GAS COST SHARING WORK (SKETCH NO. 5)

GAS MAIN ENCROACHMENT ON AND/OR PARALLEL TO EXCAVATION OF UNSHEETED TRENCH

NOTES:

(1) GAS MAIN LOCATED AS SHOWN MAY HAVE TO BE REMOVED BY THE FACILITY OPERATOR PRIOR TO THE START OF CITY EXCAVATION, OTHERWISE, THE CONTRACTOR WILL BE PAID UNDER SECTION 6.06 FOR THE SAID WORK. IF GAS MAIN IS ABANDONED THEN SECTION 6.03 SHALL APPLY.

(2) EIGHTEEN (18) INCHES FROM STANDARD NEAT LINE IS THE MAXIMUM ALLOWABLE WIDTH OF AREA THAT MAY BE DISTURBED OR EXCAVATED DURING INSTALLATION OF CERTAIN TYPES OF SHEETING SYSTEMS THAT MEET THE REQUIREMENTS OF THE STANDARD SPECIFICATIONS OF THE DEPARTMENT OF DESIGN AND CONSTRUCTION OF THE CITY OF NEW YORK.

REVISED OCT. 2004 - I. ADRIEN
REVISED OCT. 1998 - J. WONG/W. PATALANO/P. MOY

V - PRELIMINARY GAS WORK TO BE PERFORMED BY FACILITY OPERATOR.

APPLICABLE TO ALL GAS DRAWINGS:

- ALL RELOCATION WORK SHOWN IN THIS SECTION IS TO BE PERFORMED BY FACILITY OPERATOR.
- ALL SUPPORT AND PROTECTION WORK TO BE PERFORMED BY CITY CONTRACTOR
- IF ADDITIONAL INFORMATION IS NEEDED REGARDING THE FACILITY OPERATOR'S RELOCATION WORK, THE CONTRACTOR IS ADVISED TO CONTACT THE GAS COMPANY REPRESENTATIVE:

conEdison	LAST REVIEW DATE: 6/27/2024	REVIEW CYCLE:
	EFFECTIVE DATE: 8/29/2024	5 Years

SPECIFICATION: **G-11863-13**

★ **TITLE:** **INSPECTION AND ASSESSMENT REQUIREMENTS ASSOCIATED WITH EXCAVATION ACTIVITIES NEAR GAS PIPELINES AND OTHER HAZARDOUS CONDITIONS, FOR PIPELINES OPERATING AT 125 PSIG AND ABOVE (ENERGIZED & UNENERGIZED)**

VOLUME: **1 and 10**

★ **COURSE ID:** **GAS0413**

★ **REQUIRED TRAINING GROUPS:** **Gas Construction, Gas Distribution Services, Construction Management, Gas Control, The Welding Center of Excellence, Project Management and Customer Programs, Transmission Integrity Management, Transmission Maintenance, Major Projects, LNG, Corrosion Control, Gas Emergency Response Center, Tunnel Maintenance, Field Engineering and System Reliability, Gas Compliance, System Programs, Quality Control, Scheduling and Sequencing, Contractors and Per Diem Contractors**

★ Each group listed is responsible for its own training which may be specific to a title/individual and not to the group in its entirety. Please check with your local training coordinator/department.

SUBSTANTIVE REVISIONS: (See ★)

1) Cover Page - Replaced “Core Groups” and “Target Audience” with “Required Training Groups”. Identified the Required Training Groups. Included terminology for training responsibility. Updated the title of this specification.

2) Section 1.0 - This section was revised to provide clarified on the types of pipelines this specification is applicable too.

SUBSTANTIVE REVISIONS: (Continued)

3)	Section 2.0	-	Reformatted the legal section to match current format. Added in code section 49 CFR 192, Section 615 & 16 NYCRR Part 255, Section 615.
4)	Section 4.0	-	This section was added with this revision. All subsequent sections were renumbered.
5)	Section 5.0	-	This section is new with this revision. All subsequent sections have been renumbered.
6)	Section 6.1	-	Provided details as to what a gas pipeline is. Placed the Note in a text box.
7)	Section 6.2	-	Placed the Note in a text box.
8)	Section 6.6	-	Added in what the acronym GERC stands for.
9)	Section 7.1	-	Added in that the OQ Job Function Matrix can be found on the Gas Hub.
10)	Section 7.5 A)	-	Labelled image “Figure 1”.
11)	Section 7.5 B)	-	Added in that the OQ Job Function Matrix can be found on the Gas Hub. Placed the Note in a text box.
12)	Section 7.7	-	Labelled image “Figure 2”. Added in Figure 3 and the Special Precautions section discussing drip pots. Placed the Note in a text box.
13)	Section 8.2	-	Added in the title of the referenced specification G-11810.
14)	Section 8.3	-	Added in the specification associated for the referenced DOJT GAS0576.
15)	Section 8.5	-	Added in the title of the referenced specification G-11868. Updated the referenced section 8.0 to section 10.0 cause the section has changed.
16)	Section 10.1	-	Placed the Note in a text box.
17)	Section 10.5	-	Added in the title of the referenced specification G-8209.
18)	Section 10.6	-	Updated the referenced section 8.7 to section 10.7 cause the section has changed.
19)	Section 10.7	-	Added in the title of the referenced specification G-11870.

SUBSTANTIVE REVISIONS: (Continued)

20)	Section 10.9	-	Removed the referenced specification title for G-11870 as it is stated in one of the sections above.
21)	Section 10.10	-	Added in the title for the referenced drawing EO-6799-C.
22)	Section 11.0	-	This section was added with this revision. All subsequent sections were renumbered.
23)	Section 13.0	-	Added in referenced specifications G-11884, G-8153 and IP-42. Updated the titles for specifications G-11870, G-8005, G-8209, G-11854, G-11810, G-11814, and EO-6799-C.
24)	Attachment B	-	The title of this attachment was revised.
25)	Attachment D	-	The title of this attachment was revised. All of the flow charts were updated to reflect the current process.
26)	Throughout this specification and accompanying attachments the names of the groups involved were updated to clearly reflect the current process and to ensure each group was referred to correctly. The term “transmission main or TM” was replaced with “Pipeline” throughout since the definition of transmission main is being updated.		

Gas Operations Standards

★ TITLE: INSPECTION AND ASSESSMENT REQUIREMENTS ASSOCIATED WITH EXCAVATION ACTIVITIES NEAR GAS PIPELINES AND OTHER HAZARDOUS CONDITIONS, FOR PIPELINES OPERATING AT 125 PSIG AND ABOVE (ENERGIZED & UNENERGIZED)

★ 1.0 SCOPE

This specification covers the inspection and assessment procedures that Con Edison will perform associated with any excavation activity, manmade condition or natural condition that could potentially impact pipeline integrity within 25 feet of the following gas pipeline types (*referred to as "**Pipeline**" throughout this specification*):

- All energized gas pipelines (including mains, services, regulator laterals, stubs and appurtenances) operating at 125psig and above.
- All mapped unenergized gas pipelines (including mains, services, regulator laterals, stubs and appurtenances) that will be energized and operate at 125psig and above at a future date.

> **Note:** Exceptions for unenergized gas pipelines are noted within the body of this specification.

Inspection activities will also include visual inspection of the pipeline for leakage and condition of pipeline markings.

★ 2.0 LEGAL REQUIREMENTS

Federal: 49 CFR 192, Section 459, 614, 615, 705 and 935
49 CFR 196, All sections

State: 16 NYCRR Part 255, Section 459, 614, 615, 705 and 935.
16 NYCRR Part 753, All sections

3.0 ORGANIZATIONS APPLICABLE

All Con Edison departments (including Gas Operations, Electric Operations and Central Operations) that perform excavation work or have contractors that excavate for them in Manhattan, Queens, the Bronx and Westchester. This

includes all departments that oversee and monitor municipal contractors, Company contractors, third party contractors and Code Rule 753 mark-out vendors (Construction).

Also included are Gas Control; Gas Engineering – Major Projects, Gas Engineering – Transmission Maintenance; Gas Transmission Integrity Management, and Corrosion Control.

★ 4.0 OPERATOR QUALIFICATION

Span of Control means the ratio of nonqualified to qualified individuals allowed for a covered task to be performed. Nonqualified individual(s) may be directed and observed by a qualified individual when performing a single covered task. The qualified individual must be able to effectively respond to errors or abnormal operating conditions that may occur during the performance of the task by the non-qualified individuals. Tapping a pipeline, welding steel, and joining plastic pipe have a span of control of zero. Meaning, the Operator Qualified individual must perform the entire task. Certain other covered tasks also have a span of control of zero, and those are detailed in their applicable specifications and the OQ Written Plan. All other covered tasks shall be completed by either Operator Qualified individuals or individuals under the direct observation of someone who is Operator Qualified. Direct observation means that the Operator Qualified individual remains in direct visual and verbal contact at all times with the individual performing the single covered task. When span of control is being used, both the nonqualified and qualified individuals should be identified on the applicable records being generated, for the work performed under span of control.

5.0 ENVIRONMENT, HEALTH, AND SAFETY (EH&S) REQUIREMENTS

5.1 Prior to starting any task pursuant to this Specification, CECONY personnel should be familiar with the hazards associated with excavations and with the general requirements in CEHSP S13.00 “Excavation and Trenching”. If Company or contractor personnel are performing the excavation activities, these activities are to be in accordance with GEHSI E05.10 “Management of Excavation Soils on Company Property” and GEHSI E05.11

"Management of Excavation Soils on Property Not Owned By The Company".

5.2 Third-party vendors performing functions outlined in this Specification must be in compliance with the requirements in CEHSP A12.03 "EH&S Qualifications for Supplier Procurement and Oversight", including the preparation and approval of an Environmental, Health, and Safety Plan (EHASP). The approved EHASP is to be available on the job location. Job functions pursuant to this Specification are to be performed in compliance with the EHASP.

5.3 All work performed pursuant to this Specification shall be performed with due diligence for the safety of CECONY employees, contractor personnel, the public, and public property.

5.4 Notify the EH&S Control Desk (212-580-8383) immediately if CECONY personnel or company contractor personnel are involved in an accident, injury, or property damage at the job location, as per CEHSP S08.00 "Notification, Reporting, and Recording of Accidents, Injuries, and Property Damage". Contact EH&S Gas Operations Support to initiate the incident investigation.

5.5 Notify the EH&S Control Desk (212-580-8383) immediately if a spill is discovered, as per GEHSI E02.01 "Spill Reporting". Contact EH&S Gas Operations Support for guidance related to spill clean-up.

5.6 Prior to starting any task pursuant to this Specification, Con Edison employees should be familiar with Con Edison's Job Safety Analysis (JSA) library. Any Con Edison employee preparing a job briefing for any task to be accomplished pursuant to this Specification should review the JSA library to determine if there is a JSA applicable to the task. Any relevant JSA found in the library should be discussed during the job briefing for the task. This provision is applicable to Con Edison employees.

6.0 NOTIFICATIONS

★ 6.1 Gas Control, at telephone numbers listed in Attachment C, shall be notified of any excavation activity within 25 feet of the following:

- A gas pipeline operating at 125psig and above.
- An unenergized gas pipeline that will be energized to operate at 125psig or above in the future (i.e. newly installed facilities).

This notification includes **planned and emergency work** by all Company forces, Company contractors, municipal contractors and all third party contractors. Gas Control shall also be notified of **any of the following**:

- known or suspected water leak(s) (main and/or service water leaks);
- sinkholes/depressions;
- facility installation(s) using trenchless technology;
- overhead pole installation work;
- soil borings;
- any work in or around open excavations and backfilling;
- pavement removal or rehabilitation which includes but is not limited to milling and paving, pavement saw cutting, or pavement breaking (jack hammering).

NOTE:	Notifications for permanent paving restoration, including milling and paving, may be made via an email to GasSSGroup@coned.com.

This notification includes any Code Rule 753 mark-out requests by all company crews, contractors, municipalities, or private contractors. This notification shall be emailed to the Gas Sequencing and Scheduling Group.

The notification to the Gas Sequencing and Scheduling Group shall include:

- The location of the work;
- Name and telephone number of the contractor;
- Start and completion dates;
- Brief description of the planned excavation;
- Remarks (e.g. identifying where work will take place);
- Gas transmission main size; and
- M&S plate number

All initial notifications of planned work should be made at least two (2) business days prior to the start of the excavation/work so Gas Sequencing and Scheduling Group can establish a Contingency. Notification will also be required when work is completed.

★ 6.2 Upon notification of any work 25 feet or less from said pipelines, Gas Control shall:

- Review the information acquired in Section 6.1
- Identify the appropriate transmission contingency case(s) which could be used in the event of an emergency*****

*** Note:**	This requirement is not required for unenergized pipelines. Gas Control shall note that "No Contingency Case" is available on Contingency Communication (4.1).

- Log the activity in a Gas Transmission Management System.

6.3 Gas Control shall maintain a Gas Transmission Management System to track all reported 3rd party excavation activity and communicate this activity to the following internal Con Edison groups: Gas Transmission Integrity

Management, Corrosion Control, the applicable Gas Construction and Gas Distribution Services groups, Gas Control and Construction.

6.4 Gas Control shall notify Gas Transmission Engineering –Transmission Maintenance and request a review if it receives any notifications of the following:

- Planned facilities being installed using trenchless technology (microtunneling, directional drilling, pipe bursting, underground piercing tools (a.k.a hole hogging)) that may cross or impact a Pipeline.

- Pile driving, blasting or other conditions that may potentially impact the Pipeline.

6.5 If Gas Control receives notifications of water services or other facilities being installed using trenchless technology (microtunneling, directional drilling, pipe bursting, underground piercing tools (a.k.a hole hogging)) that crosses a Pipeline, they shall notify Gas Transmission Integrity Management to review.

★ 6.6 If Gas Control receives notification of a suspected water leak, the caller shall be instructed to call the Gas Emergency Response Center (GERC) to generate a special surveillance to dispatch Gas Distribution Services (GDS).

- If the water leak is within 25 feet of a Pipeline, Gas Distribution Services or approved company personnel shall perform a gas leak investigation.

- If the water leak is within 5 feet of a Pipeline, Gas Control shall request a review by Gas Engineering - Transmission Maintenance. Based on their inspection, they shall determine the need to excavate.

Upon notification from Gas Control, Construction shall assign full-time inspection of:

A) confirmed water leaks that are within 5 feet of a Pipeline;

B) confirmed water leaks that are within 5 to 15 feet of a Pipeline in which a gas leak is detected in the water leak area.

6.7 Whenever a Pipeline is fully or partially exposed; or damaged (including coating), the group overseeing the work shall notify: Gas Control so the occurrence can be documented; and Corrosion Control to request an inspection of the pipeline coating including any visible metal surface.

6.8 The Gas Sequencing and Scheduling Group shall maintain appropriate mailing lists for their outward communications including routine daily reports.

6.9 Upon notification to Gas Control that work within 25 feet of the Pipeline has been completed, the Gas Sequencing and Scheduling Group shall update their *Gas Contingency Management System* to indicate the completion and/or cancellation of that contingency.

6.10 Gas Distribution Engineering – Maps & Records shall notify Gas Transmission Integrity Management anytime a section of Transmission Main is updated on a gas M&S Plate.

7.0 DAMAGE PREVENTION – EXCAVATION OVERSIGHT INSPECTION

★ 7.1 Definition of Parties performing work in the vicinity of the gas transmission pipeline:

- **1st Party** - Any Con Edison Gas Operator Qualified employee or crew.
- **2nd Party Contractors** - Any Gas Operator Qualified contractor working for Gas Operations or Construction. The Gas Operator Qualified contractor must be qualified as per OQ Job Function Matrix found on the Gas Hub. *"**2nd Party Contractor (G-11863)"**.*
- **3rd Party Contractors** - Any contractor or Company crew which is not Gas Operator Qualified. This includes: Electric and Central Operations

employees and/or Municipal, Telephone, fiber optic, cable company or other contractors and/or personnel working in the vicinity of the Gas Transmission main.

7.2 Prior to any excavation within 25 feet of a Pipeline, a Con Edison Company Authorized Representative shall meet with the excavator at the field site to explain the physical attributes of the Pipeline, such as size, operating pressure, depth of cover, presence of special facilities or appurtenances (regulators, drips, etc.). The Company Authorized Representative shall also discuss limits of excavation and methods and procedures for supporting and protecting the pipeline and facilities.

7.3 Con Edison Company Authorized Representative shall perform a daily visual inspection of all excavation work within 15 to 25 feet of a Pipeline to ensure the contractor's scope of work has not changed; and markings are renewed as required.

7.4 Con Edison Company Authorized Representative shall provide daily updates to Gas Control via phone for all known excavations and work within 25 feet of a Pipeline. Gas Control shall document excavation activities using the "Damage Prevention Checklist" found in Attachment B as a guideline, based on communication with Construction's Company Authorized Representatives. Communications regarding 3rd party excavation activity details reported to Gas Control shall be logged in the *Gas Contingency Management System*.

7.5 Oversight requirements for excavation and other work categories defined in Section 6.1 which falls within 15 feet of a pipeline:

★ A) Anytime **3rd Party Contractor** work is being performed within 15 feet (see Figure 1 below) of a gas Pipeline centerline, Construction shall assign a full-time inspector.

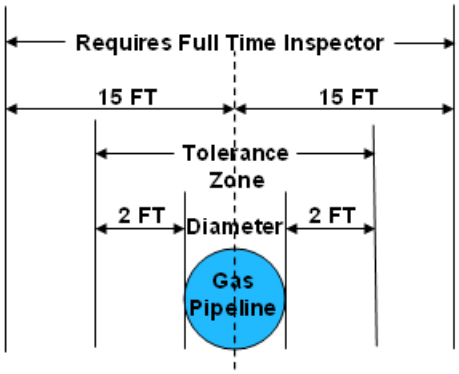

Figure 1

★ B) Anytime **2nd Party Contractor** (Gas Operator Qualified Contractor) work is being performed within 15 feet of a gas Pipeline centerline, an operator qualified Company Authorized Representative from the overseeing company organization shall perform two field inspections of the 2nd Party contractor per shift. The operator qualified Company Authorized Representative must be qualified as per OQ Job Function Matrix found on the Gas Hub. "***Transmission Main Oversight (G-11863)".***

Con Edison Company Authorized Representatives shall provide daily updates to Gas Control via phone, for each excavation oversight inspection performed per shift. Gas Control shall document inspection activities using the "Damage Prevention Checklist" found in Attachment B as a guideline, based on communication with inspector. Communications regarding 3rd party excavation activity details reported to Gas Control shall be logged in the *Gas Contingency Management System*.

NOTE: A full time inspector is not required for permanent paving restoration (milling and paving) within 15' of the gas Pipeline centerline. Locations shall be monitored by the overseeing company organization to ensure work is completed.

C) **1st Party** work within 15 feet of a gas Pipeline centerline shall not require oversight.

For guidance related to this section and for specific circumstances which may not require full coverage, contact Gas Transmission Integrity Management (See Attachment C).

7.6 Inspection process flow diagrams are included in Attachment D of this procedure. These diagrams shall be used as an aid to assist in handling various typical types of excavations and work within 25 feet of a Pipeline. Other non-typical excavations, work, and situations in the vicinity of a pipeline shall be addressed as specified herein or as directed by Gas Transmission Engineering -Transmission Maintenance. The three (3) representative cases covered in the flow diagrams are:

- **Unregistered excavations within 25 feet of a Pipeline** – excavations or work which was **not** reported to Gas Control.
- **Registered excavation activity within 25 feet of a Pipeline** - excavations or work which was reported to Gas Control.
- **Water leaks within 25 feet of a Pipeline** – water main in the vicinity of a Pipeline.

★ 7.7 Allowable Excavation Practices in Vicinity of pipelines

Excavating five feet or more from Pipeline: Powered or mechanical excavating equipment may be used as per Code Rule 753.

Excavating less than five feet from Pipeline: Hand excavation methods shall be used. See Figure 2 below.

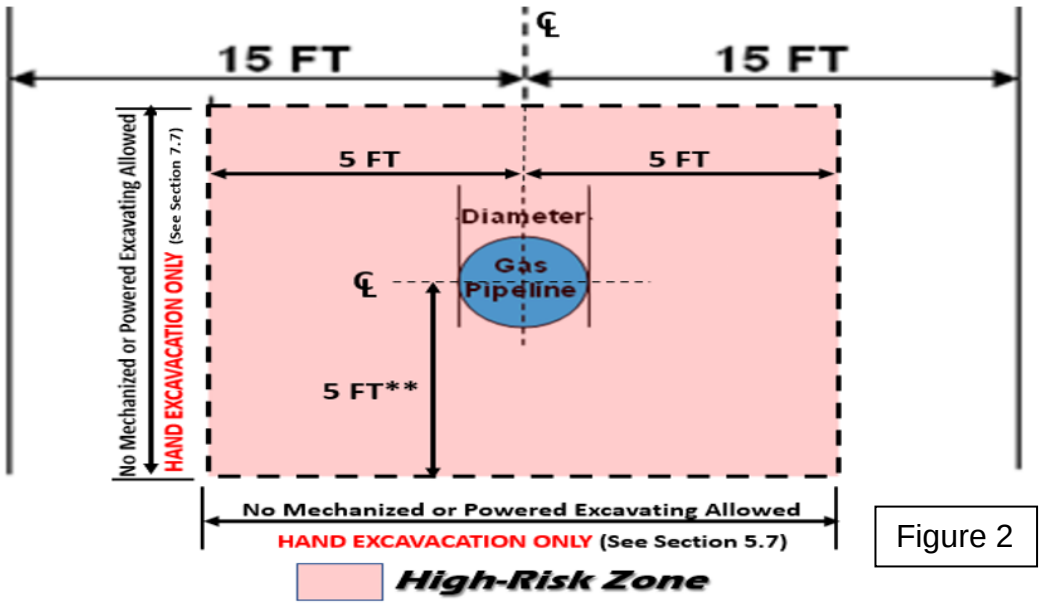

Figure 2

** Pipeline must be located by hand digging prior to use of any trenchless technology installations Within the high-risk zone.

Special Precautions in vicinity of Drip Pots:

Special precautions should be taken in areas of Drip Pots due to the potential presence of small diameter drip pot flushing riser piping that run horizontally on either side or directly above the pipeline. Existence of a valve box at the drip pot and an additional valve box (flush point) situated nearby may be indicative of the presence of drip pot flushing riser piping. Drip pot flushing riser piping lengths may vary in distance from the pipeline/drip pot; and may not be captured on company mapping system. Review company drawings, hand dig to verify the complete path of the riser piping and contact Gas Transmission Engineering if assistance is needed. (See Figure 3 below)

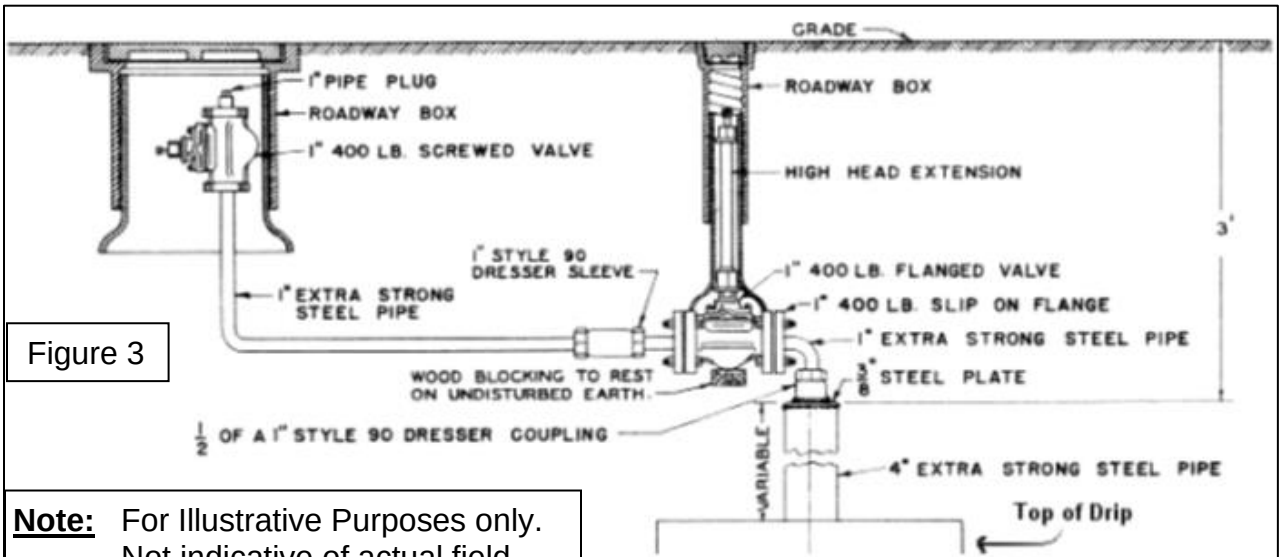

Figure 3

Note: For Illustrative Purposes only. Not indicative of actual field configurations.

Special Cases:

1. Permission to machine excavate less than five feet from the gas pipelines may be granted in special planned cases, given the following criteria:

   - A written request for permission to utilize powered or mechanical excavating equipment within five feet of the Pipeline shall be submitted to Gas Sequencing & Scheduling Group, Gas Transmission Engineering and Gas System Planning no less than five (5) business days in advance of the work.
   - Written permission must be received from the Gas Transmission Chief Engineer.
   - Hand excavation shall be performed to verify the exact location and depth of the Pipeline by exposing the Pipeline as per Code 753.

- Use of powered or mechanical excavating equipment requires a minimum of **12-inches clearance** from the Pipeline, after verifying the exact location of the Pipeline by hand excavation.
- Approved use of powered or mechanical excavating equipment within five feet of the Pipeline requires staffing of isolation valves (contingency valves) coordinated by Gas Control.
- The Pipeline should be protected from damage (i.e. sandbags, plating, sheeting, etc.) and supported as required following exposure and for the duration of work.

2. Permission to machine excavate less than five feet from a pipeline may be granted in special cases during system emergencies given the following criteria:

   - An emergency situation (ex: Transmission Leak) where the transmission main has been lowered to an operating pressure below 125psig and coordinated with Gas Control.
   - Written permission has been received from the Gas Transmission Chief Engineer.
   - As required by Code Rule 753, hand excavation shall be performed until the exact location of the pipeline is determined before powered equipment can be used within the tolerance zone (one half of the pipe diameter plus two feet). A minimum of **4 inches clearance** from a Pipeline shall be maintained after verifying the location.

Use of powered or mechanical excavating equipment within five feet of the Pipeline is considered high risk due to the potential existence of unmapped pipeline appurtenances (High-Hats, side-out fittings, stubs, etc.) protruding from the pipeline body. Extreme caution and preplanning shall be required as follows:

NOTE: 3rd Party Contractors should be made aware of CECONY stringent excavation requirements in the vicinity of Pipelines by Gas Control and/or Con Edison field oversight personnel.

Construction must also witness and report to Gas Control on backfilling activities to assure adequate support and to prevent large rocks or other injurious debris (e.g. wood, asphalt, rags, etc.) from being placed in contact with the Pipeline.

7.8 Gas Control shall arrange for crews to staff valves whenever an excavator is using mechanical excavation equipment within five feet of a Pipeline or whenever any heavy mechanical construction work is being performed within five feet of a Pipeline (e.g. lifting/placing of heavy materials that could potentially damage the Pipeline). They shall also arrange for valve crews when otherwise requested by Gas Engineering – Transmission Maintenance or Gas Transmission Integrity Management .

The local Gas Operations area shall verify the locations and accessibility of the isolation valves (except Remote Operating Valves (ROVs)). When crews are staffing valves. Construction shall maintain a full-time inspector who shall maintain communication with Gas Control. Gas Control shall direct gas field crews as required.

7.9 For excavations parallel to and within 5 to 15 feet of a Pipeline and within the angle of repose of a pipeline, Construction shall contact Gas Control, who shall advise Gas Engineering -Transmission Maintenance. If the pipeline is within the angle of repose and the excavation is longer than shown in the table below, Gas Transmission Engineering –Transmission Maintenance shall discuss the project with Construction to evaluate sheeting being used, type of soil, method of excavation and other field conditions. When warranted, field visits shall also be made by Gas Transmission Engineering - Transmission Maintenance with Construction.

The need for follow-up visits by Construction shall be jointly determined after the discussion and/or field visit.

Pipe Size	Length of Excavation
8" or less	20 feet
12"	30 feet
16"	35 feet
20" or larger	40 feet

7.10 For all third party boring activity within 15 feet of a pipeline, Con Edison's Facilities Protection Group must perform all pipeline mark-outs using a conductive locating technique. The Con Edison construction representative on location shall confirm that the main has been marked out using a conductive method. If the vendor is not capable of conductively locating the main, Corrosion Control must be contacted to locate the main.

If Corrosion Control cannot conductively mark out the pipeline, the Con Edison construction group on location must contact Gas Transmission Engineering – Transmission Maintenance. Transmission Maintenance will decide if a test pit is required to verify the Pipeline location before the boring activity can begin. The construction group on location will be responsible to coordinate and perform test pits and make all proper notifications to Gas Control.

8.0 DAMAGE PREVENTION – PIPELINE PATROLS AND FOLLOW-UP ACTIONS

8.1 Corrosion Control shall patrol the routes of all pipelines (mains, services, regulator laterals, stubs and appurtenances) on a weekly basis not to exceed 12 calendar days; and daily in Manhattan by Gas Distribution Services (GDS).

★ 8.2 The patrol (visual survey) shall be conducted to observe surface conditions for evidence of construction activity or any other hazardous condition along the route of all pipelines operating at 125psig or greater, as per G-11810 "Procedure for Inspection and Maintenance of Gas Pipelines Operating at

125 PSIG or More", in all four gas operating areas. Their observations shall be recorded, and the records retained for the lifetime of the pipeline. The patroller shall have up-to-date M&S Plates (hard copy or electronically) in their possession for the pipeline being patrolled. The Patroller shall also use the *Gas Contingency Management System* established by the Gas Sequencing and Scheduling Group, during patrol of the pipelines to identify excavation work that is not on the list (Unregistered Excavation).

★ 8.3 The patrol shall include observation and reporting of potential hazards such as the following:

- Construction activity and other factors that would affect the pipeline integrity or operation by one or more of the following:
    - Damage to the pipe;
    - Loss of support due to settlement or shifting of soil around the pipe;
    - Undermining or damage to pipe supports;
    - Loss of cover; or
    - Excessive fill
    - Abnormal conditions that could potentially affect the pipe
- Evidence that excavation, grading, demolition, or other construction activity may take place or has taken place, such as the presence of any new patches, cuts, excavations, or steel plates over the pipeline not previously reported or listed in the - *Gas Contingency Management System*. (Unregistered Excavation)
- The presence and condition of pipeline markers including signs at submarine crossings.
- Land subsidence, earth slippage, soil erosion, flooding, climatic conditions, and other natural causes that can result in impressed secondary loads.

- The presence of suspected water leaks, which may include sunken depressions and visible water at street surface. The patroller shall immediately notify the GERC, who shall notify the DEP and municipalities, regarding any suspected water leaks.
- Location of roadway or sidewalk depressions, sinkholes, and cave-in over or within 5 feet of the pipeline. The patroller shall notify the GERC. Reference DOJT GAS0576 for specification G-11884 "Sinkholes/Street Collapses and Roadway Depressions near Gas Facilities".
- The presence of bubbles at any submarine crossings that might indicate a gas leak (visual Inspection for leakage). The patroller shall notify the GERC.
- Damage to casing vents and leakage from encased pipe. The patroller shall notify the GERC.
- Areas of continual earth moving activities, such as quarries and industrial plants or large construction sites which may require special attention.

8.4 If a leak or some other situation that presents an immediate danger to the pipeline is discovered, the patroller shall immediately notify Gas Control and standby for further instructions. The patroller should make every attempt to stop work or other situations that are presenting immediate danger to the pipeline, including requesting Fire Department assistance to protect the pipeline until further instructions are provided.

★ 8.5 If a recent patch or plate is within 25 feet of a Pipeline that was not previously identified in the *Gas Contingency Management System*, the patroller shall notify Gas Control, who shall request a review by Construction. If Construction determines an excavation was performed and not covered by Con Edison personnel within 5 feet of a Pipeline, the Gas Sequencing and Scheduling Group shall identify the location as an "unregistered excavation" and contact Corrosion Control to perform an indirect inspection tool survey (Close Interval Survey – CIS) of the pipeline. Survey indication classification and indirect inspection prioritization shall be in accordance with G-11868 "External Corrosion Direct Assessment (ECDA) Process for Buried Onshore Gas Transmission Pipelines"– Table 1

& Table 2. "Unregistered excavation" locations may be required to be excavated to perform a detailed pipeline integrity assessment to ensure that the Pipeline and its associated appurtenances have not been damaged.

The indirect inspection tool survey shall be performed within fifteen (15) calendar days of the date the patch or plate was discovered. Results of this survey will be used in determining the scheduling of excavation based on indication severity. An indirect inspection tool survey will not be required if the location is excavated for direct assessment/examination within fifteen (15) calendar days of the date the patch or plate was discovered. Refer to Section 10.0 for specifics on Direct Assessment requirements and scheduling.

8.6 Gas Transmission Integrity Management may require excavation of "unregistered excavation" locations to perform a detailed pipeline integrity assessment to ensure that the Pipeline and its associated appurtenances have not been damaged. Gas Transmission Integrity Management shall work with Construction and/or Gas Operations to excavate the locations as required.

9.0 DAMAGE PREVENTION – MARK-OUT VERIFICATION

9.1 Corrosion Control shall monitor/verify the accuracy of the mark-outs completed by Con Edison's Code Rule 753 vendor(s) for any excavation activity within 25 feet of a Pipeline. A minimum of 15% of planned mark-outs shall be monitored for accuracy. A planned mark-out is defined when notification is received at least 48 hours prior to the commencement of excavation activity. The monitoring can be performed before, during or after excavation as long as the mark-outs are still visible.

9.2 If a discrepancy (more than 2 feet) is found, Corrosion Control shall immediately notify Construction and Gas Distribution Engineering - Maps & Records for a resolution. Maps & Records shall correct any confirmed mapping errors. Gas Transmission Integrity Management shall maintain records of all locations verified for the lifetime of the pipeline.

9.3 For all third party boring activity within 15 feet of a pipeline (in all areas excluding Manhattan), Con Edison's Facilities Protection Group must perform all Pipeline mark-outs using a conductive locating technique. The Con Edison Construction Company Authorized Representative on location shall confirm that the main has been marked out using a conductive method. If the vendor is not capable of conductively locating the main, Corrosion Control must be contacted to conductively mark out the main.

If Corrosion Control cannot conductively mark out the Pipeline, the Con Edison construction group on location must contact Gas Transmission Engineering – Transmission Maintenance. Transmission Maintenance will decide if a test pit is required to verify the Pipeline location before the boring activity can begin. The construction group on location will be responsible to make all proper notifications to Gas Control, and coordinate with the area Construction Management group to perform test pits.

9.4 For all third party boring activities within 15 feet of a Pipeline in Manhattan, Con Edison's Facilities Protection Group must contact Transmission Maintenance, who will determine the additional requirements for locating the main (i.e. test pitting, toning, etc.). The construction group on location will be responsible for coordinating the appropriate locating procedure.

10.0 PIPELINE DIRECT ASSESSMENT

★ 10.1 Gas Transmission Integrity Management shall arrange for a pipeline integrity investigation excavation (test pit) when an "unregistered excavation" (i.e. unknown patch, plate or unmonitored excavation) is discovered over or within 5 feet of a pipeline as reported to them. Gas Transmission Integrity Management shall work with Construction and/or Gas Operations to excavate the locations as required.

Scheduling locations for excavation and direct assessment shall be based on indirect inspection tool survey indication severities in accordance with the following:

- "Immediate" tool indications, which may be indicative of severe coating damage and potential 3rd party damage, shall be scheduled to be excavated within sixty (60) calendar days (system condition permitting).

- "Scheduled" or "Monitored" indications shall be completed as soon as possible (system condition permitting) but not to exceed 180 days from date of discovery.

> **NOTE:** Excavation of locations not exhibiting any indications shall not be required.

The Pipeline must be fully exposed and examined for coating and/or pipe damage, unless Company personnel (Corrosion Control, Construction, Gas Transmission Integrity Management, etc.) can provide verification or documentation that the pipeline was not exposed by 3rd party activity. A pipeline integrity investigation excavation (test pit) shall also be requested when a water service crossing a Pipeline was installed using trenchless technology.

10.2 Gas Transmission Engineering - Transmission Maintenance or Gas Transmission Integrity Management shall review any reports of defects or damage to the pipeline. They shall also determine what corrective actions, if any, are needed. A report of their review and the corrective actions taken shall be prepared and maintained for the life of the structure.

10.3 Water impingement rubber mat(s) (Class & Stock #: 059-5306) shall be installed between water facilities and the pipelines, anytime a water service or main crosses (above or below) the gas pipeline.

Where possible, a minimum clearance of 12 inches must be maintained from any water main or service. If this clearance cannot be maintained, rubber matting (2' X 2' X 1/2" thick mat, class and stock #059-5306) must be installed. The matting shall be installed either horizontally over/under the gas main or vertically alongside the gas main (DO NOT wrap the rubber mat around the gas main). The rubber matting shall be installed a minimum

of 2 inches from the gas main and shall not be installed "edge to edge". When more than one rubber mat is installed to protect the gas, the mats shall overlap a minimum of 6 inches.

10.4 Installation of Phenolic boards shall be installed between subsurface structures (including electric facilities) when clearances are less than 12 inches. If 12 inches clearance cannot be maintained, then a minimum clearance of 2 inches is acceptable, provided that the service is properly protected (e.g. with phenolic board - 1' X 2' - class and stock #596-4473; 1' X4' - class and stock #596-4432) from damage that might result from the proximity to the other structure.

★ 10.5 If a Pipeline is exposed, a qualified Corrosion Control employee shall visually inspect the coating of the exposed surface and determine if further excavation and a full direct assessment inspection is required. Visual inspection of the exposed pipeline shall be documented on the "Pipeline Visual Inspection Form" located in Attachment A.

A) Visual inspections that do not reveal coating and/or pipeline anomalies shall require completion of the "Pipeline Visual Inspection Form" located in Attachment A.

B) Visual inspections that reveal coating and/or pipeline anomalies shall be reviewed by a qualified Corrosion Control employee to determine if the entire circumference of the pipe should be excavated and a full direct assessment inspection performed.

- Visual inspections that reveal minor coating anomalies (with no pipeline anomalies) do not require a full direct assessment inspection or excavation of the entire pipe circumference. These findings shall require completion of the "Pipeline Visual Inspection Form" located in Attachment A and repair with mastic in accordance with G-8209 “Preparation and Field Coating of Gas and Other Steel Pipes Installed Aboveground and Underground”.

A minor coating anomaly is defined as an area of the coating which has damage such as a scrape, scratch, abrasion, etc.

The underlying steel pipe surface has not been exposed, scratched, scraped, defaced, etc. as determined by the inspection performed by a qualified Corrosion Control employee.

- Visual inspections that reveal coating and/or pipeline anomalies that may require further investigation shall require a full direct assessment inspection. A qualified Corrosion Control employee shall inspect the coating and pipe; and document the inspection on the "Direct Assessment Data Collection Form" in accordance with G-11868 (Attachment B) and Con Edison's Transmission Integrity Management Plan (Chapter 7). Associated activities performed by a qualified Corrosion Control employee shall include, but are not limited to, the following:
  - Arrange for the entire circumference of the pipe to be excavated.
  - Arrange for the appropriate level of coating removal/abatement and/or pipe cleaning in order to perform an accurate inspection.
- Coating that is inspected and found to be sound and well adhered to the pipe does not require removal unless required by the qualified Corrosion Control employee to perform an accurate inspection of the pipeline or its coating.
  - Gather all pertinent data (field measurements, pipe anomaly measurements, field testing, and photographic documentation) necessary to analyze the integrity of the affected section of gas main.
  - Arrange for coating repairs.
  - Document all inspections and file a copy of the Direct Examination Data Collection Form in the appropriate pipeline integrity file.

★ 10.6 Upon notification of the anomalous condition and receipt of pertinent pipe inspection data (Direct Examination Data Collection Form, etc.), the Anomaly Review Team shall evaluate any potential threat to pipeline integrity and determine through remaining strength calculations (as per section 10.7) whether the affected pipeline section can safely remain in-service, requires remediation, or shall be protected by an immediate pressure reduction commensurate with the remaining strength of the pipe. Results of the evaluation and action recommendations shall be communicated to the Chief Gas Transmission Engineer via email for approval.

