin and cure system specified.

B. General Design Requirements:

1. All material shall be new and both workmanship and materials shall be of the very best quality, entirely suitable for the liquids which the FRP tanks are to contain and shall conform to all applicable requirements specified herein.

C. Side Manway Materials:

1. General: The materials used for side manway installation shall be clean, consistent in quality and in conformance with these specifications and the manufacturer's specifications for the materials.

a. All batches of resin that have been modified by the addition of additives (such as promoters or accelerators) shall be tested for gel time and proper cure characteristics.

b. The laminate surface and materials temperatures shall be as specified by the resin manufacturer. A minimum 5 degree F spread between the atmospheric wet bulb (higher) and the laminate surface temperatures shall be maintained at all times during fabrication.

c. All fiberglass reinforcements, catalysts, cure-control additives and paraffinic waxes used shall be as recommended by the resin manufacturer, in writing, as consistently giving the best results with the resin being used. Resin binders in chopped strand mats shall be suitable for fabrication of the corrosion barrier.

2. Resins: Resins shall be suitable for the liquid to be contained in the FRP tanks.

a. Resin for the corrosion barrier and structural layer shall be similar to the existing material used on the existing FRP tanks and shall be a Bisphenol A Epoxy Vinyl Ester Resin compatible with the material stored.

b. Resins used in the corrosion barrier and resin-rich inner liner and structural layers shall not have any fire retardant agents or antimony compounds and shall be cured using Benzoyl Peroxide (BPO) catalyst and a Dimethylaniline (DMA) promoter cure system.

c. No thixotropic agent shall be added to resins used for the resin-rich inner liner, corrosion barrier, or structural layer. Up to 2 percent by weight of thixotropic agent may be added for viscosity control of resins not used for a corrosion barrier and resin-rich inner liner. The quantity of thixotropic agent added, however, shall not interfere with visual inspection of the laminate. No other fillers to the resin, including pigments, dyes and colorants, shall be permitted, unless approved in writing by the Engineer.

d. An ultraviolet adsorption agent shall be added to the resin throughout the outer layer beyond the structural layer.

3. Reinforcement: Glass reinforcement shall be Type E, electrical glass, unless otherwise specified in Schedule 43 41 45-1.

a. Surfacing Veil:

1) Protective veils for exterior surfaces shall be Type C glass surfacing mat. The thickness of the surfacing veil shall be 10 to 20 mils for all applications.

2) Surfacing veils for interior surface applications where the glass may be attacked by compounds in the process shall be a suitable spun-laced synthetic organic entangled fiber fabric not less than 20 mils in thickness, consisting of two plies of 10 mils each with each ply separately gelled prior to application of the subsequent ply, all backed by chopped strand in resin.

b. Chopped strand mat shall be Type E glass, 1½ oz./sq ft.

c. Continuous roving used in chopper guns for spray-up shall be Type E glass with coupling agent.

d. Woven roving shall be Type E glass, 24 oz./sq. yd, 4 x 5 weave.

e. Woven cloth shall be Type E glass.

4. Laminate Construction:

a. The structural laminate thickness of the tanks and components shall be ½-inch minimum, or double the calculated design thickness, whichever is greater.

b. The corrosion barrier shall consist of Type I Laminate and shall contain two (2) resin rich veil layers (saturated with catalyzed resin)

followed by three (3) layers of chopped strand mat (saturated with catalyzed resin).

1) The total thickness of the resin rich veil layer shall be 20 to 30 mil (0.02 to 0.03-inch). These first layers consisting of veil and resin shall contain 90 percent resin and 10 percent veil material by weight.

2) Each layer of chopped strand mat (saturated with catalyzed resin) shall have a thickness of 43 mils. The chopped strand mat layers in the finished corrosion barrier laminate shall be 70-80 percent resin and 20-30 percent glass by weight.

3) The inner corrosion barrier plus the three mat layers shall total 0.149-inches minimum thickness and constitute the inner lining. The entire lining shall reach complete cure before the structural layers are applied. The corrosion barrier thickness shall not be included in the structural laminate thickness calculations.

c. The structural layer shall consist of a Type II laminate saturated with catalyzed resin. The structural layer shall be placed over the corrosion barrier within 12 hours after the corrosion barrier has cured, otherwise the surface of the corrosion barrier must be completely ground to assure adequate bonding with the structural layer being applied. The structural layer shall have an average glass content of at least 35 percent by weight per ASTM D2584.