★ 10.7 When a corrosion pipe anomaly is discovered on a pipeline, the Anomaly Review Team shall calculate its remaining strength from the remaining wall thickness and geometry of the corroded area in accordance with methodology described in Chapter 10 of the Transmission Integrity Management Plan (i.e. this methodology is based on ASME B31G "Manual for Determining the Remaining Strength of Corroded Pipelines, A Supplement to ASME B31 Code for Pressure Piping") or an equivalent method.

A) Any corrosion that results in a local wall thickness less than the mill tolerance of new pipe is deemed significant and requires an evaluation of the strength of remaining metal at the corroded area.

B) The applicability of ASME B31G is limited to evaluating the remaining strength of steel pipe damaged by corrosion pitting or general area corrosion. (Corrosion pitting that is closely grouped and affects the overall strength of the pipe is considered general area corrosion.)

C) The remaining strength evaluation of steel pipe with anomalies other than corrosion, such as mechanical damage (e.g. dent, gouge, scratch, or groove) caused by a third party, defective welds, arc burns, cracks, or manufactured defects, cannot be evaluated using ASME B31G. These anomaly types shall be assessed in accordance to G-11870 "Integrity Assessment and Repair of Steel Gas Transmission Pipelines Operating at 125 PSIG or More" by the Anomaly Review Team or an approved metallurgical vendor.

10.8 Documentation of integrity assessment, analysis, and recommendations shall be maintained by the Anomaly Review Team in accordance with Con Edison's Transmission Integrity Management Program (IMP), Chapters 7A and 10.

★ 10.9 Anomalies shall be repaired in accordance with G-11870.

★ 10.10 Steel plates shall be installed to provide protection, if feasible, whenever company forces or company contractors expose a pipeline. If other subsurface structures interfere with the installation of protection plates and the subsurface structures are located above the pipeline(s), Gas Engineering – Transmission Maintenance must be notified. Refer to EO-6799-C "Protective Covers for Gas Main and Service Installations" for plate installation.

★ 11.0 EXCAVATION OVER POTENTIAL PIPELINE LEAK AT FULL OPERATING PRESSURE

With approval from Gas Engineering Major Projects or Transmission Maintenance, the below steps should proceed while an IP-9 procedure is being developed:

- Identify contingency valves
- Request planning study
- Evaluate embedment and pipe geometry per G-8153 "Reinforcing Non-Restraining Compression Fittings".
- Staff contingency valves
- Remove pavement with the use of pavement breakers
- Excavate by hand (Vac truck is considered hand excavation)
- Continuously monitor the excavation and refer to IP-42 "Requirements for Airline Respirators (ALR), Flame Retardant Coveralls (FRC), Harness & Line (H/L), Harness & Gantry (H/G) and Continuous Atmospheric Monitoring (CAM)" for PPE.

12.0 RECORDS RETENTION

Any records generated in the course of performing work in accordance with this specification shall be maintained as required by Corporate Instruction CI-870-1 "Records Management". Guidance on the retention of Company Gas Operations records can also be found on the Records Management intranet site

ATTACHMENT A

PIPELINE VISUAL INSPECTION FORM

1. GENERAL INFORMATION

Location (Dimension /Street):

Date of Inspection:

Technician(s)/Inspector(s):

Contingency Number:

Pipeline Section: **Segment:**

Corrosion Section: **Segment:**

Pipe Diameter: **inch**

Reason for Excavation: (Check One)

- ☐ **3rd Party Excavation**
- ☐ **Planned Gas Work**
- ☐ **Contingency/Patrol Finding**
- ☐ **Other**

Supervisor Review:

Date of Review:

2. ACCESSIBILITY

Is pipeline accessible for a visual inspection?

☐ **YES** **Continue to Section 3**

☐ **NO** **Explain in Remarks/Notes below**

3. VISUAL INSPECTION

Coating or pipeline damage or anomaly?

☐ **NO** **Inspection Complete.**

☐ **YES; Minor coating damage only**
- Coating Repair completed? ☐ **YES** ☐ **NO**

☐ **YES; damage or anomaly is not minor** **Perform full direct assessment; document on "*Direct Assessment Data Collection Form*".**

Remarks/Notes:

4. HAND SKETCH AREA

(E, W, N, S) ⟶

NOTE: Photos supporting findings should be taken and filed with this inspection form.

★ ATTACHMENT B

DAMAGE PREVENTION CHECKLIST FOR CONSTRUCTION AND GAS CONTROL GROUP FOR EXCAVATIONS WITHIN 25 FEET OF A PIPELINE DESCRIBED IN G-11863 (SECTION 1.0)

Gas Control shall document the following information for each known excavation within 25 feet of a Pipeline:

- **Location**
- **Work Description**
  - **Excavation Type (Hand/Machine)**
  - **M&S Plate Number**
  - **Facility Main Size**
  - **Called In By:**
- **Code 753 Ticket Number**
- **Transmission Contingency Case Number**
  - **Valve Number/Segment**
  - **Is staffing of valves required?**
- **Contractor's Name**
- **Contractor's Contact Info**
- **Project Start Date**
- **Project Completion Date**
- **Inspector's Name**

When applicable, the following items shall be addressed by either Construction, Gas Operations, etc., for each known excavation within 25 feet of a Pipeline main as noted:

- **The location is monitored daily by Construction and mark-outs are renewed as required until start of excavation;**
- **The physical attributes (size, pressure, cover, etc.) of the main we are protecting from damage is communicated by Construction to the excavator;**
- **The methods and means for supporting and protecting the main is reviewed with the excavator by Construction;**
- **That, if the excavation is within 15 feet of the pipe centerline, Construction has assigned a fulltime inspector to the location throughout the excavation or other heavy mechanical construction work ;**
- **That, if the excavation is a boring excavation, and is within 15 feet of the pipe centerline, the 753 Mark Out has been performed using a conductive mark out method.**
- **That, if the excavation or other heavy mechanical construction work is within 5 feet of the pipe centerline, Gas Operations shall standby the valves during excavation;**
- **That, if the pipe is/was exposed, Corrosion Control is notified to inspect the pipe;**
- **That, if the pipe was exposed and following inspection, Construction documents any damage to the pipe and/or coating by the excavator;**

★ ATTACHMENT B

DAMAGE PREVENTION CHECKLIST FOR CONSTRUCTION AND GAS CONTROL GROUP FOR EXCAVATIONS WITHIN 25 FEET OF A PIPELINE DESCRIBED IN G-11863 (SECTION 1.0)

- **That, if the pipe was exposed and following inspection, Construction inspector has witnessed the backfilling operation to ensure no large rocks or other injurious material are placed against the pipe and that protection plates have been installed as per Section 10.10.**

NOTE: Code 753 information should be provided as soon as possible for emergency or short lead time work

Corporate Instruction

SUBJECT

GAS FACILITIES—CLEARANCES, ENCROACHMENTS, INTERFERENCE, CORROSION AND INSPECTIONS

1.0 **PURPOSE** -- In accordance with the Rules and Regulations of the State of New York NYCRR 16 Part 255 (Sections 325, 361, 459, 475, 604, 755, 756, and 757), PSC Case 14-G0212, and the Code of Federal Regulations 49 CFR 192.325, 361, 459, 475, 465, 604 and 755, this Instruction establishes procedures for:

a. Documenting and taking necessary action to maintain sufficient clearances for new installations between gas facilities and sub-surface facilities.

b. Inspecting and documenting the conditions of existing gas main cover; clearance concerns; and application of phenolic board, rubber matting, and steam blankets when found in excavations during the normal course of business.

c. Identifying and correcting encroachments on cast iron gas facilities caused by excavation within the Company's gas franchise areas.

d. Examining exposed steel gas facilities for evidence of external and/or internal corrosion.

e. Documenting actions taken when exposed electric conduit or cable is found in deteriorating condition and is within 12 inches of gas facilities.

f. Notifying Gas Control, Gas Operations, for excavation work within 25 feet of any gas facility operating at 125 pounds per square inch gauge (psig) and above.

g. Inspectiing and documenting gas PE plastic fusions exposed in excavations during the normal course of business.

2.0 **APPLICATION** -- This Instruction applies to all Consolidated Edison Company of New York, Inc. (CECONY) organizations (hereafter referred to as the “Company”) and contractors working for the Company in designing, planning, commencing or engaging in underground construction activities associated with excavations and demolitions within the Company's franchise areas. This also applies to organizations with oversight responsibility for municipal public improvement contractors and non-municipal contractors (e.g., telephone, cable, plumbing, homeowner, etc.) engaging in excavation activity where the Company provides direct oversight.

3.0 **DEFINITIONS** -- NOTE: All Gas Specifications referenced in this Instruction are available on the Gas Operations Gas Hub or by accessing this link: https://ceorg/sites/GasOps/GasEng/GasSpecs/Gas%20Specifications%20%20Index/Forms/Index%20%20Numerical.aspx.

3.1 Angle of Repose –

a. The space above a line drawn at an angle upward and outward from the base of the vertical walls of an excavation based on the soil condition present. (Reference Gas Specification EO-15447-B, "Replacement and Maintenance of Cast Iron Gas Mains" and OSHA Technical Manual, Section V: Chapter 2, VIII Sloping and Benching).

b. An angle of repose encroachment occurs when a buried cast iron gas facility eight inch diameter or smaller runs alongside an excavation and half or more of the gas facility diameter lies in the angle of repose.

3.2 Encroachment – When an eight inch diameter or smaller cast iron gas facility is exposed, undermined or lies in the angle of repose in any excavation activity being performed other than for work on the CI gas main.

3.3 Facility – A gas main or service line.

3.4 Gas Clearance Mitigation Form- form used to document the installation and/or inspection of new and existing gas facility cover and clearance concerns.

3.5 Gas Line Clearance Report – The Gas Line Clearance Report can be found on the Gas Forms website and is used to document encroachments.

3.6 Hold Point- A documented inspection, confirming that the required protective measures have been utilized to protect the newly installed gas facilities prior to being backfilled. Reference Tailboard Talk (TBT) GAS6042 "Hold Points for Gas Construction Work."

3.7 Interference – A situation where an existing gas facility is located in the lane of another proposed underground facility.

3.8 Operator Qualified – An individual who has been evaluated and can perform assigned covered tasks (e.g., visually inspecting a facility for external/internal corrosion, inspecting the condition of exposed facility, or pipe coating for atmospheric corrosion) and can recognize and react to abnormal operating conditions (e.g., escaping/blowing gas, damage to a gas facility).

3.9 Protection – Provisions taken to ensure the gas facilities are guarded or shielded from damage. Forms of protection include but are not limited to: supporting exposed gas facilities, performing leak surveillances, installing phenolic board between gas facilities and electric facilities or between gas and non-electric facilities (e.g., telephone, cable), installing rubber mats (or most current approved material) between gas facilities and water or sewer facilities, installing steam blankets between gas facilities and steam facilities, installing steel protection plates over facilities due to shallow cover, and over gas facilities operating at 125 psig and above when exposed, etc.

3.10 Undermined Gas Facility – An encroachment situation where half or more of a cast iron gas facility eight inch diameter or smaller is exposed within an excavation or is above an area that has been excavated below it.

4.0 PROCEDURES --

4.1 Pipeline Integrity –

a. When any excavation activity (including planned and emergency work) is within 25 feet of any gas facility operating at 125 psig or above, Gas Control must be notified and the inspection and maintenance procedures as prescribed in Gas Specification G-11863, "Inspection and Assessment Requirements Associated with Excavation Activities Near Gas Pipelines and other Hazardous Conditions for Pipelines Operating at 125 PSIG and Above" must be followed.

b. For gas facilities operating at 125 psig or above, protective plates or cover pipes are required for all new installations and if feasible, whenever an existing main is exposed. When the cover on the main is less than three feet, rubber matting shall be installed below the protective steel plate or cover pipe at a minimum of two inches from the gas main. If the rubber matting is compromised or missing, it must be replaced as required. New gas facility installations must be documented by submitting a Hold Point through the approved mobile application. Existing locations shall be entered into the Gas Clearance Mitigation Form (Reference Gas Specifications EO-6799-C, "Protective Covers for Gas Main and Service Installations" and G-11863.)

4.2 Construction Excavation Activities near Gas Regulator Stations-

a. If excavation work is within 200 feet of the "Control Area" of a regulator station or will directly impact a regulator station or a contingency will impact a regulator station, contact Pressure Control prior to the start of excavation (Reference GAS DOJT GAS6039, "Regulator Stations Near Gas Distribution Layouts").

4.3 Gas PE Plastic Fusions Exposed During Normal Course of Business-

a. PE plastic fusions exposed during the normal course of business excavation activities must be inspected and documented by Operator Qualified personnel. (Reference Gas DOJT GAS6020 "Visual Inspection of Exposed PE Plastic Fuses".)

4.4 Clearances –

a. Maintain the following standard required clearances between gas facilities and subsurface facilities: (Reference Electric Standards EO-6224, "Trenching Requirements for Installing URD Cables in Conduit or DBC and Joint Trenching.")

Subsurface Facility	Gas Service	Gas Distribution Main (<125 psig)	Gas Transmission Main (≥ 125 psig)	Minimum Clearance with Protection
Electric conduit or structure	6 inches**	6 inches**	12 inches	2 inches
Electric Underground Residential Development system (URD) (direct buried) cable	12 inches	12 inches	12 inches	2 inches
Electric oil-o-static (Electric Transmission)*	12 inches	12 inches	12 inches	6 inches
Steam	6 inches** (metallic gas pipe) 35 feet (PE plastic gas pipe)	6 inches** (metallic gas pipe) 35 feet (PE plastic gas pipe)	12 inches	2 inches (metallic gas pipe) 35 feet (PE plastic gas pipe)
Water & sewer	6 inches**	6 inches**	12 inches	2 inches
Other facility (e.g., telephone, cable, petroleum)	6 inches**	6 inches**	12 inches	2 inches

**Where gas mains/services run parallel to electric transmission lines for significant distances contact electric transmission for guidance.*
***It is recommended that where practical, a minimum of 12" clearance be maintained.*

b. All practical means must be considered, including offsets and relocating facilities, to obtain the standard required clearances specified in paragraph 4.4 a for new and eixitng facilities. When field conditions preclude these standard required clearances from being met between gas and other subsurface facilities or structures, protection shall be installed between the two facilities. **Exception**: 35 feet clearance must be maintained between polyethylene (PE) plastic gas pipe and steam facilities at all times and any PE pipes found not in compliance shall be relocated or replaced with metallic (e.g., steel or copper) gas pipe.

(1) For instances where the proximity of the electric facility is not within allowable clearance to a gas facility, either facility shall be relocated or phenolic board (Class and Stock # 596-4473 or 596-4432) shall be installed between the two facilities for protection. (Reference Electric Standards EO-6224.) New gas facility installations must be documented by submitting a Hold Point through the approved mobile application. Excavations made during the normal course of business containing existing electric and gas facilities must be inspected for proper phenolic board installation and any evidence of electric burn-through. Phenolic board that is compromised or missing must be replaced. Existing location conditions found must be documented through the Gas Clearance Mitigation Form.

(2) In any instance where exposed electric conduits within 12 inches of gas facilities are found to be deteriorated to the extent that cable is visible, the deteriorated conduits shall be removed in accordance with Distribution Engineering Specification EO-10613, “Procedure for Removing Conduit From Underground Distribution Cable” and repaired in accordance with Distribution Engineering Specification EO-8007, “Installation of Precast Concrete Conduit.” If it can be ascertained that the cable installation is visibly damaged or further guidance is required to repair the damaged conduits, contact the applicable Electric Operations’ Control Center to coordinate the replacement of the damaged cable prior to any repair. If cable and/or conduit repair is made, the location must be entered into the Gas Clearance Mitigation Form.

(3) For instances where the proximity of the steam facility is not within the allowable clearance to a PE plastic gas facility, the PE plastic gas facility shall be relocated or the gas facility shall be replaced with metallic (e.g., steel or copper) gas pipe. For instances where the proximity of the steam facility is not within the allowable clearance to a metallic gas facility, the gas facility shall be relocated or a steam blanket (Class and Stock #415-0116) shall be installed between the two facilities for protection. New gas facility installations must be documented by submitting a Hold Point through the approved mobile application. (Reference Gas

Specifications G-8005, "General Specification for the Installation of Gas Distribution Mains" and G-8100, "General Specification for the Installation of Gas Distribution Services.", and G-8223, "General Specification for the Installation of Gas Transmission Pipelines.") Excavations made during the normal course of business containing existing steam and gas facilities, must be inspected for proper installation of a steam blanket. If the steam blanket is compromised or missing, it must be replaced as required. Existing location conditions found must be documented through the Gas Clearance Mitigation Form.

(4) For instances where the proximity of the water or sewer facility is not within allowable clearance to a gas facility, either facility shall be relocated or water impingement rubber mat(s) (Class & Stock # 059-5306) shall be installed between the two facilities for protection. The rubber matting shall be installed a minimum of two inches from the gas main. (Reference Gas Specifications G-8005, G-8100, G-11863, and G-8223.) New gas facility installations must be documented by submitting a Hold Point through the approved mobile application. Excavations made during the normal course of business containing existing water and/or sewer facilities and gas facilities, must be inspected for proper installation of rubber matting. If the rubber matting is compromised or missing, it must be replaced as required. Existing location conditions found must be documented through the Gas Clearance Mitigation Form.)

(5) For instances where the proximity of a facility other than electric, steam, water, or sewer (e.g., telephone, cable, petroleum) is not within allowable clearance to a gas facility, either facility shall be relocated or phenolic board (Class and Stock # 596-4473 or 596-4432) shall be installed between the two facilities for protection. (Reference Gas Specifications G-8005, G-8100 G-11863, and G-8223.) New gas facility installations must be documented by submitting a Hold Point through the approved mobile application. Excavations made during the normal course of business containing existing gas facilities and facilities other than electric, steam, water, or sewer (e.g., telephone, cable, petroleum) must be inspected for proper installation of phenolic boards. If the phenolic boards are compromised or missing, it must be replaced as required. Existing location conditions found must be documented through the Gas Clearance Mitigation Form.)

c. For gas facilities operating at pressures up to 99 psig, steel protective plates or cover pipes are required when the cover on the main or service is less than two feet. Where the cover is less than 18 inches (one foot six inches) consult Gas Distribution Engineering at dl-srfieldengineers@coned.com for guidance. (Reference Gas Specification

EO-6799-C.) New installation locations must be documented by submitting a Hold Point through the approved mobile application. Existing location conditions found shall be addressed and entered into the Gas Clearance Mitigation Form.

4.5 Identifying Potential Encroachments, Clearances, and Interferences –

a. New York City Public Improvement Projects. The responsible section of Public Improvement Engineering, Engineering and Planning, will be responsible for identifying potential encroachments and interference work for planned municipal projects in the Bronx, Manhattan, and Queens. Test pits must be excavated to confirm questionable encroachments and interferences. Layouts shall be prepared to replace any cast iron gas facilities that will be encroached or exposed and undermined. Every effort must be made to replace the affected cast iron facilities prior to the start of municipal construction. Gas Line Clearance Reports (found on the Gas Forms website) will be prepared by Public Improvement, Construction, for encroachments that are encountered in the field during construction. Gas Distribution Engineering will prepare layouts for unplanned or unscheduled public improvement projects to correct these deficiencies.

b. Westchester. For planned municipal projects in Westchester, Gas Distribution Engineering is responsible for identifying potential encroachments and interference work. Test pits must be excavated to confirm questionable encroachments and interferences. Layouts shall be prepared by Gas Distribution Engineering to replace any cast iron gas facilities that will be encroached. Public Improvement will be advised. Every effort must be made to replace the affected cast iron facilities prior to the start of municipal construction. Gas Line Clearance Reports will be prepared by Public Improvement for encroachments encountered in the field during construction. Gas Distribution Engineering will prepare layouts for unplanned or unscheduled public improvement projects to correct these deficiencies.

c. Facilities Protection, Construction, is responsible for identifying possible encroachments by a third party (e.g., plumbers, telecom providers, etc.) or non-municipal projects engaging in underground construction activities associated with excavations and demolitions within the Company's franchise areas. Gas Line Clearance Reports will be prepared by Facilities Protection for encroachments encountered in the field during construction.

d. All other excavations or Company Projects (i.e., Electric, Gas, or Steam - New Business, System Reinforcement, etc.). Prior to construction, the sponsoring organization's engineering department is responsible for identifying potential encroachments and clearance requirements for its planned projects in the Company's franchise areas. If potential

encroachments and clearance issues are identified, contact appropriate personnel in Gas Engineering Public Improvement and Interference Support/Gas Distribution Engineering to determine an appropriate solution. For unplanned projects or emergencies, the organization overseeing the construction is responsible for identifying potential ecnroachments and clearance requirements. Gas Line Clearance Reports will be prepared by the organization overseeing construction for encroachments encountered in the field during construction. Test pits must be excavated to confirm questionable encroachments and clearances. Gas Distribution Engineering will prepare layouts to correct these deficiencies. Every effort must be made to replace the affected cast iron facilities prior to the start of construction.

4.6 Identified Interference Locations –

a. Negotiations with outside organizations to eliminate interferences will be conducted by Public Improvement Engineering or others authorized by the responsible officer.

b. Gas Distribution Engineering or the responsible section of Public Improvement Engineering will prepare layouts for replacement, retirement, protection, or relocation of gas facilities in interference with other construction.

4.7 Actual Encroachments on Cast Iron Gas Facilities –

a. Whenever a CECONY cast iron gas facility eight inches in diameter or smaller is crossed by an excavation and/or is located in parallel to an excavation, an Operator Qualified individual from the responsible Company organization is accountable for identifying the encroachment and preparing a Gas Line Clearance Report. Gas Distribution Engineering personnel assigned to handle interference work will determine the extent of replacement required in accordance with Gas Specification G-11839, “Replacement and Maintenance of Cast Iron Pipe Located in Construction Areas,” and its referenced drawing Gas Specification EO-15447-B.

b. If a CECONY cast iron gas facility greater than eight inches in diameter is undermined, in the angle of repose, or may be subject to damage, Gas Distribution Engineering personnel assigned to handle interference work must be notified to evaluate the need for support, replacement, or retirement.

c. Cast iron gas facilities exposed for maintenance need not be replaced in accordance with paragraphs 4.7a and 4.7b. Proper care shall be taken to support the facility if it is undermined during repairs and to ensure proper compaction when backfilling in accordance with EO-1181, “General Specification for Backfilling of Trench and Small Openings.”

d. Gas Distribution Engineering or the responsible section of Public Improvement Engineering will prepare layouts for replacement, retirement, protection, or relocation of gas facilities as needed.

4.8 Annual Review of Procedures –

a. All Company organizations will maintain files of their respective completed Gas Line Clearance Reports and associated layouts. Annually, Gas Compliance and Quality Assessment will review Gas Distribution Engineering's encroachment files for compliance with this Instruction.

b. Each excavating organization and organization that oversees excavation work will be subject to Gas Compliance and Quality Assessment reviews of the requirements of this Instruction.

c. Gas Compliance and Quality Assessement will perform annual field reviews of the requirements of this Instruction in conjunction with their normal review schedule.

4.9 Gas Line Clearance Report –

a. A Gas Line Clearance Report will be prepared as specified in paragraphs 4.5 and 4.7 and sent to Gas Distribution Engineering to document the following:

(1) If a cast iron main of 8- inch diameter or less is exposed and undermined for any length.

(2) If a trench runs parallel to a cast iron main of 8- inch diameter or less, and the distance between the edge of the trench and the marked out location of the main is less than one and a half times the depth of the trench (this criteria accounts for a 34^{o} angle of repose to ensure all soil conditions, including Type C are properly addressed).

Depth of Trench	Minimum distance from edge of the trench to the marked out location of the main where a clearance report is not required
3′	4.5′
4′	6′
5′	7.5′
6′	9′
7′	10.5′
8′	12′
9′	13.5′
10′	15′
11′	16.5′
12′	18′
13′	19.5′
14′	21′
15′	22.5′
16′	24′
17′	25.5′
18′	27′
19′	28.5′
20′	30′

(3) If the gas mains and services (m & s) plates and/or the mark out of an 8-inch or less cast iron gas mains indicated that the main was going to be exposed or undermined. The reports are also required if the main was subsequently not found in the excavation.

b. Reporting and paper flow for encroachments will be in accordance with Gas Specification G-11839, “Replacement and Maintenance of Cast Iron Pipe Located in Construction Areas.”

4.10 External Corrosion Control –

a. Whenever an existing buried steel gas facility is exposed in an excavation made for gas purposes, the exposed portion must be examined by an Operator Qualified individual for evidence of external corrosion if the pipe is bare or if the coating is deteriorated. If corrosion is found, the exposed steel pipe will be inspected longitudinally and circumferentially in/around the corroded area and the findings shall be recorded on the paperwork for the respective job (e.g., Leak History Report [50-13R] or its electronic equivalent in the Computer Aided Dispatch [CAD] system). This may

require additional excavation. If corrosion is found to a degree that will require replacement, the responsible Gas Distribution Engineering will be contacted to perform an additional inspection to determine if further action is needed. (Reference Gas Specification G-11814, "Procedure for Determining the Soundness of Steel Gas Distribution Piping," and Gas Specification G-11863 for additional inspection criteria.)

b. Whenever a gas facility operating at 125 psig or above is fully or partially exposed, or damaged (including coating), notify Corrosion Control and request an inspection of the pipeline coating, including any visible metal surface. If corrosion is found, the topography and pit depth measurements of the corroded area will be recorded by Corrosion Control or its representative and reviewed for integrity assessment by Gas Engineering—Corrosion Control, Pipeline Integrity, or Major Projects - System Reliability. (Reference Gas Specifications G-11814 and G-11863 for additional inspection criteria.)

4.11 Internal Corrosion Control –

a. Whenever any portion or section of an existing pipeline is removed for any reason, the internal surface must be visually inspected by an Operator Qualified individual and the observations documented on the paperwork for the respective job (e.g., Leak History Report [50-13R] or its electronic equivalent in the CAD system). If corrosion is found, visually inspect the adjacent internal pipe surface, both longitudinally and circumferentially, in/around the corroded area and record findings. If corrosion is found to a degree that requires replacement, notify Gas Engineering so that an additional inspection can be performed to determine if further action is needed. (Reference Gas Specifications G-11814 and G-11863 for additional inspection criteria.)

b. If a gas facility operating at 125 psig or above is removed for any reason, the internal surface must be visually inspected and documented by Corrosion Control in accordance with the provisions of Gas Specification G-11879, "Gas Transmission System Internal Corrosion Monitoring Program." Corrosion Control should be called to schedule an inspection in advance of internal surfaces being exposed, if feasible. (Reference Gas Specifications G-11814 and G-11863 for additional inspection criteria.)

5.0 RESPONSIBILITIES --

5.1 Gas Distribution Engineering – Review gas line clearance reports to confirm encroachment conditions, calculates the minimum replacement length for cast iron encroachment jobs and designs the layouts for encroachment jobs in all Gas operating areas and interference jobs in Westchester.

5.2 **All Company Excavating Organizations –** Ensure proper clearances between electric and gas facilities and repair or replacement of deteriorated electric conduits in accordance with paragraph 4.4. All corrections are to be made while excavations are opened and entered into the Gas Clearance Mitigation Form. or documented by submitting a Hold Point through the approved mobile application. Ensure encroachments are identified, reported to Gas Distribution Engineering, and documented in acordance with G-11839.

5.3 **Report Preparation and Training –**

a. As required, each organization is responsible for identifying potential encroachments and clearance requirements for its planned projects in the Company's franchise areas in accordance with paragraphs 4.5 and 4.7. In addition, each organization is responsible for the preparation of Gas Line Clearance Reports in accordance with paragraph 4.9. The documentation of external and internal corrosion shall be followed in accordance with paragraphs 4.10 and 4.11 by Operator Qualified individuals.

b. In accordance with the provisions covered in paragraph 2.0, each General Manager or Director is responsible for ensuring that engineers, construction inspectors and appropriate construction personnel are trained in and are adhering to these procedures and instructions. Annual training for cast iron encroachments (available through eLearning ONL0006 or equivalent DOJT GAS0426 "Replacement and Maintenance of Cast Iron Pipe Located in Construction Areas.") will be provided by The Learning Center (TLC), Learning and Inclusion, and will be given to all engineers, inspectors and appropriate construction personnel responsible for gas facility clearances. Training will cover rules and regulations and inspection of in-progress jobs.

c. Each engineering, excavating organization and each organization that designs, plans or oversees excavation work will perform refresher training annually on the requirements of paragraph 4.4b of this Instruction. (Reference Documented On-The-Job Training [DOJT] GAS0466, "Gas Clearance Mitigation Requirements.")

5.4 **Learning and Inclusion –** Individuals must be properly trained and Operator Qualified to perform any covered task per Con Edison's Operator Qualification Compliance Program (e.g., inspection of third party excavations for damage prevention/cast iron encroachment; visually inspecting gas pipe for internal corrosion; inspecting gas pipe for atmospheric corrosion). Contact TLC for appropriate training and Operator Qualification.

6.0 **ADVICE AND COUNSEL --** The Vice President, Gas Engineering, will provide advice and counsel on this Instruction.

PART 1 GENERAL

1.01 SUMMARY

A. This Section details the requirements for construction and demolition activities affecting Asbestos-Containing Materials (ACM), trace asbestos materials (i.e., Building Materials containing 1% or less of asbestos), and Asbestos-Containing Waste Materials, as shown in the following report and on Table No. 3, Summary of Asbestos Analysis (Asbestos was not detected), attached to Section 01 35 45 – Hazardous Materials Control, specified herein, or required to complete the Work, including all ACM identified and impacted by the Work.

1. Hazardous Materials Mitigation Report, Rev.1, Contract WP-169 CSO-FC-DF, Bidwell Environmental, LLC, June 2025.

B. All Work under this Section shall be performed to minimize the creation of airborne emissions; minimize the quantity of waste generated; protect the health and safety of all personnel and welfare of the public; and avoid adverse environmental impacts.

C. It should be noted that DEP Asbestos Projects being conducted on New York City property that is physically located outside of the five boroughs, would be subject to the requirements of 12 NYCRR 56, and not the requirements of RCNY Title 15, Chapter 1.

D. In the absence of analytical testing results for certain materials, the material shall be classified as suspect ACM pending the analytical results. Abatement of unforeseen or suspect/confirmed asbestos during the Work performed under this Section shall be in accordance with Section 01 35 45 – Hazardous Materials Control.

E. All Independent Third-Party air monitoring shall be outside this Contract and performed by others.

F. The Contractor shall label all known ACM in the field to prevent accidental disturbance by workers.

G. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s), or allowance(s) as set forth in Section 01 27 00 – Measurements and Payments.

1.03 RELATED SECTIONS

A. Section 01 35 27 – Environmental Health and Safety Requirements

B. Section 01 35 45 – Hazardous Materials Control

C. Section 01 41 00 – Regulatory Requirements

D. Section 01 51 11 – Temporary Water and Sanitary Services

E. Section 01 51 12 – Temporary Heat and Ventilation

F. Section 01 51 30 – Temporary Electrical System

1.04 REFERENCES

A. Definitions

1. Abatement: Any and all procedures physically taken to control fiber releases from ACM. This includes Removal, Encapsulation, enclosure, cleanup, and Repair.

2. Adequately Wet: Defined by the EPA (40 CFR 61.141) as a material sufficiently mixed or penetrated with amended water to prevent the release of Visible Emissions. If Visible Emissions are observed coming from an ACM or asbestos waste, then the material has not been "Adequately Wetted." However, the absence of Visible Emissions is not evidence of being Adequately Wet. ACM must be fully penetrated with the wetting agent to be Adequately Wet. If the ACM being abated is resistant to amended water penetration, the wetting agent shall be applied to the

material prior to and during Abatement as necessary to minimize the potential for fiber releases.

3. Aggressive Air Sampling: A method of sampling within a Negative Pressurized Enclosure (NPE) in which mechanical equipment is used before and during the sampling period to stir up settled dust/asbestos fibers. Mechanical equipment includes 20-inch fans and forced air equipment (e.g., a one-horsepower leaf blower).

4. Air Sampling Technician: A person who performs Asbestos Project air sampling and possesses a valid Air Sampling Technician certificate issued by the NYSDOL.

5. Ambient Air Monitoring: The measurement or determination of airborne asbestos fiber concentrations outside but in the general vicinity of the Work site, performed in accordance with NIOSH or EPA sampling methodologies.

6. Asbestos Abatement Contractor: A Subcontractor licensed by the NYSDOL who performs Abatement during an Asbestos Project, or employs persons performing such Abatement.

7. Asbestos Abatement Permit: A permit issued by the DEP ACP in accordance with RCNY Title 15, Chapter 1, authorizing the performance of construction Work for Asbestos Projects involving any of the activities defined in RCNY Title 15, Chapter 1-26(a) (1)-(13).

8. Asbestos Assessment Report (Form ACP-5): A form submitted to the DEP ACP by which a DEP-certified Asbestos Investigator certifies that a building or structure (or portion thereof) is free of ACM or the amount of ACM to be abated constitutes a Minor Asbestos Project.

9. ACM: Any material containing greater than one percent asbestos.

10. Asbestos Handler: An individual certified by the DEP and/or NYSDOL who disturbs, removes, encapsulates, repairs, or encloses ACM. Asbestos Handlers working on projects within the five boroughs shall possess both DEP and NYSDOL certifications. Asbestos Handlers working on projects outside of the five boroughs shall possess NYSDOL certifications.

11. Asbestos Handler Supervisor: An individual certified by the DEP and/or NYSDOL who supervises the asbestos handlers during an Asbestos Project, and ensures that proper asbestos Abatement procedures as well as individual safety procedures are being adhered to. Asbestos Handler Supervisors working on projects within the five boroughs shall possess both DEP and NYSDOL certifications. Asbestos Handler Supervisors working on projects outside of the five boroughs shall possess NYSDOL certifications.

12. Asbestos Project: Any Work performed in connection with the alteration, renovation, modification, or demolition of a building or structure, or in connection with the replacement or repair of equipment, pipes, or electrical equipment not located in a building or structure, which will involve the

Abatement, Disturbance, or cleanup of friable or Non-Friable Asbestos. Asbestos Projects are classified as either Large Asbestos Projects, Small Asbestos Projects, or Minor Asbestos Projects in New York State and New York City, and each type of project involves several phases, which can include: background air monitoring, mobilization, pre-abatement/Containment construction, Abatement, cleaning/re-cleaning, final Clearance Air Monitoring, Containment breakdown, and demobilization.

13. Asbestos Project Notification (Form ACP-7): A form submitted to the DEP ACP for all Large Asbestos Projects and Small Asbestos Projects. Minor Asbestos Projects do not require an ACP-7 form.

14. Asbestos-Containing Waste Material: ACM or asbestos-contaminated objects requiring disposal.

15. Building Materials: Any and all materials listed in 12 NYCRR 56-5.1(f)(1), including but not limited to interior and exterior finished, equipment, plaster, roofing, flooring, caulking, sealants, tiles, insulation, and mortar and refractory bricks used in the construction of boilers.

16. Clean Room: An uncontaminated area or room that is part of the Personal Decontamination Enclosure System, with provisions for the storage and changing of "street clothes" into clean Personal Protective Equipment (PPE).

17. Clearance Air Monitoring: Area air monitoring performed inside the Restricted Area and Regulated Abatement Work Area after the completion of the final cleaning, final waiting period, and Final Visual Inspection by the Asbestos Handler Supervisor and Project Monitor. Aggressive Air Sampling shall be performed as part of the Clearance Air Monitoring activities inside of the Containment.

18. Containment: The NPE within the Restricted Area, which establishes the Regulated Abatement Work Area, and surrounds the location where the asbestos Abatement is actually taking place.

19. Critical Barrier: A term used by the NYSDOL to define barriers that seal-off all openings to or within the defined Regulated Abatement Work Area, including but not limited to operable windows, skylights, doorways, ducts, grills, diffusers, and any other penetrations to surfaces adjacent to or within the Regulated Abatement Work Area.

20. Disturbance: Any activities that disrupt the matrix of ACM, or Asbestos-Containing Waste Materials. This includes activities that generate dust, debris, Visible Emissions, or airborne asbestos fibers, including moving friable ACM or Asbestos-Containing Waste Materials from one place to another.

21. Encapsulation: The coating or spraying of ACM, or the bare substrate surface that is exposed after an Abatement, with a pigmented (i.e., non-

transparent) liquid sealant that creates a membrane over the surface of the material (bridging encapsulant) or penetrates into the material and binds its components together (penetrating encapsulant).

22. Excursion Limit: Defined in the OSHA Asbestos Standard for the Construction Industry (29 CFR 1926.1101) as individual exposure, without regard to the use of respirators, to an airborne concentration of asbestos fibers of 1.0 fiber per cubic centimeter of air (1.0 f/cc) averaged over a 30-minute sampling period. No employee of the Contractor shall at any time be exposed to concentrations of asbestos fibers above the Excursion Limit.

23. Worker Exposure Monitoring: Personal air sampling performed outside the respirator within the breathing zone of individuals that are representative of the 8-hour TWA and 30-minute short-term exposures of each employee, for the purpose of determining compliance with OSHA's Asbestos Standard for the Construction Industry (29 CFR 1926.1101). Analytical results from Worker Exposure Monitoring will be used to select appropriate respiratory protection and PPE for individuals within a Restricted Area and Regulated Asbestos Work Area. For the purpose of this Section, Worker Exposure Monitoring samples shall be collected from individuals who are representative of each task being conducted by the Contractor, and all Worker Exposure Monitoring shall follow pertinent NIOSH or EPA sampling methodologies.

24. Final Visual Inspection: An inspection performed by the Project Monitor and Asbestos Handler Supervisor at the completion of the final waiting period on an Asbestos Project (but prior to Clearance Air Monitoring). The inspection is performed in accordance with ASTM E1368 to determine the completeness of Abatement and cleanup.

25. Friable Asbestos: A term used by the NYSDOL to define any ACM or asbestos waste that can be crumbled, pulverized or reduced to powder when dry, by hand pressure.

26. Glovebag: A manufactured, impervious, bag-like enclosure with two (2) inward-projecting long sleeve gloves, one (2) inward-projecting waterwand sleeve, an internal tool pouch, and an attached, labeled receptacle for asbestos waste. The Glovebag is constructed and installed to surround an object or area to be abated, and contain all asbestos fibers released during the Abatement process.

27. High-Efficiency Particulate Air (HEPA) Filter: A filter designed to remove 99.97% of all particles greater than 0.3 micrometers (μm) in diameter. For the purpose of this Section, HEPA vacuum and Negative Air Pressure Equipment (i.e., Microtraps) used by the Contractor shall meet the Standard for Safety High-Efficiency, Particulate, Air Filter Units (UL 586) developed by Underwriters Laboratories.

28. Holding Area: A room or area in the Waste Decontamination Enclosure System utilized for the temporary (i.e., no longer than the current work shift)

storage of containerized asbestos waste, prior to its transfer to a final on-site storage container (i.e., dumpster, trailer, or roll-off) or a licensed asbestos waste transport vehicle. The Holding Area is located between the washroom and an uncontaminated area.

29. Independent Third-Party Monitor: A NYSDOL-licensed asbestos contractor who will be contracted by the Engineer or the City, and is completely independent of the Asbestos Abatement Contractor involved with the Asbestos Project. The Independent Third-Party who conducts ambient and clearance air monitoring or Project Monitoring on an Asbestos Project shall not have any business, personal, or other relationship with the Asbestos Abatement Contractor.

30. Isolation Barrier: A term used to define the construction of partitions, the placement of solid materials, and the plasticizing of apertures to seal off the Regulated Abatement Work Area from surrounding areas and contain asbestos fibers.

31. Large Asbestos Project: An Asbestos Project involving the Removal, enclosure, Encapsulation, Repair, Disturbance, cleanup, or handling of 260 linear feet or more of ACM, or 160 square feet or more of ACM.

32. Log: An official record, maintained by the Asbestos Abatement Contractor, of all activities that occurred during the Asbestos Project. The Log shall be in the form of a bound notebook, and at a minimum, identify the following information: (a) the building owner, agent, contractor, and workers; (b) daily activities, cleanings, and waste transfers; (c) the names and certificate numbers of all Asbestos Handlers and Asbestos Handler Supervisors; (d) the results of inspections of decontamination systems, barriers, and negative pressure ventilation equipment; (e) summaries of all corrective actions and Repairs; (f) work stoppages with reasons for stoppages; (g) manometer readings at least twice per work shift; (h) daily checks of emergency and fire exits; (i) any unusual events.