5. The post-cure process shall be a heat post cure utilizing a forced hot air heating system or an oven curing system.

a. If a forced hot air heating system is used for the heat post-cure, as per the resin manufacturer's recommendations, the manufacturer shall utilize a forced hot air heating system that induces the heat on the interior and forces the heat through the wall to the exterior. An optimum cure is achieved when the temperature normalizes on the tank exterior.

1) Post-curing may also be conducted in a hot air convection curing oven such that both the interior and exterior laminate surfaces are exposed to the same hot air temperatures.

2) Post-curing ovens/structures shall be equipped with time/temperature recording devices such that the temperatures are logged. A continuous record or chart or curing air temperatures shall be made available for review by the Engineer prior to shipment of the tanks.

3) Manufacturer shall post-cure the equipment at a minimum of 180 degrees F. Post-cure temperature shall not exceed the Heat Distortion Temperature of the resin.

4) The post-cure hold period shall be a minimum of 4 hours. The duration of the hold period shall be engineered based upon laminate volume. Laminate volume calculations shall be made available for review by the Engineer along with the post curing temperature charts specified above.

5) The post-cure temperature shall be ramped up to and down from the hold period temperature to avoid thermal shock to the laminates being cured. The post-cure period, including ramping and holding time shall be a minimum of 6 hours and shall be engineered based upon laminate volume plus laminated thermal properties. The calculations shall be made available for review by the Engineer along with the previously specified calculations.

6) Any cracking that results from the post-cure process shall meet RTP-1 visual inspection acceptance criteria, Table 6-1.

7) All FRP covers and blinds shall be removed from the tanks during post-cure; Manway covers shall be post-cured.

D. Tank Liners:

1. General:

a. Liner shall be fabricated in one piece.

b. Liner and all material components shall be selected for the specific chemical service required. Chemical services include the following water treatment chemicals:

1) Sodium Hypochlorite (15%)

2. Liners:

a. Material: Modified vinyl terpolymer in accordance with ASTM D130.

1) Specific gravity: 1.32 in accordance with ASTM D792.

2) Durometer Hardness “D”: 65 in accordance with ASTM D2240.

3) Tensile Strength: 3,200 psi in accordance with ASTM D412.

4) Modulus at 300% Elongation: 2,100 psi.

5) Elongation at Break: 325% in accordance with ASTM D638.

6) Graves Tear: 420 lbs/inch in accordance with ASTM D624.

b. Thickness: 0.065-inch minimum thickness

3. Support Structure:

a. Materials: PVC piping in accordance with Section 40 05 31 – Thermoplastic Process Pipe and polyethylene tubing.

b. Fabrication: PVC to PVC connections shall be solvent cement glued.

E. Dip Pipe

1. Material: CPVC in accordance with Section 40 05 31 - Thermoplastic Process Pipe or fiberglass. PVC cement shall be compatible with the chemical

2. Size: 1.5-inch

3. Inside each storage tank, install a flanged dip pipe connected to the tank top inlet nozzle connected to transfer pump discharge. Each dip pipe shall be equipped with one-inch diameter siphon break hole drilled at an elevation equal to the centerline elevation of the tank overflow pipe.

4. Each dip pipe shall be installed with sufficient number of pipe supports molded to the tank interior wall to restrain the dip pipe. Pipe support shall provide not only restraint of dip pipe, but also permit dip pipe removal.

F. Gaskets:

1. Material: Viton.

2. Thickness: 1/8-inch

3. Gaskets shall be suitable for Class 150 flange connections.

G. Liquid Level Gages:

1. General: Liquid level gages shall be furnished in accordance with the details shown on the Contract Drawings .

2. Glass Liquid Level Gage: Glass liquid level gage shall be furnished with upper and lower valves, glass tube, guard rods and all required supports. All components of the gage shall be resistant to the chemicals being stored.

a. Valves shall be of plastic, furnished with internal ball checks in case of glass tube breakage and provided with ¾-in. NPT male threads to fit the threaded outlet fitting on the tank. Materials of construction to be compatible with the stored chemical.

b. Glass gage shall be installed so that the full capacity of the tank shall be measured. Tubes shall be ¾-inch diameter and shall be graduated to indicate gallons or feet of liquid remaining in the tank.

c. Four guard rods with a minimum diameter of $^{3}/_{16}$-inch shall be provided.