33. Microtrap: (See definition of "Negative Air Pressure Equipment").

34. Minor Asbestos Project: An Asbestos Project involving the Removal, enclosure, Encapsulation, Repair, Disturbance, cleanup, or handling of 25 linear feet or less of ACM, or 10 square feet or less of ACM.

35. Negative Air Pressure Equipment: A local exhaust system capable of maintaining air pressure within the Containment at a lower pressure than the air outside of the Containment. The Negative Air Pressure Equipment also provides for the HEPA filtration of all air exhausted from the Containment.

36. Non-Friable Asbestos: A term used by the NYSDOL to define any ACM or asbestos waste that cannot be crumbled, pulverized or reduced to powder when dry, by hand pressure.

37. Obstruction: The blocking of a means of egress with any temporary structure or barrier. Polyethylene sheeting shall not be considered an Obstruction when it is prominently marked with exit signage or paint, and cutting tools (i.e., a knife or razor blade) are attached to the work area side of the sheeting for use in the event that the sheeting must be cut to permit egress. A corridor shall not be considered obstructed when there is a clear path measuring at least three feet wide.

38. OSHA Monitoring: (See definition of "Worker Exposure Monitoring").

39. P-100 Filter: (See definition of: "HEPA").

40. Perimeter Monitoring: (See definition of "Area Monitoring").

41. Permissible Exposure Limit (PEL): Defined in the OSHA Asbestos Standard for the Construction Industry (29 CFR 1926.1101) as individual exposure, without regard to the use of respirators, to an airborne concentration of asbestos fibers of 0.1 fibers per cubic centimeter of air (f/cc) calculated as an 8-hour Time-Weighted Average (TWA). No employee of the Contractor shall at any time be exposed to concentrations of asbestos fibers above the PEL. See also Excursion Limit.

42. Personal Decontamination Enclosure System: A series of connected rooms designed to control the passage of Asbestos Handlers, and other authorized individuals into the Regulated Abatement Work Area from uncontaminated areas. The system consists of a Clean Room, a Shower Room, and an equipment room separated from each other and the Regulated Abatement Work Area by airlocks and curtained doorways.

43. Personal Monitoring: (See definition of "Worker Exposure Monitoring").

44. Phase Contrast Microscopy (PCM): An analytical method (e.g., NIOSH 7400 and 7401) used for determining the asbestos fiber concentration in an air sample.

45. Polarized Light Microscopy (PLM): An analytical method (e.g., 40 CFR 763, Subpart F, Appendix A or ELAP Item 198.1 or 198.6) used for determining the asbestos content in a bulk material.

46. Post Abatement Air Monitoring: (See definition of "Clearance Air Monitoring").

47. Presumed Asbestos-Containing Material (PACM): Material suspected of containing asbestos as described in 15 RCNY 1-38. PACM is considered to be ACM unless proven otherwise by appropriate bulk sampling and laboratory analysis.

48. Project Designer: A person who performs Asbestos Project design functions and possesses a valid Project Designer certificate issued by the NYSDOL.

49. Project Monitor: A person who performs Asbestos Project Monitoring functions and possesses a valid Project Monitor certificate issued by the NYSDOL

50. Regulated Abatement Work Area: The portion of the Restricted Area where Abatement Work actually occurs. This includes the interior of the Restricted Area Containment enclosure. For Glovebag operations, the areas contiguous to where the operation takes place are Regulated Abatement Work Areas. For tents, the interior of each tent is a Regulated Abatement Work Area. For exterior, Non-Friable Asbestos Abatement conducted without the establishment of negative air ventilation systems or Containment enclosures, the entire Restricted Area surrounding the Abatement location is considered to be the Regulated Abatement Work Area.

51. Removal: The stripping of any ACM from surfaces or components of a building or structure.

52. Repair: A term used by the DEP to define a corrective action using specified work practices (e.g., Glovebags or tents) to minimize potential asbestos fiber releases from minimally damaged ACM.

53. Restricted Area: An area established and marked for the Abatement portion of an Asbestos Project. The area shall include, but not be limited to, Regulated Abatement Work Areas and any contiguous decontamination enclosure systems, adjoining staging areas where work materials, debris, or waste materials from such Work may accumulate, and waste storage areas (e.g., dumpsters, trailers, or roll-offs).

54. Shower Room: A room between the Clean Room and the equipment room in the Personal Decontamination Enclosure System set up to prevent cross-contamination by ensuring the removal of potential asbestos contamination from the body that may have accumulated during Abatement operations. The Shower Room shall have hot and cold running water controllable at the tap, shall be arranged for complete showering during decontamination, and shall include clean, dry towels, soap, and shampoo in quantities sufficient to accommodate the personnel working on the Asbestos Project.

55. Small Asbestos Project: An Asbestos Project involving the Removal, enclosure, Encapsulation, Repair, Disturbance, cleanup, or handling of more than 25 linear feet but less than 260 linear feet of ACM, or more than 10 square feet but less than 160 square feet of ACM.

56. Suspect ACM: All friable and non-friable materials suspected of containing asbestos as determined by a certified NYSDOL Asbestos Inspector and/or certified DEP Asbestos Investigator, which have not been sampled and analyzed for asbestos content. Suspect ACM includes PACM.

57. Tent: (See definition of “Containment”).

58. Transmission Electron Microscopy (TEM): An analytical method (e.g., 40 CFR 763, Subpart F, Appendix A or ELAP Item 198.4) used for determining the asbestos fiber concentration in an air sample, or for determining the asbestos content in a bulk material.

59. Trace Asbestos-Containing Material: A building material that contains less than or equal to 1% of asbestos.

60. Variance: Relief from specific requirements set forth in state or local asbestos regulations, which is granted in writing by the agency that enforces the regulations.

61. Visible Emission: Any emission containing particulate material that can be seen without the aid of instruments.

62. Waste Decontamination Enclosure System: A series of connected rooms designed to control the transfer of materials and equipment from the Regulated Abatement Work Area. The system consists of a washroom and a Holding Area separated from each other and the Regulated Abatement Work Area by airlocks and curtained doorways.

63. Wet Cleaning: The process of eliminating asbestos contamination from surfaces, equipment, or other objects by using cloths, mops, or other cleaning tools that have been saturated with amended water.

64. Worker Decontamination Enclosure System: (See definition of "Personal Decontamination Enclosure System").

65. Work Place Safety Plan: Construction documents prepared by a registered design professional and submitted for review to the DEP ACP in order to obtain an Asbestos Abatement Permit. The plan shall include, but not be limited to, plans, sections, and details of the Regulated Abatement Work Area clearly showing the extent, sequence, and means and methods by which the Work is to be performed.

B. Reference Standards:

1. The Contractor shall comply with all applicable regulations, standards, and guidelines of federal, state, and local environmental and occupational safety and health agencies regarding ACM, trace asbestos materials, and Asbestos-Containing Waste Materials. These regulations, standards, and guidelines include, but are not limited to the following:

   a. ASTM International:

      1) D2898 – Standard Practice for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing;

      2) E84 – Standard Test Method for Surface Burning Characteristics of Building Materials;

      3) E1368 – Standard Practice for Visual Inspection of Asbestos Abatement Projects.

   b. United States (U.S.) Department of Transportation (DOT):

      1) 49 CFR 171 - General Information, Regulations, and Definitions;

2) 49 CFR 172 – Hazardous Materials Table, Special Provisions, Hazardous Materials Communications, Emergency Response information, and Training Requirements;

3) 49 CFR 173 – Shippers: General Requirements for Shipments and Packagings;

4) 49 CFR 178 – Specifications for Packagings.

2. United States Environmental Protection Agency (EPA):

   a. 40 CFR 61 - National Emission Standards for Hazardous Air Pollutants (NESHAP);

   b. 40 CFR 262 - Standards Applicable to Generators of Hazardous Waste;

   c. 40 CFR 268 – Land Disposal Restrictions;

   d. 40 CFR 302 – Designation, Reportable Quantities, and Notification;

   e. 40 CFR 763 - Asbestos Hazard Emergency Response Act (AHERA).

3. National Institute for Occupational Safety and Health (NIOSH):

   a. Method 7400 – Asbestos and Other Fibers by PCM;

   b. Method 7401 – Asbestos by TEM.

4. National Fire Protection Association (NFPA):

   a. NFPA 255, Standard Method of Test of Surface Burning Characteristics of Building Materials;

   b. NFPA 701, Standard Methods of Fire Tests for Flame Propagation of Textiles and Films.

5. New York City Department of Environmental Protection (DEP):

   a. Environmental Health and Safety Policies and Procedures – Vol. II, Spill Prevention, Environmental Release Reporting and Investigation;

   b. Environmental Health and Safety Policies and Procedures – Vol. III, Asbestos Management;

   c. RCNY Title 15 Chapter 1 - Asbestos Control Program Rules and Regulations; RCNY Title 15 Chapter 19 – Discharges of Wastewater and Other Materials to Public Sewers.

6. New York City Department of Sanitation (DSNY):

   a. RCNY Title 16 Chapter 8 – Asbestos Rules and Regulations.

7. New York State Department of Environmental Conservation (NYSDEC):

a. 6 NYCRR 360 - Solid Waste Management Facilities;

b. 6 NYCRR 364 - Waste Transporter Permits;

c. 6 NYCRR 376 – Land Disposal Restrictions.

8. New York State Department of Health (NYSDOH):

a. 10 NYCRR 55-2 – Approval of Laboratories Performing Environmental Analysis.

9. New York State Department of Labor (NYSDOL):

a. 12 NYCRR 56 - Asbestos Rules and Regulations.

10. Occupational Safety and Health Administration (OSHA):

a. 29 CFR 1910 – Occupational Safety and Health Standards;

b. 29 CFR 1910.28 – Safety Requirements for Scaffolding;

c. 29 CFR 1926.65 – Hazardous Waste Operations and Emergency Response;

d. 29 CFR 1910.134 - Respiratory Protection Standard;

e. 29 CFR 1910.1001 - Asbestos Standard for General Industry;

f. 29 CFR 1910.1200 - Hazard Communication Standard;

g. 29 CFR 1926 - Safety and Health Regulations for Construction;

h. 29 CFR 1926.1101 - Asbestos Standard for the Construction Industry.

11. Underwriters Laboratories, Inc. (UL):

a. UL 586 – Standard for Safety High Efficiency, Particulate, Air Filter Units;

b. UL 723 – Standard for Test for Surface Burning Characteristics of Building Materials.

1.05 DESCRIPTION

A. Commencement of Work: Ten (10) business days prior to the proposed start of Work at each separate location, the Contractor shall notify the Engineer, the onsite safety staff, and building occupants. No Work may proceed at any location until authorized by the Engineer.

B. The Contractor shall coordinate any required equipment shutdowns with the Engineer prior to starting the work.

C. Access Restrictions: The Contractor shall inform the Engineer of proposed access restrictions (i.e., areas or items of equipment which will not be accessible during the proposed Asbestos Project), and provide them estimated time frames (including specific dates) of such proposed access restrictions. The Contractor shall notify Other Contractors in advance of the abatement Work included herein, to provide

them with sufficient time for coordination of interrelated items that are included in their contracts and that must be performed before, after, or in conjunction with the Work included under this Section.

D. The Contractor shall ensure that Personal and Waste Decontamination Enclosure Systems along with the Regulated Abatement Work Area are constructed of solid materials with lockable doors to prevent unauthorized entry during non-working hours.

E. Meetings: In addition to the pre-construction meeting and site walk-through, other meetings may be required or may be requested by the Engineer, including briefings with Site Operations personnel. Written documentation (i.e., "minutes") of all meetings shall be generated by the Contractor, and copies shall be provided to DEP within three (3) business days following each meeting.

1.06 QUALITY ASSURANCE

A. Permits and Notifications: The Contractor shall make all necessary notifications, secure any necessary permits and Variances, complete agency-required forms, and pay all fees in conjunction with asbestos Abatement activities, waste transportation, and waste disposal in accordance with federal, state, and local asbestos regulations (as per 01 41 00 - Regulatory Requirements). Prior to the submittal of any notifications, permit/Variance applications, or forms to regulatory agencies, the Contractor shall provide them to the Engineer for review.

B. Scheduling: The Contractor shall coordinate and schedule all phases of the Work to be performed under this Section with the DEP, subcontractors, material suppliers, and other parties as necessary to ensure the proper execution of the Work.

C. Compliance: In addition to the requirements of this Section, DEP EHS Policies and Procedures and Section 01 35 27 – Environmental Health and Safety Requirements, the Contractor shall comply with all applicable regulations of federal, state, and local authorities pertaining to the Abatement, disturbance, cleanup, handling, transportation, storage, and disposal of ACM, trace asbestos materials, and Asbestos-Containing Waste Materials. All matters regarding the interpretation of any regulations, standards, or policies shall be submitted to the Engineer for resolution before starting the Work. Where the requirements of this Section, DEP EHS Policies and Procedures, and federal, state, or local regulations conflict or vary, the most stringent requirements or regulations shall apply.

D. Rejection of Non-Complying Items: DEP reserves the right to reject Contractor submittal items, including proposed disposal facility, vendors, subcontractors or personnel with regulatory citations/violations, that it deems inappropriate or unacceptable by the Engineer or DEP. The DEP further reserves the right, and without prejudice to other recourse, to accept non-complying items subject to an adjustment in the Contract amount, as approved by the DEP.

E. Suspect Material Characterization: All caulking and bitumastic coatings are considered suspect ACM. Therefore, if a confirmatory sample will be collected, the sampling shall be performed by a certified DEP Asbestos Investigator or NYSDOL Asbestos Inspector.

F. Qualifications:

1. Asbestos Abatement Contractor: The Contractor shall possess a current NYSDOL asbestos license and shall have successfully completed at least two (2) Asbestos Projects of comparable scope and methodologies within the past three (3) years. This experience shall be documented and provided as follows: (a) the name, address, and phone number of each facility where the work was performed; (b) the volume and type of each material that was abated; (c) the specific methods of Abatement (including the tools, technologies, and engineering controls employed);

2. Asbestos Handler Supervisor:

   a. Shall be currently certified by the DEP (if working on Asbestos Projects in the five boroughs) and NYSDOL (for all Asbestos Projects).

   b. Shall have a minimum of two (2) years of experience on Asbestos Projects, and shall have served as the Asbestos Handler Supervisor on at least three (3) Asbestos Projects of comparable scope and methodologies to the work being performed under this Section.

3. Asbestos Handler:

   a. Shall be currently certified by the DEP (if working on Asbestos Projects in the five boroughs) and NYSDOL (for all Asbestos Projects), and

   b. Shall have a minimum of one (1) year of experience on Asbestos Projects, and shall have worked on at least three (3) Asbestos Projects of comparable scope and methodologies to the Work being performed under this Section.

1.07 SUBMITTALS

A. Thirty (30) business days prior to commencement of the Work of this Section or as directed by the Engineer, the Contractor shall submit the following to the Engineer:

1. Asbestos Inspection and Sampling Plan: The Contractor shall provide an Asbestos Inspection and Sampling Plan to identify suspect asbestos-containing materials and collect confirmatory samples, as appropriate during the inspection.

2. The Asbestos Inspection and Sampling Plan shall include at a minimum:

   a. At a minimum, the inspection shall be performed by a certified NYSDOL Asbestos Inspector or a certified NYCDEP Asbestos Investigator (if performed within the City), who shall have OSHA 10-hour certification, and confined space entry training as applicable to the location or work, and shall have performed similar inspection work on at least three (3) projects of comparable scope.

b. Credentials of the laboratory providing sample analysis. The credentials shall include current certification by the NYSDOH ELAP.

c. Sample collection, analysis and reporting protocol in accordance with RCNY Title 15 Chapter 1 or 12 NYCRR Part 56, as applicable to the Work location.

d. Health and safety protocol (Job Hazard Analysis) for all investigation activities.

3. Asbestos Inspection Report: The Contractor shall provide an Asbestos Inspection Report summarizing the results of all inspection activities, and as applicable, a sampling narrative, laboratory data packages and an inventory, including photographs, of all identified suspect and confirmed asbestos-containing materials. All reporting shall be in accordance with RCNY Title 15, Chapter 1 or 12 NYCRR Part 56, as applicable to the Work location.

4. Asbestos Work Plan: The Asbestos Work Plan shall be prepared in accordance with RCNY Title 15, Chapter 1 or 12 NYCRR 56, all applicable DEP EHS Policies and Procedures, and all other pertinent federal, state, and local regulations. In addition, the Asbestos Work Plan shall be coordinated with the Engineer. The Asbestos Work Plan shall also be signed and dated by a NYSDOL-certified Project Designer, with a copy of the Project Designer's current NYSDOL certification, attached to the Work Plan. The Asbestos Work Plan shall include the following elements:

a. Asbestos Control:

1) Drawings showing the location and details of the following: (a) each Regulated Asbestos Work Area; (b) the type, location, and number of negative air pressure machines that will be used, as well as all exhaust locations; (c) proposed electrical hookups and temporary electrical panels; (d) proposed water hookups; (e) each Restricted Area; (f) each Personal Decontamination Enclosure System; (g) each Waste Decontamination Enclosure System; (h) each waste storage area (e.g., dumpster, trailer, or roll-off); (i) restroom areas; (j) areas designated for eating and drinking.

2) A section on the interfacing of trades (i.e., other contractors) and the sequencing of asbestos-related Work.

3) A section on the collection, handling procedures, cleanup, and disposal of Asbestos-Containing Waste Materials (including the collection, filtering, and disposal of wastewater).

4) A section on the procedures and methodologies that will be used to conduct Worker Exposure Monitoring, including the

name and qualifications (i.e., training and experience documentation) of the individual who will be responsible for conducting the Worker Exposure Monitoring.

5) A section on housekeeping procedures to be used for maintaining clean Regulated Abatement Work Areas, clean Restricted Areas, and clean decontamination enclosure systems.

6) A section on the specific methods and procedures that will be used to control fiber releases, and ensure that as per 40 CFR Part 763, Subpart E, of the EPA Asbestos in Schools Rule measured by Phase Contrast Microscopy (PCM), fiber concentrations less than or equal to the clearance and action criteria of 0.01 f/cc of air, or background levels (whichever are greater), are not exceeded outside of each Regulated Abatement Work Area. For projects conducted outside of the five boroughs of New York City, the clearance and action criteria is less than 0.01 f/cc; of air, or background levels (whichever is greater).

7) Task Analysis: Each task analysis shall include, but is not limited to, the following information: (a) the type of Work activity; (b) the tools/equipment that will be used and their respective decontamination procedures; (c) the types of ACM that will be disturbed, or Asbestos-Containing Waste Materials that may be generated when performing the activity; (d) the engineering controls that will be used to control the spread of asbestos fibers during the activity; (e) the proposed crew size for the activity and individual employee responsibilities during the activity; (f) housekeeping procedures that will be used during the activity; (g) PPE and proposed respiratory protection that will be used for the activity.

8) Equipment and Supplies: Identify the materials and equipment that will be used to perform the Work, including materials and equipment designed to be non-combustible or fire retardant in accordance with NFPA 701 and 255. Materials and equipment utilized for Abatement activities that take place within the five boroughs, shall conform to RCNY Title 15 Chapter 1-61.

9) Rental Equipment Notification: If rental equipment is to be used during the Work, the Contractor shall notify the rental agency in writing concerning the intended use of the equipment, and shall develop and submit an equipment decontamination plan to the Engineer for review and approval prior to the start of Work.

10) Safety Data Sheets (SDSs): Provide SDSs for all chemical products (including wetting agents and encapsulants) to be used for the Work.

b. Waste Management:

1) A description of the types of ACM and Asbestos-Containing Waste Materials associated with the Work (include details regarding whether the materials are friable or non-friable) as per 49 CFR 171 and 172.

2) The estimated quantity of each waste stream that will be generated as per 40 CFR 302.

3) Name, address, telephone number and current permit documentation for the disposal facility indicating that the facility is approved by federal, state, and local regulatory agencies to receive Asbestos-Containing Waste Materials.

4) Current 6 NYCRR 364 and 49 CFR 173 permit documentation for the waste transporter that will transport Asbestos-Containing Waste Materials from the Work Site to the disposal facility.

5) Spill prevention, Containment, and cleanup contingency measures to be implemented during a suspected fiber release or emergency situation.

6) A detailed discussion of the on-site handling, storage, removal, cleanup, and disposal of waste materials, including the following: (a) description of the waste storage areas; (b) the methods and procedures that will be used to collect and containerize wastes on a daily basis; (c) the types of bags/containers; (d) the submittal of weekly waste inspection records.

7) The name and qualifications of the Asbestos Handler Supervisor. At a minimum, the Asbestos Handler Supervisor shall be onsite during all activities affecting ACM.

c. Asbestos Abatement Project Notifications and Permits: Submit completed permits and notifications to the Engineer for review and approval prior to submittal to the applicable agencies. All Large Asbestos Projects and Small Asbestos Projects that take place within the five boroughs are required to follow notification and permitting procedures per RCNY Title 15, Chapter 1. All Large Asbestos Projects require notification procedures per 12 NYCRR 56. Documents that may be required based upon the scope and location of the project include, but are not limited to, the following:

1) EPA Large Asbestos Project Notification;

2) DEP Asbestos Assessment Report (Form ACP-5);

3) DEP Asbestos Project Notification (Form ACP-7);

4) DEP Asbestos Project Amendment (Form ACP-8);

5) DEP Asbestos Variance Application (Form ACP-9);

6) DEP Asbestos Technical Review Unit Permit (A-TRU Permit);

7) DEP Work Place Safety Plan;

8) NYSDOL Asbestos Project Notification;

9) NYSDOL Asbestos Variance Application.

d. A detailed schedule for the implementation of the Asbestos Work Plan elements, including the different phases of the Asbestos Project, the projected start and completion dates for Restricted Area preparation, gross Removal and Abatement, cleanings, Clearance Air Monitoring, and demobilization activities.

e. Medical Surveillance: The Contractor shall provide a sufficient number of properly trained, experienced, and certified workers, each of whom shall: (a) have received a medical exam that included a Pulmonary Function Test (PFT) within the past year; (b) have received written medical clearance within the past year, by a licensed physician, to wear a respirator; (c) have received a qualitative or quantitative respirator fit-test within the past year for the specific respirator the employee will be using for this Work.

f. Employee Documentation: The Contractor shall provide a sufficient number of properly trained, experienced, and certified workers, each of whom shall: (a) have current NYSDOL-issued and DEP-issued asbestos certificates; (b) documentation for Asbestos Handlers and Asbestos Handler Supervisors, including required work experience; and (c) dates and written proof of respiratory clearance, including fit-test and medical examinations by the Contractor or other employer within the past year.

g. A current (i.e., within the last month) signed and notarized statement disclosing all of the Abatement Contractor's OSHA, EPA, NYSDOL, DEP, DSNY, and DOT citations/violations on Asbestos Projects within the past three (3) years.

h. A current (i.e., within the last month) signed and notarized statement disclosing all of the Asbestos Handler Supervisor's NYSDOL and DEP citations/violations within the past three (3) years.

i. Analytical Laboratory Qualifications for Analyzing Air Samples: Submit the name, address, and telephone number of each analytical laboratory, including copies of current AIHA and ELAP certificates

along with dates of accreditation/reaccreditation. ELAP certificates should show evidence of certification for the specific analytical methods that will be used.

5. The Contractor shall submit all Worker Exposure Monitoring results to the DEP no later than 24-hours after the collection of the air samples.

B. Field Reports and Recordkeeping: The Contractor shall maintain and provide the following documentation:

1. Worker Exposure Monitoring Documentation: Worker Exposure Monitoring Documentation shall be made available to the DEP immediately upon request. All laboratory analytical results shall be accompanied by complete COC documentation.

a. The signed Worker Exposure Monitoring documentation shall include, but not be limited to, the following information: (a) sample "start" and "stop" times; (b) flow rates (initial and final) for each sample; (c) the total volume of air collected for each sample; (d) names of individuals being sampled along with the specific Work task each individual is performing; (e) specific respiratory protection and PPE worn by each individual; (f) types (i.e., makes and models) of sampling equipment used; (g) types of sample media (i.e., filters and cassettes) used; (h) the most recent calibration dates, along with the calibration results, for the sampling equipment used; (i) name of the individual who conducted the Worker Exposure Monitoring; (j) dates that the Worker Exposure Monitoring was conducted; (k) Work tasks being performed adjacent to the Restricted Area during the Worker Exposure Monitoring; (l) unique sample numbers used to identify each sample; (m) the phase of the Asbestos Project being performed (i.e., background, pre-abatement, Abatement, cleaning, or clearance).

2. Waste Manifest Documentation: A Waste Profile for all asbestos waste shall be completed and submitted to the Engineer for review and approval prior to DEP signature. The Contractor shall submit a Facility Letter of Acceptance form the selected asbestos-permitted landfill stating that the facility will accept the asbestos wastes generated during abatement. The Contractor shall also submit advance copies of the completed manifest for the Engineer's review and approval, prior to NYCDEP signature on the date of disposal. Following disposal, completed and signed waste manifests from the approved, asbestos-permitted landfill, shall be provided to the DEP within 10 business days of disposal. In addition, on-site waste storage areas shall be inspected weekly by the Asbestos Handler Supervisor.

3. Waste Storage Area Inspection Documentation: Each weekly waste storage area inspection shall be documented in the Asbestos Abatement Contractor's bound Log. The Log shall be signed by the Asbestos Handler Supervisor, and shall be made available to the DEP immediately upon

request. The content of this documentation shall include, but not be limited to, the following information: (a) the name of the inspector; (b) descriptions of waste streams; (c) waste container type and quantity; (d) the current disposal status (i.e., when the waste container is scheduled to be removed from the Work Site) and physical condition of each waste container; (e) the present condition of each waste storage area; (f) proper label type; (g) storage area security method to prevent unauthorized entry.

4. Asbestos Project Inspection Documentation: Project Monitors and Restricted Areas shall be inspected daily by the Asbestos Handler Supervisor.

   a. Each daily Asbestos Project inspection shall be documented in the Asbestos Abatement Contractor's bound Log. The Log shall be signed by the Asbestos Handler Supervisor, and shall be made available to the DEP immediately upon request. The content of the Log shall include, but is not limited to, the following information: (a) the type of Asbestos Project (i.e., Large Asbestos Project, Small Asbestos Project, or Minor Asbestos Project) being conducted; (b) the current phase of the Asbestos Project (i.e., mobilization, background pre-Abatement, abatement, cleaning, Clearance Air Monitoring, or Containment breakdown); (c) the names of the Asbestos Handlers, Asbestos Handler Supervisors, Project Monitors, and Air Sampling Technicians on site, as well as the name of the company each individual is representing; (d) the types of air monitoring (i.e., Worker Exposure Monitoring or area monitoring) being conducted, and the number of samples being collected for each type of air monitoring activity; (e) the results of decontamination enclosure system, Critical Barrier, Isolation Barrier, and Negative Air Pressure Equipment inspections; (f) a summary of corrective actions and Repairs; (g) reasons for Work stoppages, if any; (h) manometer readings (at least twice per work shift); (i) emergency and fire exit checks; (j) verification that functional fire extinguishers are present in the Restricted Areas; (k) any unusual events that occurred during the Work; (l) non-compliance issues observed, including their corrective actions.

5. Contractor Project Record: The Asbestos Handler Supervisor shall maintain a project record in the Regulated Abatement Work Area. The Contractor Project Record shall be made available to the Engineer or DEP for review at any time during the Asbestos Project, and shall be submitted to the DEP within 24- hours after the completion of the Asbestos Project.

   a. At a minimum, the Contractor Project Record shall contain the following information: (a) copies of DEP and NYSDOL asbestos certificates/licenses for all individuals/companies working on the Asbestos Project; (b) copies of all notifications, amendments, permits, work safety plans, and Variances related to the Asbestos

Project; (c) copies of all exposure and Ambient Air Monitoring results generated during the Asbestos Project; (d) documentation of all pressure differential readings for Regulated Abatement Work Areas; (e) copies of all available bulk sample analytical data as well as asbestos survey reports relating to the Asbestos Project; (f) copies of all daily sign-in sheets as defined in this Article; (g) a list of emergency phone numbers, including the local fire department, local police department, nearest hospital, as well as phone numbers for the Engineer and DEP personnel responsible for administering the Asbestos Project; (h) a copy of New York City's Asbestos Control Program Rules and Regulations (Title 15, Chapter 1); (i) a copy of New York State's Asbestos Rules and Regulations (12 NYCRR 56); (j) a copy of EPA's asbestos regulations (40 CFR 61, Subparts A and M); (k) copies of all SDSs pertaining to all chemicals being used during the Asbestos Project; (l) a copy of the Contractor's Asbestos Work Plan; (m) copies of all daily air monitoring reports as defined in this Article; (n) copies of all daily Asbestos Project inspection reports as defined in this Article; (o) copies of all weekly waste storage area inspection reports as defined in this Article.

6. Daily Sign-In Documentation: The Contractor shall generate daily sign-in documentation for all individuals entering and exiting each Regulated Abatement Work Area and Restricted Area, for the duration of the Asbestos Project. The daily sign-in documentation shall be maintained in the Asbestos Abatement Contractor's bound Log. The daily sign-in documentation shall be made available to the Engineer or DEP for review at any time during the Asbestos Project.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. Respirators: The Contractor shall select respirators approved by NIOSH for use in Regulated Abatement Work Areas where the Abatement or Disturbance of ACM

or Asbestos-Containing Waste Materials will occur. If not included within the EHASP the Contractor shall submit their Respiratory Protection Program to DEP for review prior to abatement activities. At a minimum, the Contractor shall provide each individual within a Regulated Abatement Work Area with a half-face, negative pressure, air purifying respirator equipped with HEPA filter cartridges. The Contractor's Asbestos Handler Supervisor shall make all determinations regarding respiratory protection modifications that will be implemented for the Work. All modifications shall be in accordance with the OSHA Asbestos Standard for the Construction Industry (29 CFR 1926.1101) and the Contractor's Asbestos Work Plan. At no time during the Asbestos Project shall respiratory protection within a Regulated Abatement Work Area be downgraded to below the minimum requirement of a half-face, negative pressure, air purifying respirator equipped with HEPA filter cartridges.

B. PPE: The Contractor shall provide personnel who have a potential to be exposed to asbestos with appropriate PPE.

C. HEPA Filters: HEPA filters used in vacuuming equipment and Negative Air Pressure Equipment must meet or exceed any manufacturer's specifications and recommendations, as well as specifications presented in the Standard for Safety High Efficiency, Particulate, Air Filter Units (UL 586).

D. Containment Materials: Plastic sheeting used in the construction of temporary enclosures shall be fire retardant in accordance with NFPA 701. Wood or other materials used in the construction of temporary enclosures shall be non-combustible or fire-retardant in accordance with NFPA 255, ASTM D2898, ASTM E84 and UL 723.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Safe Work Practices for Trace Asbestos materials

1. An exposure assessment shall be performed in accordance with 29 CFR 1926.1101(f) (2) (i) to determine if workers disturbing, handling, or performing cleanup activities involving trace asbestos materials, must wear PPE or respiratory protection.

2. Wetting agents or special work methods shall be utilized to control potential employee exposures to asbestos during the handling, mixing, removing, cutting, application, or cleanup, of trace asbestos materials, except if the use

of these wetting agents/work methods is not feasible (e.g., using them may create electrical hazards or equipment malfunctions).

3. Asbestos-contaminated wastes and debris shall be cleaned-up promptly and disposed of in leak-tight containers. The handling, disposal, and transport of Trace Asbestos-Containing Material wastes is not regulated since the wastes are not ACM (i.e., they do not contain greater than 1% asbestos).

4. The use of high-speed abrasive saws that are not equipped with "point-of-cut" ventilators or enclosures with HEPA-filtered exhaust air shall be prohibited.

5. The use of compressed air to cleanup or remove trace asbestos materials is prohibited.

B. Preparation

1. Utilities: The temporary use of any on-site utilities shall be subject to the approval of the DEP. The Contractor shall furnish all water, hoses and water filtration devices needed for the Work as per 01 51 11 - Temporary Water and Sanitary Services; as well as any temporary electrical hookups and temporary lighting to the Asbestos Control Area as per 01 51 30 - Temporary Electrical System. All temporary lighting and temporary electrical service to an Asbestos Control Area shall be provided by the Contractor and shall be in weather-proof enclosures and be ground fault protected. Also, the Contractor shall supply all heating and ventilation equipment needed for the Work as per 01 51 12 Temporary Heat and Ventilation.

2. Signs: The Contractor shall post conspicuous warning signs at all approaches to Regulated Abatement Work Areas, Restricted Areas, and waste storage areas. The signs shall be located at such a distance so that personnel may read the sign and take necessary precautions before entering a Regulated Abatement Work Area, Restricted Area, or waste storage area. Signs shall comply with the requirements of federal, state, and local regulations. Once Clearance Air Monitoring results indicate that a Regulated Abatement Work Area is in compliance with the provisions for re-occupancy set forth in RCNY Title 15, Chapter 1 or 12 NYCRR 56, the signs shall be removed. At a minimum, each sign shall bear the following information in English and the predominant language that is spoken by the Contractor's employees if English is not spoken:

DANGER
ASBESTOS CANCER AND LUNG DISEASE HAZARD
AUTHORIZED PERSONNEL ONLY
RESPIRATORS AND PROTECTIVE CLOTHING
ARE REQUIRED IN THIS AREA
NO SMOKING

C. Fire Extinguishers: The Contractor shall maintain at least two functional fire extinguishers in each Restricted Area. The fire extinguishers shall have a minimum rating of 2-A:10-B:C, and each fire extinguisher shall be checked daily by the Asbestos Handler Supervisor to ensure that it remains functional throughout the duration of the Asbestos Project.

3.02 IMPLEMENTATION

A. Bulk Removal

1. Protection of Existing Work to Remain: All Work involving the Abatement or Disturbance of ACM or Asbestos-Containing Waste Materials, must be conducted without damage to, or contamination of equipment or surfaces within the Regulated Abatement Work Areas, Restricted Areas, or other areas adjacent to these areas. All such damage or contamination shall be immediately corrected and cleaned up by the Contractor at the Contractor's expense.

2. Containments and Negative Air Pressure Equipment: Pressure differential readings for each workday shall be obtained, documented in the Contractor's Project Record, and reviewed by the Asbestos Handler Supervisor on a daily basis. The Asbestos Handler Supervisor shall notify the Engineer and the DEP immediately, if any variations in the pressure differential readings may have led to the migration of asbestos fibers outside of a Regulated Abatement Work Area. Corrective actions shall be implemented immediately to ensure that negative pressure is restored.

3. Personal Decontamination Enclosure System: The Contractor shall ensure that employees do not leave a Regulated Abatement Work Area wearing any potentially contaminated protective work clothing or PPE. Employees are required to shower prior to leaving the Regulated Abatement Work Area.

3.03 FIELD TESTING / QUALITY CONTROL

A. Air Monitoring

1. Air monitoring for airborne concentrations of asbestos fibers shall be conducted by the Asbestos Handler Supervisor (or by a qualified air monitoring firm) in accordance with OSHA.

a. Worker Exposure Monitoring: Worker Exposure Monitoring shall be conducted during each phase of the Asbestos Project (e.g., pre-abatement, Abatement, and cleanup) for one (1) Work shift from at least one (1) employee that is representative of each type of Work task that is being performed. Each personal air sample will "run" for the employee's entire Work shift in order to ensure that enough volume (of air) is collected and an accurate 8-hour TWA can be calculated. Representative 30-minute short-term employee exposures shall also be conducted and shall be determined on the basis of one or more samples representing 30-minute exposures

associated with operations that are most likely to produce exposures above the excursion limit for employees in each Regulated Abatement Work Area as per OSHA 1926.1101(f)(1)(iii). Documentation regarding the sample numbers, specific shift when the sampling was conducted, the Work tasks that were sampled, the dates of sampling, the employee hours that were worked during the shift, and the total sampling times, shall accompany each laboratory COC form.

b. Complete documentation of all Worker Exposure Monitoring activities shall be in accordance with this Article.

c. The Contractor shall submit all Worker Exposure Monitoring results to the DEP within 24- hours from when the air samples were collected.

d. If at any time, PCM analysis of any air sample (i.e., from Worker Exposure Monitoring performed by the Contractor) in any phase of the Asbestos Project (i.e., pre-abatement, Abatement, cleanup, or clearance) indicates that the filter was "overloaded" and a fiber count cannot be obtained, the sample shall immediately undergo TEM analysis. All costs of the additional TEM analysis will be at the Contractor's expense.

2. Area Monitoring: Air monitoring for airborne concentrations of asbestos fibers shall be conducted by the DEP.

a. All Clearance Air Monitoring results shall meet or be below background ambient air levels or 0.01 f/cc of air (whichever is greater), prior to the breakdown of the Containment. If Clearance Air Monitoring results indicate a fiber count greater than background ambient air levels or 0.01 f/cc of air in any area, the Contractor will be required to re-clean that area. For projects conducted outside of the five boroughs, the clearance and action criteria is less than 0.01 f/cc; of air, or background levels (whichever is greater). Repeated cycles of cleaning and Clearance Air Monitoring will be performed until a fiber count is achieved that meets or is below background ambient air levels or 0.01 f/cc of air within the area. All costs of re-cleaning and additional Clearance Air Monitoring will be at the Contractor's expense.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Cleanup: All cleaning Work shall progress from the point most remote from the intakes of the Negative Air Pressure Equipment, towards the intakes of the equipment, as well as from the highest point of the surfaces to be cleaned towards the lowest point of the surfaces. Dry sweeping and using compressed air to cleanup

a Regulated Abatement Work Area or a Restricted Area is strictly prohibited. HEPA-filtered vacuums and Wet Cleaning methods shall be used to ensure that these areas remain free of visible dust and debris on a daily basis. In addition, only cleaning materials and equipment which are compatible with the surface being cleaned, as recommended by the manufacturer of the materials or as approved by the DEP, shall be used.

B. Collection, Filtration and Containerization of Wastes: The Contractor shall collect and containerize asbestos waste (solid and liquid), debris, PPE, and Containment materials on a daily basis in accordance with the Asbestos Work Plan. Using chutes to move construction debris or waste (bagged or not bagged) will not be permitted at any time.

1. Prior to containerizing Asbestos-Containing Waste Materials, the wastes shall be "Adequately Wetted," and wrapped in 6-mil (0.006") polyethylene sheeting, or double-bagged in 6-mil polyethylene bags. The bags shall be "goose necked" and sealed air tight with duct tape, and each bag (or wrapped item) shall be labeled before being placed in an appropriate container (i.e., dumpster, trailer, or roll-off) for disposal.

2. Corrugated cartons or drums may be used in conjunction with polyethylene bags and sheeting for the disposal of Asbestos-Containing Waste Materials that have sharp-edged components (e.g., nails, screws, or tin sheeting) which may tear the bags or sheeting. The waste within these drums or cartons must be wrapped or double-bagged, and the cartons/drums must be labeled.

3. Wastewater derived from the Asbestos Project shall be collected and filtered through a system with at least a 5.0-micron particle size collection capability. A system containing a series of several filters with progressively smaller pore sizes shall be used to avoid the rapid clogging of the filtration system by large particles. Contaminated filters shall be disposed of as asbestos waste. Filtered wastewater shall be discharged in accordance with all applicable federal, state, and local regulations.

   a. Discharging filtered asbestos decontamination water to a DEP Wastewater Treatment Plant (WWTP) will require written permission from the DEP Bureau of Wastewater Treatment (BWT) and the submission of analytical testing results for asbestos to the BWT for review and approval prior to discharge. The disposal requirements for filtered asbestos decontamination water generated on other DEP properties (e.g., drinking water shafts) may be more stringent or prohibited.

C. Storage of Wastes: The Contractor shall store all bagged Asbestos-Containing Waste Materials in DOT-approved container systems (e.g., a roll-off or trailer), as per 49 CFR 178. No container shall be filled in excess of the capacity marked on the container, and all containers shall be lined with 6-mil (0.006") polyethylene sheeting, have a hard top, and shall be lockable. In addition, all containers shall

have an intact and legible label affixed to it. No bagged asbestos waste shall be stored in a Regulated Abatement Work Area or decontamination enclosure system for longer than the current Work shift that generated the waste.

1. Non-Asbestos Waste: The Contractor shall store non-Asbestos-Containing Waste Materials separately from Asbestos-Containing Waste Materials, shall provide all non-asbestos waste containers, and shall make all transportation and disposal arrangements for non-Asbestos-Containing Waste Materials in accordance with federal, state, and local regulations.

D. Labeling: The Contractor shall affix warning labels to all asbestos waste disposal bags, wrapped items, and containers (i.e., drums, dumpsters, trailers, or roll-offs). Labels shall comply with the requirements of federal, state, and local regulations. At a minimum, each label on disposal containers/bags/items shall bear the following information in English:

DANGER
CONTAINS ASBESTOS FIBERS
AVOID CREATING DUST
CANCER AND LUNG DISEASE HAZARD
[Generator Name, Address, and Telephone Number]

E. Final Visual Inspection and Clearance Air Monitoring: The Independent Third-Party Monitor shall not conduct Clearance Air Monitoring until the Regulated Abatement Work Area has been inspected by the Asbestos Handler Supervisor and the Project Monitor has performed the Final Visual Inspection. During this inspection, the Asbestos Handler Supervisor and the Project Monitor shall determine if the following has been achieved: (a) all ACM and Asbestos-Containing Waste Materials have been abated and removed from the area; (b) the area is clean and dry; (c) Critical Barriers and Isolation Barriers are intact; (d) Negative Air Pressure Equipment is turned on and functioning. If any of these items have not been achieved, the Contractor shall perform the necessary corrective actions to achieve compliance before conducting the Clearance Air Monitoring.

F. Breakdown of the Regulated Abatement Work Area: Critical Barriers shall not be removed and Negative Air Pressure Equipment shall not be turned off until Clearance Air Monitoring results meet the criteria specified in this Section and RCNY Title 15, Chapter 1 or 12 NYCRR 56.

G. Asbestos Project Completion Form/Asbestos Project Conditional Completion: Upon successful completion of an Asbestos Project performed in the five boroughs, a copy of the Asbestos Project Completion Form (ACP-21) or Asbestos Project Conditional Completion Form (ACP-20) issued by the DEP shall be submitted to the Engineer.

H. Disposal of Wastes: Asbestos-Containing Waste Materials shall be disposed of to ensure that containers do not remain on the job site for longer than necessary.

Containers that have reached their storage capacity shall not remain on site and transportation arrangements shall be made for their removal.

I. Disposal Documentation: Once all waste profiles have been completed and signed by DEP, the Contractor shall provide DEP with a "Letter of Acceptance" issued by the TSDF indicating that the wastes will be accepted, and a copy of the advance manifest. On the date of disposal, the Contractor shall submit one (1) copy of the completed manifest that has been signed and dated by the initial transporter in accordance with 6 NYCRR 372, 40 CFR 262 and 40 CFR 302, to the DEP for signature as Generator. All manifests and Land Disposal Restrictions (LDRs) must be signed by a DEP employee as per 6 NYCRR 376 and 40 CFR 268, and as described in Section 01 35 45 - Hazardous Materials Control.

END OF SECTION

NO TEXT ON THIS PAGE

PART 1 GENERAL

1.01 SUMMARY

A. This Section details the requirements for construction and demolition activities affecting materials and structures coated with or containing Lead as shown on Table No.1, Summary of Lead and PCB Analysis on Paints, attached to Section 01 35 45 – Hazardous Materials Control, specified herein, or required to complete the Work, including all affected coatings identified and impacted by the Work.

1. Hazardous Materials Mitigation Report, Rev. 1, Contract WP-169 CSO-FC-DF, Bidwell Environmental, LLC, June 2025.

B. All Work under this Section shall be performed to minimize the creation of airborne emissions (40 CFR 50); minimize the quantity of hazardous waste generated; protect the health and safety of all site personnel and the welfare of the public; and avoid adverse environmental impacts.

C. The Contractor shall perform the abatement and disposal of additional lead-containing materials not included in the reports listed in 1.01A. In the absence of analytical testing results for a specific painted/coated material, air monitoring and worker Personal Protective Equipment (PPE) requirements, including respiratory protection, shall address the potential presence of Lead.

D. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment will be made for performing any work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s), or allowance(s) as set forth in Section 01 27 00 – Measurements and Payments.

1.04 REFERENCES

A. Definitions

1. Abatement: Any measure or set of measures designed to permanently eliminate Lead Paint hazards (refer to 40 CFR 745.223 for description of what is included). Abatement does not include renovation, remodeling, landscaping, or other activities, when such activities are not designed to permanently eliminate Lead Paint hazards, but instead, are designed to repair, restore, or remodel a given structure or dwelling, even though these activities may incidentally result in a reduction or elimination of Lead Paint hazards. Furthermore, Abatement does not include interim controls, (e.g., the spot removal of a Lead paint/bitumastic coating on a surface in order to perform torch cutting at that location), Operation and Maintenance (O&M) activities, or other measures and activities designed to temporarily reduce Lead Paint hazards.

2. Action Level: Defined by OSHA as individual exposure, without regard to the use of respirators, to a specific airborne concentration of a contaminant expressed in micrograms per cubic meter of air ($\mu g/m^3$) calculated as an 8-hour Time-Weighted Average (TWA). Once an Action Level is met or exceeded, the Contractor is responsible for meeting specific requirements outlined in the applicable OSHA standard, which may include additional worker Exposure Monitoring, the use of PPE including respiratory protection, the use of Hygiene Facilities, medical surveillance, or training

for workers. The following Action Levels are pertinent to the disturbance, removal, construction/demolition, and disposal activities associated with painted/coated materials and structures (as per 01 74 20 - Construction Waste Management, 02 41 10 - Demolition and Removals):

a. Lead - 30 µg/m^3 per 29 CFR 1926.62.

3. Area Monitoring: Stationary air sampling outside of a Lead Control Area for the purpose of determining compliance with OSHA's Lead in Construction Standard (29 CFR 1926.62), and for the purpose of ensuring that airborne Lead concentrations remain below 30 ug/m^3 outside of the Lead Control Area during all work activities that have the potential to disturb Lead-Containing Materials or Lead Wastes. All Area Monitoring shall follow pertinent NIOSH (Methods 5503, 7048, 7082, 7105, 7300, 7600, 7604, 7900) or ASTM sampling methodologies.

4. Certified Industrial Hygienist (CIH): Refers to an individual employed by the Contractor who is currently certified by the American Board of Industrial Hygiene (ABIH).

5. Competent Person: Defined in the OSHA Lead in Construction Standard (29 CFR 1926.62) as one who is capable of identifying existing and predictable hazards in the surroundings or working conditions, and who has authorization to take prompt corrective measures to eliminate them. Duties of the Competent Person include the following: (a) determining prior to the performance of the Work, whether Lead is present in the workplace; (b) establishing Lead Control Areas and assuring that access to and from those areas is limited to authorized personnel; (c) assuring the adequacy of any employee Exposure Monitoring required by OSHA; (d) assuring that all employees exposed to airborne contaminant levels above Action Levels, Permissible Exposure Limits, or Recommended Exposure Limits wear appropriate PPE, respiratory protection, and are trained in the use of appropriate methods of exposure control for all of the contaminants present; (e) assuring that proper Hygiene Facilities are provided and that workers are trained to use those facilities; (f) assuring that engineering controls specific to the contaminants present are implemented, maintained in proper operating condition, and functioning properly.

6. Decontamination Area: Designated area within the Hygiene Facilities for removing gross contamination from PPE (using a HEPA vacuum), washing away contamination that has accumulated on the skin and hair (using soap and water), removing and disposing/washing of contaminated PPE, and donning clean clothing that will not potentially contaminate areas outside of a Lead Control Area's Physical Boundary.

7. DOT Hazardous Materials Transportation Training: Training that meets the criteria outlined in 49 CFR 172.704. This training shall include discussions from 49 CFR 171 of the following: (a) hazardous materials tables within 49 CFR 172; (b) material packaging and labeling within 49 CFR 178; (c)

shipping papers and placards within 49 CFR 173; (d) material loading and segregation within 49 CFR 173.

8. EPA Lead-Based Paint Supervisor Training: A training course administered by the EPA or approved company - which includes discussions of the following: (a) worker protection and safety; (b) occupant protection; (c) clan-up and clearance; (d) waste disposal; (e) residence and community relations; (f) regulatory aspects; (g) use of X-Ray Fluorescence (XRF) paint analyzers; (h) legal and insurance issues.

9. Exclusion Zone: (See definition of "Lead Control Area").

10. Exposure Monitoring: Personal air sampling performed outside the respirator within the breathing zone of individuals, for the purpose of determining compliance with OSHA's Limits for Air Contaminants Table (29 CFR 1910.1000, Table Z-1) and Lead in Construction Standard (29 CFR 1926.62). Analytical results obtained from Exposure Monitoring will be used to select appropriate respiratory protection and PPE for individuals within a work area. For the purpose of this Section, Exposure Monitoring samples shall be collected from individuals who are representative of each type work task being conducted by the Contractor, and all Exposure Monitoring shall follow pertinent NIOSH or ASTM sampling methodologies.

11. Hazardous Waste Operations (HAZWOPER) Training: Training that meets the criteria outlined in the OSHA Hazardous Waste Operations and Emergency Response Standard (29 CFR 1910.120). A minimum of 24-hour HAZWOPER Training will be required for Abatement work being performed under this Section. However, certain types of work may require 40-hour HAZWOPER Training.

12. High-Efficiency Particulate Air (HEPA) Filter: A filter designed to remove 99.97% of all particles greater than 0.3 micrometers (μm) in diameter. For the purpose of this Section, HEPA vacuum and local exhaust filtration equipment used by the Contractor shall meet the Standard for Safety High-Efficiency, Particulate, Air Filter Units (UL 586) developed by Underwriters Laboratories.

13. Homogenous Materials: Lead-Containing Materials which are similar in appearance, color, texture, and substrate type.

14. Hygiene Facilities: Facilities within the Physical Boundary of a Work area that are set up to prevent cross contamination and are equipped with change areas and separate storage facilities for PPE and clean clothing. Hygiene Facilities shall include adequately supplied hand washing station(s) (i.e., running water, soap, and clean towels) or shower(s) (hot and cold water that is controllable at the tap, soap, shampoo, and clean towels).

15. Lead: Defined in the OSHA Lead in Construction Standard (29 CFR 1926.62) as metallic Lead, all inorganic Lead compounds, and organic Lead soaps. Excluded from this definition are all other organic Lead compounds.

16. Lead-Based Paint (LBP): A term used by Department of Housing and Urban Development (HUD) and the EPA to define paint or other surface coatings (e.g., glazes) with Lead levels equal to or exceeding 1.0 milligram per square centimeter (1.0 mg/cm^2) in a paint XRF reading, or 0.5% by dry weight (5,000 mg/kg (ppm)) in a paint chip sample. LBP is subject to the requirements set forth in the OSHA Lead in Construction Standard (29 CFR 1926.62).

17. Lead-Containing Material: Any material that contains, or is coated with, a detectable concentration of Lead.

18. Lead-Containing Paint (LCP): A term used to define paint or other surface coatings (e.g., glazes) with any detectable amount of Lead less than 1.0 milligram per square centimeter (1.0 mg/cm^2) in a paint XRF reading, or 0.5% by dry weight (5,000 mg/kg (ppm)) in a paint chip sample. LCP is subject to the requirements set forth in the OSHA Lead in Construction Standard (29 CFR 1926.62).

19. Lead Control Area: The area within the Physical Boundary where worker Hygiene Facilities are located and where all Work activities take place that involve the disturbance of Lead-Containing Materials and Lead Wastes.

20. Lead Paint: A generic term that refers to both LBP and LCP.

21. Lead Waste: Non-specific liquid or solid waste generated during the Abatement, removal, construction/demolition, handling, or cleanup of a Lead-Containing Material.

22. Organic Vapor Cartridge: A NIOSH approved respirator filter typically containing 25 to 40 grams of sorption media such as activated charcoal.

23. OSHA Lead Awareness Training: Annual training that meets the criteria outlined in the OSHA Lead in Construction Standard (29 CFR 1926.62) for individuals that have the potential to be exposed to Lead-Containing Materials or Lead Wastes. This training shall include discussions of the following: (a) current federal, state, and local regulations pertaining to Lead (including 29 CFR 1926.62) and other heavy metals that may be disturbed during the Work; (b) the health effects of Lead and other heavy metal exposure; (c) state-of-the-art work practices, engineering controls, and procedures for Abatement, removal, construction/demolition, materials handling, waste management, and housekeeping activities that involve Lead-Containing Materials and Lead Wastes; (d) the use and maintenance of PPE and the use and maintenance of respirators in accordance with 29 CFR 1910.134; (e) medical surveillance programs and the medical removal protection program; (f) requirements regarding warning signs, labeling, and Safety Data Sheets (SDSs) in accordance with 29 CFR 1910.1200; (g) responsibilities of the Competent Person.

24. OSHA Lead in Construction Standard (29 CFR 1926.62): A federal standard that applies to all construction work where an employee may be occupationally exposed to Lead. In this standard, “construction work” is

defined as work for construction, alteration, or repair, including painting and decorating. It also includes, but is not limited to, the following: (a) the demolition or salvage of structures where Lead or materials containing Lead are present; (b) the removal or encapsulation of materials containing Lead; (c) new construction, alteration, repair, or renovation of structures, substrates, or portions thereof, that contain Lead, or materials containing Lead; (d) the installation of products containing Lead; (e) Lead contamination/emergency cleanup; (f) the transportation, disposal, storage, or containment of Lead or materials containing Lead on the site or location at which construction activities are performed; (g) maintenance operations associated with any of the construction activities described in this definition.

25. OSHA Monitoring: (See definition of "Exposure Monitoring").

26. P-100 Filter: (See definition of: "High-Efficiency Particulate Air (HEPA) Filter").

27. Perimeter Monitoring: (See definition of "Area Monitoring").

28. Permissible Exposure Limit (PEL): Defined by OSHA as employee exposure, without regard to the use of respirators, to a specific airborne concentration of a contaminant expressed in micrograms per cubic meter of air ($\mu g/m^3$) calculated as an 8-hour TWA. Once a PEL is met or exceeded for a particular contaminant, the Contractor is responsible for meeting specific requirements outlined in the applicable OSHA standard, which may include worker Exposure Monitoring, the use of PPE including respiratory protection, the use of Hygiene Facilities, medical surveillance, or training for workers. The following PELs are pertinent to removal, demolition, and disposal activities associated with Lead-Containing Materials and Lead Wastes:

    a. Lead - 50 $\mu g/m^3$ per 29 CFR 1926.62.

29. Personal Monitoring: (See definition of "Exposure Monitoring").

30. Physical Boundary: A physical barrier designated with ropes, "caution tape," or a partition that surrounds a work area in order to limit the entry of unauthorized personnel and delineate "clean areas" from areas that may meet or exceed an Action Level, PEL, or REL.

31. Recommended Exposure Limit (REL): An exposure limit recommended by the NIOSH that can be expressed as a TWA, Ceiling Limit, or Short-Term Exposure Limit (STEL). Once an REL is met or exceeded for a particular contaminant, the Contractor is responsible for ensuring that workers receive appropriate Exposure Monitoring, PPE, including respiratory protection, Hygiene Facilities, medical surveillance, and training.

32. Regulated Area: (See definition of "Lead Control Area").

33. Resource Conservation and Recovery Act (RCRA) Training: Training that meets the criteria outlined in 40 CFR 265.16. This training shall include

Site-specific discussions of the following: (a) hazardous waste identification; (b) waste storage container use and labeling; (c) waste storage area management; (d) personal health and safety, including fire safety; (e) manifesting and the off-site transportation of wastes; (f) procedures for using, inspecting, repairing, and replacing emergency equipment and monitoring equipment; (g) procedures for communicating with other employees and outside emergency response personnel; (h) responses to fires or explosions; (i) responses to leaks, spills, and potential groundwater contamination incidents ; (j) the shutdown of operations.

34. Time Weighted Average (TWA): The average time over a given work period (e.g., an 8-hour workday) of a person's exposure to a chemical or agent. The average is determined by sampling for the chemical or agent throughout the time period.

35. Trigger Activities: Certain activities that involve a disturbance of Lead-Containing Materials or Lead Wastes. Depending upon whether the performance of these activities exceeds an Action Level, PEL, or REL, the requirements may include additional worker Exposure Monitoring, the use of PPE including respiratory protection, the use of Hygiene Facilities, medical surveillance, or training for workers. Examples of Trigger Activities include, but are not limited to, the following: abrasive blasting, welding, torch cutting/burning, heat gun usage, needle gunning/scaling, rivet busting, using a roto peen, mechanical sanding/grinding, using mechanical shears, hand scraping/sanding, chemical stripping, and the manual demolition of Lead-Containing Materials.

36. X-Ray Fluorescence (XRF): An analytical method that can be used in the field for determining the Lead content of paints/coatings on a building component or material surface.

B. Reference Standards

1. The Contractor shall comply with all applicable regulations, standards, and guidelines of federal, state, and local environmental and occupational safety and health agencies regarding Lead-Containing Materials and Lead Wastes. These regulations, standards, and guidelines include, but are not limited to the following:

a. United States (U.S.) Department of Transportation (DOT):

1) 49 CFR 171 - General Information, Regulations, and Definitions;

2) 49 CFR 172 – Hazardous Materials Table, Special Provisions, Hazardous Materials Communications, Emergency Response Information, and Training Requirements;

3) 49 CFR 173 – Shippers: General Requirements for Shipments and Packaging's;

4) 49 CFR 178 – Specifications for Packaging.

b. United States Environmental Protection Agency (EPA):

1) 40 CFR 50 – National Primary and Secondary Ambient Air Quality Standards;

2) 40 CFR 116 – Designation of Hazardous Substances;

3) 40 CFR 117 – Determination of Reportable Quantities for Hazardous Substances;

4) 40 CFR 260 – Hazardous Waste Management Systems: General;

5) 40 CFR 261 – Identification and Listing of Hazardous Waste;

6) 40 CFR 262 – Standards Applicable to Generators of Hazardous Waste;

7) 40 CFR 263 – Standards Applicable to Transporters of Hazardous Waste;

8) 40 CFR 264 – Standards for Owners and Operators of Hazardous Waste Treatment, Storage, and Disposal Facilities;

9) 40 CFR 265 – Interim Status Standards for Owners and Operators of Hazardous Waste Treatment, Storage, and Disposal Facilities;

10) 40 CFR 268 – Land Disposal Restrictions;

11) 40 CFR 302 – Designation, Reportable Quantities, and Notification;

12) 40 CFR 745 – Lead-Based Paint Poisoning Prevention in Certain Residential Structures.

c. National Institute for Occupational Safety and Health (NIOSH):

1) Method 5503 – Polychlorobiphenyls;

2) Method 7082 – Lead by FAAS;

3) Method 7105 – Lead by GFAAS;

4) Method 7300 – Elements by ICP;

5) NIOSH Pocket Guide (NPG) to Chemical Hazards.

d. New York City Department of Environmental Protection (DEP):

1) Environmental Health and Safety Policies and Procedures – Vol. III, Lead Management;

2) Environmental Health and Safety Policies and Procedures – Vol. IV, Hazardous Waste Management;

3) Environmental Health and Safety Policies and Procedures – Vol. III, EHS Reporting and Investigation

4) RCNY Title 15, Chapter 19 – Discharges of Wastewater and Other Materials to Public Sewers.

e. New York State Department of Environmental Conservation (NYSDEC):

1) 6 NYCRR 364 – Waste Transporter Permits;

2) 6 NYCRR 370 – Hazardous Waste Management Regulations;

3) 6 NYCRR 371 – Identification and Listing of Hazardous Waste;

4) 6 NYCRR 372 – Hazardous Waste Manifest System and Related Standards for Generators, Transporters, and Facilities;

5) 6 NYCRR 373 – Hazardous Waste Management Facilities;

6) 6 NYCRR 376 – Land Disposal Restrictions.

f. Occupational Safety and Health Administration (OSHA):

1) 29 CFR 1910 – Occupational Safety and Health Standards;

2) 29 CFR 1910.28 – Safety Requirements for Scaffolding;

3) 29 CFR 1910.120 – Hazardous Waste Operations and Emergency Response;

4) 29 CFR 1910.134 – Respiratory Protection Standard;

5) 29 CFR 1910.1200 - Hazard Communication Standard;

6) 29 CFR 1926 – Safety and Health Regulations for Construction;

7) 29 CFR 1926.62 – Lead in Construction Standard;

g. Society for Protective Coatings (SSPC):

1) SSPC Guide 6, Guide for Containing Debris Generated During Paint Removal Operations;

2) SSPC Guide 7, Guide for the Disposal of Lead-Contaminated Surface Preparation Debris;

3) SSPC SP COM, Surface Preparation Commentary for Steel and Concrete Substrates;

4) SSPC SP 1, Solvent Cleaning;

5) SSPC SP 2, Hand Tool Cleaning;

6) SSPC SP 3, Power Tool Cleaning;

7) SSPC SP 11, Power Tool Cleaning to Bare Metal;

8) SSPC SP 13/ NACE No.6, Surface Preparation of Concrete;

9) SSPC SP 15, Commercial Grade Power Tool Cleaning.

h. Underwriters Laboratories, Inc. (UL):

1) UL 586 – Standard for Safety High Efficiency, Particulate, Air Filter Units.

1.05 DESCRIPTION

A. Commencement of Work: Five (5) business days prior to the proposed start of the Work required under this Section at each separate location, the Contractor shall notify the Engineer and the onsite EHS staff. No Work may proceed at any location until authorized by the Engineer.

B. The Contractor shall coordinate any required equipment shutdowns with the Engineer prior to starting the Work.

C. Access Restrictions: The Contractor shall inform the Engineer of proposed access restrictions (i.e., areas or items of equipment which will not be accessible during the proposed work) and provide estimated time frames (including specific dates) of such proposed access restrictions. The Contractor shall notify other contractors in advance of the disturbance, Abatement, spot removal, construction/demolition, and disposal Work included herein, to provide them with sufficient time for coordination of interrelated items that are included in their contracts and that must be performed before, after, or in conjunction with the Work included under this Section.

D. Unexpected Entry into a Lead Control Area: In the event that DEP personnel must enter a Lead Control Area for emergency reasons, the Contractor shall immediately stop work and cleanup any loose debris, so as to permit the safe entry by DEP personnel. Any disturbance of paints/coatings, dusts, materials, or wastes that may potentially generate airborne concentrations of contaminants equal to or above an OSHA Action Level shall not proceed until all DEP personnel have exited from the Lead Control Area.

E. Meetings: In addition to the pre-construction meeting and Site walk-through, other meetings may be required or may be requested by the Engineer, including briefings with Site operations personnel. Written documentation (i.e., “minutes”) of all meetings shall be generated by the Contractor, and copies shall be provided to the DEP within three (3) business days following each meeting.

1.06 QUALITY ASSURANCE

A. Scheduling: The Contractor shall coordinate and schedule all phases of the Work to be performed under this Section with the DEP, subcontractors, material suppliers, and other parties as necessary to ensure the proper execution of the Work.

B. Compliance: In addition to the detailed requirements of this Section and DEP EHS Policies and Procedures, the Contractor shall comply with all applicable regulations of federal, state, and local authorities pertaining to the disturbance, Abatement, removal, construction/demolition, handling, storage, transportation, and disposal of Lead-Containing Materials and Lead Wastes. All matters regarding the interpretation of any regulations, standards, or policies shall be submitted to the Engineer for resolution before starting the Work. Where the requirements of this Section, DEP EHS Policies and Procedures, or federal, state, or local regulations conflict or vary, the most stringent requirements or regulations shall apply.

C. Rejection of Non-Complying Items: The DEP reserves the right to reject Contractor materials/tools/submittal items that are deemed inappropriate or unacceptable by the Engineer or DEP. Submittal items that may be deemed inappropriate or unacceptable include proposed TSDFs, vendors, or subcontractors with previous regulatory citations/violations. The DEP further reserves the right, and without prejudice to other recourse, to accept non-complying items subject to an adjustment in the Contract amount, as approved by the DEP.

D. Suspect Material Characterization: To classify a paint or coating as Lead-containing, a paint chip/coating sample or an XRF reading must be collected. The bulk samples shall be sent to an analytical laboratory meeting the requirements of this Section.

1. Suspect Lead: Although there are no certification requirements pertaining to an individual that collects paint chip/coating samples in an industrial or commercial setting, this Section requires paint chip/coating sampling to be performed by a Lead Sampler.

E. Qualifications:

1. The Paint Removal Company shall have successfully completed at least two (2) projects of comparable scope and methodologies, and shall document the following: (a) the name, address, and phone number of each facility where the Work was performed; (b) the volume and type of each material that was abated/removed; (c) the specific methods of Abatement/removal used (including the tools, technologies, and engineering controls employed).

2. Competent Person:

a. The Competent Person shall have successfully completed:

1) EPA Lead-Based Paint Supervisor Training Certification (current) in accordance with 40 CFR 745.225 (b)(7)(vi); and

2) OSHA Lead Awareness Training (annual); and

3) 24-hr HAZWOPER Training.

b. The Competent Person shall have a minimum of two (2) years' experience on projects involving Lead and has served as the

Competent Person on at least three (3) projects of comparable scope and methodologies to the work being conducted under this Section.

3. Waste Manager:

   a. The Waste Manager shall have successfully completed:

      1) DOT Hazardous Materials Transportation Training; and

      2) RCRA Training - Each training course shall have been completed within the past year in the form of either an initial course or a refresher course.; and

      3) 24-hr HAZWOPER Training; and

      4) OSHA Lead Awareness Training (annual).

   b. The Waste Manager shall have a minimum of two (2) years' experience on projects involving hazardous wastes (including Lead). It is acceptable for an individual who meets the criteria of the Competent Person, to also serve as the Waste Manager for this Contract as long as the individual fulfills all of the requirements of this paragraph.

4. Lead Worker:

   a. Lead Workers shall have successfully completed:

      1) OSHA Lead Awareness Training (annual) as defined in this Section; and

      2) EPA-certified Lead Worker Training for all Lead Abatement activities (current). OSHA Lead Awareness Training satisfies the training requirement for other Lead removal activities (e.g., spot removal and demolition work).

   b. Each Lead Worker shall have a minimum of one (1) year of experience on projects involving Lead and have worked on at least three (3) projects of comparable scope and methodologies to the work being conducted under this Section.

5. Lead Sampler:

   a. Lead Sampler shall have successfully completed:

      1) OSHA Lead Awareness Training (annual) as defined in this Section; and

      2) EPA Certified Lead Inspector course or EPA-certified Risk Assessor course (current).

   b. The Lead Sampler shall have documented experience in collecting paint chip samples.

   c. The qualifications of the Lead Sampler must be approved by the Engineer prior to sample/reading collection.

6. Air Monitor:

   a. The Air Monitor shall have successfully completed:

      1) OSHA Lead Awareness Training (annual).

   b. The Air Monitor shall have a minimum of two (2) years' experience in conducting Area Monitoring and Exposure Monitoring on projects involving hazardous wastes (including Lead). It is acceptable for an individual who meets the criteria of the Competent Person or Waste Manager to also serve as the Air Monitor for this Contract as long as the individual satisfies all of the requirements of this paragraph.

1.07 SUBMITTALS

A. Thirty (30) business days prior to the Work of this Section or as directed by the Engineer, the Contractor shall submit the following to the Engineer:

1. Lead Inspection and Sampling Plan: The Contractor shall provide a Lead Inspection and Sampling Plan to identify suspect Lead-Containing Materials and collect confirmatory samples, as appropriate during the inspection. The Lead Inspection and Sampling Plan shall include at a minimum:

   a. At a minimum, the inspection shall be performed by an Environmental Professional, who has current OSHA Lead Awareness and EPA Lead Inspector Training, as applicable to the location of the work, and has performed inspection work on at least three (3) projects of comparable scope.

   b. Credentials of the laboratory providing sample analysis, including current certification by the New York State Department of Health's (NYSDOH) Environmental Laboratory Approval Program (ELAP) and by the American Industrial Hygiene Association (AIHA).

   c. Sample collection, analysis and reporting protocol.

   d. Health and safety protocol (Job Hazard Analysis) for all investigative activities.

2. Lead Inspection Report: The Contractor shall provide a Lead Inspection Report prepared by the Environmental Professional summarizing the results of all inspection activities, and as applicable, a sampling narrative, laboratory data packages and inventory, including photographs, of all identified suspect and confirmed Lead-Containing Materials.

3. Lead Management Plan(s): Work requiring a Lead Management Plan includes Lead Paint Abatement and Lead Paint spot removal activities. The Lead Management Plan shall be signed and dated by a CIH meeting the definition in this Section.

a. If the Lead-Containing Materials or Lead Wastes that will be disturbed also contain PCBs, it is acceptable to integrate the Lead Management Plan elements into the relevant PCB Management Plan (required under Section 02 84 05 - PCB Management). The Lead Management Plan shall include the following elements:

1) Lead Control:

a) Drawings showing the location and details of the following: (a) each Lead Control Area; (b) each Hygiene Facility; (c) proposed electrical hookups; (d) proposed water hookups: (e) each waste storage area: (f) restroom areas; (g) areas designated for eating, drinking, and smoking;

b) Section on the interfacing of trades (other Contractors) and the sequencing of Lead-Related Work;

c) Section on the collection, handling procedures, and disposal of Lead-Containing Materials and Lead Wastes (including the collection, filtering, and disposal of wastewater);

d) Section on the procedures and methodologies that will be used to conduct Exposure Monitoring and Area Monitoring for particulates. Also, provide the name and qualifications (i.e., training and experience documentation) of the Air Monitor who will be responsible for conducting the air monitoring activities. The Air Monitor shall at a minimum, satisfy the qualification requirements set forth in this Section;

e) Section on housekeeping procedures to be used for maintaining clean work areas and clean Hygiene Facilities;

f) Section on the specific methods and procedures of emissions control that will be used to ensure that airborne contaminant levels do not meet or exceed an OSHA Action Level outside of each Lead Control Area. It should be noted that even after paint/coating removal, the DEP has found that demolition activities (e.g., torch-cutting abated steel) still have the potential to generate elevated airborne levels of Lead. Therefore, the Contractor shall provide engineering controls to capture potential Lead dusts or fumes emitted during demolition work that

involves the cutting or burning of steel structures that have already been abated;

g) Task Analysis: Each task analysis shall include, but is not limited to, the following information: (a) the type of work activity; (b) the tools/equipment that will be used and their respective decontamination procedures; (c) operation and maintenance practices and procedures that will be used for the tools/equipment; (d) the types of Lead-Containing Materials that may be disturbed or Lead Wastes that may be generated when performing the activity; (e) the engineering controls that will be used to control the spread of contamination during the activity; (f) the proposed crew size for the activity and individual employee responsibilities during the activity; (g) housekeeping procedures that will be used during the activity; (h) PPE and proposed respiratory protection that will be used for the activity;

2) Equipment and Supplies: Identify the equipment and supplies that will be used to perform the Work;

3) Rental Equipment Notification: If rental equipment is to be used during the Work, the Contractor shall notify the rental agency in writing concerning the intended use of the equipment;

4) SDSs: Provide SDSs for all chemical products (including chemical stripping products) to be used for the Work;

5) The name and qualifications (i.e., experience and training documentation) of the Competent Person, who shall satisfy the qualification requirements set forth in this Section and be present whenever Work of this Section is being performed.

b. Waste Management:

1) The identification of Lead-Containing Materials, Lead Wastes, and hazardous wastes (as defined in 40 CFR 116, 40 CFR 260, 40 CFR 261, 6 NYCRR 370 and 6 NYCRR 371) associated with the Work;

2) The estimated quantity of each waste stream (regulated and non-regulated) that will be generated and disposed of/recycled as per 40 CFR 302;

3) The name, address, 24-hour phone number, and current permit documentation for each recycling facility or TSDF indicating that the facility is approved by federal, state, and local regulatory agencies to receive Lead-Containing

Materials and Lead Wastes, and that there are no outstanding violations or enforcement actions;

4) Current 6 NYCRR 364 and 40 CFR 263 permit documentation for the waste transporter that will transport Lead-Containing Materials and Lead Wastes from the Work Site to the TSDF;

5) Spill prevention, containment, and cleanup contingency measures to be followed during a suspected Lead emissions/bulk material release or emergency situation;

6) Section on the on-site handling, storage, removal, and disposal of waste materials, including but not limited to, the following: (a) secondary containment system for each drum storage area; (b) description of the waste storage areas; (c) the methods and procedures that will be used to collect and containerize wastes on a daily basis; (d) the types of containers; (e) the submittal of weekly regulated waste inspection and inventory records;

7) The name and qualifications (i.e., experience and training documentation) of the Waste Manager.

c. A detailed schedule for the implementation of the Lead Management Plan elements, including start and completion dates that allow for adequate time for cleanup, inspections, and air monitoring activities.

d. Medical Surveillance: For all activities within a Lead Control Area, each worker shall have: (a) an initial blood testing (including Zinc Protoporphyrin (ZPP) testing), and have a Blood Lead Level (BLL) below 35 micrograms per deciliter (µg/dl)(if the worker's BLL is in excess of 35 µg/dl, the worker shall show medical approval for this Work); (b) a medical exam, including a Pulmonary Function Test (PFT) within the past year; (c) written medical clearance within the past year, by a licensed health care professional, to wear a respirator; (d) a qualitative/quantitative respirator fit-test for the specified respirator within the past year.

e. Employee Documentation: For all activities that take place within a Lead Control Area, each worker shall: (a) have written proof of resumes and training (e.g., certificates) for Lead Workers, Competent Persons, Waste Managers, and Air Monitors; (b) dates and written proof of initial medical surveillance by the Contractor or other employer within the past year, and proof that the employee is currently participating in the employer's ongoing medical surveillance program in accordance with this Section; (c) dates and written proof of respiratory clearance and a medical exam; (d) dates and written proof of a respirator fit-test.

f. A current (i.e., within the last month) signed and notarized statement disclosing all of the Contractor's or subcontractor's OSHA, EPA, and DOT citations/violations on projects involving Lead within the past three (3) years.

4. Analytical Laboratory Qualifications for Analyzing Suspect Lead-Containing Materials and Lead Wastes: Submit the name, address, and telephone number of each analytical laboratory selected to perform the analyses of waste samples (solid and liquid), air samples collected for Area Monitoring and Exposure Monitoring purposes, and paint/coating samples collected to classify building components, including copies of current AIHA and ELAP certificates, including dates of accreditation/reaccreditation. .

B. Field Reports and Recordkeeping: The Contractor shall maintain and provide the following documentation:

1. Air Monitoring Documentation: All air monitoring results, including COC, and daily air monitoring reports shall be provided to the DEP within 24-hours from the date the samples are collected.

a. Each signed daily air monitoring report shall include, but not be limited to, the following information: (a) sample "start" and "stop" times; (b) flow rates (initial and final) for each sample; (c) the total volume of air collected for each sample; (d) sample location descriptions/sample location drawings/names of individuals being sampled; (e) types (i.e., makes and models) of sampling equipment used; (f) types of sample media (i.e., filters and cassettes) used; (g) the most recent calibration dates, along with the calibration results, for the sampling equipment used; (h) the name of the Air Monitor that conducted the air monitoring; (i) dates that the air monitoring was conducted; (j) work tasks being performed during the air monitoring; (k) unique sample numbers used to identify each sample.

2. Waste Documentation: Completed and signed waste manifests from TSDFs shall be provided to the DEP no later than thirty (30) days after disposal. In addition, on-site waste storage areas shall be inspected weekly by the Waste Manager.

a. Each waste storage area inspection shall be coordinated with the Engineer, documented in the form of a written signed report, and shall be provided to the DEP within 24-hours of the inspection date. These reports shall include, but not be limited to, the following information: (a) the name of the inspector; (b) descriptions of waste streams; (c) waste container type, physical condition, and quantity; (d) proper label type; (e) secondary containment system; (f) storage area security method to prevent any unauthorized entry; (g) the

presence of any containers that violate RCRA generator storage time limitations, as defined in 40 CFR 262.

b. In addition to performing weekly waste storage area inspections, the Waste Manager shall also maintain an ongoing waste inventory, including: (a) specific dates that each waste container was added/removed from the waste storage area; (b) the full name (printed) and signature of the individual responsible for adding/removing each waste container from the waste storage area.

3. Lead Control Area Inspection Documentation: Lead Control Areas shall be inspected daily by the Competent Person.

a. Each daily Lead Control Area inspection shall be documented in the form of a signed written report. All reports shall be provided to the DEP no later than 24-hours after the inspection is completed. The content of these reports shall include : (a) the types of Work being performed; (b) the names of the Lead Workers, Competent Person, Waste Manager, and Air Monitor on site, including company name; (c) the types of air monitoring and the number of samples being collected; (d) any non-compliance issues observed, including the corrective actions that were taken to achieve compliance.

4. Contractor Project Record: The Contractor's Competent Person shall maintain a project record at the Work Site that shall be made available to the Engineer or DEP for review at any time, and shall be submitted to the DEP within 24-hours after the completion of the Work.

a. At a minimum, the Contractor project record shall contain the following information: (a) copies of training certificates for all individuals involved with the Work; (b) copies of all air monitoring results generated during the Work; (c) copies of all available paint chip/coating sample analytical data and XRF analyzer data, as well as paint/coating survey reports related to the Work; (d) copies of all daily sign-in sheets; (e) a list of emergency phone numbers, including the local fire department, local police department, nearest hospital, as well as phone numbers for the Engineer and DEP personnel responsible for administering the Work; (f) a copy of the OSHA Lead in Construction Standard (29 CFR 1926.62); (g) copies of all SDSs pertaining to all chemicals being used during the Work; (h) a copy of the Contractor's Lead Management Plan; (i) copies of all daily Lead Control Area inspection records; (j) copies of all weekly waste storage area inspection records; (k) a copy of the waste inventory; and (l) a copy of the Contractor's Hazard Communication (HAZCOM) program.

5. Daily Sign-In Sheets: The Contractor shall generate daily sign-in sheets for all individuals entering and exiting each Lead Control Area for the duration of the Work. The daily sign-in sheets shall be maintained by the Competent

Person and shall be made available to the Engineer or DEP for review at any time during the Work. All daily sign-in sheets shall be submitted to the DEP within 24-hours after the completion of the Work.

a. At a minimum, each daily sign-in sheet shall include: (a) the individual's printed name and signature; (b) company name; (c) the time of entry and exit from each Lead Control Area.

6. HAZCOM Program: The Contractor's HAZCOM program shall be made available to the Engineer or DEP for review at any time during the Work.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. Respirators: The Contractor shall select respirators approved by the NIOSH for use in areas where paints/coatings, dusts, materials, or wastes containing contaminants may be disturbed. At a minimum, the Contractor shall provide each individual with a half-face, negative pressure, air purifying respirator equipped with HEPA/P-100 Filter cartridges until Exposure Monitoring results indicate that respiratory protection can be modified. The Contractor's CIH shall make all determinations regarding respiratory protection modifications that will be implemented for the Work. All modifications shall be in accordance with the OSHA Lead in Construction Standard (29 CFR 1926.62).

B. PPE: The Contractor shall provide personnel who have a potential to be exposed to materials or wastes containing contaminants, with appropriate PPE as prescribed by the Contractor's CIH.

C. HEPA Filters: HEPA/P-100 Filters used in vacuuming equipment, power tools, and local exhaust equipment must meet or exceed any manufacturer's specifications and recommendations, as well as specifications presented in the Standard for Safety High Efficiency, Particulate, Air Filter Units (UL 586).

D. Waste Containers: Containers for the storage of all wastes shall be DOT-approved, and shall be provided by the Contractor.

E. Abrasives: Mechanical paint/coating removal equipment shall not use any products containing crystalline silica, and the equipment shall not utilize any non-recoverable materials or any cutting materials which introduce toxic or hazardous materials into the environment.

F. Chemical Strippers: The Contractor shall utilize an environmentally safe chemical paint stripping system, with demonstrated suitability and efficiency in preparing cast-in-place concrete, cement, and plaster surfaces that are free of any visible residues of paints/coatings. The system shall include non-alkaline or alkaline strippers that provide the lowest possible level of toxicity consistent with the types of paints/coatings to be removed. Neutralization products and procedures shall be provided for all alkaline stripping systems, no stripping system shall contain methylene chloride, and the stripping system shall be low in volatile organic compounds (VOCs).

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Hygiene Facilities: The Contractor shall provide functional Hygiene Facilities as defined in this Section that are appropriate for the types of Work to be performed under this Section. The Contractor shall ensure that employees do not leave a Lead Control Area wearing any potentially contaminated PPE. Using compressed air to dislodge dust from clothing/PPE shall be strictly prohibited. The Contractor shall collect, test, and properly dispose of all wastewater generated from Hygiene Facilities.