H. Flange and Installation Hardware for all Components:

1. Provide bolts, nuts, and washers fabricated of commercially pure, Grade 2 Titanium, 47 Ksi minimum yield strength, and 50 Ksi minimum tensile strength. Bolts and nuts shall be hex-flange type, with SAE dimensions and coarse threads. Provide flat washers.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Gaskets: Gaskets shall be provided for all existing vessel connections in the number and dimensions shown on the Contract Drawings and as specified in the Contract Documents.

B. Tank Liners:

1. Liner Contractor shall fabricate a fully enclosed liner, including floor, sidewall, and top for installation into existing horizontal storage tanks in accordance with the details shown on the Contract Drawings or as specified in Schedule 43 41 45.01-1. The Contractor shall field measure

and locate all existing tank nozzles, openings, manways and penetrations and new manways as needed for the custom fabrication of the tank liner.

a. Tank Nozzles and Manways:

1) Tank nozzles and manways are flanged for external pipe connections.

2) The liner nozzle shall extend from the liner body through the tank nozzle with an exterior liner flange to provide complete protection of the tank and nozzle.

3) Liner boots or nozzle flanges shall be attached to the liner body using heat welding.

4) Liner boots on tank fill or transfer lines that enter from the tank ceiling shall be reinforced and supported by means other than relying on the exterior flange gaskets for support.

2. Liner shall be constructed so that all seams and joints between two or more components shall be thermally fused using RF-welding or heat-welding. Glued or adhesive-bonded seams or joints are not acceptable.

C. Tank Labels:

1. Tank Labels shall be in compliance with all applicable Federal, State, and local codes and regulations including but not limited to OSHA, FDNY, NFPA, and NYC Right-to-Know Requirements.

D. Chemical Labels:

1. Provide designation of chemical conforming to the specifications contained in the NFPA 704. Hazardous materials classification shall include rating for health, flammability, reactivity, specific hazard, contents, viscosity, and hazard number:

a. The sign shall be mounted on equipment at a height and location clearly visible for all personnel. The sign shall be located near the liquid level gauges, as shown on the Contract Drawings.

b. Provide a minimum of 2 signs per tank that are shop fastened and readily visible when tanks are installed.

2. Size of labels shall be 18-in. x 18-in., unless a larger size is shown on the Contract Drawings or required by the Contract Documents.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Tank Liners:

1. All plant welds shall be inspected and tested prior to shipment. All plant-welds shall be lap-weld with a minimum ½-inch overlap. Thickness of the finished weld shall not be more than 0.010-inch more than the thickness of the unwelded original material.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Contractor shall inspect and clean the interior of each existing FRP tank prior to beginning the modification work.

1. All interior surfaces shall be made clean by brushing, wiping, or with compressed air blast as required to remove all loose foreign materials. There shall be no remaining chemical product or standing liquid upon completion of the tank cleaning.

B. Upon delivery of the FRP side manways to the Site, a thorough examination will be performed. The Engineer reserves the right to reject any and all or require repair to FRP sideways found to have blisters , chips, crazing, exposed glass, dry cracks, burned areas, dry spots, foreign matter, or entrapped air at the laminate surfaces which do not satisfy the tolerances specified in ASME RTP-1, Table 6-1, visual acceptance levels as hereinbefore stated for inside and outside surfaces.

3.02 INSTALLATION

A. Side Manways:

1. Installation of the side manway access hatch shall be in accordance with the manufacturer’s/installer’s instructions and approved drawings.

2. Install side manway in the locations shown on the Contract Drawings.

B. Gaskets:

1. Contractor shall reinstall existing flange hardware.

C. Tank Liners:

1. Liner shall be provided with a suspension system fastened to J-hooks fastened to the roof of the tank.

2. Field adjustments of the factory installed liner shall not be permitted and shall be cause for rejection of the liner.

3. The liner nozzle shall extend from the liner body through the tank nozzle with an exterior liner flange to provide complete protection of the tank and nozzle.

4. Liner boots or nozzle flanges shall be attached to the liner body using heat welding. Field welds shall be lap-welded with minimum of 3-inch overlap. Field welds shall be vacuum tested.

5. Liner boots on tank fill or transfer lines that enter from the tank ceiling shall be reinforced and supported by means other than relying on the exterior flange gaskets for support.

6. Special care must be taken in protecting the installed liner against protrusion of existing tank nozzles into the interior of the tank.