1. Handwash Stations: The Contractor shall provide functioning handwash stations on all projects that disturb Lead-Containing Materials or Lead Wastes. Handwash stations shall have running water at the tap, clean towels, and soap per 29 CFR 1926.51. Substituting “hand wipes” in place of soap and running water will not be acceptable.

2. Showers: The Contractor shall provide shower facilities in accordance with 29 CFR 1926.62, for use by employees whose airborne exposure to Lead is above the PEL. When shower facilities are necessary, employees are required to shower at the end of the work shift each day prior to leaving the Lead Control Area that they are working in.

B. Utilities: The temporary use of any on-site utilities shall be subject to the approval of the DEP. The Contractor shall furnish all water, hoses and water filtration devices needed for the Work as per 01 51 11 Temporary Water and Sanitary Services; as well as any temporary electrical hookups and temporary lighting to the

Lead Control Area as per 01 51 30 Temporary Electrical System. All temporary lighting and temporary electrical service to a Lead Control Area shall be provided by the Contractor and shall be in weather-proof enclosures and be ground fault protected. Also, the Contractor shall supply all heating and ventilation equipment needed for the Work as per 01 51 12 Temporary Heat and Ventilation.

C. Signs: The Contractor shall post conspicuous warning signs at all approaches to work areas and waste storage areas. Signs shall comply with federal, state, and local regulations, including the requirements of OSHA. Signs shall not be removed until all Abatement, removal, and construction/demolition activities have been completed. At a minimum, each sign shall bear the following information in English and the predominant language that is spoken by the Contractor's employees if English is not spoken:

WARNING

LEAD WORK AREA

POISON

NO SMOKING, EATING OR DRINKING

1. Each sign shall be appropriately modified to include additional warnings for other contaminants that are identified during Exposure Monitoring.

D. Physical Boundary Delineation: The Contractor shall clearly delineate each Work area and waste storage area with a Physical Boundary as defined in this Section.

E. Work Area Preparation: The Contractor shall utilize HEPA-filtered vacuums, and wet methods during the initial cleaning of each work area. Prior to removal from each work area, all movable objects and mounted objects that can be removed shall be pre-cleaned using HEPA-vacuums and wet methods. Fixed objects that must remain within each work area shall be pre-cleaned using HEPA vacuums and wet methods, and subsequently covered with 6-mil polyethylene sheeting.

3.02 IMPLEMENTATION

A. Bulk Removal

1. Protection of Existing Work to Remain: All Work involving the disturbance of Lead-Containing Materials or Lead Wastes must be conducted without damage to, or contamination of equipment or surfaces within the work areas or other areas adjacent to the work areas. All such damage or contamination shall be immediately corrected and cleaned up by the Contractor at the Contractor's expense.

2. Prohibited Activities: Contractors shall not conduct activities that are prohibited by OSHA and EPA regulations. The following activities are prohibited, regardless of whether they are conducted subject to an exposure assessment and written compliance program: (a) burning-off paints/coatings; (b) using heat guns operating above 1100oF; (c) dry

machine sanding, grinding, or blasting paint without a HEPA vacuum exhaust tool; (d) uncontained hydroblasting or high-pressure washing; (e) welding painted/coated surfaces unless the paint/coating is removed at least 4-inches from area of heat application (per 29 CFR 1926.345(c)(1)), and local exhaust ventilation is used.

3. Test Patches: Prior to choosing the paint removal method(s) for paints/coatings, the Contractor shall perform test patches on surfaces subject to Abatement, to determine if the method(s) meet the requirements of this Section.

4. Mechanical Removal Equipment: When removing paints/coatings from metal surfaces, the paints/coatings must be removed to the extent that only the bare metal remains (i.e., no mill scale remains) as per SSPC SP 2, 3, 11, 15 and COM, as applicable. In the case of substrates other than metal (e.g., concrete, brick, and block), paints/coatings shall be removed from the surface of the substrate as per SSPC SP 13 and SSPC SP COM, as applicable, and managed in accordance with SSPC Guide 7. Acceptance of the Work shall be contingent upon inspection of the substrate surfaces by the Engineer and must demonstrate the absence of residual paint/coating layers that can be physically measured, pried loose, or peeled away using a scraping device. The Contractor may only use products and tools meeting the performance specifications outlined below:

   a. Contractor shall utilize a vacuum-assisted power tool system with demonstrated suitability and efficiency in preparing metal surfaces as per SSPC Guide 6 and SSPC SP 11, and with demonstrated effectiveness in maintaining Lead emissions below OSHA exposure limits during the disturbance of paints/coatings. Such systems may include dustless needle guns, dustless roto peens, and dustless right-angle grinders, all of which capture dust and debris at the cutting tool edge and transport the material under vacuum conditions to an air-tight disposal container. Dustless needle guns shall only be utilized on metal surfaces.

   b. The vacuum-assisted power tool system shall also be designed to permit the removal and replacement of collection containers under negative pressure in order to prevent the release of dusts. The system shall be equipped with an automatic “shut-off” in the event of vacuum failure.

   c. Abrasive/recovery tools shall be monitored at all times by a device capable of determining recovery at the face of each tool, and capable of automatically disabling the tool in the event that recovery levels are insufficient. The monitor, at a minimum, shall have the following features: (a) a remote warning light; (b) an adjustable recovery set point; (c) automatic equipment disabling capabilities; (d) a sensing range of 0 - 5 pounds per square inch (psi); (e) solid

state photohelic instrumentation; (f) remote sensing at the face of the tool.

d. The safe recovery point shall be calibrated each day before start-up, or each time a new tool or vacuum source is used. All manufacturer recommendations shall be followed with respect to the set up and use of the monitor, and the manufacturer's operations manual shall be kept on site at all times. A daily log shall be maintained by the Contractor, identifying all calibrations of recovery levels, as well as any “down time” as a result of insufficient recovery levels.

e. The cutting head of the vacuum-assisted power tool system that is used on flat surfaces shall be capable of cutting to within 1-1/2" of any inside corner, molding, or edge, and may include dustless roto peens or dustless needle guns. Tools for corners and moldings shall be specifically designed for that purpose, and conform to all inside corners, outside corners, curved, flat, and angled surfaces that are to be abated under this Section. These tools shall also maintain vacuum control at the work surface/cutting head interface at all times. HEPA vacuum-shrouded needle guns may be used for non-flat surfaces in accordance with manufacturer recommendations. Vacuum-assisted finishing tools, such as right angle grinders, may be used to achieve the SSPC SP 11 standard, but may not be used for primary removal.

f. Vacuum-assisted power tool systems meeting all of the specifications outlined herein, may be used pending the submittal of all required performance documentation, and their acceptance by the Engineer. Any tools which do not meet all of the specifications outlined herein, shall be removed from the project Site immediately, and shall not be used for the Work to be performed under this Section.

5. Chemical Strippers: Acceptance of the Work shall be contingent upon inspection of the abated substrate surfaces by the Engineer, and must demonstrate the absence of residual paint/coating layers that can be physically measured, pried loose, or peeled away using a scraping device. The Contractor may only use products and paint stripping systems meeting the performance specifications outlined below:

a. The Contractor shall utilize a chemical paint stripping system with a demonstrated effectiveness in maintaining Lead emissions below OSHA exposure limits during the disturbance of paints/coatings. The Contractor shall utilize a mechanical ventilation system during the Work that exhausts away from occupied areas. The application of all paint stripping systems shall be in accordance with manufacturer recommendations and SSPC SP 1. Debris shall be managed in accordance with SSPC Guide 7.

b. The Contractor should note that more than one product may be required to strip LCP/coatings. The use of multiple products shall be in accordance with Work practices approved by the individual manufacturer of each chemical paint stripping compound.

c. All chemical paint stripping products shall be presented to the Engineer for approval prior to the start of any Work to be performed under this Section. Also, the manufacturer's labels on each container shall be intact and legible.

d. Chemical paint stripping systems may be used pending the submittal of all required performance documentation, and its acceptance by the Engineer.

3.03 FIELD TESTING / QUALITY CONTROL

A. Air Monitoring

1. Air monitoring for airborne concentrations of Lead shall be conducted by the Air Monitor in accordance with OSHA and as defined in this Section.

a. Exposure Monitoring: For Work involving the disturbance of any detectable concentration of Lead, the Contractor shall collect personal air samples from employees who are anticipated to have the greatest risk of exposure, as determined by the Contractor's CIH or Competent Person. Personal air samples shall be collected during every work shift from at least one (1) employee that is representative of each type of work task that is being performed. Each personal air sample shall "run" for the employee's entire work shift to ensure that enough volume (of air) is collected and an accurate 8-hour TWA can be calculated. Documentation regarding the sample numbers, specific shift when the sampling was conducted, the work tasks that were sampled, the dates of sampling, the employee hours that were worked during the shift, and the total sampling times, shall accompany each laboratory COC form.

2. Area Monitoring: The Contractor shall collect a minimum of two (2) area air samples outside of each Lead Control Area on a daily basis for the duration of the Abatement, removal, or construction/demolition Work, as well as any other Work involving the disturbance of Lead-Containing Materials or Lead Wastes. During sampling activities, all air sample filter cassettes shall be positioned approximately five to six feet above the ground (to simulate an individual's breathing zone), and shall not be placed immediately adjacent to obstructions (e.g., walls or columns) which may restrict the flow of air to the filter cassettes. Each air sample shall be analyzed for all contaminants identified during the exposure assessment. If area air monitoring indicates an emission level in excess of an OSHA Action Level outside of a Lead Control Area, all Work in that area shall be stopped immediately. The Contractor shall then take immediate corrective actions to reduce emission levels to below the Action Level(s), and the

Contractor shall clean all adjacent areas that may have become contaminated due to the emissions. Documentation regarding the sample numbers, sample locations, the dates of sampling, the employee hours that were worked during the shift, and the total sampling times, shall accompany each laboratory COC form.

3. The Contractor shall submit all air monitoring results to the DEP within 24 hours of date of air sample collection.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Cleanup: The Contractor shall maintain all surfaces, including protective coverings (polyethylene sheeting) within each work area, free of accumulations of paint chips/coating debris, dusts, and wastes. Dry sweeping and using compressed air to cleanup a Work area shall be strictly prohibited. HEPA-filtered vacuums and wet methods shall be used to ensure that each Work area remains free of visible paint chips/coating debris, dusts, and wastes.

B. Collection, Separation, and Containerization of Wastes: The Contractor shall collect, separate (by waste stream/waste type), and containerize Lead Wastes (solid and liquid), debris, PPE, and containment materials on a daily basis in accordance with the Lead Management Plan. Where the TCLP analysis for the eight (8) RCRA metals are below hazardous waste standards, all PPE, poly and paint/coating waste will be characterized as Lead-Containing non-hazardous, contaminated waste, and should not be managed as construction and demolition (C&D) debris.

1. The Contractor shall store all wastes in DOT-approved container systems. No drum/container shall be filled in excess of the capacity marked on the drum/container. All drums/containers shall be sealed and covered immediately after filling, and each drum/container shall have an intact and legible label affixed to it.

2. No water mixed with or contaminated by hazardous waste may be released onto the ground or into any drain or sewer (RCNY Title 15, Chapter 19). It should be noted that a discharge of more than 10 pounds of Lead (this includes 10 pounds of debris containing Lead) onto the ground or into the water within a 24-hour period, shall be considered a violation of the Clean Water Act and shall be treated as a "reportable quantity" in accordance with 40 CFR 117. Such a release shall be grounds for immediate termination of this Contract, and the Contractor shall be liable for any fines, penalties, or remediation costs.

3. The Contractor shall store non-hazardous wastes separately from hazardous wastes, shall provide all non-hazardous waste containers, and shall make all transportation and disposal arrangements for non-hazardous wastes in accordance with federal, state, and local regulations.

C. Storage of Wastes: The Contractor shall ensure that all drummed wastes are stored in a secondary containment system, and that each waste storage area is demarcated with a Physical Boundary. In addition, the Contractor shall post weekly waste inspections and waste inventories in the regulated waste storage area, as well as the following emergency information in accordance with DEP's EHS Policies and Procedures: (a) the name and telephone number of the facility's Emergency Coordinator; (b) the location of fire extinguishers and fire alarms; (c) the location of spill control materials; (d) the telephone number for the fire department (unless the facility has a direct alarm).

D. Labeling: The Contractor shall affix warning labels to all waste drums/containers. At a minimum, all hazardous waste labels shall bear the following information in English:

HAZARDOUS WASTE

FEDERAL LAW PROHIBITS IMPROPER DISPOSAL

HANDLE WITH CARE

[Generator Name, Address, and Telephone Number]

[Specific Contents of Container]

[EPA-Issued Generator Identification Number]

[EPA Waste Identification Number]

[Accumulation Start Date]

[Accumulation End Date]

1. If waste classification is pending analysis, labels shall indicate "Hazardous Waste - Pending Analysis." If wastes contain PCBs, drums/containers must also be labeled per Section 02 84 05 - PCB Management.

E. Sampling and Laboratory Analysis of Paint Removal Wastes: For hazardous waste characterization, the Waste Manager shall sample all potential Lead-Containing Waste Streams in accordance with 40 CFR 261 and 6 NYCRR Part 371. All waste samples shall be collected in the presence of the Engineer using the following procedure:

1. One (1) composite waste sample shall be collected for laboratory analysis from each waste drum that is generated. Each composite sample shall be a mixture of four (4) grab samples. As an example, if the drum is full, collect four grab samples, if the drum is half-full, collect two grab samples, and if the drum is one-tenth full, collect one sample. Grab samples shall be composited into one (1) bulk composite sample. Each composite sample shall undergo Toxicity Characteristic Leaching Procedure (TCLP) analysis for the eight (8) RCRA metals.

2. In addition, if the waste stream is associated with the use of a chemical paint stripping system, the Contractor shall have the laboratory analyze each sample for pH and any other RCRA characteristic that may fail due to the chemical composition of the waste. Furthermore, if the waste stream contains PCB-Containing paint/coating chips, the Contractor shall collect samples in accordance with Section 02 84 05 - PCB Management. The Contractor shall ensure that the laboratory being used is also capable of performing these additional analytical tests.

3. One (1) representative wastewater sample shall be collected for laboratory analysis using appropriate field sampling equipment (e.g., a pipette or bailer), and shall be labeled appropriately.

F. Sampling and Laboratory Analysis of Painted Demolition Debris: The Contractor shall collect representative bulk samples of demolition wastes to determine proper disposal. All bulk samples shall undergo TCLP analysis for the eight (8) RCRA metals. Furthermore, if the waste stream may contain PCB-Containing paint/coating chips, the Contractor shall collect samples in accordance with Section 02 84 05 - PCB Management.

1. Scrap Metal Exemption for Recycling: Under 6 NYCRR 371.1(c)(7), painted scrap metal can be sent to a recycling facility, rather than be discarded as hazardous waste. For the DEP to submit a "c7 notification" to the NYSDEC and claim the "scrap metal exemption," the Contractor must first submit notification to their recycling facility indicating that Lead is present on the scrap metal. If PCBs are detected in the paints/coatings on the scrap metal, the Contractor shall also disclose this information to the recycling facility as per Section 02 84 05 - PCB Management. The Contractor shall submit this documentation to the Engineer for approval prior to disposal.

G. Disposal of Wastes: The Contractor shall notify the DEP at least 14 business days prior to the removal of any waste drums/containers. All hazardous waste profiles for containerized wastes must be reviewed by the Engineer and signed by the DEP as the generator of the waste streams. Wastes shall be disposed of so that drums/containers do not remain on the job site for more than 90 calendar days from the initial "accumulation start date" on the drum/container label. Containers that have reached their storage capacity shall not remain on site, and transportation arrangements shall be made for their immediate removal.

H. Disposal Documentation: Once all waste profiles have been completed, the Contractor shall provide the DEP a "Letter of Acceptance" issued from the TSDF indicating that the wastes will be accepted, and a copy of the advance manifest. On the date of disposal, the Contractor shall submit one (1) copy of the completed manifest that has been signed and dated by the initial transporter in accordance with 6 NYCRR 372 and 40 CFR 262, to the DEP for signature as Generator. All hazardous waste documentation (e.g., waste profiles, manifests and Land Disposal Restrictions (LDRs)) must be signed by a DEP employee as described in Section

01 35 45- Hazardous Materials Control. Non-hazardous waste documentation may be signed by a DEP-designated alternate.

END OF SECTION

PART 1 GENERAL

1.01 SUMMARY

A. This Section details the requirements for construction and demolition activities affecting materials and structures coated with or containing polychlorinated biphenyls (PCBs), as shown on Table No. 1, Summary of Lead and PCB Analysis on Paints and Table No. 2, Summary of PCB Analysis on Miscellaneous Materials, attached to Section 01 35 45 – Hazardous Materials Control, specified herein, or required to complete the Work, including all affected coatings identified and impacted by the Work.

1. Hazardous Materials Mitigation Report, Rev. 1, Contract WP-169 CSO-FC-DF, Bidwell Environmental, LLC, June 2025.

B. All Work under this Section shall be performed to minimize the creation of airborne emissions (40 CFR 50); minimize the quantity of hazardous waste generated; protect the health and safety of all site personnel and the welfare of the public; and avoid adverse environmental impacts.

C. The Contractor shall perform the abatement and disposal of additional PCB-containing materials not included in the reports listed in 1.01A. In the absence of analytical testing results for a specific painted/bitumastic-coated material, the material shall be classified as PCB-containing and lead-containing, until proven otherwise by sampling and testing. If the material is caulking or has a bitumastic coating, the material shall also be classified as asbestos-containing, until proven otherwise by sampling and testing.

D. Small Capacitors and Fluorescent Light Ballasts manufactured prior to 1978 may contain PCBs in their capacitors or potting materials. Unless a Fluorescent Light Ballast is marked “No PCBs” by the manufacturer, it shall be assumed that the ballast contains PCBs. All PCB-containing light ballasts and Small Capacitors shall be removed, handled, packaged, and disposed of in accordance with this Section.

E. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment will be made for performing any work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s), or allowance(s) as set forth in Section 01 27 00 – Measurements and Payment.

1.04 REFERENCES

A. Definitions

1. Abatement: Any measures or set of measures designed to permanently eliminate PCB paint/bitumastic coating hazards. Abatement includes, but is not limited to, the removal of PCB paints/bitumastic coatings or the replacement of PCB-painted/bitumastic-coated surfaces or fixtures. Abatement also includes the removal of paints/bitumastic coatings (with a PCB concentration greater than or equal to 50 parts per million (ppm)) when the underlying substrate is to remain in place. Abatement does not include renovation, remodeling, landscaping, or other activities, when

such activities are not designed to permanently eliminate PCB hazards, but instead, are designed to repair, restore, or remodel a given structure or dwelling, even though these activities may incidentally result in a reduction or elimination of PCB hazards. Furthermore, Abatement does not include interim controls (e.g., the spot removal of a PCB paint/bitumastic coating on a surface in order to perform torch cutting at that location), Operations and Maintenance (O&M) activities, or other measures and activities designed to temporarily reduce PCB hazards.

2. Area Monitoring: Stationary air sampling outside of a PCB Control Area for the purpose of determining compliance with OSHA's Limits for Air Contaminants Table (29 CFR 1910.1000, Table Z-1), and for the purpose of ensuring that airborne PCB concentrations remain below 1.0 mg/m^3 (Aroclor 1242) and 0.5 mg/m^3 (Aroclor 1254) outside of the PCB Control Area during all Work activities that have the potential to disturb PCB-Containing Materials with PCB concentrations greater than or equal to 50 ppm. Area Monitoring for lead will be required if Exposure Monitoring results exceed corresponding Action Levels, Permissible Exposure Limits (PELs), or Threshold Limit Values (TLVs). If asbestos is present, Area Monitoring shall also be conducted in accordance with DEP (RCNY Title 15, Chapter 1) or NYSDOL (12 NYCRR 56) regulations. All Area Monitoring shall follow pertinent NIOSH or ASTM sampling methodologies.

3. Certified Industrial Hygienist (CIH): Refers to an individual employed by the Contractor who is currently certified by the American Board of Industrial Hygiene (ABIH).

4. Competent Person: Defined by OSHA as someone who is capable of identifying existing and predictable hazards in the surroundings or working conditions, and who has authorization to take prompt corrective measures to eliminate them. Duties of the Competent Person include the following: (a) determining prior to the performance of the Work whether PCBs or lead are present in the workplace; (b) establishing PCB Control Areas and assuring that access to and from those areas is limited to authorized personnel; (c) assuring the adequacy of any employee Exposure Monitoring required by OSHA; (d) assuring that all employees exposed to airborne contaminant levels above Action Levels, PEL, or TLV wear appropriate Personal Protective Equipment (PPE), respiratory protection, and are trained in the use of appropriate methods of exposure control for all of the contaminants present; (e) assuring that proper Hygiene Facilities are provided and that workers are trained to use those facilities; (f) assuring that engineering controls specific to the contaminants present are implemented, maintained in proper operating condition, and functioning properly.

5. Decontamination Area: Designated area within the Hygiene Facilities for removing gross contamination from PPE (using a HEPA vacuum),

washing away contamination that has accumulated on the skin and hair (using soap and water), removing, and disposing/washing of contaminated PPE, and donning clean clothing that will not potentially contaminate areas outside of a PCB Control Area's Physical Boundary.

6. DOT Hazardous Materials Transportation Training: Training that meets the criteria outlined in 49 CFR 172.704. This training shall include discussions of the following: (a) hazardous materials tables within 49 CFR 172; (b) material packaging and labeling within 49 CFR 178; (c) shipping papers and placards within 49 CFR 173; (d) material loading and segregation.

7. Exclusion Zone: (See definition of "PCB Control Area").

8. Exposure Monitoring: Personal air sampling performed outside the respirator within the breathing zone of individuals, for the purpose of determining compliance with OSHA's Limits for Air Contaminants Table (29 CFR 1910.1000, Table Z-1). Analytical results obtained from Exposure Monitoring will be used to select appropriate respiratory protection and PPE for individuals within a work area. For the purpose of this Section, Exposure Monitoring samples shall be collected from individuals who are representative of each type work task being conducted by the Contractor, and all Exposure Monitoring shall follow pertinent NIOSH (Method 5503) or ASTM sampling methodologies.

9. Fluorescent Light Ballast: A device that electrically controls fluorescent light fixtures and includes a capacitor containing 0.1 kilograms (kg) or less of dielectric fluid.

10. Hazardous Waste Operations (HAZWOPER) Training: Training that meets the criteria outlined in the OSHA Hazardous Waste Operations and Emergency Response Standard (29 CFR 1910.120). A minimum of 24-hour HAZWOPER training will be required for Work being performed under this Section. However, certain types of Work may require 40-hour HAZWOPER Training. All decisions regarding the specific HAZWOPER Training that will be required for each Work task shall be made by the Engineer.

11. High-Efficiency Particulate Air (HEPA) Filter: A filter designed to remove 99.97% of all particles greater than 0.3 micrometers (μm) in diameter. For the purpose of this Section, HEPA vacuum and local exhaust filtration equipment used by the Contractor shall meet the Standard for Safety High-Efficiency, Particulate, Air Filter Units (UL 586) developed by Underwriters Laboratories.

12. Homogenous Materials: PCB-Containing Materials which are similar in appearance, color, texture, and substrate type.

13. Hygiene Facilities: Facilities within the Physical Boundary of a work area that are set up to prevent cross contamination and are equipped with change areas and separate storage facilities for PPE and clean clothing.

Hygiene Facilities shall include adequately supplied hand washing station(s) (i.e., running water, soap, and clean towels) or shower(s) (hot and cold water that is controllable at the tap, soap, shampoo, and clean towels).

14. Organic Vapor Cartridge: A respirator filter typically containing 25 to 40 grams of sorption media such as activated charcoal.

15. OSHA Monitoring: (See definition of "Exposure Monitoring").

16. P-100 Filter: (See definition of: "High-Efficiency Particulate Air (HEPA) Filter").

17. PCB Awareness Training: Training for individuals that have the potential to be exposed to PCB-Containing Materials or PCB Wastes. This training shall include discussions of the following: (a) sources of PCBs; (b) current federal, state, and local regulations pertaining to PCBs (including 40 CFR 761) and other contaminants that may be disturbed during the Work; (c) the health effects of PCBs and other contaminant exposures; (d) state-of-the-art work practices, engineering controls, and procedures for Abatement, removal, construction/demolition, materials handling, housekeeping, and waste management activities that involve PCB-Containing Materials and PCB Wastes; (e) the use and maintenance of PPE and the use and maintenance of respirators in accordance with 29 CFR 1910.134; (f) medical surveillance programs; (g) requirements regarding warning signs, labeling, and Safety Data Sheets (SDSs) in accordance with 29 CFR 1910.1200; (h) responsibilities of the Competent Person.

18. PCB Bulk Product Waste: Waste derived from manufactured products containing PCBs in a non-liquid state, at any concentration where the concentration at the time of designation for disposal is greater than or equal to 50 ppm of PCBs.

19. PCB-Containing Material: Any material that contains, or is coated with, a detectable concentration of PCBs.

20. PCB Control Area: The area within the Physical Boundary where worker Hygiene Facilities are located and where all Work activities take place that involve the disturbance of PCB-Containing Materials and PCB Wastes.

21. PCB Hazardous Waste (per NYSDEC): All solid wastes containing PCB concentrations greater than or equal to 50 ppm. Refer to 6 NYCRR Part 371.4(e) for specific details and exceptions regarding the classification of PCB Wastes as "hazardous wastes" (listed waste B001-B007) in New York State.

22. PCB Waste (TSCA-regulated): Non-specific liquid or solid waste generated during the Abatement, removal, construction/demolition, handling, or cleanup of a PCB-Containing Material with a PCB concentration greater than or equal to 50 parts per million (ppm). PCB

Waste also includes any waste (including remediation waste, polyethylene sheeting and PPE) that has been in contact with a material that has a PCB concentration greater than or equal to 50 ppm, regardless of whether the waste itself has a PCB concentration of less than 50 ppm. PCB Wastes are subject to the disposal requirements set forth in Toxic Substances Control Act (TSCA) (40 CFR 761, Subpart D).

23. Perimeter Monitoring: (See definition of "Area Monitoring").

24. Permissible Exposure Limit (PEL): Defined by OSHA as individual exposure, without regard to the use of respirators, to a specific airborne concentration of a contaminant expressed in milligrams per cubic meter of air (mg/m3) calculated as an 8-hour Time-Weighted Average (TWA). Once a PEL is met or exceeded for a particular contaminant, the Contractor is responsible for meeting specific OSHA requirements, which may include worker Exposure Monitoring, the use of PPE including respiratory protection, the use of Hygiene Facilities, medical surveillance, or training for workers. The following PELs are pertinent to disturbance, removal, construction/demolition, and disposal activities associated with PCB-Containing Materials and PCB Wastes: (a) PCB Aroclor 1254 – 0.5 mg/m3 per 29 CFR 1910.1000, Table Z-1; (b) PCB Aroclor 1242 – 1.0 mg/m3 per 29 CFR 1910.1000, Table Z-1.

25. Personal Monitoring: (See definition of "Exposure Monitoring").

26. Physical Boundary: A physical barrier designated with ropes, "caution tape," or a partition that surrounds a work area in order to limit the entry of unauthorized personnel and delineate "clean areas" from areas that may meet or exceed an Action Level, PEL, or TLV.

27. PCBs: Any group of chlorinated isomers of biphenyl, formerly used in the form of a toxic, colorless, odorless, viscous liquid typically added to lubricants, heat-transfer fluids, and plasticizers.

28. Regulated Area: (See definition of "PCB Control Area").

29. Resource Conservation and Recovery Act (RCRA) Training: Training that meets the criteria outlined in 40 CFR 265.16. This training shall include site-specific discussions of the following: (a) hazardous waste identification; (b) waste storage container use and labeling; (c) waste storage area management; (d) personal health and safety, including fire safety; (e) manifesting and the off-site transportation of wastes; (f) procedures for using, inspecting, repairing, and replacing emergency equipment and monitoring equipment; (g) procedures for communicating with other employees and outside emergency response personnel; (h) responses to fires or explosions; (i) responses to leaks, spills, and potential groundwater contamination incidents; and (j) the shutdown of operations.

30. Small Capacitor: A device for accumulating and holding a charge of electricity and consisting of conducting surfaces separated by a dielectric fluid in a quantity less than 1.36 kg or three pounds. If the weight of the

dielectric fluid is unknown, it can be assumed that a Small Capacitor is a capacitor that has a total volume of less than 1,639 cubic centimeters (cm^3) or 100 cubic inches (in^3).

31. TLV: Threshold Limit Value

32. TWA: The average time over a given work period (e.g., an 8-hour workday) of a person's exposure to a chemical or agent. The average is determined by sampling for the chemical or agent throughout the time period.

33. Trigger Activities: Certain activities that involve a disturbance of PCB-Containing Materials or PCB Wastes. Depending upon whether the performance of these activities exceeds an Action Level, PEL or TLV, the requirements may include additional worker Exposure Monitoring, the use of PPE including respiratory protection, the use of Hygiene Facilities, medical surveillance, or training for workers. Examples of Trigger Activities include, but are not limited to, the following: abrasive blasting, welding, torch cutting/burning, heat gun usage, needle gunning/scaling, rivet busting, using a rotopeen, mechanical sanding/grinding, using mechanical shears, hand scraping/sanding, chemical stripping, and the manual demolition of PCB-Containing Materials.

B. Reference Standards

1. The Contractor shall comply with all applicable regulations, standards, and guidelines of federal, state, and local environmental and occupational safety and health agencies regarding PCB-Containing Materials and PCB Wastes. These regulations, standards, and guidelines include, but are not limited to the following:

   a. United States (U.S.) Department of Transportation (DOT):

      1) 49 CFR 171 - General Information, Regulations, and Definitions

      2) 49 CFR 172 – Hazardous Materials Table, Special Provisions, Hazardous Materials Communications, Emergency Response Information, and Training Requirements

      3) 49 CFR 173 – Shippers: General Requirements for Shipments and Packaging's

      4) 49 CFR 178 – Specifications for Packaging's

   b. United States Environmental Protection Agency (EPA):

      1) 40 CFR 50 – National Primary and Secondary Ambient Air Quality Standards

      2) 40 CFR 116 – Designation of Hazardous Substances

3) 40 CFR 117 – Determination of Reportable Quantities for Hazardous Substances

4) 40 CFR 260 – Hazardous Waste Management Systems: General

5) 40 CFR 261 – Identification and Listing of Hazardous Waste

6) 40 CFR 262 – Standards Applicable to Generators of Hazardous Waste

7) 40 CFR 263 – Standards Applicable to Transporters of Hazardous Waste

8) 40 CFR 264 – Standards for Owners and Operators of Hazardous Waste Treatment, Storage, and Disposal Facilities

9) 40 CFR 265 – Interim Status Standards for Owners and Operators of Hazardous Waste Treatment, Storage, and Disposal Facilities

10) 40 CFR 268 – Land Disposal Restrictions

11) 40 CFR 302 – Designation, Reportable Quantities, and Notification

12) 40 CFR 761 – Polychlorinated Biphenyls (PCBs) Manufacturing, Processing, Distribution in Commerce, and Use Prohibitions

13) Method 8082A (SW-846) – Polychlorinated Biphenyls (PCBs) (soxhlet extraction method 3540) by Gas Chromatography

c. National Institute for Occupational Safety and Health (NIOSH):

1) Method 5503 – Polychlorobiphenyls

d. New York City Department of Environmental Protection (DEP):

1) Environmental Health and Safety Policies, Procedures and Guidelines – Vol. II, Spill Prevention, Environmental Release Reporting and Investigation;

2) Environmental Health and Safety Policies, Procedures and Guidelines – Vol. IV, Hazardous Waste Management;

3) Environmental Health and Safety Policies, Procedures and Guidelines – Vol. IV, PCB Management;

4) RCNY Title 15, Chapter 19 – Discharges of Wastewater and Other Materials to Public Sewers

e. New York City Department of Buildings (DOB) – Building Code (Chapter 33)

f. New York State Department of Environmental Conservation (NYSDEC):

1) 6 NYCRR 364 – Waste Transporter Permits

2) 6 NYCRR 370 – Hazardous Waste Management Regulations

3) 6 NYCRR 371 – Identification and Listing of Hazardous Waste

4) 6 NYCRR 372 – Hazardous Waste Manifest System and Related Standards for Generators, Transporters, and Facilities

5) 6 NYCRR 373 – Hazardous Waste Management Facilities

6) 6 NYCRR 376 – Land Disposal Restrictions

7) 12 NYCRR 56 – Asbestos

g. Occupational Safety and Health Administration (OSHA):

1) 29 CFR 1910 – Occupational Safety and Health Standards

2) 29 CFR 1910.28 – Safety Requirements for Scaffolding

3) 29 CFR 1910.120 – Hazardous Waste Operations and Emergency Response

4) 29 CFR 1910.134 – Respiratory Protection Standard

5) 29 CFR 1910.1200 - Hazard Communication Standard

6) 29 CFR 1926 – Safety and Health Regulations for Construction

7) 29 CFR 1926.62 – Lead in Construction Standard

h. Society for Protective Coatings (SSPC):

1) SSPC Guide 6 - Guide for Containing Debris Generated During Paint Removal Operations

2) SSPC Guide 7 - Guide for the Disposal of Lead-Contaminated Surface Preparation Debris

3) SSPC SP 1, Solvent Cleaning

4) SSPC SP 2, Hand Tool Cleaning

5) SSPC SP 3, Power Tool Cleaning

6) SSPC SP 11, Power Tool Cleaning to Bare Metal

7) SSPC SP 13/ NACE No.6, Surface Preparation of Concrete

8) SSPC SP 15, Commercial Grade Power Tool Cleaning

i. Underwriters Laboratories, Inc. (UL):

1) UL 586 – Standard for Safety High Efficiency, Particulate, Air Filter Units.

1.05 DESCRIPTION

A. Commencement of Work: Five (5) business days prior to the proposed start of the work of this Section at each separate location, the Contractor shall notify the Engineer and the onsite safety staff. No Work may proceed at any location until authorized by the Engineer.

B. The Contractor shall coordinate any required equipment shutdowns with the Engineer prior to starting the Work.

C. Access Restrictions: The Contractor shall inform the Engineer of proposed access restrictions (i.e., areas or items of equipment which will not be accessible during the proposed Work) and give them estimated time frames (including specific dates) of such proposed access restrictions. The Contractor shall notify other contractors in advance of the disturbance, Abatement, removal, construction/demolition, and disposal Work included herein, to provide them with sufficient time for coordination of interrelated items that are included in their contracts and that must be performed before, after, or in conjunction with the Work included under this Section.

D. Unexpected Entry into a PCB Control Area: In the event that DEP personnel must enter a PCB Control Area for emergency reasons, the Contractor shall immediately stop Work and cleanup any loose debris, so as to permit the safe entry by DEP personnel. Any disturbance of paints/bitumastic coatings, dusts, materials, or wastes that may potentially generate airborne concentrations of contaminants equal to or above an OSHA Action Level shall not proceed until all DEP personnel have exited from the PCB Control Area.

E. Meetings: In addition to the pre-construction meeting and site walk-through, other meetings may be required or may be requested by the Engineer, including briefings to Site Operations personnel. Written documentation (i.e., “minutes”) of all meetings shall be generated by the Contractor, and copies shall be provided to the DEP within three (3) business days following each meeting.

1.06 QUALITY ASSURANCE

A. Scheduling: The Contractor shall coordinate and schedule all phases of the Work to be performed under this Section with the DEP, subcontractors, material suppliers, and other parties as necessary to ensure the proper execution of the Work.

B. Compliance: In addition to the detailed requirements of this Section, DEP EHS Policies and Procedures, and Section 01 35 27 – Environmental Health and Safety Requirements, the Contractor shall comply with all applicable regulations of federal, state, and local authorities pertaining to the disturbance, Abatement,

removal, construction/demolition, handling, storage, transportation, and disposal of PCB-Containing Materials and PCB Wastes. All matters regarding the interpretation of any regulations, standards, or policies shall be submitted to the Engineer for resolution before starting the Work. Where the requirements of this Section, DEP EHS Policies and Procedures, or federal, state, or local regulations conflict or vary, the most stringent requirements or regulations shall apply.

C. Rejection of Non-Complying Items: The DEP reserves the right to reject Contractor materials/tools/submittal items that are deemed inappropriate or unacceptable by the Engineer or DEP. Submittal items that may be deemed inappropriate or unacceptable include proposed TSDFs, vendors or subcontractors with previous regulatory citations/violations.

D. Suspect Material Characterization: To classify caulking or a paint or bitumastic coating as non-PCB containing, a paint chip/coating sample must be collected as a grab sample from the source. The sample shall be sent to an analytical laboratory meeting the requirements of this Section.

1. Suspect PCB-Containing Paints/Coatings: Although there are no certification requirements pertaining to an individual that collects paint chip samples in an industrial or commercial setting, this Section requires paint chip sampling to be performed by an individual who has successfully completed a PCB Awareness Training course (within the past year) as defined in this Section.

2. Suspect ACM: All caulking and bitumastic coatings are considered suspect ACM. Therefore, if a sample will be collected, the sampling shall be performed by a certified DEP Asbestos Investigator or NYSDOL Asbestos Inspector.

3. Estimate an approximate number of samples to adequately characterize painted/coated surfaces. Collect grab samples that include all layers of paint/coating from different areas randomly dispersed throughout the painted surface area. Grab samples are not to be composited.

4. PCB concentrations are based on the cumulative total of the nine (9) Aroclor cogeners (aka PCB compounds) analyzed by EPA Method SW 846-8082A (soxhlet extraction method 3540) by Gas Chromatography.

E. Qualifications:

1. The Contractor or their proposed PCB removal subcontractor shall have successfully completed at least two (2) projects of comparable scope and methodologies and shall document the following: (a) the name, address, and phone number of each facility where the work was performed; (b) the volume and type of each material that was abated/removed; (c) the specific methods of Abatement/removal used (including the tools, technologies, and engineering controls employed).

2. Competent Person:

a. When disturbing materials and wastes with PCB concentrations greater than or equal to 50 ppm, the Contractor shall have on staff and assigned to this Contract a Competent Person who has successfully completed:

1) 40-hr HAZWOPER Training;

2) PCB Awareness Training (annual), and RCRA Training courses as defined in this Section.

a) Each training course shall be current in accordance with the course and regulatory requirements.

b. The Competent Person shall have a minimum of two (2) years' experience with work involving PCBs, and shall have served as the Competent Person on at least three (3) projects of comparable scope and methodologies to the work being performed under this Section.

c. The Competent Person shall be on site during all PCB-related work activities. It should be noted that depending upon the specific contaminants present during the work, additional training for the Competent Person may be required.

3. PCB Waste Manager:

a. When disturbing materials and wastes with PCB concentrations greater than or equal to 50 ppm, the Contractor shall have on staff and assigned to this Contract a PCB Waste Manager who has successfully completed:

1) DOT Hazardous Materials Transportation Training;

2) RCRA Training course, completed within the past year in the form of either an initial course or a refresher course;

3) 24-hr HAZWOPER Training;

4) PCB Awareness Training (annual) as defined in this Section.

b. The PCB Waste Manager shall have a minimum of two (2) years experience on projects involving PCB Wastes. It is acceptable for an individual who meets the criteria of the Competent Person, to also serve as the PCB Waste Manager for this Contract as long as the individual fulfills all of the requirements of this paragraph.

4. PCB Worker:

a. When disturbing materials and wastes with PCB concentrations greater than or equal to 50 ppm, the Contractor shall have on staff and assigned to this Contract a sufficient number of PCB Workers who have successfully completed:

1) PCB Awareness Training course (annual) as defined in this Section.

b. Each PCB worker shall have a minimum of one (1) year of experience on projects involving PCBs and shall have worked on at least three (3) projects of comparable scope and methodologies to the work being performed under this Section.

5. Worker (low PCB concentrations):

a. When disturbing materials and wastes with PCB concentrations less than 50 ppm, the Contractor shall have on staff and assigned to this Contract a sufficient number of workers who have successfully completed:

1) PCB Awareness Training course (annual) as defined in this Section.

b. Until a negative exposure assessment has been established via Exposure Monitoring, workers must wear appropriate respiratory protection.

6. Air Monitor:

a. When disturbing any detectable concentration of PCBs, the Contractor shall have an Air Monitor assigned to this Contract who has successfully completed:

1) PCB Awareness Training course (annual) as defined in this Section.

b. The Air Monitor shall have a minimum of two (2) years experience in conducting Area Monitoring and Exposure Monitoring on projects involving PCBs.

c. It is acceptable for an individual who meets the qualification requirements for Competent Person or PCB Waste Manager to also serve as the Air Monitor for this Contract, as long as the individual satisfies all of the requirements of this paragraph.

1.07 SUBMITTALS

A. Thirty (30) business days prior to the Work of this Section or as directed by the Engineer, the Contractor shall submit the following to the Engineer:

1. PCB Inspection and Sampling Plan: The Contractor shall provide a PCB Inspection and Sampling Plan to identify suspect PCBs, not otherwise sampled during Design, and collect samples, as appropriate during the inspection. This plan shall include at a minimum:

a. At a minimum, the inspection shall be performed by an Environmental Professional, as defined in this Contract, who shall have PCB awareness training (annual), and OSHA 10-hr

certification, and shall have performed similar inspection work on at least three (3) projects of similar scope.

b. Credentials of the laboratory providing sample analysis, including current certification by the New York State Department of Health's Environmental Laboratory Approval Program (ELAP) and by the American Industrial Hygiene Association (AIHA).

c. Sample collection, analysis, and reporting protocol.

d. Health and safety protocol (Job Hazard Analysis) for all investigation activities.

2. PCB Inspection Report: The Contractor shall provide a PCB Inspection Report prepared by the Environmental Professional summarizing the results of all inspection activities, and as applicable, a sampling narrative, laboratory data packages, and inventory of all identified suspect and confirmed PCB-Containing Materials.

3. PCB Safe Work Practices: Each Contractor that will disturb PCB-Containing Materials with a PCB concentration less than 50 ppm during the course of Work to be performed under this Section shall submit detailed, project-specific PCB Safe Work Practices designed to protect their workers and control the spread of potential PCB contamination. Work requiring the development of PCB Safe Work Practices includes, but is not limited to, the mechanical disturbance of paints/coatings (e.g., drilling or sawing, or spot removal). The PCB Safe Work Practices shall be signed and dated by a CIH meeting the definition in this Section, and shall include the following elements:

a. Section on the procedures and methodologies that will be used to conduct Exposure Monitoring. Also, provide the name and qualifications (i.e., training and experience documentation) of the Air Monitor who shall, at a minimum, satisfy the qualification requirements set forth in this Section;

b. Section on housekeeping procedures to be used for maintaining clean work areas and clean Hygiene Facilities;

c. Task Analysis: Each task analysis shall include, but is not limited to, the following information: (a) the type of Work activity; (b) the tools/equipment that will be used and their respective decontamination procedures; (c) operation and maintenance practices and procedures that will be used for the tools/equipment (SSPC SP 1, 2, 3, 11, 13 and 15 as applicable); (d) the types of PCB-Containing Materials that may be disturbed when performing the activity; (e) the engineering controls that will be used to control the spread of contamination during the activity; (f) housekeeping procedures that will be used during the activity; (g) PPE and proposed respiratory protection that will be used for the activity;

d. Equipment and Supplies: Identify the equipment and supplies that will be used to perform the Work;

e. Rental Equipment Notification: If rental equipment is to be used during the Work, the Contractor shall notify the rental agency in writing concerning the intended use of the equipment;

f. SDSs: Provide SDSs for all chemical products to be used for the Work;

g. Medical Clearance for Respiratory Protection: For all activities that disturb PCB-Containing Materials with a PCB concentration less than 50 ppm, the Contractor shall provide a sufficient number of properly trained and experienced workers, each of whom shall: (a) have received a medical exam that included a Pulmonary Function Test (PFT) within the past year; (b) have received written medical clearance within the past year, by a licensed physician, to wear a respirator; (c) have received a qualitative or quantitative respirator fit-test for the specific respirator the employee will be using for this Work within the past year;

h. Employee Documentation: For all activities that may disturb PCB-Containing Materials with a PCB concentration less than 50 ppm, the Contractor shall provide a sufficient number of properly trained and experienced workers, each of whom shall: (a) have written proof of training (e.g., certificates) in accordance with the qualification requirements of this Section for workers and Air Monitors that will be used for the Work; (b) dates and written proof of respiratory clearance and a medical exam in accordance with this Article; (c) dates and written proof of a respirator fit-test in accordance with this Article.

4. PCB Management Plan: Each Contractor that will disturb PCB-Containing Materials with a concentration of PCBs greater than or equal to 50 ppm, and PCB Wastes during the course of Work to be performed under this Section shall submit a detailed, project-specific PCB Management Plan that addresses work procedures and equipment to be used during the disturbance, removal, handling, collection, and disposal of PCB-Containing Materials and PCB Wastes. Work requiring a PCB Management Plan includes, but is not limited to, Abatement, spot removal and construction/demolition activities. The PCB Management Plan shall be prepared in accordance with OSHA Construction Standards and all other pertinent federal, state, and local regulations, including DEP (RCNY Title 15, Chapter 1) or New York State Department of Labor (NYSDOL) (12 NYCRR 56) asbestos regulations, only if asbestos is present. In addition, the PCB Management Plan shall follow all DEP EHS Policies and Procedures (referenced in this Section) and shall be coordinated with the Engineer. The PCB Management Plan shall also be signed and dated by a CIH meeting the definition in this Section.

a. If the PCB-Containing Materials or PCB Wastes that will be disturbed also contain asbestos or lead, it is acceptable to integrate the PCB Management Plan elements into the relevant Asbestos Work Plan (required under Section 02 82 05 - Asbestos Management) or Lead Management Plan (required under Section 02 83 05 - Lead Management and SSPC Guide 7). PCB Management Plan elements that are integrated into an Asbestos Work Plan or Lead Management Plan must still satisfy all of the requirements of this Section. The PCB Management Plan (or relevant Asbestos Work Plan or Lead Management Plan) shall include the following elements:

1) PCB Control:

a) Drawings showing the location and details of the following: (a) each PCB Control Area; (b) each Hygiene Facility; (c) proposed electrical hookups; (d) proposed water hookups: (e) each waste storage area: (f) restroom areas; (g) areas designated for eating, drinking, and smoking;

b) Section on the interfacing of trades (i.e., other contractors) and the sequencing of PCB-Related Work;

c) Section on the collection, handling procedures, and disposal of PCB-Containing Materials with a PCB concentration equal to or greater than 50 ppm, and PCB Wastes (including the collection, filtering, and disposal of wastewater). If reusable equipment used during the Work will be in contact with PCB-Containing Materials or PCB Wastes, the Contractor shall submit an equipment decontamination procedure using a Performance-based Decontamination Fluid (PODF) in accordance with 40 CFR 761;

d) Section on the procedures and methodologies that will be used to conduct Exposure Monitoring and Area Monitoring. Also, provide the name and qualifications (i.e., training and experience documentation) of the Air Monitor who will be responsible for conducting the Air Monitoring activities. The Air Monitor shall at a minimum, satisfy the qualification requirements set forth in this Section;

e) Section on housekeeping procedures to be used for maintaining clean work areas and clean Hygiene Facilities;

f) Section on the specific methods and procedures of emissions control that will be used to ensure that airborne contaminant levels do not meet or exceed an OSHA PEL outside of each PCB Control Area;

g) Task Analysis: Each task analysis shall include, but is not limited to, the following information: (a) the type of Work activity; (b) the tools/equipment that will be used; (c) operation and maintenance practices and procedures that will be used for the tools/equipment; (d) the types of PCB-Containing Materials that may be disturbed or PCB Wastes that may be generated when performing the activity; (e) the engineering controls that will be used to control the spread of contamination during the activity; (f) the proposed crew size for the activity and individual employee responsibilities during the activity; (g) housekeeping procedures that will be used during the activity; (h) PPE and proposed respiratory protection that will be used for the activity;

h) Equipment and Supplies: Identify the equipment and supplies that will be used to perform the Work;

i) Rental Equipment Notification: If rental equipment is to be used during the Work, the Contractor shall notify the rental agency in writing concerning the intended use of the equipment.;

j) SDSs: Provide SDSs for all chemical products (including chemical stripping products and PODFs) to be used for the Work;

k) The name and qualifications (i.e., experience and training documentation) of the Competent Person who shall satisfy the qualification requirements set forth in this Section.

2) Waste Management:

a) The identification of PCB-Containing Materials with a PCB concentrations equal to or greater than 50 ppm, and PCB Wastes associated with the Work;

b) The estimated quantity of each waste stream (regulated and non-regulated) that will be generated and disposed of;

c) The name, address, 24-hour phone number, and current permit documentation for each TSDF indicating that the facility is approved by federal, state, and local regulatory agencies to receive PCB-Containing Materials with a PCB concentration equal to or greater than 50 ppm, and PCB Wastes. The documentation shall include an "acceptance letter" from each TSDF indicating its ability to accept the specific waste streams that will be generated during Work performed under this Section;

d) Current 6 NYCRR 364 permit documentation for the waste transporter that will transport PCB-Containing Materials with a PCB concentration equal to or greater than 50 ppm, and PCB Wastes from the work site to the TSDF.;

e) Spill prevention, containment, and cleanup contingency measures to be followed during a suspected PCB emissions/bulk material release or emergency situation.;

f) Section on the on-site handling, storage, removal, and disposal of waste materials, including but not limited to the following: (a) secondary containment system for each drum storage area; (b) description of the waste storage areas; (c) the methods and procedures that will be used to collect and containerize wastes on a daily basis; (d) types of containers; (e) the submittal of weekly regulated waste inspection and inventory records;

g) The name and qualifications (i.e., experience and training documentation) of the PCB Waste Manager.

b. A detailed schedule for the implementation of the PCB Management Plan elements, including starting and completion dates for the Work, and shall allow adequate time for cleanup, inspections, and Air Monitoring activities.

c. Medical Surveillance: For all activities that disturb PCB Containing Materials with PCB concentrations that are greater than or equal to 50 ppm, and PCB Wastes, the Contractor shall provide a sufficient number of properly trained and experienced workers,

each of whom shall: (a) have completed initial blood testing for PCBs; (b) have received a medical exam that included a PFT within the past year; (c) have received written medical clearance within the past year, by a licensed physician, to wear a respirator; (d) have received a qualitative or quantitative respirator fit-test within the past year for the specific respirator the employee will be using for this Work.

d. Employee Documentation: For all activities that take place within a PCB Control Area, each worker shall: (a) have resumes and training (e.g., certificates) for PCB workers, Competent Persons, PCB Waste Managers, and Air Monitors; (b) initial medical surveillance, dated within the past year, and proof of participation in the employer's ongoing medical surveillance program; (d) dates and written proof of respiratory clearance and a medical exam; (e) dates and written proof of a respirator fit-test.

e. A current (i.e., within the last month) signed and notarized statement disclosing all OSHA, EPA, and DOT citations/violations within the past three (3) years for the company performing the PCB Abatement.

5. Analytical Laboratory Qualifications for Analyzing Suspect PCB-Containing Materials and Wastes: Submit the name, address, and telephone number of each analytical laboratory selected to perform the analyses of waste samples (solid and liquid), air samples collected for Area Monitoring and Exposure Monitoring purposes, and paint/bitumastic coating samples collected to classify painted/coated surfaces, including. copies of current AIHA and ELAP certificates.

B. Field Reports and Recordkeeping: During all Work performed under this Section, the Contractor shall maintain and provide the following documentation:

1. Air Monitoring Documentation: All PCB Air Monitoring results and daily Air Monitoring reports shall be provided to the DEP within 24-hours from the date the samples are collected, including signed, complete COC documentation.

a. Each signed daily Air Monitoring report shall include, but not be limited to, the following information: (a) sample “start” and “stop” times; (b) flow rates (initial and final) for each sample; (c) the total volume of air collected for each sample; (d) sample location descriptions/sample location drawings/names of individuals being sampled; (e) types (i.e., makes and models) of sampling equipment used; (f) types of sample media (i.e., filters and cassettes) used; (g) the most recent calibration dates, along with the calibration results, for the sampling equipment used; (h) the name of the Air Monitor that conducted the Air Monitoring; (i) dates that the Air Monitoring was conducted; (j) work tasks being performed during

the Air Monitoring; (k) unique sample numbers used to identify each sample; and, (l) highlighting of all PEL exceedances.

2. Waste Documentation: Completed and signed waste manifests from TSDFs shall be provided to the DEP no later than thirty (30) calendar days of disposal. In addition, on-site waste storage areas shall be inspected weekly by the PCB Waste Manager.

   a. Each waste storage area inspection shall be coordinated with the Engineer, signed by the inspector, and shall be provided to the DEP within 24-hours of the inspection date. The report shall include: (a) the name of the inspector; (b) descriptions of waste streams; (c) types, quantities, and physical condition of waste containers;(d) proper labeling for each waste containers; (e) secondary containment systems being used; (f) storage area security method to prevent any unauthorized entry.

   b. In addition to performing weekly waste storage area inspections, the PCB Waste Manager shall also maintain an ongoing waste inventory, including: (a) specific dates that each waste container was added/removed from the waste storage area; (b) the full name (printed) and signature of the individual responsible for adding/removing each waste container from the waste storage area.

3. PCB Control Area Inspection Documentation: PCB Control Areas shall be inspected daily by the Competent Person.

   a. All signed reports shall be provided to the DEP within 24-hours after the inspection is completed. The content of these reports shall include: (a) the types of work being performed; (b) the names of the PCB workers, Competent Person, PCB Waste Manager, and Monitor on site, including company names; (c) the types of Air Monitoring, including the number of samples being collected; (d) any non-compliance issues observed, including the corrective actions that were taken to achieve compliance.

4. Contractor Project Record: The Contractor's Competent Person shall maintain a project record at the Work Site that shall be made available to the Engineer or DEP for review at any time and shall be submitted to the DEP within 24-hours after the completion of the Work.

   a. At a minimum, the Contractor Project Record shall contain the following information: (a) copies of training certificates for all individuals involved with the Work; (b) copies of all Air Monitoring results generated during the Work; (c) copies of all available caulking and paint chip/bitumastic coating sample analytical data and survey reports related to the Work; (d) copies of all daily sign-in sheets; (e) copies of all SDSs pertaining to all chemicals being used during the Work; (f) a copy of the Contractor's PCB Management Plan; (g) copies of all daily PCB

Control Area inspection records; (h) copies of all weekly waste storage area inspection records; (i) a copy of the waste inventory; (j) a copy of the Contractor's Hazard Communication (HAZCOM) program.

5. Daily Sign-In Sheets: The Contractor shall generate daily sign-in sheets for all individuals entering and exiting each PCB Control Area. The daily sign-in sheets shall be maintained by the Competent Person and shall be made available to the Engineer or DEP for review at any time during the Work. All daily sign-in sheets shall be submitted to the DEP within 24-hours after the completion of the Work.

   a. At a minimum, each daily sign-in sheet shall include: (a) the individual's printed name and signature; (b) company name; (c) the time of entry and exit from each PCB Control Area.

6. HAZCOM Program: The Contractor's HAZCOM program shall be made available to the Engineer or DEP for review at any time during the Work.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. Respirators: The Contractor shall select respirators approved by the NIOSH for use in areas where paints/bitumastic coatings, dusts, materials, or wastes containing contaminants may be disturbed. At a minimum, the Contractor shall provide each individual with a half-face, negative pressure, air purifying respirator equipped with HEPA/P-100 Filter cartridges and Organic Vapor Cartridges, until Exposure Monitoring results indicate that respiratory protection can be modified. The Contractor's CIH shall make all determinations regarding respiratory protection modifications that will be implemented for the Work. All modifications shall be in accordance with OSHA requirements, the Contractor's PCB Management Plan, and any relevant Asbestos Work Plan or Lead Management Plan associated with the Work.

B. PPE: The Contractor shall provide personnel who have a potential to be exposed to materials or wastes containing contaminants, with appropriate PPE as prescribed by the Contractor's CIH.

C. HEPA Filters: HEPA/P-100 Filters used in vacuuming equipment, power tools, and local exhaust equipment must meet or exceed any manufacturer's specifications and recommendations, as well as specifications presented in the Standard for Safety High Efficiency, Particulate, Air Filter Units (UL 586).

D. Waste Containers: Containers for the storage of all PCB Wastes shall be DOT-approved and shall be provided by the Contractor.

E. Abrasives: Mechanical paint/bitumastic coating removal equipment shall not use any products containing crystalline silica, and the equipment shall not utilize any non-recoverable materials or any cutting materials which introduce toxic or hazardous materials into the environment.

F. Chemical Strippers: The Contractor shall utilize an environmentally safe chemical paint stripping system, with demonstrated suitability and efficiency in preparing cast-in-place concrete, cement, and plaster surfaces that are free of any visible residues of paints/bitumastic coatings. The system shall include non-alkaline or alkaline strippers that provide the lowest possible level of toxicity consistent with the types of paints/bitumastic coatings to be removed. Neutralization products and procedures shall be provided for all alkaline stripping systems, no stripping system shall contain methylene chloride, and the stripping system shall be low in volatile organic compounds (VOCs).

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Hygiene Facilities: The Contractor shall provide functional Hygiene Facilities as defined in this Section that are appropriate for the types of Work to be performed under this Section. The Contractor shall ensure that employees do not leave a PCB Control Area wearing any potentially contaminated PPE. Using compressed air to dislodge dust from clothing/PPE shall be strictly prohibited. The Contractor shall collect, test, and properly dispose of all wastewater generated from Hygiene Facilities.

1. Handwash Stations: The Contractor shall provide functioning handwash stations on all projects that disturb PCB-Containing Materials with a PCB concentration equal to or greater than 50 ppm, or PCB Wastes. Handwash stations shall have running water at the tap, clean towels, and soap per 29

CFR 1926.51. Substituting "hand wipes" in place of soap and running water will not be acceptable.

2. Showers: The Contractor shall provide shower facilities for use by employees whose airborne exposure to PCBs is above an OSHA PEL. When shower facilities are necessary, employees are required to shower at the end of the work shift each day prior to leaving the PCB Control Area that they are working in.

B. Utilities: The temporary use of any on-site utilities shall be subject to the approval of the DEP. The Contractor shall furnish all water, hoses and water filtration devices needed for the Work as per 01 51 11 Temporary Water and Sanitary Services; as well as any temporary electrical hookups and temporary lighting to the PCB Control Area as per 01 51 30 Temporary Electrical System. All temporary lighting and temporary electrical service to a PCB Control Area shall be provided by the Contractor and shall be in weather-proof enclosures and be ground fault protected. Also, the Contractor shall supply all heating and ventilation equipment needed for the Work as per 01 51 12 Temporary Heat and Ventilation.

C. Signs: The Contractor shall post conspicuous warning signs at all approaches to work areas and waste storage areas. Signs shall comply with federal, state, and local regulations, including the requirements of OSHA. Signs shall not be removed until all Abatement, removal, and construction/demolition activities have been completed. At a minimum, each sign shall bear the following information in English and the predominant language that is spoken by the Contractor's employees if English is not spoken:

WARNING
PCB WORK AREA
POISON
NO SMOKING, EATING OR DRINKING

1. Each sign shall be appropriately modified to include additional warnings for other contaminants that are identified during Exposure Monitoring.

D. Physical Boundary Delineation: The Contractor shall clearly delineate each work area and waste storage area with a Physical Boundary as defined in this Section.

E. Work Area Preparation: The Contractor shall utilize HEPA-filtered vacuums, and wet methods during the initial cleaning of each work area. Prior to removal from each work area, all movable objects and mounted objects that can be removed shall be pre-cleaned using HEPA-vacuums and wet methods. Fixed objects that must remain within each work area shall be pre-cleaned using HEPA vacuums and wet methods, and subsequently covered with 6-mil polyethylene sheeting.

3.02 IMPLEMENTATION

A. Bulk Removal

1. Protection of Existing Work to Remain: All Work involving the disturbance of PCB-Containing Materials and PCB Wastes must be conducted without damage to, or contamination of equipment or surfaces within the work areas or other areas adjacent to the work areas. All such damage or contamination shall be immediately corrected and cleaned up by the Contractor at the Contractor's expense.

2. Prohibited Activities: Contractors shall not conduct activities that are prohibited by OSHA and EPA regulations. The following activities are prohibited, regardless of whether they are conducted subject to an exposure assessment and written compliance program: (a) burning-off paints/bitumastic coatings; (b) using heat guns operating above 1100° F; (c) dry machine sanding, grinding, or blasting paint without a HEPA vacuum exhaust tool; (d) uncontained hydroblasting or high-pressure washing; (e) welding painted/coated surfaces unless the paint/coating is removed at least 4-inches from area of heat application (per 29 CFR 1926.345(c)(1)), and local exhaust ventilation is used.

3. Test Patches: Prior to choosing the paint removal method(s) for paints/bitumastic coatings, the Contractor shall perform test patches on surfaces subject to Abatement or spot removal, to determine if the method(s) meet the requirements of this Section.

4. Mechanical Removal Equipment: The use of mechanical equipment to remove asbestos-containing caulking or bitumastic coatings will require compliance with DEP (RCNY Title 15, Chapter 1) or NYSDOL (12 NYCRR 56) asbestos regulations, including the use of a full containment enclosure under negative air pressure.

    a. When removing paints/bitumastic coatings from metal surfaces, the paints/bitumastic coatings must be removed to the extent that only the bare metal remains (i.e., no mill scale remains). In the case of substrates other than metal (e.g., concrete, brick, and block), paints/bitumastic coatings shall be removed from the surface of the substrate to the extent that flaking and peeling will not occur subsequent to the performance of the Work. Acceptance of the Work shall be contingent upon inspection of the substrate surfaces by the Engineer and must demonstrate the absence of residual paint/coating layers that can be physically measured, pried loose, or peeled away using a scraping device. The Contractor may only use products and tools meeting the performance specifications outlined below:

        1) The Contractor shall utilize a vacuum-assisted power tool system with demonstrated suitability and efficiency in preparing metal surfaces to the SSPC SP-11 standard, and with demonstrated effectiveness in maintaining PCB emissions below OSHA exposure limits during the disturbance of paints/bitumastic coatings. Such systems

may include dustless needle guns, dustless roto peens, and dustless right-angle grinders, all of which capture dust and debris at the cutting tool edge, and transport the material under vacuum conditions to an air-tight disposal container. Dustless needle guns shall only be utilized on metal surfaces.

2) The vacuum-assisted power tool system shall also be designed to permit the removal and replacement of collection containers under negative pressure in order to prevent the release of dusts. The system shall be equipped with an automatic “shut-off” in the event of vacuum failure.

3) Abrasive/recovery tools shall be monitored at all times by a device capable of determining recovery at the face of each tool, and capable of automatically disabling the tool in the event that recovery levels are insufficient. The monitor, at a minimum, shall have the following features: (a) a remote warning light; (b) an adjustable recovery set point; (c) automatic equipment disabling capabilities; (d) a sensing range of 0 5 pounds per square inch (psi); (e) solid state photohelic instrumentation; (f) remote sensing at the face of the tool.

4) The safe recovery point shall be calibrated each day before start-up, or each time a new tool or vacuum source is used. All manufacturer recommendations shall be followed with respect to the set up and use of the monitor, and the manufacturer's operations manual shall be kept on site at all times. A daily log shall be maintained by the Contractor, identifying all calibrations of recovery levels, as well as any “down time” as a result of insufficient recovery levels.

5) The cutting head of the vacuum-assisted power tool system that is used on flat surfaces shall be capable of cutting to within 1-1/2" of any inside corner, molding, or edge, and may include dustless roto peens or dustless needle guns. Tools for corners and moldings shall be specifically designed for that purpose, and conform to all inside corners, outside corners, curved, flat, and angled surfaces that are to be abated under this Section. These tools shall also maintain vacuum control at the Work surface/cutting head interface at all times. HEPA vacuum-shrouded needle guns may be used for non-flat surfaces in accordance with manufacturer recommendations. Vacuum-assisted finishing tools, such as right-angle grinders, may be used to achieve the SSPC SP 11 standard, but may not be used for primary removal.

6) Vacuum-assisted power tool systems meeting all of the specifications outlined herein, may be used pending the submittal of all required performance documentation, and their acceptance by the Engineer. Any tools which do not meet all of the specifications outlined herein, shall be removed from the project site immediately, and shall not be used for the Work to be performed under this Section.

5. Chemical Strippers: Acceptance of the Work shall be contingent upon inspection of the abated substrate surfaces by the Engineer and must demonstrate the absence of residual paint/bitumastic coating layers that can be physically measured, pried loose, or peeled away using a scraping device. The Contractor may only use products and paint stripping systems meeting the performance sections outlined below:

   a. The Contractor shall utilize a chemical paint stripping system with a demonstrated effectiveness in maintaining PCB emissions below OSHA exposure limits during the disturbance of paints/bitumastic coatings. The Contractor shall utilize a mechanical ventilation system during the Work that exhausts away from occupied areas. The application of all paint stripping systems shall be in accordance with manufacturer recommendations.

   b. The Contractor should note that more than one (1) product may be required to strip PCB-containing paints/bitumastic coatings. The use of multiple products shall be in accordance with work practices approved by the individual manufacturer of each chemical paint stripping compound.

   c. All chemical paint stripping products shall be presented to the Engineer for approval prior to the start of any Work to be performed under this Section. The manufacturer's labels on each container shall be intact and legible.

   d. Chemical paint stripping systems may be used pending the submittal of all required performance documentation, and its acceptance by the Engineer.

3.03 FIELD TESTING / QUALITY CONTROL

A. Air Monitoring

1. Exposure Monitoring: For Work involving the disturbance of any detectable concentration of PCBs, the Contractor shall collect personal air samples from employees who are anticipated to have the greatest risk of exposure, as determined by the Contractor's CIH or Competent Person. Personal air samples shall be collected during every work shift from at least one (1) employee that is representative of each type of work task that is being performed. Each personal air sample shall "run" for the employee's entire work shift in order to ensure that enough volume (of air) is collected, and an accurate 8-hour TWA can be calculated.

Documentation regarding the sample numbers, specific shift when the sampling was conducted, the work tasks that were sampled, the dates of sampling, the employee hours that were worked during the shift, and the total sampling times, shall accompany each laboratory COC form.

a. If PCB concentrations being disturbed are less than 50 ppm, Exposure Monitoring may be discontinued following a complete negative exposure assessment and approval from the Engineer and the Contractor's CIH. A negative exposure assessment is defined as current initial exposure monitoring using breathing zone air samples representing the 8-hour TWA exposure for each individual who are representative of each task being conducted. Following discontinuation of exposure monitoring, if there is a change to work practices, exposure monitoring shall again be performed until a second negative exposure assessment is conducted and analyzed.

2. Area Monitoring: If PCB concentrations being disturbed are greater than or equal to 50 ppm, the Contractor shall collect a minimum of two (2) area air samples outside of each PCB Control Area on a daily basis for the duration of the Abatement, removal, or construction/demolition Work, as well as any other Work involving the disturbance of PCB-Containing Materials or PCB Wastes. During sampling activities, all air sample filter cassettes shall be positioned approximately five to six feet above the ground (to simulate an individual's breathing zone) and shall not be placed immediately adjacent to obstructions (e.g., walls or columns) which may restrict the flow of air to the filter cassettes. Each air sample shall be analyzed for all contaminants identified during the exposure assessment. If area Air Monitoring indicates an emission level in excess of an OSHA PEL outside of a PCB Control Area, all Work in that area shall be stopped immediately. The Contractor shall then take immediate corrective actions to reduce emission levels to below the OSHA PEL(s), and the Contractor shall clean all adjacent areas that may have become contaminated due to the emissions. Documentation regarding the sample numbers, sample locations, the dates of sampling, the employee hours that were worked during the shift, and the total sampling times, shall accompany each laboratory COC form.

3. The Contractor shall submit all Air Monitoring results to the DEP within 24 hours after the air sample was collected.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Cleanup: The Contractor shall maintain all surfaces, including protective coverings (polyethylene sheeting) within each work area, free of accumulations of paint chips/coating debris, dusts, and wastes. Dry sweeping and using compressed air to cleanup a work area shall be strictly prohibited. HEPA-filtered vacuums and

wet methods shall be used to ensure that each work area remains free of visible paint chips/coating debris, dusts, and wastes. Perform work in accordance with SSPC Guide 6.

1. Equipment Decontamination: All reusable equipment (e.g., hand tools and power tools) that has been in contact with materials that have a PCB concentration greater than or equal to 50 ppm and PCB Wastes, shall be thoroughly decontaminated prior to being removed from the PCB Control Area in accordance with 40 CFR 761.79(c)(2)(i), which permits "swabbing surfaces that have contacted PCBs with a solvent." The solvent shall be a PODF as defined in 40 CFR 761.79(c)(3)(iv)(C) or (D). Used decontamination materials (e.g., rags used to swab equipment) shall be collected, stored, and disposed of in accordance with this Article.

B. Collection, Separation, and Containerization of Wastes: The Contractor shall collect, separate (by waste stream/waste type), and containerize PCB containing wastes (solid and liquid), debris, PPE, and containment materials on a daily basis in accordance with the PCB Safe Work Practices or PCB Management Plan.

1. If any source sample from a specific work area indicates that PCBs in paints/coatings are greater than or equal to 50 ppm, then all waste from that area will be characterized as TSCA-regulated waste. All waste streams must be segregated into separate drums and labeled with PCB waste labels, including out of service date (when PCB waste is first place in the drum) in addition to RCRA hazardous waste labels (pending analysis). This may include one or more drums for paint chips, chemical stripper waste, and HEPA filters associated with HEPA vacuums. Other waste such as PPE, rags and polyethylene sheeting from a specific work area may be comingled in drums separate from the drums containing paint chips, stripper waste and HEPA filters.

2. If all source samples from a specific work area indicate that PCBs in paints/coatings are less than 50 ppm, then all PPE, poly and paint/coating waste from that area will be characterized as PCB-containing non-hazardous or hazardous waste pending TCLP analysis of the eight (8) RCRA metals in the waste stream and should not be managed as C&D debris. Drums should be labeled with RCRA hazardous waste labels (pending analysis). All waste streams shall be segregated into separate drums. Paint chips and HEPA filters shall be drummed as one waste stream from each work area, and polyethylene sheeting, rags, paper towels and PPE from each work area will be drummed as a separate waste stream.

3. The Contractor shall store all wastes in DOT-approved container systems. All drums/containers shall be labeled, sealed and covered immediately after filling.

4. No water mixed with or contaminated by hazardous waste may be released onto the ground or into any drain or sewer. It should be noted that a discharge of more than 1 lb. of PCBs onto the ground or into the water

within a 24-hour period, shall be considered a violation of the Clean Water Act and shall be treated as a "reportable quantity" in accordance with 40 CFR 116, 40 CFR 117, and 40 CFR 302. Such a release shall be grounds for immediate termination of this Contract, and the Contractor shall be liable for any fines, penalties, or remediation costs.

5. The Contractor shall store non-hazardous wastes separately from hazardous wastes and TSCA-regulated wastes, shall provide all non-hazardous waste containers, and shall make all transportation and disposal arrangements for non-hazardous wastes in accordance with federal, state, and local regulations. TSCA-regulated PCB waste must be disposed within 180 days subject to the requirements of 40 CFR 761.65, in addition to any RCRA hazardous waste storage requirements (i.e., 90 days), as applicable.

C. Storage of Wastes: The Contractor shall ensure that all drummed wastes have secondary containment, and that each waste storage area has a Physical Boundary. In addition, the Contractor shall post weekly waste inspections and waste inventories in the regulated waste storage area, including the following emergency information: (a) contact details for the facility's Emergency Coordinator; (b) map indicating the location of fire extinguishers and spill control materials; (d) the telephone number for the fire department (unless the facility has a direct alarm).

D. Labeling: The Contractor shall affix warning labels to all waste drums/containers. Labels must be filled out completely at the point of generation when waste is first containerized. PCB labels shall be used to designate PCB waste, including out-of-service date, in addition to RCRA hazardous waste labels. At a minimum, all PCB and hazardous waste labels shall bear the following information in English:

CAUTION
CONTAINS PCBs
[Out-of-Service Date – when PCB waste is first placed in drum]
HAZARDOUS WASTE
FEDERAL LAW PROHIBITS IMPROPER DISPOSAL
HANDLE WITH CARE
[Generator Name, Address, and Telephone Number]
[Specific Contents of Container]
[EPA-Issued Generator Identification Number]
[EPA Waste Identification Number]
[Accumulation Start Date]

1. Since waste classification is pending analysis for RCRA/NYSDEC hazardous waste, the RCRA hazardous waste labels shall indicate "PCB/Hazardous Waste - Pending Analysis."

E. Sampling and Laboratory Analysis of PCB-Containing Wastes: For PCB Waste characterization, the PCB Waste Manager shall sample all potential PCB-

Containing Waste Streams in accordance with the TSCA (40 CFR 761). According to the EPA, characterizing PCB-containing waste streams (i.e., determining whether wastes are regulated or non-regulated under TSCA) shall be made based upon the total PCB concentration at the "source" (e.g., the paint/bitumastic coating) prior to any disturbance that may be initiated through Abatement, removal, or construction/demolition activities. Unlike hazardous waste determinations that are made under RCRA (40 CFR 260 and 40 CFR 261), sampling to determine whether a waste is TSCA-regulated shall not be made based on the sampling and analysis of mixed bulk waste materials/debris generated as a result of Abatement, removal, or construction/demolition activities. Instead, source materials for PCBs must be collected as grab samples and must not be composited during collection or analysis as that may reduce the concentration of PCBs detected. Rather, individual source samples shall be submitted for analysis to determine the highest concentration of PCBs contained in the source material or wastes.

1. PCB concentrations are based on the cumulative total of the nine (9) Aroclor congeners (aka PCB compounds) analyzed by EPA Methods SW 846-8082A (soxhlet extraction method 3540) by Gas Chromotography.

2. If PCB concentrations in paints/coatings are present greater than or equal to 50 ppm, all PCB-containing waste generated during paints/coatings disturbance will be classified as TSCA-regulated PCB waste. If PCB concentrations in paints/coatings are less than 50 ppm, all PCB-containing waste generated in the area will be classified as non-TSCA PCB-containing waste.

3. If it cannot be confirmed that the source of drummed waste (e.g., paints/coatings) is non-TSCA-regulated, or no source samples are available, or the soxhlet extraction method 3540 was not used for previous analyses, then four (4) biased worse-case grab samples shall be collected from the drum and each sample analyzed for Total PCBs. If any one grab sample result has a PCB concentration of equal to or greater than 50 ppm, the drummed waste shall be characterized as TSCA-regulated waste.

4. Waste materials/debris generated during Abatement, removal, or construction/demolition activities may be classified as RCRA or NYSDEC hazardous waste (6 NYCRR Part 370 and 6 NYCRR Part 371.4(e)) in addition to being TSCA-regulated. Therefore, wastes/debris must still be sampled and characterized prior to disposal. All waste samples shall be collected in the presence of the Engineer using the following procedure:

    a. Sampling of drummed waste will be biased for the worst-case (highest result) and will be based on inspection of drum contents. For drums with paint chips, with or without stripper waste, collect one grab sample for every quarter of the drum, from any hot spots (i.e., paint chips). As an example, if the drum is full, collect four grab samples, if the drum is half-full, collect two grab samples, and if the drum is one-tenth full, collect one sample. Grab samples

shall be composited into one (1) bulk composite sample. For drums with PPE, polyethylene sheeting, rags, and towels, collect up to four (4) grab samples with positive bias for paint chips or paint-related staining. As such, samples are likely to be collected from dust or chips at the bottom of the drum. Each grab sample shall be composited into one (1) bulk composite sample, labeled, and submitted to a laboratory. Composite samples shall undergo Toxicity Characteristic Leaching Procedure (TCLP) analysis for the eight (8) RCRA metals and Total PCBs to determine if waste is a NYSDEC hazardous waste (i.e., listed waste B007), and any additional parameters that are required by the specific TSDF being used. Furthermore, if the waste stream is associated with the use of a chemical paint stripping system, the Contractor shall have the laboratory analyze each sample for pH and any other RCRA characteristic that may fail due to the chemical composition of the waste.

b. One (1) representative wastewater sample shall be collected for laboratory analysis from each drum generated. Each sample shall be collected using appropriate field sampling equipment (e.g., a pipette or bailer), and shall be labeled and submitted to a laboratory that satisfies the requirements of this Section.

F. Sampling and Laboratory Analysis of PCB-Containing Demolition Debris: The Contractor shall collect representative bulk samples of anticipated demolition wastes to determine proper disposal. In addition to a total PCB analysis of the source materials (e.g., paints/bitumastic coatings), representative bulk samples shall be collected from painted/bitumastic-coated building materials for TCLP analysis for the eight (8) RCRA metals and Total PCBs to determine if waste is a NYSDEC listed hazardous waste (i.e., listed waste B007).

1. Scrap Metal Exemption for Recycling: Under 6 NYCRR Part 371.1(c)(7), painted scrap metal can be sent to a recycling facility, rather than be discarded as hazardous waste. In order for the DEP to submit a "c7 notification" to the NYSDEC and claim the "scrap metal exemption," the Contractor must first submit notification to their recycling facility indicating that PCBs are present on the scrap metal in concentrations less than 50 ppm. If concentrations are greater than or equal to 50 ppm, the scrap metal cannot be recycled and instead must be disposed of as a TSCA-regulated waste. If Lead or other heavy metals are detected in the paints/bitumastic coatings on the scrap metal, the Contractor shall also disclose this information to the recycling facility. The Contractor shall submit this documentation to the Engineer for approval prior to disposal.

G. Bulk demolition debris (e.g., painted concrete) that is sampled and determined to be non-RCRA-regulated and non-TSCA-regulated waste may be disposed of as construction and demolition (C&D) debris as per Section 01 74 20 – Construction Waste Management and Section 02 41 10 – Demolition and Removals.

H. Disposal of Wastes: The Contractor shall notify the DEP at least 14 business days prior to the removal of any waste drums/containers. All waste profiles for containerized wastes must be reviewed by the Engineer and signed by the DEP as the generator of the waste streams. As per 40 CFR Part 761.207, a Uniform Hazardous Waste Manifest shall be completed for TSCA-regulated and/or NYSDEC hazardous wastes. Wastes shall be disposed of to ensure that drums/containers do not remain on the job site for more than 90 calendar days from the initial "accumulation start date" on the label affixed to the drum/container. Containers that have reached their storage capacity shall not remain on site, and transportation arrangements shall be made for their immediate removal.

1. Small Capacitors and Fluorescent Light Ballasts: Small Capacitors and Fluorescent Light Ballasts are not classified as hazardous wastes under NYSDEC regulations (6 NYCRR 371.3(e)). However, these items are assumed to contain PCBs, and therefore must be disposed of as PCB Bulk Product Wastes unless marked "No PCBs" by the manufacturer. Small Capacitors and Fluorescent Light Ballasts that are not marked "No PCBs" or are leaking (regardless of PCB concentration), must be managed at one of the following facilities in accordance with 40 CFR 761.62(a): (a) in facilities using a TSCA-approved incinerator; (b) at a TSCA/RCRA-permitted landfill; (c) in facilities using an approved alternate method of destroying PCBs; (d) at a facility using an approved method of removing/decontaminating PCBs; (e) using a TSCA PCB Coordinated Approval issued by the EPA Regional Administrator.

I. Disposal Documentation: If asbestos or lead (as defined in Section 02 82 05 - Asbestos Management and Section 02 83 05 - Lead Management) were detected in the wastes, the Contractor shall also ensure that the TSDF is approved by federal, state, and local regulatory agencies to receive these wastes. Once all waste profiles have been completed, the Contractor shall provide the DEP with a "Letter of Acceptance" issued from the TSDF indicating that the wastes will be accepted, and a copy of the advance manifest. On the date of disposal, the Contractor shall submit one (1) copy of the completed manifest that has been signed and dated by the initial transporter in accordance with 6 NYCRR 372, 6 NYCRR 373, 40 CFR 262, 40 CFR 263 and 40 CFR 264, to the DEP for signature as Generator. All waste containing PCBs must be identified on the manifest, including out of service date for hazardous waste manifests. All hazardous waste documentation (e.g., waste profiles, manifests, and Land Disposal Restrictions (LDRs)) must be signed by a DEP employee as described in Section 01 35 45 - Hazardous Materials Control. Non-hazardous waste documentation may be signed by a DEP-designated alternate.

END OF SECTION

SECTION 02 84 10 – MERCURY MANAGEMENT
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. This Section details the requirements for construction and demolition activities affecting materials containing mercury, attached to Section 01 35 45 - Hazardous Materials Control, specified herein, or required to complete the Work, including all Mercury and Mercury-Containing Equipment and Material identified and impacted by the Work. There are no known mercury-containing wastes or equipment.