3.03 FIELD TESTING / QUALITY CONTROL

A. Leakage Tests:

1. Contractor shall perform leakage tests on each tank after installing the tank liners.

2. Test Procedure

a. Bulkhead the openings and fill the tanks with potable water to a level 6-inches below the overflow level.

1) The tank shall be kept full until the water temperature has stabilized but not less than 24 hours before the start of the leakage test.

b. Measure the water surface elevation from a fixed point on the tank at two locations 180-degrees apart.

c. Where environmental conditions could lead to changes in water level due to evaporation or precipitation, measurement of these factors shall be made as specified for testing concrete structures.

1) A clear plastic calibrated open-top container not less than 18 inches in diameter and depth shall be partially filled, floated in the tank, and held in position near each measurement location.

2) The container shall be located so as not to be shaded by tank walls and away from any items passing over it such as beams or pipes.

d. The following measurements shall be recorded at each test location at the start of the test period and 24 hours later:

1) Distance from reference point to test water surface.

2) Depth of water in the floating container.

3) Temperature of the test water at 18 inches below water surface.

4) Temperature of the water in the evaporation-precipitation container at mid-depth.

e. The exterior surface of the structure shall be inspected for leakage, especially in areas around joints.

f. Leakage:

1) The change in water surface elevation at each test location shall be averaged.

2) The total change in test water surface elevation shall then be adjusted by the average change in water surface elevation in evaporation-precipitation containers, if applicable.

3) Where averaged water temperature measurements vary by more than 3° F from start to completion of the test period, adjustment in tank volume shall be determined by change of water density resulting from the change in the average water temperature.

g. The leakage test shall be considered failed if there is any measurable drop in the water surface (after adjusting for evaporation and precipitation) during the 24-hour test period or if there is any visible leakage.

3. All openings in the tank shall be plugged and tanks shall be filled with water to the working capacity. Over a period of twenty-four (24) hours, there shall be no leakage from the tank.

4. Corrective Actions: In the event of leakage the Engineer may:

a. Require the Contractor to re-torque the flanges using bolting pattern as prescribed in RTP-1; or

b. Require the side manway installer to provide the personnel, materials, and equipment to perform the necessary repairs, if leakage is seen at the side manways.

c. Require the liner installation crew to provide personnel, materials and equipment to perform the necessary repairs, if leakage is seen due to the liner system.

5. Leakage tests shall be repeated for any repaired tank.

6. No additional payments will be made for tests or retests.

7. Passage of the leakage test does not relieve the Contractor from repairing leaks that may appear when the tanks are filled with the service liquid.

3.04 STARTUP / DEMONSTRATION

A. Furnish the services of a qualified manufacturer's representative to check and approve all installations before operation as well as conduct field testing, in accordance with the requirements of the Contract documents. In addition, the manufacturer representative shall:

1. Assist in the installation of the equipment;

2. Check the installation before the equipment is placed into operation;

3. Assist in the performance of field tests;

4. Verify that all work furnished and installed conforms to the requirements the Contract Documents.

B. At a minimum, the services of the manufacturer's representative and installers shall be provided as indicated, below. The time per tank and person-days per visit indicated below shall be understood as referring to the total required services for each individual tank provided under this Specification.

Visit	Purpose:	No. of Visits	Person-days per visit
1	Installation Checkout	3	1
2	Field Testing	3	1
3	Startup	1	1

C. The services provided shall be in accordance with the requirements of the Contract Documents. In addition:

1. Regardless of the time per tank and person-days per visit indicated, above, the Contractor shall provide the services of the manufacturer/installer's representative at such times and for such durations of time as needed to perform the tasks required of the representative as specified.
2. The Engineer reserves the right to require that any unused person-days from any visit will be applied to any other specified visit.
3. Person-days shall be understood only as days spent on-Site (not in transit).
4. Unless otherwise authorized by the Engineer, the manufacturer's representative shall be a direct employee of the equipment manufacturer, with at least 3 year experience in the installation, testing, and start-up of equipment of the type provided under this Specification. The manufacturer's sales and marketing personnel will not be accepted as manufacturer's representatives.
5. The manufacturer's representative shall sign in and out at the office of the Engineer each day they are at the Site.
6. Reports: The Contractor shall submit reports from the manufacturer for each visit to the Site of the manufacturer's representative as per the requirements specified herein.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