B. When necessary, the Contractor shall perform the removal and recycling/disposal of additional materials containing mercury not specified herein.

C. All mercury-containing wastes generated during this Contract Work that qualify as Universal Wastes under federal, state, or local regulations, must be recycled (and not disposed of as hazardous wastes) regardless of the quantity of wastes generated.

D. The Contractor shall perform all Work under this Section without damaging or contaminating adjacent areas to where the Work is being performed. Where such areas are damaged or contaminated, as determined by DEP, the Contractor shall restore the areas to their original condition at no additional cost to the City.

E. The following index of this Section is presented for convenience:

Article	Title	Section Page

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s), or allowance(s) as set forth in Section 01 27 00 – Measurements and Payment.

1.03 RELATED SECTIONS

A. Section 01 35 27 – Environmental Health and Safety Requirements

B. Section 01 35 45 – Hazardous Materials Control

1.04 REFERENCES

A. Definitions

1. Certified Industrial Hygienist (CIH): Refers to an individual employed by the Contractor or its Subcontractors who is currently certified by the American Board of Industrial Hygiene (ABIH).

2. Competent Person: Defined by OSHA as one who is capable of identifying existing and predictable hazards in the surroundings or working conditions, and who has authorization to take prompt corrective measures to eliminate them. Duties of the Competent Person include the following: (a) determining prior to the performance of the Work, what contaminants are present in the workplace; (b) establishing work areas and assuring that access to and from those areas is limited to authorized personnel; (c) assuring the adequacy of any employee exposure monitoring required by OSHA; (d) assuring that all employees exposed to airborne contaminant levels above Action Levels, Permissible Exposure Limits (PELs), or Recommended Exposure Limits (RELs) wear appropriate Personal Protective Equipment (PPE), respiratory protection, and are trained in the use of appropriate methods of exposure control for all of the contaminants present; (e) assuring that proper hygiene facilities are provided and that workers are trained to use those facilities; (f) assuring that engineering controls specific to the contaminants present are implemented, maintained in proper operating condition, and functioning properly

3. DOT Hazardous Materials Transportation Training: Training that meets the criteria outlined in 49 CFR 172.704. This training shall include discussions from 49 CFR 171 of the following: (a) hazardous materials tables within 49 CFR 172; (b) material packaging and labeling within 49 CFR 178; (c) shipping papers and placards within 49 CFR 173; (d) material loading and segregation within 49 CFR 173.

4. Hazardous Waste Operations (HAZWOPER) Training: Training that meets the criteria outlined in the OSHA Hazardous Waste Operations and Emergency Response Standard (29 CFR 1910.120). Certain types of Work may require 24 or 40-hour HAZWOPER Training. All decisions regarding the specific HAZWOPER Training that will be required for each work task shall be made by the Engineer.

5. High-Efficiency Particulate Air (HEPA) Filter: A filter designed to remove 99.97% of all particles greater than 0.3 micrometers (μm) in diameter. HEPA vacuum equipment used by the Contractor shall meet the Standard for Safety High-Efficiency, Particulate, Air Filter Units (UL 586) developed by Underwriters Laboratories.

6. Mercury-Containing Equipment and Material: Material or equipment/device that contains a detectable amount of elemental mercury, inorganic mercury compounds, or organic mercury compounds. Mercury-Containing Materials may include, but are limited to, the following: batteries, light bulbs, thermometers, thermostats, barometers, manometers, temperature gauges, pressure gauges, and switches.

7. Mercury Awareness Training: Training for individuals that have the potential to be exposed to mercury-containing materials/equipment or mercury wastes. This training shall include discussions of the following: (a) sources of mercury; (b) current federal, state, and local regulations pertaining to mercury; (c) the health effects of mercury exposure; (d) state-of-the-art work practices, engineering controls, and procedures for removal, materials handling, waste management, housekeeping, and spills that involve mercury; (e) the use and maintenance of PPE and the use and maintenance of respirators in accordance with 29 CFR 1910.134; (f) requirements regarding warning signs, labeling, and Safety Data Sheets (SDSs) in accordance with 29 CFR 1910.1200; (g) responsibilities of the Competent Person.

8. Mercury Waste: Non-specific liquid or solid waste generated during the disturbance, removal, construction/demolition, handling, and cleanup of Mercury-Containing Equipment and Material.

9. P-100 Filter: (See definition of: "High-Efficiency Particulate Air (HEPA) Filter").

10. Physical Boundary: A physical barrier designated with ropes, red "do not enter tape," or a partition that surrounds a work area in order to limit the entry of unauthorized personnel.

11. Recommended Exposure Limit (REL): An exposure limit recommended by the NIOSH that can be expressed as a Time-Weighted Average (TWA), Ceiling Limit, or Short-Term Exposure Limit (STEL). Once an REL is met or exceeded for a particular contaminant, the Contractor is responsible for ensuring that workers receive appropriate exposure monitoring, PPE, including respiratory protection, hygiene facilities, medical surveillance, and training. The following REL is pertinent to removal, demolition, and disposal activities associated with Mercury-Containing Equipment and Materials and Mercury Wastes: (a) mercury – 0.05 mg/m^3 as a TWA for up to a ten (10) hour workday and a 40-hour work week, and a ceiling limit of 0.1 mg/m^3, as per DEP EHS Policies and Procedures - Vol. III, Mercury Management.

12. Resource Conservation and Recovery Act (RCRA) Training: Training that meets the criteria outlined in 40 CFR 265.16. This training shall include site-specific discussions of the following: (a) hazardous waste identification; (b) waste storage container use and labeling; (c) waste storage area management; (d) personal health and safety, including fire safety; (e) manifesting and the off-site transportation of wastes; (f) procedures for using, inspecting, repairing, and replacing emergency equipment and monitoring equipment; (g) procedures for communicating with other employees and outside emergency response personnel; (h) responses to fires or explosions; (i) responses to leaks, spills, and potential groundwater contamination incidents; (j) the shutdown of operations.

13. Time Weighted Average (TWA): The average time over a given work period (e.g., an eight (8) hour workday) of a person's exposure to a chemical or agent. The average is determined by sampling for the chemical or agent throughout the time period.

14. Universal Waste: Any Mercury-Containing Material and Equipment that meets the criteria outlined in the Standards for Universal Waste Management (40 CFR 273), the Standards for Universal Wastes (6 NYCRR 374-3), or the Mercury-Added Consumer Products Law (Chapter 145, Laws of New York, 2004). Per 40 CFR 273.4(b)(3), if the mercury is removed from Mercury-Containing Equipment/Material, the material can no longer be considered a Universal Waste and must be managed as a hazardous waste, or a determination must be made to characterize the material as non-hazardous.

B. Reference Standards

1. The Contractor shall comply with all applicable regulations, standards, and guidelines of federal, state, and local environmental and occupational safety and health agencies regarding Mercury-Containing Equipment and Material, and Mercury Wastes. These regulations, standards, and guidelines include, but are not limited to the following:

   a. United States (U.S.) Department of Transportation (DOT):

      1) 49 CFR 171 – General Information, Regulations, and Definitions;

      2) 49 CFR 172 – Hazardous Materials Table, Special Provisions, Hazardous Materials Communications, Emergency Response Information, and Training Requirements;

      3) 49 CFR 173 – Shippers: General Requirements for Shipments and Packaging's;

      4) 49 CFR 178 – Specifications for Packaging's.

   b. U.S. Environmental Protection Agency (EPA):

      1) 40 CFR 273 – Standards for Universal Waste Management;

2) 40 CFR 302 – Designation, Reportable Quantities, and Notification.

c. New York City Department of Environmental Protection (DEP):

1) Environmental Health and Safety Policies and Procedures – Vol. II, Spill Prevention, Environmental Release Reporting and Investigation;

2) Environmental Health and Safety Policies and Procedures – Vol. III, Mercury Management;

3) Environmental Health and Safety Policies and Procedures – Vol. IV, Hazardous Waste Management;

4) Environmental Health and Safety Policies and Procedures – Vol. IV, Universal Waste Management;

5) 15 RCNY Chapter 19 – Discharges of Wastewater and Other Materials to Public Sewers.

d. New York City Department of Buildings (NYCDOB)

1) New York City Building Code.

e. New York State Department of Environmental Conservation (NYSDEC):

1) 6 NYCRR 364 – Waste Transporter Permits;

2) 6 NYCRR 370 – Hazardous Waste Management Regulations;

3) 6 NYCRR 371 – Identification and Listing of Hazardous Waste;

4) 6 NYCRR 372 – Hazardous Waste Manifest System and Related Standards for Generators, Transporters, and Facilities;

5) 6 NYCRR 374 – Management of Specific Hazardous Waste;

6) 6 NYCRR 376 – Land Disposal Restrictions.

f. Chapter 145, Laws of New York, 2004 – Mercury-Added Consumer Products Law.

g. National Institute for Occupational Safety and Health (NIOSH):

1) NIOSH Pocket Guide to Chemical Hazards.

h. Occupational Safety and Health Administration (OSHA):

1) 29 CFR 1910 – Occupational Safety and Health Standards;

2) 29 CFR 1910.28 – Safety Requirements for Scaffolding;

3) 29 CFR 1910.120 – Hazardous Waste Operations and Emergency Response;

4) 29 CFR 1910.1200 – Hazard Communication Standard

5) 29 CFR 1926 – Safety and Health Regulations for Construction.

i. Underwriters Laboratories, Inc. (UL):

1) UL 586 – Standard for Safety High Efficiency, Particulate, Air Filter Units.

1.05 DESCRIPTION

A. Commencement of Work: Five (5) business days prior to the proposed start of Work at each separate location, the Contractor shall notify the Engineer and the onsite safety staff. No Work may proceed at any location until authorized by the Engineer.

B. The Contractor shall coordinate any required equipment shutdowns with the Engineer prior to starting the Work.

C. Access Restrictions: The Contractor shall inform the Engineer of proposed access restrictions (i.e., areas or items of equipment which will not be accessible during the Work) and give them estimated periods (including specific dates) of such proposed access restrictions. The Contractor shall not have exclusive rights to the work site and shall fully cooperate and coordinate this Work with the work of Other Contractors who may be on site.

D. Unexpected Entry into a Work Area: In the event that DEP personnel must enter a work area for emergency reasons, the Contractor shall immediately stop work and cleanup any loose debris, so as to permit the safe entry by DEP personnel. Any disturbance of Mercury-Containing Equipment and Material or Mercury Wastes shall not proceed until all DEP personnel have exited from the work area.

1.06 QUALITY ASSURANCE

A. Compliance: In addition to the detailed requirements of this Section, and DEP EHS Policies and Procedures, the Contractor shall comply with all applicable regulations of federal, state, and local authorities pertaining to the disturbance, removal, construction/demolition, handling, storage, transportation, and recycling/disposal of Mercury-Containing Equipment and Material and Mercury Wastes. All matters regarding the interpretation of any regulations, standards, or policies shall be submitted to the Engineer for resolution before starting the Work. Where the requirements of this Section, DEP EHS Policies and Procedures, or federal, state, or local regulations conflict or vary, the most stringent requirements or regulations shall apply.

1. Rejection of Non-Complying Items: The DEP reserves the right to reject items incorporated into the Work which fail to meet the specified minimum requirements. The DEP also reserves the right to reject Contractor submittal items (e.g., proposed TSDFs, vendors or subcontractors with previous regulatory citations/violations) that are deemed inappropriate or unacceptable by the Engineer or DEP. The DEP further reserves the right, and without prejudice to other recourse, to accept non-complying items subject to an adjustment in the Contract amount, as approved by the DEP.

B. Qualifications:

1. Competent Person:

a. The Contractor and/or Mercury Removal Company shall have on staff and assigned to this Contract a Competent Person, who shall be onsite during all mercury-related work activities, and who has successfully completed:

1) DOT Hazardous Materials Transportation Training;

2) HAZWOPER Training if required;

3) Mercury Awareness Training; and

4) RCRA Training courses as defined in this Section.

a) Each training course shall have been completed within the past year in the form of either an initial course or a refresher course.

b. The Competent Person shall have a minimum of two (2) years' experience with work involving mercury, including at least three (3) projects of comparable scope and methodologies.

2. Mercury Worker: Mercury workers shall have Mercury Awareness Training, completed within the past year.

1.07 SUBMITTALS

A. Thirty (30) business days prior to the Work of this Section or as directed by the Engineer, the Contractor shall submit the following to the Engineer:

1. Mercury Management Plan: . The Mercury management plan, signed and dated by a CIH, shall include the following elements:

1) Mercury Control:

a) Drawings showing the locations and details of each work area and each waste storage;

b) A detailed discussion regarding the interfacing of trades and the sequencing of Mercury-Related Work;

c) A detailed discussion on the implementation of proper precaution when Mercury-Containing Equipment (gauges, switches, flow meters, manometers, thermometers, flow regulators, laboratory equipment, lamps, etc.,) is removed to prevent release of elemental mercury onto or into connected equipment or appurtenances;

d) A detailed discussion regarding the collection, handling procedures, and recycling/disposal of Mercury-Containing Equipment and Material and Mercury Wastes;

e) A detailed discussion regarding "real-time" air monitoring for mercury vapor (e.g., using a Jerome® meter), including Action Levels, to be implemented during the Work, as applicable. Also, indicate how compliance with the Action Levels and the REL (per the DEP EHS Policy and Procedure for Mercury Management) will be determined, and who will be responsible for ensuring that compliance with the Action Levels and REL is maintained. At a minimum, Action Levels shall be established for the following situations: (a) the removal of broken/leaking Mercury-Containing Equipment and Material; (b) the implementation of engineering controls and safe work practices; (c) upgrades/downgrades in levels of PPE; (d) work stoppage or the emergency evacuation of on-site personnel;

f) A detailed discussion regarding housekeeping procedures to be used for maintaining clean work areas;

g) A detailed task analysis for each work activity including, but is not limited to, the following information: (a) the type of work activity; (b) the tools/equipment/supplies that will be used; (c) the types of Mercury-Containing Equipment and Material that may be disturbed, or Mercury Wastes that may be generated when performing the activity; (d) the engineering controls that will be used to control the spread of contamination during the activity; (e) the proposed crew size for the activity and individual employee responsibilities during the activity; (f) housekeeping procedures that will be used during the activity; (g) PPE that will be used for the removal of both intact and broken (leaking) Mercury-Containing Equipment, and the decontamination protocol when handling removal of broken (leaking) Mercury-Containing Equipment;

h) SDSs: Provide SDSs for all chemical products to be used during the Work.

b. Waste Management:

1) The identification of Mercury-Containing Equipment and Material and Mercury Wastes (as defined in 40 CFR 116, 40 CFR 260, 40 CFR 261, 6 NYCRR 370 and 6 NYCRR 371) associated with the Work;

2) The estimated quantity of each waste stream that will be generated and recycled/disposed of as per 40 CFR 302;

3) The name, address, phone number (24-hour), and permit documentation for each recycling facility/TSDF, indicating that the facility is approved by federal (40 CFR 264 and 40 CFR 265), state (6 NYCRR 373), and local regulatory agencies to receive Mercury-Containing Equipment and Material and Mercury Wastes;

4) Current Waste Transporter 6 NYCRR 364 and 40 CFR 263 permit documentation;

5) Spill prevention, containment, and cleanup contingency measures, to be followed during a suspected mercury emissions/bulk material release or emergency situation, in accordance with this Section, including 15 RCNY Chapter 19;

6) A detailed discussion of the on-site handling, storage, removal, and recycling/disposal of waste materials, including but not limited to the following:; (a) the methods of demarcation that will be used to identify the waste storage area; (b) the method of collection and containerization of wastes on a daily basis; (c) the types of containers (d) the posting of weekly regulated waste inspection and inventory records.

c. A detailed schedule for the implementation, start date, and completion date of the Mercury Management Plan elements.

d. The name, qualifications (i.e., experience and training documentation), and resume of the Competent Person.

e. Employee Documentation: The Contractor shall provide a sufficient number of properly trained and experienced workers, each of whom shall: (a) have written proof of training (e.g., certificates) in accordance with the qualification requirements of this Section for Mercury workers.

f. A current (i.e., within the last month) signed and notarized statement disclosing all of the OSHA, EPA, and DOT citations/violations within the past three (3) years.

B. Field Reports and Recordkeeping: During all Work performed under this Section, the Contractor shall maintain and provide the following documentation:

1. Recycled Materials/Waste Documentation: Completed and signed waste manifests from recycling facilities/TSDFs shall be provided to the DEP within ten (10) business days of disposal. In addition, on-site waste storage areas shall be inspected weekly by the Competent Person.

a. Each weekly waste storage area inspection report shall be provided to the DEP within 24-hours of the inspection date. The content of these reports shall include, but is not limited to, the following information: (a) the name of the inspector; (b) descriptions of waste streams; (c) waste container type, quantity, and condition; (d) recycling/disposal time limit (i.e., 365 days or 90 days, respectively; (e) proper label type; (f) secondary containment system; (g) storage area security method to prevent any unauthorized entry.

b. In addition to performing weekly waste storage area inspections, the Competent Person shall maintain an ongoing waste inventory that includes, but is not limited to, the following information: (a) specific dates that each waste container was added/removed from the waste storage area; (b) the full name (printed) and signature of the individual responsible for adding/removing each waste container from the waste storage area.

2. Contractor Project Record: The Contractor Project Record shall be made available to the Engineer or DEP for review at any time during the Work, and shall be submitted to the DEP within 24-hours after the completion of the Work.

a. At a minimum, the Contractor Project Record shall contain the following information: (a) copies of training certificates for all individuals involved with the Work; (b) copies of all Mercury-Containing Equipment and Material inventory reports relating to the Work; (c) copies of all daily worker sign-in sheets as required in this Section; (d) copies of all SDSs pertaining to all chemicals being used during the Work; (e) related Drawings; (f) a copy of the Contractor's Mercury Management Plan; (g) copies of all weekly waste storage area inspection records; (h) and a copy of the waste inventory.

3. Daily Sign-In Sheets: The Contractor shall generate daily sign-in sheets for all individuals entering and exiting each work area for the duration of the Work.

4. HAZCOM Program: The Contractor's HAZCOM program shall be made available to the Engineer or DEP for review at any time during the Work.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. PPE: The Contractor shall provide personnel who have a potential to be exposed to Mercury-Containing Equipment and Material or Mercury Wastes, with appropriate PPE as prescribed by the Contractor's CIH.

B. Waste Containers: Containers for the storage of all recyclable materials and wastes shall be DOT-approved and shall be provided by the Contractor.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Utilities: The temporary use of any on-site utilities shall be subject to the approval of DEP. The Contractor shall furnish all water and hoses, water filtration devices, and heating equipment, as well as any temporary hookups. In addition, all temporary lighting and temporary electrical service to a work area shall be provided by the Contractor, and shall be in weatherproof enclosures and be ground fault protected.

B. Signs: The Contractor shall post conspicuous warning signs at all approaches to work areas and waste storage areas. Signs shall not be removed until all removal and construction/demolition activities have been completed. At a minimum, each sign shall bear the following information in English and the predominant language that is spoken by the Contractor's employees if English is not spoken:

WARNING
MERCURY WORK AREA
POISON
NO SMOKING, EATING OR DRINKING

C. Physical Boundary Delineation: The Contractor shall clearly delineate each work area and waste storage area with a Physical Boundary as defined in this Section.

D. Removal

1. Work Area Containment Measures: To prevent potential contamination, the Contractor shall place 6-mil polyethylene sheeting on the floor beneath

Mercury-Containing Equipment and Material that are being removed. Any containment materials that become contaminated during the Work shall not be reused, and shall be properly containerized and disposed of in accordance with this Section.

3.02 IMPLEMENTATION

A. Not Used

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Cleanup: The Contractor shall maintain all surfaces, including protective coverings (polyethylene sheeting) within each work area, free of accumulations of debris, dusts, and wastes. The Contractor shall perform housekeeping activities, using HEPA-filtered vacuums and wet methods, daily throughout each work shift and at the end of each work shift, to prevent any accumulation of debris, dusts, and wastes in the work areas. Using compressed air to cleanup a work area shall be strictly prohibited.

B. Collection, Separation, and Containerization of Wastes: The Contractor shall collect, separate (by waste stream/waste type), and containerize Mercury Wastes (solid and liquid), debris, PPE, and containment materials on a daily basis.

1. The Contractor shall store all wastes in DOT-approved container systems. All drums/containers shall be sealed and covered immediately after filling, and each drum/container will have a label affixed to it in accordance with this Article. All labels shall remain intact and legible at all times.

2. No water mixed with or contaminated by mercury may be released onto the ground or into any drain or sewer. It should be noted that a discharge of more than 1 lb. of mercury onto the ground or into the water within a 24-hour period, shall be considered a violation of the Clean Water Act and shall be treated as a “reportable quantity” in accordance with 40 CFR 117. Such a release shall be grounds for immediate termination of this Contract and the Contractor shall be liable for any fines, penalties, or remediation costs.

3. Any quantity of Elemental Mercury that is released or spilled must be immediately reported to DEP. Reporting to NYSDEC Spill Hotline is required for a release of one pound (approximately two tablespoons) or more.

C. Storage of Wastes: The Contractor shall ensure that all drummed wastes are stored in a secondary containment system, and that each waste storage area is demarcated with a Physical Boundary. In addition, the Contractor shall post weekly waste inspections and waste inventories in the hazardous waste storage area, including the following emergency information in accordance with DEP’s EHS Policies and

Procedures: (a) the name and telephone number of the facility's Emergency Coordinator; (b) the location of fire extinguishers and fire alarms; (c) the location of spill control materials; (d) the telephone number for the fire department (unless the facility has a direct alarm).

D. Labeling: The Contractor shall affix warning labels to all recycling/waste drums and containers. Labels shall comply with the requirements of federal, state, and local regulations, including EPA and DOT requirements. At a minimum, all labels shall bear the following information in English:

[Generator Name, Address, and Telephone Number]
[Specific Contents of Container]
[Accumulation Start Date]
[Accumulation End Date]

1. If necessary (i.e., if waste is to be disposed of as hazardous waste rather than Universal Waste), also include the following information on the label:

HAZARDOUS WASTE
FEDERAL LAW PROHIBITS IMPROPER DISPOSAL
HANDLE WITH CARE
[EPA-Issued Generator Identification Number]
[EPA Waste Identification Number]

E. Characterization of Wastes: Mercury-Containing Equipment and Material to be removed under the Work of this Section shall be recycled in accordance with the EPA's Standards for Universal Waste Management (40 CFR 273), the NYSDEC's Standards for Universal Wastes (6 NYCRR 374-3), and the NYSDEC's Mercury-Added Consumer Products Law (Chapter 145, Laws of New York, 2004). If a material is not regulated as a Universal Waste, the material shall be considered a hazardous waste, and shall be disposed of in accordance with RCRA requirements.

F. Disposal of Wastes: Hazardous wastes shall be disposed of to ensure that drums/containers do not remain on the job site for more than 90 calendar days from the initial "accumulation start date". Universal Wastes shall not remain on the job site for more than one (1) year from the initial "accumulation start date". Containers that have reached their storage capacity shall not remain on site and transportation arrangements shall be made for their immediate removal.

G. Disposal Documentation: Once all waste profiles have been completed and signed by DEP, the Contractor shall provide DEP with a "Letter of Acceptance" issued by the TSDF indicating that the wastes will be accepted, and a copy of the advance manifest. On the date of disposal, the Contractor shall submit one (1) copy of the completed manifest, that has been signed and dated by the initial transporter in accordance with 6 NYCRR 372 and 40 CFR 262, to the DEP for signature as Generator. All hazardous waste documentation (e.g., waste profiles, manifests and Land Disposal Restrictions (LDRs)) must be signed by a DEP employee as

described in Section 01 35 45- Hazardous Materials Control. Non-hazardous waste documentation may be signed by a DEP-designated alternate.

END OF SECTION

SECTION 03 01 30.71 – REHABILITATION OF CAST-IN-PLACE CONCRETE
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish all labor, materials, equipment and appliances required for the complete execution of concrete rehabilitation to existing structures as indicated on the Contract Drawings, determined by field survey directed by the Engineer and in accordance with the requirements specified herein.

B. Principal items of Work include:

1. The Contractor shall determine by field survey, in conjunction with the Engineer, the extent of concrete to be repaired, stabilized and resurfaced. Areas to be replaced or modified by new work shall not be included. Report of field survey shall be submitted by the Contractor to the Engineer for review and approval prior to starting work.

2. Preparation for repairing, stabilizing and resurfacing exterior and interior cast-in-place concrete floors, walls, ceilings, platforms, steps and the like.

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 01 35 63 – Sustainability Certification Project Requirements.

B. Section 07 90 00 - Joint Protection

1.04 REFERENCES

A. Definitions

1. Environmental Product Declaration - A third-party-verified International Organization for Standardization (ISO) Series 14025 Type III declaration that quantifies environmental information on the life cycle of a product to enable comparisons between products fulfilling the same function.

B. Reference Standards

1. ASTM C33 – Concrete Aggregates.

2. ASTM C881 – Epoxy-Resin Base Bonding System for Concrete.

3. ACI 503.4 – Standard Specification for Repairing Concrete with Epoxy Mortars.

4. ISO 14025 – Environmental labels and declarations - Type III environmental declarations

5. ACI 562-21 – Assessment, Repair, and Rehabilitation of Existing Concrete Structures

1.05 DESCRIPTION

A. Services of Manufacturer’s Representatives

1. The Contractor shall provide the services of a qualified manufacturer's technical representative who shall instruct the Contractor's personnel in the mixing, proper use and application of the epoxy, polyurethane, polymer-modified and cement-based compounds.

2. The manufacturers' representative shall provide written certification that materials have been mixed and applied properly and surfaces to receive these products have been prepared properly, all in conformance with manufacturer's requirements.

3. The onsite time required for the manufacturer's representative to achieve a successful installation shall be at the expense of the Contractor. The manufacturer's representative shall sign in and out at the office of the Resident Engineer and provide written verification of the areas he has approved on each day he is at the project.

1.06 QUALITY ASSURANCE

A. The Contractor shall furnish the name of all subcontractors which he proposes to use for this work including necessary evidence and/or experience records to ascertain their qualifications in the application of epoxy, polyurethane, polymer-modified and cement-based compounds.

B. Approved applicator qualifications shall include:

1. A minimum of five years of experience in applying epoxy, polyurethane and polymer-modified and cement-based compounds similar to those specified in this Section.

2. A letter from the manufacturer of the specified materials, on the manufacturer's letterhead, signed by an officer of the company, stating that the subcontractor/applicator has been trained in the proper techniques for the preparation of the surface, and proper methods for mixing, placing, curing, and caring of the manufacturer's products. This letter shall further state that the subcontractor/applicator is on the manufacturer's approved list of contractors.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. Proposed methods and corresponding area to be repaired.

2. Samples of all materials proposed to be used.

3. Material certifications and technical data sheets on all grouts, mortars, chemical resins, sealers, aggregates and repair products specified.

4. Name, address and detailed qualifications of firm to which the Contractor intends to award the work under this Section.

B. Sustainability Submittals:

1. Environmental Product Declarations

a. The Contractor shall provide product-specific type III Environmental Product Declaration (EPD) conforming to ISO 14025, 14044.

2. Envision Submittals

a. The Contractor shall report information pertaining to the sustainable procurement, regional sourcing, and/or recycled content of new materials to be procured during the Work, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall coordinate with its vendor on sustainable product requirements as stipulated by the Contractor's approved New Materials Sustainable Implementation Plan, in accordance with Section 01 35 63 – Sustainability Certification

Project Requirements. The Contractor shall submit vendor shop drawings for review by the Engineer that clearly illustrate the vendor is meeting the requirements as approved in the Contractor's New Materials Sustainable Implementation Plan.

1.08 DELIVERY, STORAGE, AND HANDLING

A. All materials shall be delivered in original unopened and undamaged cartons or packing bearing the name of manufacturer.

B. Cementitious materials shall be stored in waterproof locations to prevent intrusion of moisture and other damage from the elements. Containers showing evidence of damage will be rejected.

C. Aggregates shall be stored in separate bins to prevent mixing with foreign particles.

D. Any materials that have hardened, partially set, become caked and/or been contaminated or deteriorated shall be rejected.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The epoxy bonding agent resin shall be:

1. Sika Armatec 110 as manufactured by Sika Corp. Lyndhurst, NJ;
2. CR 246 as manufactured by Sto Concrete Restoration Division, Atlanta, GA;
3. Duralbond as manufactured by Tamms Industries Co., Kirkland, IL;
4. Or an approved equal.

B. Anti-corrosion coating material shall be:

1. Sika Armatec 110 as manufactured by Sika Corp., Lyndhurst, NJ;
2. CR 246 manufactured by Sto Concrete Restoration Division, Atlanta, GA;
3. Or an approved equal.

C. Epoxy crack repair binder shall be:

1. Sikadur 35-Hi-Mod LV as manufactured by Sika Corp., Lyndhurst, NJ;

2. CR 633 Epoxy Binder as manufactured by Sto Concrete Restoration Division, Atlanta, GA;
3. Duralcrete LV as manufactured by Tamms Industries, Kirkland, IL;
4. Or an approved equal.

D. Hydrophilic injection grout shall be:
1. Hydro-Active Flex LV as manufactured by De Neef Construction Chemicals, Houston, TX;
2. Prime Flex 900 LV as manufactured by Prime Resins, Conyers, GA;
3. Scotch Seal 5600 Chemical Grout as manufactured by 3M Construction Markets, St. Paul, MN;
4. Or an approved equal.

E. Spall repair mortar for use in horizontal applications not requiring formwork shall be:
1. Sikatop 122 Plus as manufactured by Sika Corp., Lyndhurst, NJ;
2. CR 700 as manufactured by Sto Concrete Restoration Division, Atlanta, GA;
3. Duraltop Fast Set as manufactured by Tamms Industries, Kirkland, IL;
4. Or an approved equal.

F. Spall repair mortar for use in vertical applications not requiring formwork shall be:
1. Sikatop 123 Plus as manufactured by Sika Corp., Lyndhurst, NJ;
2. CR 702 as manufactured by Sto Concrete Restoration Division, Atlanta, GA;
3. Duraltop Gel as manufactured by Tamms Industries, Kirkland, IL;
4. Or an approved equal.

2.02 MATERIALS / EQUIPMENT

A. Water
1. The water used for mixing concrete repair products shall be clear, potable and free of deleterious substances.

B. Aggregate
1. All aggregates shall conform to ASTM C33 and the requirements listed below:
a. Pea Gravel: Pea gravel shall meet the gradation of New York State size #9 and meet all material requirements specified in Section 703 for coarse aggregate as described by the New York State Department of Transportation Standard Specifications and shall be

clean and free from deleterious matter. Pea gravel shall contain no limestone.

C. Epoxy Bonding Agent

1. Epoxy bonding agent shall conform to ASTM C881 Type I, II, IV or V; Grade 2 for epoxy resin adhesives, depending on the application. The class of epoxy bonding agent shall be suitable for all ambient and substrate temperatures.

D. Anti-Corrosion Coating

1. Anti-corrosion coating shall be a two-component, polymer-modified cementitious material.

E. Epoxy Crack Repair Binder

1. Epoxy crack repair binder shall be a two-component, 100 percent solids, high-modulus, low viscosity epoxy adhesive designed for structural repair.

F. Flexible Polyurethane Hydrophilic Injection Grout Crack Repair Material

1. Flexible polyurethane crack repair material shall be a one-component, water-activated polyurethane hydrophilic injection grout capable of 700 percent expansion. Polyurethane grout shall form a tough flexible foam seal that is impenetrable to water.

G. Spall Repairs Mortar Not Requiring Formwork

1. Spall repairs not requiring formwork shall be repaired using a two-component, polymer-modified cementitious mortar and shall have a minimum 28-day compressive strength of 7,000 psi.

H. Sealant

1. Sealant shall be a two-component polyurethane sealant as specified in Section 07 90 00 – Joint Protection. Primers and bond breakers shall conform to the sealant manufacturer's recommendations.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 IMPLEMENTATION

A. General Requirements

1. All exterior Work shall be performed during dry weather and appropriate temperature conditions in accordance with the manufacturer's recommendations. All unfinished work shall be protected during inclement weather with tarpaulins or heavy gage polyethylene sheeting.
2. All Work in spaces within structures shall be performed at temperature and conditions suitable for proper curing in accordance with the manufacturer's recommendations.
3. Concrete rehabilitation Work shall be coordinated and sequenced by the Contractor. Scaling, broken, loose and disintegrating materials shall be removed by use of hand tools or power driven saws, down to solid unyielding material.
4. Scaling, broken, loose and disintegrating materials shall be removed by use of hand tools or power driven saws, down to solid unyielding material.
5. All surfaces shall be thoroughly cleaned of efflorescence, oils, grease and other objectionable material in area to be repaired in accordance with the manufacturer's recommendations.

B. Epoxy Bonding Agent

1. As directed by the Engineer, an epoxy bonding agent shall be used to adhere fresh concrete to existing concrete. Existing concrete surfaces shall be roughened prior to application of bonding agent. Concrete surface shall be clean and sound, free of all foreign particles and laitance. Repair material shall be placed while bonding agent is still tacky. If bonding agent cures prior to placement of repair material, bonding agent shall be reapplied.
2. Repairing concrete with epoxy mortars shall conform to all the requirements of ACI 503.4, and as specified herein.

C. Anti-corrosion Coating

1. Reinforcing steel cut or exposed during alteration and/or repair operations shall be sandblasted, cleaned and coated with an anti-corrosive coating.
2. Coating shall thoroughly cover all exposed parts of the steel and shall be applied according to manufacturer's recommendations.

D. Epoxy Crack repair

1. Cracks 1/4-Inch and Narrower: As directed by the Engineer, all existing structural cracks 1/4-inch or narrower to be repaired shall be pressure injected an epoxy crack repair binder into the prepared crack. Crack surface shall be sealed and injection ports installed per manufacturer's recommendations.
    a. Holes drilled for injection ports shall not cut rebar. If rebar is encountered during drilling, the hole shall be abandoned and relocated, and the abandoned hole shall be patched immediately with non-shrink grout flush with the surface of the existing concrete.

b. Once the surface sealing material has cured, inject crack with epoxy crack repair binder using pressure injection equipment as directed by the manufacturer.

2. Cracks wider than 1/4-Inch: As directed by the Engineer, all existing structural cracks wider than 1/4 inch to be repaired shall be gravity fed an epoxy crack repair binder into the prepared crack.

a. Concrete surface shall be routed to form a minimum 1/4 inch wide by 1/4 inch deep V-notch and the crack cleaned to remove all loose and foreign particles. Crack shall be filled with clean, dry sand and then epoxy crack repair binder poured into V-notch, completely filling crack.

b. As binder penetrates into crack, additional binder shall be applied to the V-notch.

E. Flexible Polyurethane Crack Repair

1. As directed by the Engineer, all existing, leaking cracks 1/4 inch and narrower to be repaired shall be pressure injected with a waterproof hydrophilic injection grout into the prepared crack. Crack surface shall be sealed and injection ports installed per manufacturer's recommendations.

2. Holes drilled for injection ports shall not cut rebar. If rebar is encountered during drilling, the hole shall be abandoned and relocated, and the abandoned hole shall be patched immediately with non-shrink grout flush with the surface of the existing concrete.

3. Once the surface sealing material has cured, inject crack with waterproof hydrophilic injection grout using pressure injection equipment as directed by the manufacturer.

F. Spall Repair

1. As directed by the Engineer, all voids or spalled areas to be repaired shall be chipped back a minimum of 1/8-inch to sound concrete and the area cleaned and repaired to original dimensions with spall repair patching material according to manufacturer's recommendations.

2. All patching shall provide a final finished surface which is flat, level and even with the existing concrete surface. Repair mortar shall not be feathered to meet existing concrete surface.

3. Final patching on horizontal surfaces shall receive a finish consistent with the finish on the existing structure.

G. Curing

1. All repair materials utilized shall be cured in strict accordance with manufacturer recommendations.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Pumps and hoses used for crack repair shall be completely flushed. A sharp sided tool such as a putty knife or trowel shall be used to remove excess material from walls, floors, etc. Material shall be cured before removing.

B. The uncured polyurethane chemical grout shall be cleaned from tools with an approved solvent. The cured polyurethane chemical grout can only be removed mechanically.

C. The uncured polymer-modified Portland cement mortar shall be cleaned from tools with water. The cured polymer-modified Portland cement mortar can only be removed mechanically.

D. Excess materials caused by work under this Section shall be cleaned from existing surfaces by the use of power sanders and the surfaces shall be vacuumed clean and readied to receive final cleaning and finishing specified in other Sections. All cracks shall be sanded and shall lie in the same plane as adjacent surfaces.

E. Misplaced sealants shall be removed using methods and materials recommended by the manufacturers, and the finished work and work area shall be left in a neat and clean condition.

END OF SECTION

SECTION 03 10 00 - CONCRETE FORMING AND ACCESSORIES
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Work specified in this Section consists of designing, furnishing materials for, fabricating, erecting, and removing formwork, falsework and shoring for cast-in-place concrete as indicated on the Contract Drawings, specified herein and needed for a complete installation.

B. The following index of this Section is presented for convenience:

6. ISO 14025 – Environmental labels and declarations - Type III environmental declarations
7. New York City Building Code
8. Western Wood Products Association (WWPA): Western Lumber Product Use Manual

1.05 DESCRIPTION

1. Formwork materials shall be protected before, during and after erection to insure acceptable finished concrete Work. In-place materials and other operations of work in connection with concrete pours shall be protected.
2. In the event of damage to erected forms, necessary repairs or replacements prior to concrete pours shall be performed at no expense to the City.
3. The Contractor shall allow sufficient time, as determined by the Engineer from the approved schedule, between erection of forms and placing of concrete for the various trades to properly install their Work.
4. External or superimposed loads, lateral or vertical, shall not be applied on casting concrete until concrete has developed specified 28-day compressive strength and reached the minimum curing age required by Section 03 30 10- Low Carbon Cast-in-Place Concrete.
5. Stay-in-place forms are not permitted unless otherwise shown on the Contract Drawings or approved by the Engineer.

B. Design of Formwork:

1. Formwork shall be designed and constructed in compliance with ACI SP-4.

2. The Contractor shall assume responsibility for the design, engineering and construction of formwork. Forms shall be designed to produce concrete members identical in shape, lines and dimensions to members shown on the Contract Drawings.

3. The formwork shall be designed for the loads and lateral pressures in accordance with ACI 347 and wind loads as specified by the New York City Building Code.

4. Construction and control joints, openings, offsets, keyways, recesses, moldings, chamfers, blocking, screeds, bulkheads, waterstops, anchorages, inserts, and other features shall be provided as required.

5. Formwork shall be designed to be readily removable without impact, shock, or damage to 'green' concrete surfaces and adjacent materials.

6. The maximum deflection of facing materials reflected in concrete surfaces exposed to view shall be 1/240 of the span between structural members. The formwork shall be cambered to compensate for anticipated deflections in the formwork due to the weight and pressure of the fresh concrete and due to construction loads.

7. Formwork surface materials shall meet the requirements of Section 03 35 00 - Concrete Finishing.

1.06 QUALITY ASSURANCE

A. Unless otherwise noted on the Contract Drawings, formwork shall be constructed so that the concrete surfaces will conform to the tolerance limits as given in ACI 117.

B. Shop Drawings approvals shall be obtained before custom fabrication is started and before delivery of materials to the Site.

C. Work of this Section shall be coordinated with the work of other trades so that construction is not delayed.

D. Formwork erection procedures and health and safety of the work force shall be the responsibility of the Contractor. The requirements of authorities having jurisdiction shall be complied with.

E. Errors of detailing and fabrication and the correct fit of the formwork shall be the responsibility of the Contractor.

F. Materials, fabrications and workmanship found defective shall be promptly removed and replaced and new acceptable work shall be provided in accordance with Contract requirements at no additional expense to the City.

G. Design of formwork layout, spans, fastenings, joints, and framed openings shall be under the direct supervision of a Professional Engineer, who is licensed and registered in the State of New York with minimum of 10 years of experience in structural design of formwork.

1.07 SUBMITTALS

A. Shop Drawings submitted for approval of the Engineer shall include, but not be limited to, the following data:

1. Design of all field-constructed and prefabricated formwork. The Contractor shall submit drawings and calculations signed and sealed by a professional engineer licensed in the State of New York for form designs and re-shoring.