END OF SECTION

SCHEDULE 43 41 13-1

EXISTING FRP TANK DETAILS

Tank Tags:	HYPO-T-1, HYPO-T-2, HYPO-T-3
Manufacturer:	Justin Tanks
Liquid contained:	15% Sodium Hypochlorite
Temperature range: (°F)	55 to 85°F
Viscosity:	5.4
Specific gravity:	1.2
Number of tanks:	3
Nominal capacity: (gal)	8,136
Usable volume: (gal)	7,322
Horizontal tank nominal diameter: (ft)	8
Horizontal tank length: (ft)	21
Type of resin and cure:	Vinyl ester resin with BPO-DMA cure
Glass reinforcement Type:	Derakane 411
Exterior color:	Beige

*Refer to Contract Drawings for details of all tank nozzles and orientation

To Whom it may concern,

The following report will disclose the condition of the FRP equipment as it was at the time of my visit. This report should be added or kept on file to compare with future reports to monitor the vessel activity. While we attempt to discover all flaws, defects may be present that are undetectable by the inspector. These inspections are not an attempt to verify the adequacy of the original design, but rather an inspection of the current condition to suggest the most efficient and cost-effective route for repair or replacement, if needed. See the following inspection summary below.

Thank you for making me part of your inspection team. If you have any questions about this report please feel free to give me a call. I look forward to serving your inspection needs in the future.

INSPECTOR: Steven Hunt

Outside Temperature	36 º F	Relative Humidity	100 %
Inside Temperature	78° F	Barometer	

Equipment Information:
End user: Flushing Bay CSO Facility
Equipment: Manufacturer: Justin Tanks
Equipment: FRP Storage Tank
Design Pressure: Unlisted
Design Temperature: Unlisted
Weight Empty: Unlisted
Contents: Sodium Hypochlorite
Capacity: 8136 Gallons
Date Mfg.: 2003
Veil: Nexus
Liner Resin: Unknown
Structure Resin: Unknown

PURPOSE OF INSPECTION:

Inspection of current condition to assess suitability for use as these tanks are 20 years old. Located at the Flushing Bay CSO Chemical Storage Area

FINDINGS:

Egress is not ideal with the current arrangement, but manageable. A solid ladder was placed on the exterior to the manway, interior access made via rope ladder with retrieval line connected to the back D ring of safety harness. Rope ladder secured to manway rings. Continuous air monitoring with fresh air blower on hand as well as the SCBA system on hand as needed in case of emergency. There is a factory lifting lug for the tank directly beside the manway. This can easily support dead weight of a person for rescue, as an alternative to more costly options.

Upon inspection of this tank, I have found no defects that would require repair prior to use; per ASTM-D-2563. Resin rich surface is noted, where free of service buildup. There is buildup noted on the lower half of the tank. Some discoloration noted in secondary joints, patches from the factory.

The fit up of components, material placement and quality of the secondary welds are of acceptable visual quality. There is putty noted in the shell-to-shell joints. Joints overall are at minimum width.

SUB-VENDOR (if applicable): N/A
SUB-VENDOR CONTACT (if applicable): N/A

ITEM / SPEC NUMBER: ASME RTP-1, ASTM

INSPECTOR: Steven Hunt

UV scanning performed on tank interior. Nexus coverage is acceptable over visible surface. Nexus overlaps vary in width, but are acceptable.

Barcol hardness readings were taken in random areas. All readings are acceptable with no cause for alarm. No areas noted with service content permeation.

Barcol readings			
Location	**Low reading**	**High Reading**	**Average reading**
L HEAD	24	28	25
SHELL	24	27	25
R HEAD	23	26	24
SECONDARYS	22	27	24

Tank exterior has no areas of concern. Saddles appear to be in tact with no cracking or defects noted.

RECOMMENDATIONS:

Tank can be placed into service immediately. Minor defects noted will not affect service life at this point.

The original drawings should be reviewed, if possible, to ensure the resin and catalyst used for this tank so that when repairs are needed, it is available.

Preventative Maintenance inspections are suggested. For this service, it is typical to have an inspection performed every 2-3 years over the service life. With the age of the fiberglass of this scrubber, it is recommended to inspect annually. Age is 20 years old.

PURPOSE OF INSPECTION:

Inspection of current condition to assess suitability for use as these tanks are 20 years old. Located at the Flushing Bay CSO Chemical Storage Area

FINDINGS:

Egress is not ideal with the current arrangement, but manageable. A solid ladder was placed on the exterior to the manway, interior access made via rope ladder with retrieval line connected to the back D ring of safety harness. Rope ladder secured to manway rings. Continuous air monitoring with fresh air blower on hand as well as the SCBA system on hand as needed in case of emergency. There is a factory lifting lug for the tank directly beside the manway. This can easily support dead weight of a person for rescue, as an alternative to more costly options.

Upon inspection of this tank, I have found no defects that would require repair prior to use; per ASTM-D-2563. A number of minor defects that would be outside the scope of ASME RTP-1 Table 6-1, however the tank is suitable to be used as is. From what is visible on each major component (head, shell, bottom), I suspect all of the internals generally meet level 2 visual quality. Resin rich surface is noted, where free of service buildup. There is buildup noted on the lower half of the tank. Some discoloration noted in secondary joints, patches from the factory.

Reference: Inspection of FRP Tank – 4215-07

To Whom it may concern,

The following report will disclose the condition of the FRP equipment as it was at the time of my visit. This report should be added or kept on file to compare with future reports to monitor the vessel activity. While we attempt to discover all flaws, defects may be present that are undetectable by the inspector. These inspections are not an attempt to verify the adequacy of the original design, but rather an inspection of the current condition to suggest the most efficient and cost-effective route for repair or replacement, if needed. See the following inspection summary below.

Thank you for making me part of your inspection team. If you have any questions about this report please feel free to give me a call. I look forward to serving your inspection needs in the future.

Outside Temperature	36 º F	Relative Humidity	100 %
Inside Temperature	78° F	Barometer	

Equipment Information:
End user: Flushing Bay CSO Facility
Equipment: Manufacturer: Justin Tanks
Equipment: FRP Storage Tank
Design Pressure: Unlisted
Design Temperature: Unlisted
Weight Empty: Unlisted
Contents: Sodium Hypochlorite
Capacity: 8136 Gallons
Date Mfg.: 2003
Veil: Nexus
Liner Resin: Unknown
Structure Resin: Unknown

PURPOSE OF INSPECTION:

Inspection of current condition to assess suitability for use as these tanks are 20 years old. Located at the Flushing Bay CSO Chemical Storage Area

FINDINGS:

Egress is not ideal with the current arrangement, but manageable. A solid ladder was placed on the exterior to the manway, interior access made via rope ladder with retrieval line connected to the back D ring of safety harness. Rope ladder secured to manway rings. Continuous air monitoring with fresh air blower on hand as well as the SCBA system on hand as needed in case of emergency. There is a factory lifting lug for the tank directly beside the manway. This can easily support dead weight of a person for rescue, as an alternative to more costly options.

Upon inspection of this tank, I have found no defects that would require repair prior to use; per ASTM-D-2563. A number of minor defects that would be outside the scope of ASME RTP-1 Table 6-1, however the tank is suitable to be used as is. From what is visible on each major component (head, shell, bottom), I suspect all of the internals generally meet level 2 visual quality. Resin rich surface is noted, where free of service buildup. There is buildup noted on the lower half of the tank. Some discoloration noted in secondary joints, patches from the factory.

The interior support for the agitator or fill header is misplaced from its holder. See picture below. This should be reset prior to placing this into service

ITEM / SPEC NUMBER: ASME RTP-1, ASTM

INSPECTOR: Steven Hunt

The fit up of components, material placement and quality of the secondary welds are of acceptable visual quality. There is putty noted in the shell-to-shell joints. Joints overall are at minimum width.

UV scanning performed on tank interior. Nexus coverage is acceptable over visible surface. Nexus overlaps vary in width, but are acceptable.

Barcol hardness readings were taken in random areas. All readings are acceptable with no cause for alarm. No areas noted with service content permeation.

Barcol readings			
Location	**Low reading**	**High Reading**	**Average reading**
L HEAD	27	31	28
SHELL	24	29	27
R HEAD	27	30	28
SECONDARYS	26	31	28

Tank exterior has no areas of concern. Saddles appear to be in tact with no cracking or defects noted.

RECOMMENDATIONS:

Tank can be placed into service immediately. Minor defects noted will not affect service life at this point.

The original drawings should be reviewed, if possible, to ensure the resin and catalyst used for this tank so that when repairs are needed, it is available.

Preventative Maintenance inspections are suggested. For this service, it is typical to have an inspection performed every 2-3 years over the service life. With the age of the fiberglass of this scrubber, it is recommended to inspect annually. Age is 20 years old.