2. For each type of form required, material type, material thickness, finish, and a dimensional cross-sectional profile.

3. Details of erection, including various connections, layouts of form units placement directions, anchoring and support details, attachment of accessories, each condition requiring enclosures, cut opening, special jointing, and other accessories as required to complete the work.

B. Manufacturer's specifications and installation instructions for each type of required formwork and accessory shall be submitted. These include each type of sheeting, chamfer strips, form facing materials, form ties, form liners, rustication strips, form release agent, dovetail anchor slots, form coating material, form caulking, and similar items.

C. Plan for Reshoring: When reshoring is permitted or required, the operations shall be planned in advance and in accordance with acceptable procedures and the requirements of this Section.

1. The Contractor shall submit as a part of the shop drawings a Plan for Reshoring prepared and sealed by a New York State registered professional engineer.

D. Sustainability Submittals:

1. Environmental Product Declarations

a. The Contractor shall provide product-specific type III Environmental Product Declaration (EPD) conforming to ISO 14025, 14044.

2. Envision Submittals

a. The Contractor shall report information pertaining to the sustainable procurement, regional sourcing, and/or recycled content of new materials to be procured during the Work, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall coordinate with its vendor on sustainable product requirements as stipulated by the Contractor’s approved New Materials Sustainable Implementation Plan, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall submit vendor shop drawings for review by the Engineer that clearly illustrate the vendor

is meeting the requirements as approved in the Contractor's New Materials Sustainable Implementation Plan.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Materials shall be delivered to the site in an undamaged condition and at such intervals as will avoid delay in the work.

B. Material shall be stored and protected in a clean, properly drained location. Material shall be kept off the ground under a weather-tight covering permitting good air circulation. Formwork materials shall be stored on dry wood sleepers, pallets, platforms or other appropriate supports which have slope for positive drainage. Materials shall be protected from distortion, excessive stresses, corrosion and other damage. Materials shall not be stored on the structure in a manner that might cause distortion or damage to the supporting structure. The maximum uniform distributed storage load shall not exceed 20 pounds per square foot.

C. Material shall be handled safely in a manner that will prevent distortion or other damage. Care shall be exercised at all times to avoid damage through careless handling during unloading, storing and erecting. Panels shall be supported by using strong backs while lifting panels in a horizontal position.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. A-2 Cone Snap-in Form Tie shall be as manufactured by:

1. Dayton Superior.
2. Williams Form Engineering Corp.
3. Symons Corp.
4. Or approved equal.

B. Form caulking shall be as manufactured by:

1. Series 1200 Construction Caulking; GE Silicones/Momentive Performance Materials, Inc., Waterford, NY.
2. Dow Corning 999-A; Dow Corning Co., Auburn, MI.

3. Or approved equal.

C. Form release agent shall be as manufactured by:

1. Specco F-100; Specco Industries, Inc., Lemont, IL.
2. Debond Form Coating; L&M Construction Chemicals, Inc., Omaha, NE.
3. Magic Kote; Symons Corporation, Des Plaines, IL.
4. Or approved equal.

D. Form film shall be as manufactured by:

1. Symons Corporation, Des Plaines, IL.
2. Or approved equal.

E. Rustications shall be as manufactured by:

1. Symons Corporation, Des Plaines, IL.
2. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Lumber

1. Only stress-grade lumber shall be provided. Form framing, sheathing and shoring shall conform to WWPA Western Lumber Product Use Manual.
2. For lumber in contact with concrete, the lumber shall be provided with dressed or tongue-and groove edges on at least the side contacting the concrete, unless otherwise indicated on the Contract Drawings.

B. Plywood

1. Only grade-marked plywood conforming to APA shall be provided.
2. B-B Plyform, Exterior Class 1 or 2, or High Density Overlay (HDO) form plywood, Class 1 or 2 conforming to U.S. Product Standard PS-1 shall be provided.
3. Thickness shall be as required to maintain alignment and surface smoothness, but not less than 5/8 inch thick.

C. Steel Forms

1. Commercial grade sheets not less than 16 gage shall be provided.
2. Steel forms in rust-free condition shall be maintained by use of steel wool and light grinding, followed by coats of the specified release agent.
3. Stock material that is free from warps, bends, kinks, cracks, and rust or other matter that could stain the concrete shall be provided.
4. Panels shall be fabricated in conformance with the approved submittals.

5. Outward facing surfaces shall be reinforced as required to prevent warpage and deformation during concrete placement.

D. Form Ties

1. Commercially manufactured type form ties, hangers, and clamps of such type that, after removal of the forms, metal will not be closer than concrete cover as indicated on the Contract Drawings from concrete surface shall be provided. Non-fabricated wire ties will not be permitted.

2. A cone-shaped, snap-in type form tie suitable for the intended use with a working load as required and an integral hot forged head shall be provided.

3. Ties with swaged washers or other suitable devices to prevent seepage of fluid along the ties shall be provided. Ties shall be left in place. She-bolt with water seals shall be provided.

4. Form ties for all liquid-retaining structures shall have waterstop at mid-thickness of wall.

5. Lugs, cones, washers, or other devices which do not leave holes or depressions greater than 1-inch in diameter shall be provided.

E. Chamfer Strips

1. 3/4 inch by 3/4 inch triangular fillets shall be provided, all of which shall be milled from clear, straight-grain pine, surfaced each side, or all of which shall be extruded vinyl type with or without nailing flange unless otherwise indicated on the Contract Drawings.

F. Dovetail Anchor Slots

1. Dovetail anchor slots manufactured from 22 gage, electro-galvanized steel with removable felt or polyurethane filler shall be provided, where indicated on the Contract Drawings.

G. Shop Fabricated Form

1. Forms shall be fabricated in accordance with the approved submittals.

2. Forms shall be maintained clean, smooth, and free from imperfections and warpage.

3. Locate joints as indicated on the approved Shop Drawings.

   a. Form panels shall be arranged in symmetrical patterns conforming to the general lines of the structure.

   b. Except when otherwise indicated on the Contract Drawings, panels on vertical surface shall be oriented with the long dimension horizontal joints level and continuous.

c. Form panels on each side of the panel joint shall be precisely aligned by means of fasteners common to both panels, to result in a continuous, unbroken concrete surface.

d. Largest stock size practicable shall be provided.

e. Between form joints, areas less than the stock size of the form liner material shall be lined with a single piece of liner material.

H. Form Caulking

1. Form caulking shall be a one-component, gun-grade silicone sealant that is capable of producing flush, watertight and non-absorbent surfaces and joints. Sealant shall be compatible with the type of forming material and concrete ingredients used.

I. Form Release Agent

1. Form release agent shall be a VOC compliant commercial formulation form-coating compound that will not bind with, stain, nor adversely affect concrete surfaces, and will not impair subsequent treatment of concrete surfaces requiring bond or adhesion, nor impede wetting of surfaces to be cured with water or curing compounds. Form release agent shall be a nonreactive type as approved by ANSI/NSF standard 61.

J. Form Film

1. Form film shall conform to the requirements of form release agent above.

a. Thinner shall be provided as recommended by manufacturer of the form film.

K. Rustications

1. Rustications shall be provided as specified herein and/or shown on the Contract Drawings.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Field Measurements

1. Prior to commencement of the Work, existing dimensions, elevations, locations and conditions applicable to the Work shall be field verified.

Variances and discrepancies from the Contract Drawings and potential interferences shall be reported promptly to the Engineer.

2. Sufficient field measurements shall be taken prior to preparation of Shop Drawings and fabrication of construction materials, where possible, to ensure proper fitting of the work. However, job progress shall not be delayed. The Contractor shall allow for adjustments and fittings wherever the taking of field measurements before fabrication may not be possible or might delay the work.

3. Actual field-verified conditions may require modifications to the fabrication and/or erection details as indicated on the Contract Drawings. The Work shall be performed to meet actual field conditions encountered.

B. Preparation

1. The Contractor shall examine the areas and conditions under which the Work of this Section is to be performed. Conditions detrimental to the proper and timely completion of the Work shall be corrected. Work shall not proceed until unsatisfactory conditions have been corrected. Prior to placement of concrete, forms shall be inspected for cleanliness and accuracy of alignment.

2. Where different levels are indicated for wall footings, the footings shall be stepped. Unless otherwise indicated on the Contract Drawings, steps in wall footings shall not be of greater height than the thickness of the footings and steps shall not lap less than 6 inches. No form shall be set at the back of such steps and where earth has slumped off in such locations it shall be cut back to a vertical plane just before the concrete is placed.

3.02 IMPLEMENTATION

A. Erection and Installation

1. Forms shall be constructed in accordance with ACI 347 to required dimensions, plumb, straight and mortar tight, and all joints and seams shall be made mortar-tight. Forms shall be substantial, properly braced, and tied together to maintain position and shape and to resist all pressures to which they may be subject. Unless otherwise noted on the Contract Drawings, formwork shall be constructed so that the concrete surfaces will conform to the tolerance limits in ACI 117.

2. The size and spacing of studs and wales shall be determined by the nature of the work and the height to which concrete is placed. Forms shall be made adequate to produce true, smooth surfaces.

3. Forms shall be supplied for repeated use in sufficient number to ensure the required rate of progress. Forms shall be cleaned and inspected

immediately prior to depositing concrete. Deformed, broken or defective forms shall be removed from the work.

4. Joints shall be snug and tight and shall occur only at the designated locations. Construction and control joints other than those shown on the Contract Drawings shall be approved by the Engineer. Horizontal joints shall be level, and vertical joints shall be plumb. Joints shall be made perpendicular to the main reinforcement except where otherwise indicated on the Contract Drawings.

5. Temporary openings shall be provided where interior area of formwork is inaccessible for cleanout or inspection before concrete placement, and for placement of concrete. Temporary openings shall be securely braced and set tightly to forms to prevent the loss of concrete mortar. Temporary openings shall be located on forms in locations as inconspicuous as possible consistent with the requirements of the work.

6. Openings shall be provided in concrete formwork of the correct size and in the proper location to accommodate other operations of construction work in the project. Expansion joint material, waterstops, and other embedded items to be built into forms shall be accurately placed and securely supported against displacement. Voids in sleeves, inserts, and anchor slots shall be filled temporarily with readily removable material to prevent the entry of concrete into the voids.

7. Edge forms or bulkheads and intermediate screed strips for slabs shall be set to obtain required elevations and contours in the finished slab surface.

8. Forms shall be set sufficiently to prevent joints in wood forms from opening prior to concrete pour.

9. Cutting form ties back from the face of the concrete shall not be permitted.

10. Formwork shall be observed continuously while concrete is being placed to see there are no deviations from desired elevation, alignment, plumbness and camber. If, during casting, weakness develops and the formwork shows settlement, deflection or distortion, the Work shall be stopped, improperly cast concrete shall be removed and the formwork shall be reconstructed to perform properly.

    a. Forms for columns, beams, girders, walls and window openings shall be erected in accordance with ACI 117, with a maximum camber of 3/4-inch in 20 feet. Column sides shall be clamped with metal column clamps, or equal, spaced according to manufacturer's recommendation. Exposed external angles of columns, beams, girders and walls, except where specially shown on the Contract Drawings shall be provided with 3/4-inch bevel

strips securely nailed on all concrete formwork including concrete encasement of structural steel shapes.

11. Form release agents shall be applied in accordance with manufacturer's instructions and as specified herein:

    a. Form contact surfaces shall be coated with form release agent compound before reinforcement is placed. Excess form release agent material shall not be allowed to accumulate in the forms or to come into contact with surfaces which are required to be bonded to fresh concrete such as concrete reinforcement and embedded items.

    b. Steel forms shall be coated with non-staining, rust-preventive form oil or otherwise shall be protected against rusting. Rust-stained steel surfaces in contact with concrete shall not be used.

12. Excess form coating material shall not be allowed to accumulate in the forms.

13. Form coatings shall not be allowed to come in contact with construction joints or reinforcing steel.

14. Runways for moving equipment shall be provided with struts or legs and supported directly on the formwork or structural member without resting on the reinforcing steel.

15. Wood forms shall be constructed for wall openings to facilitate loosening and to counteract swelling of the forms.

16. All sleeves, inserts, anchors, and embedded items required for adjoining work or for support of joining work shall be placed prior to concreting.

B. Reshoring

1. During reshoring the concrete in beams, slabs, columns, or any other structural members shall not be loaded with combined dead and construction loads in excess of the loads permitted by the Engineer for the developed concrete compressive strength at the time of reshoring.

2. Reshores shall be placed after stripping operations are complete but in no case later than the end of the working day on which stripping occurs.

3. Reshoring for the purpose of early form removal shall be performed so that at no time will large areas of new construction be required to support their own weight. While reshoring is under way, no live loads shall be permitted on the new construction. Reshores shall be tightened to carry their required loads but they shall not be overtightened so that the new construction is overstressed. Reshores shall remain in place until the

concrete has reached its specified 28-day strength, unless otherwise noted on the Contract Drawings.

4. For floors supporting shores under newly placed concrete, the original supporting shores or reshores shall be left in place. The shoring or reshoring system shall have a capacity sufficient to resist the anticipated loads and in all cases shall have a capacity equal to at least one-half of the capacity of the shoring system above. Reshores shall be located directly under the floors supporting shores unless other locations are permitted or shown on the Contract Drawings.

5. In multi-story buildings reshoring shall be extended over a sufficient number of stories to distribute the weight of newly placed concrete, forms, and construction live loads so the design superimposed loads of the floors supporting shores are not exceeded.

C. Removal of Forms and Ties

1. Forms shall be removed in accordance with ACI 347 recommendations without damage to concrete and in a manner to ensure complete safety to the structure. Forms, form ties and bracing shall not be removed without specific permission of the Contractor's Registered Professional Engineer.

2. Top forms on sloping surfaces of concrete shall be removed as soon as removal operations will not allow the concrete to sag. Any needed repairs or treatment required on sloping surfaces shall be performed at once and shall be followed immediately with the specified curing.

3. Upon removal of forms, the Engineer shall be notified in order that a review of the newly stripped surfaces may be made before patching.

4. Wood forms for wall openings shall be loosened without causing damage to the concrete. The face of concrete shall not be pried against. Only wooden wedges shall be used.

5. Whenever the formwork is removed during the curing period, the exposed concrete shall be cured in accordance with one of the methods specified in Section 03 30 10 – Low Carbon Cast-in-Place Concrete.

6. In general, forms shall not be removed until the concrete has hardened sufficiently to safely support its own load, plus any superimposed load that might be placed thereon. As a minimum the forms shall be left in place for length of time specified below. These times represent cumulative days, not necessarily consecutive, during which the air surrounding the concrete is above 50 degrees F.

	Min Time (days)	Min Strength (psi)
1. Curbs and Walks	2	1500
2. Columns	2	2000
3. Side forms for girders and beams	2	2000
4. Walls	2	2000
5. Bottom forms of slabs:		
a. Under 20 feet clear span	7	3000
b. Over 20 feet clear span	10	3500
6. Bottom forms of beams and girders:		
a. Under 10 feet clear span	7	3000
b. 10 to 20 feet clear span	14	3500
c. Over 20 feet clear span	21	4000

a. These times shall be increased if the concrete temperature following placement is permitted to drop below 50 degrees F.

7. Care shall be taken in removing forms, wales, shorings, supports and form ties to avoid spalling or marring the concrete. Rubbed finish, if required, and such patching as may be necessary shall be started immediately after removal.

D. Re-Use of Forms

1. Forms for re-use shall meet requirements for new forms with respect to effect on cast-in-place concrete appearance and structural stability.

2. Re-use of forms shall in no way delay or change the concrete placement schedule as compared to the schedule obtainable if all forms were new (in the case of wood forms) of if the total required forms were available (in the case of metal forms).

3. Formwork shall be cleaned and re-oiled prior to re-use. Plywood forms shall not be re-used if unused holes from form ties exist from a previous use. High density overlay plywood panels shall be thoroughly cleaned and lightly recoated before each additional use. Wood forms shall not be used more than three times.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Protection

1. During installation, the forms shall not be used as a storage platform nor as a working platform until the forms have been permanently fastened in position.

2. The surface of installed forms shall not be overloaded.

END OF SECTION

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish and install all reinforcing steel as indicated on the Contract Drawings including all labor, materials, hardware, equipment, transportation, and services required for fabricating, cutting, bending, fastening and any special work and supplies necessary to hold the reinforcing steel in place and protect it from injury and corrosion in accordance with the requirements of this Section and needed for a complete installation as approved by the Engineer.

1.05 DESCRIPTION

A. Placing drawings showing all dimensions necessary for fabrication and placing of the reinforcing steel and accessories without reference to the project drawings shall be submitted for approval. Approval shall be obtained from the Engineer before fabrication.

B. Details of concrete reinforcement not covered in the Contract shall be in accordance with ACI 315, ACI 318, ACI 350 and CRSI DA4.

C. When it is found necessary to move reinforcement beyond the specified placing tolerances to avoid interference with other reinforcement, conduits, or embedded items, a submittal showing the resulting arrangement of reinforcement shall be submitted to the Engineer for approval.

D. All reinforcement, at the time concrete is placed, shall be free of mud, oil or other materials that may adversely affect or reduce the bond. Reinforcement with rust, mill scale or a combination of both shall be considered satisfactory provided the minimum dimensions, weight and height of deformation of a hand-wire-brushed test specimen are not less than the applicable ASTM specification requirement.

E. All splices shall be as indicated on the Contract Documents unless otherwise permitted by the Engineer. Mechanical connections that provide a minimum of 125 percent of the yield strength of the reinforcing bars may be used when permitted by the Engineer.

F. Temperature Reinforcing

1. Unless otherwise shown on the Contract Drawings or in the absence of the concrete temperature reinforcing being shown:

a. The minimum cross sectional area of horizontal and vertical concrete temperature reinforcing in walls shall be 0.0033 times the gross concrete area.

b. The minimum cross sectional area of temperature reinforcing perpendicular to the principal reinforcing in slabs shall be 0.0020 times the gross concrete area.

2. Temperature reinforcing shall not be spaced further apart than five times the slab or wall thickness, nor more than 18 inches.

1.06 QUALITY ASSURANCE

All reinforcement shall be supported and fastened before concrete is placed and shall be secured against displacement within the tolerances permitted in this Section.

1.07 SUBMITTALS

A. The Contractor shall submit placing drawings, Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not limited to:

1. Detailed placement and shop fabrication drawings, prepared in accordance with ACI 315 and ACI SP66 shall be furnished for all concrete reinforcing. These drawings shall be made to such a scale as to clearly show joint locations, openings, and the arrangement, layout, bending, assembly diagrams, bar schedules, spacing, lapping and splicing of the bars.

2. Certified copies of mill reports shall accompany all deliveries of reinforcing steel.

3. Description of the reinforcing steel manufacturer's marking pattern.

4. Description of proposed supports for each type of reinforcing.

B. The Contractor shall also include the following:

1. Requests to relocate any bars that cause interferences or that cause placing tolerances to be violated.

2. Request to use splices not shown on the Contract Drawings.

3. Request to use mechanical couplers along with manufacturer's literature on mechanical couplers with instructions for installation, and certified test reports on the couplers' capacity.

4. Request and procedure to field bend or straighten partially embedded reinforcing.

C. Sustainability Submittals:

1. Environmental Product Declarations

a. The Contractor shall provide product-specific type III Environmental Product Declaration (EPD) conforming to ISO 14025, 14044.

2. Envision Submittals

a. The Contractor shall report information pertaining to the sustainable procurement, regional sourcing, and/or recycled content of new materials to be procured during the Work, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall coordinate with its vendor on sustainable product requirements as stipulated by the Contractor’s approved New Materials Sustainable Implementation Plan, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall submit vendor shop drawings for review by the Engineer that clearly

illustrate the vendor is meeting the requirements as approved in the Contractor's New Materials Sustainable Implementation Plan.

1.08 DELIVERY, STORAGE, AND HANDLING

A. All reinforcing shall be neatly bundled and tagged for placement when delivered to the job site. Bundles shall be properly identified for coordination with mill test reports.

B. Reinforcing steel shall be stored above ground on platforms or other supports and shall be protected from the weather at all times by suitable covering. It shall be stored in an orderly manner and plainly marked to facilitate identification.

C. Reinforcing steel shall at all times be protected from conditions conducive to corrosion until concrete is placed around it.

D. The surfaces of all reinforcing steel and other metalwork to be in contact with concrete shall be thoroughly cleaned of all dirt, grease, loose scale and rust, grout, mortar and other foreign substances immediately before the concrete is placed. Where there is delay in depositing concrete, reinforcing shall be re-inspected and if necessary re-cleaned.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Dowel Adhesive System

1. The adhesive system shall be:

a. HIT HY-150 Injection Adhesive Anchor System as manufactured by Hilti, Inc., Plano, TX.

b. Epcon System as manufactured by ITW Ramset/Redhead, Glendale Heights, IL.

c. Sikadur Injection Gel as manufactured by Sika Corp., Lyndhurst, NY.

d. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Reinforcement

1. Reinforcing Steel:

a. All reinforcing steel shall be deformed except spirals and welded wire fabric, which may be plain bars. Reinforcement shall be the grades required by the Contract Documents and shall conform to one of the following specifications:

1) ASTM A615 - Deformed and Plain Billet-Steel Bars for Concrete Reinforcement.

2) ASTM A616 - Rail-Steel Deformed and Plain Bars for Concrete Reinforcement (including supplementary requirements S1).

3) ASTM A617 - Axle-Steel Deformed and Plain Bars for Concrete Reinforcement.

4) ASTM A706 - Low-Alloy Steel Deformed Bars for Concrete Reinforcement.

5) Wire or wire fabric with a specified yield strength fy exceeding 60,000 psi shall have the stress fy corresponding to a strain of 0.35 percent.

6) Reinforcing steel shall conform to the applicable requirements of Sections 03 30 00 – Cast-in-Place Concrete and the New York City Building Code.

2. Wire:

a. Wire shall be smooth or deformed wire as indicated in the Contract Documents.

1) Smooth wire shall conform to ASTM A82.

2) Deformed wire shall conform to ASTM A496, size D4 and larger.

3. Welded Wire Fabric:

a. Welded wire fabric shall be fabricated from smooth or deformed wire and shall conform to the wire size and wire spacing required or indicated on the Contract Documents. Welded wire fabric shall conform to one of the following specifications:

1) Plain wire fabric ASTM 1064, except welded intersections shall be spaced not farther apart than 12 inches in the direction of the principal reinforcement.

2) Deformed wire fabric ASTM A497, except welded intersections shall be spaced not farther apart than 16 inches in the direction of the principal reinforcement.

B. Wire Bar Supports

1. Unless noted otherwise on the Contract Drawings, wire bar supports shall be in accordance with Class 1, maximum protection or Class 2, moderate protection in Chapter 3 of CRSI DA4.

C. Dowel Adhesive System

1. Where shown on the Contract Drawings, reinforcing bars anchored into hardened concrete with a dowel adhesive system shall use a two-component adhesive mix which shall be injected with a static mixing nozzle following manufacturer's instructions.

2. The embedment depth of the bar shall be per manufacturer's recommendations, so as to provide a minimum allowable bond strength that is equal to 125 percent of the yield strength of the bar, unless noted otherwise on the Contract Drawings.

3. The adhesive system shall be as specified in this Section:

4. The Engineer's approval is required for use of this system in locations other than those shown on the Contract Drawings.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Welding

1. When required or permitted, all welding of reinforcing bars shall conform to ANSI/AWS D1.4. Unless otherwise permitted by the Engineer in writing, welding of reinforcement is prohibited.

2. Welding of wire to wire, and of wire or welded wire fabric to reinforcing bars or structural steels, shall conform to applicable provisions of ANSI/AWS D1.4 and any supplementary requirements specified by the Supervising Engineer for Concrete Construction for the particular application.

B. Fabrication

1. All reinforcement shall be bent cold unless otherwise permitted by the Engineer.

2. Fabricating and Placing Tolerances:

3. Reinforcing bars shall be fabricated in accordance with the standard fabricating tolerances in Figures 4 and 5 of ACI 315. Tolerances shall not permit a reduction in cover.

4. Placing Tolerances for Reinforcement:

Item	Tolerances, Inches
1. Clear distance:	
a. To formed soffit	-1/4
b. To other formed surfaces	±1/4
2. Minimum spacing between bars:	-1/4
3. Clear distance from unformed surface to top reinforcement:	

Item	Tolerances, Inches
a. Members 8 inches deep or less	±1/4
b. Members more than 8 inches deep but less than 24 inches deep	-1/4, +1/2
c. Members 24 inches deep or greater	1/4, +1
4. Uniform spacing of bars, but the required number of bars shall not be reduced:	±2
5. Uniform spacing of stirrups and ties, but the number of stirrups and ties shall not be reduced:	±1
6. Longitudinal locations of bends◦ and ends of reinforcement:	
a. General	±2
b. Discontinuous ends of members	±1/2
7. Length of bar laps:	1-1/2
8. Embedded length:	
a. For bar sizes No. 3 through 11	-1
b. For bar sizes No. 14 and 18	-2

5. When it is necessary to move bars to avoid interference with other reinforcement, conduits or embedded items exceeding the specified placing tolerances, the resulting arrangement of bars shall be subject to approval of the Engineer.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Testing

1. The Contractor shall provide samples from each load of reinforcing steel delivered in a quantity as directed by the Engineer for testing.

2. In addition,, the Contractor shall provide samples of each type of welded splice used in the work in a quantity and of dimensions as directed by the Engineer for testing. At the discretion of the Engineer, radiographic testing of direct butt-welded splices will be performed. The Contractor shall provide assistance necessary to facilitate testing. The Contractor shall repair any weld which fails to meet the requirements of AWS D1.4.

3. The testing will be performed by QA/QC consultant employed and paid by the City to ensure that reinforcing steel and welded splice comply with the technical requirements of the Contract.

4. The Contractor shall be charged by the City for the cost of any additional tests and investigation on work performed which does not meet the specifications.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 IMPLEMENTATION

A. Placing

1. Minimum concrete cover for reinforcement, except for extremely corrosive atmosphere, other severe exposures or fire protection shall be as follows unless indicated otherwise on the Contract Documents.

2. Minimum Concrete Cover for Reinforcement:

Item	Minimum Cover, Inches
1. Slabs and Joists:	
a. Top and bottom bars for dry conditions:	
1) No. 11 bars and smaller	3/4
2) No. 14 and No. 18 bars	1-1/2
b. Bars in formed concrete surfaces exposed to water or weather, and over or in contact with sewage and for bottoms bearing on work mat, or slabs supporting earth cover:	2
2. Beams and Columns:	
a. For dry conditions:	
1) Stirrups, spirals and ties	1-1/2
2) Principal reinforcement	2
b. Exposed to earth, water, sewage or weather:	2
1) Stirrups and ties	2-1/2
2) Principal reinforcement	
3. Walls:	
a. For dry conditions:	
1) No. 11 bars and smaller	3/4
2) No. 14 and No. 18 bars	1-1/2
b. Formed concrete surfaces exposed to earth, water, sewage, weather or in contact with ground	2

Item	Minimum Cover, Inches
4. Footings and Base Slabs:	
a. At formed sides and ends and bottoms bearing on concrete work mat	2
b. At unformed surfaces and bottoms in contact with earth	3
c. Top of footings	Same as slabs
d. Over top of piles	2

3. Reinforcement supported from formwork shall rest on bar supports made of concrete, metal, plastic or other acceptable materials. Where the concrete surface will be exposed to the weather in the finished structure, the portions of all bar supports within 1/2 inch of the concrete surface shall be non-corrosive or protected against corrosion.

4. Welded wire fabric for slabs on grade shall extend to within 2 inches of the concrete edge. Welded wire fabric may extend through the contraction joints. Welded wire fabric shall be adequately supported during placing of concrete to assure proper positioning in the slab.

5. Bending or straightening of bars partially embedded in concrete shall not be permitted except when specifically approved by the Engineer. Bending and preheating shall be in accordance with the requirements of this Section.

B. Bending of Bars

1. Minimum Inside Bend Diameters:

a. The minimum inside bend diameters shall conform to the following requirements unless otherwise permitted by the Engineer.

Bar Size	Minimum Diameter
No. 3 through 8	6 bar diameters
No. 9, 10, 11	8 bar diameters
No. 14 and 18	10 bar diameters

2. The beginning of the bend shall not be closer to the concrete surface than the minimum diameter of bend. Preheating, if required, shall be in accordance with the requirements of the Section. The following requirements shall be adhered to for individual bar sizes:

Bar Size	BEND REQUIREMENTS
No. 3 through No. 5	Bars may be cold bent the first time. Cold bend bars only when temperature is above 32 degrees Fahrenheit. Preheating is required for subsequent straightening or bending.
No. 6 and larger	Preheating is required.

C. Preheating of Bars

1. Preheating prior to bending or straightening, when required, shall be in accordance with the following requirements:

   a. The preheat shall be applied to a length of bar equal to at least 5 bar diameters each way from the center of the bend except that preheat shall not extend below the surface of the concrete. The temperature of the bar at the concrete interface shall not exceed 500 degrees Fahrenheit.

   b. The preheat temperature shall be 1100 to 1200 degrees Fahrenheit.

   c. The preheat temperature shall be maintained until bending or straightening is complete.

   d. The preheat temperature shall be measured by temperature measurement crayons, contact pyrometer or other acceptable method.

   e. Heated bars shall not be artificially cooled until the material temperature is less than 600 degrees Fahrenheit.

2. Preheating may be applied by any method which does not harm the bar material or cause damage to the concrete.

D. Splicing

1. Reinforcing bar splices shall only be used at locations shown on the Contract Drawings. When it is necessary to splice reinforcing at points other than where shown, the character of the splice shall be approved by the Engineer.

2. The length of lap for reinforcing bars, unless otherwise shown on the Contract Drawings shall be in accordance with ACI 318 for a class B splice.

3. Laps of welded wire fabric shall be in accordance with ACI 318. Adjoining sheets shall be securely tied together with No. 14 tie wire, one tie for each 2 running feet. Wires shall be staggered and tied in such a manner that they cannot slip.

4. Mechanical and welded splices shall be used only where shown on the Contract Drawings or when approved by the Engineer.

5. Couplers which are located at a joint face shall be a type which can be set either flush or recessed from the face as shown on the Contract Drawings. The couplers shall be sealed during concrete placement to completely eliminate concrete or cement paste from entering. After the concrete is placed, couplers intended for future connections shall be plugged and sealed to prevent any contact with water or other corrosive materials. Threaded couplers shall be plugged with plastic plugs which have an 0-ring seal.

E. Dowel Adhesive System Installation

1. The installation of the dowels shall be done in strict conformance with the manufacturer's recommendations. The dowels shall be supported in the correct position until the adhesive sets and gains enough strength to prevent any dislocation.

2. At least 25 percent of the dowels to be installed shall be proof tested to 1.33 times the allowable load specified by the manufacturer of the adhesive-injection system.

3. If the dowels are required to have a hook at the end to be embedded in the new work, an approved mechanical coupler shall be provided at a convenient distance from the face of existing concrete to facilitate the testing.

F. Miscellaneous Installation Requirements

1. Exposed Reinforcement:

a. Reinforcement left exposed for the bonding of future construction shall be effectively protected from corrosion by encasement in cement mortar or by other temporary covering as approved by the Engineer.

2. Field Cutting of Reinforcement:

a. Reinforcement shall not be cut in the field except when specifically permitted by the Engineer in writing.

3. Reinforcement Through Expansion Joint:

a. Reinforcement or other embedded metal items bonded to the concrete shall not be continuous through any joint intended as an expansion joint. Dowels bonded on only one side of a joint and waterstops may extend through the joint.

3.03 FIELD TESTING / QUALITY CONTROL

A. Inspection

1. No concrete shall be deposited until the Supervising Engineer for Concrete Construction or his approved representative has inspected the placing of

the reinforcing steel and has given permission to place the concrete. Concrete placed in violation of this provision may be rejected with subsequent removal by the Contractor.

2. The Contractor shall advise the Engineer of his intentions to place concrete and shall allow him adequate time to inspect all reinforcing steel before concrete is placed.

3. The Contractor shall advise the Engineer of his intentions to place grout in masonry walls and shall allow him adequate time to inspect all reinforcing steel before grout is placed.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

END OF SECTION

NO TEXT ON THIS PAGE

PART 1 GENERAL

1.01 SUMMARY

A. The Work specified in this Section consists of providing all labor, materials, equipment, supervising, testing and incidentals necessary to furnish and install cast-in-place concrete as indicated on the Contract Drawings and as specified herein.

B. Work includes producing concrete consisting of Portland cement, fine and coarse aggregate, water and approved admixtures; proportioned, mixed, transported, placed, finished and cured as specified. Work shall also include:

1. Providing openings in concrete as required to accommodate Work under this and other Sections.

2. Building into the concrete all items such as sleeves, frames, anchor bolts and inserts required to accommodate the Work.

C. This Section covers cast-in-place structural concrete for use in buildings and structures and miscellaneous cast-in-place concrete.

D. This Section covers the requirements of Executive Order 23 for low carbon concrete and clean construction practices.

E. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

L. Definitions

1. Environmental Product Declaration - A third-party-verified International Organization for Standardization (ISO) Series 14025 Type III declaration that quantifies environmental information on the life cycle of a product to enable comparisons between products fulfilling the same function.

2. Inspection Requirements – Special Inspections requirements of the New York City Building Code as defined in NYCBC 1704.4 shall apply to all applicable materials and construction.

3. Normal Weight Concrete - Concrete for which density is not a controlling attribute, made with aggregates of types covered by ASTM C 33, and usually having unit weights in the range of 135 to 160 lbs. per cubic foot.

4. Supervising Engineer for Concrete Construction - Professional Engineer designated by the Commissioner, who will be responsible for coordination of Special Inspections and Buildings Form TR1: Technical Report Statement of Responsibility. The Supervising Engineer for Concrete Construction may or may not be the Resident Engineer. The Supervising Engineer for Concrete Construction shall undertake all responsibilities outlined in Article 28 and NYCBC 1704.4 Special Inspections of the New York Building Code.

5. Other technical words and terms used in this Section are defined in ACI CT-18.

1.05 DESCRIPTION

A. Classes of Concrete:

1. Class 25 - use for lean concrete.

a. Class of concrete as recommended by NYCDOT specification for sidewalks, headers and curb.

2. Class 45 - use for all concrete unless indicated otherwise.

3. Class 45F - use as an alternate to Class 45 for:

a. Foundations

b. Walls greater than or equal to 18inches in thickness

4. Class 45PG – use for non-structural applications.
    a. Class of concrete recommended for driveways and patios

B. Work in Connection with other disciplines:

1. All sleeves, inserts, anchors and embedded items required for adjoining work or for its support shall be placed prior to concreting. No concrete shall be deposited until the Resident Engineer or his authorized representative has inspected the placement of the embedded items and the reinforcing bars and has given his permission to place the concrete.
2. All Work related to the concrete or must be supported by it, shall be coordinated with the work of this Section, including but not limited to the introduction or furnishing of embedded items prior to concrete placement.
3. Electrical conduits, junction boxes or pipes shall be placed prior to concreting. The Contractor shall coordinate the placement of such items of work in order that they are installed in accordance with all requirements of the New York City Building Code. The Contractor shall protect such installations to the extent that they are not displaced or damaged during concrete placement.
4. Openings in slabs shall be provided for pipes, conduits and the like required for the work of others where indicated on the Contract Drawings or for which directions are given prior to placing concrete. When work of others is completed, the excess part of the respective openings shall be completely closed up to the pipe sleeve and/or inserts to match the adjoining work.
5. Sleeves for miscellaneous metalwork, castings, pipes and anchors furnished shall be set true and to proper alignment in the concrete as indicated on the Contract Drawings or required by the manufacturer's templates.
6. Voids in embedments shall be filled temporarily with readily removable material to prevent entry of concrete into the void.

1.06 QUALITY ASSURANCE

A. General:

1. Work performed under this Section shall comply with the applicable provisions and recommendations in Article 1.04 - References of this Section.
2. The Contractor shall employ, at its own expense, a testing laboratory experienced in the design and testing of concrete materials and mixes. This laboratory shall be responsible for all concrete mix design and trial batch testing.

a. Unless otherwise approved, all mix designs shall be run in the presence of DEP designated personnel.

3. Testing agencies that perform testing services on concrete shall meet the requirements of ASTM E 329 and be licensed by the New York City Department of Buildings.

4. Testing laboratory shall have been inspected within the last 2 years by the Cement and Concrete Reference Laboratory (CCRL) of the National Institute of Standards and Technology for testing concrete aggregates and for the preparation and testing of concrete trial batches with or without admixtures. The laboratory shall provide documentation indicating how any deficiencies in the latest CCRL inspection report have been corrected.

5. Testing and inspection shall be conducted in accordance with the requirements of ASTM C 1077 and other applicable standards.

6. Prior to performing any Work, the qualifications of the proposed testing agency shall be submitted for review and acceptance by the DEP.

7. Tests of concrete required by this Section shall be made by an ACI Concrete Field Testing Technician Grade 1 or equivalent. Equivalent certification programs shall include requirements for written and performance examinations as stipulated in ACI publication CP1.

8. Prior to approval, all testing of proposed materials and mix designs including trial batch and shrinkage testing shall be at the Contractor's expense.

9. Concrete materials and operations will be tested and inspected by the Supervising Engineer for Concrete Construction or his authorized representative as the work progresses. Failure to detect defective work or material shall not in any way prevent later rejection when a defect is discovered nor shall it obligate the Engineer for final acceptance.

10. Materials and installed Work may require testing and retesting, as directed by Engineer, at any time during the progress of the Work. Contractor shall allow free access to material stockpiles and facilities at all times. Tests not specifically indicated to be done at Owner's expense, including the retesting of rejected materials and installed Work, shall be done at Contractor's expense.

B. Laboratory Trial Batch:

1. Each concrete mix specified shall be verified by a laboratory trial batch, unless indicated otherwise. Each trial batch shall also be witnessed by a DEP representative.

2. Each trial batch shall be reported on DEP's Mix Design Submittal (MDS) forms and shall include the following testing:
   a. Aggregate gradation for fine and coarse aggregates.
   b. Combined aggregate gradation including total percentage of each aggregate size retained on each sieve.
   c. Fly ash testing to verify meeting specified properties, unless certification by an independent testing laboratory is provided by the fly ash supplier.
   d. Slump.
   e. Air content.
   f. Compressive strength based on 3 cylinders tested at 7 days and 3 cylinders tested at 28 days (6 cylinders minimum.)
   g. Shrinkage test, as specified herein, for Class 45 concrete.
3. Each trial batch shall provide the following information:
   a. Project identification name and number.
      1) Specified strength f'c.
      2) Name of the concrete producer supplying materials.
      3) Name of the Design Trial Lab.
   b. Date of trial.
   c. Complete identification of aggregate source of supply.
   d. Tests of aggregates for compliance with specified requirements.
   e. Scale weight of each aggregate.
   f. Absorbed water in each aggregate.
   g. Brand, type and composition of cement.
   h. Brand, type and amount of each admixture.
   i. Amounts of water used in trial mixes.
   j. Proportions of each material per cubic yard.
   k. Gross weight and yield per cubic yard of trial mixtures.
   l. Measured slump.
   m. Measured air content.
   n. Shrinkage test results where required and as specified herein.
   o. A minimum of three (3) trial runs with different water/cement ratios shall be performed for each mix design proposed.

p. Compressive strength developed at 7 days and 28 days, and if required, 56 days or longer. A minimum of three (3) test cylinders shall be cast for each 7-day, 28-day and/or 56-day test for each trial run.

4. The requirement for a trial batch may be waived if the required test information has been provided in a previous laboratory trial batch run on the identical mix design within the previous twelve (12) months and the history of the concrete mix field results are acceptable to the Supervising Engineer for Construction. The same brand, type, source and supplier of all materials must have been used.

5. On the day of the trial test, the laboratory shall provide to the DEP witness a 1-2 lb. neat cement sample for delivery to the DEP Laboratory for chemical composition analysis, for fly ash and slag and cement.

C. Shrinkage Test:

1. Drying shrinkage tests, as specified herein, shall be performed with every trial batch test.

2. Drying shrinkage specimens shall be 4-inch by 4-inch by 11-inch prisms with an effective gage length of 10 inches, fabricated, cured, dried and measured in accordance with ASTM C 157 modified as follows: Specimens shall be removed from molds at an age of 23 $\pm$1 hours after trial batching, shall be placed immediately in water at 70 degrees F $\pm$3 degrees F for at least 30 minutes, and shall be measured within 30 minutes thereafter to determine original length and then submerged in saturated lime water at 73 degrees F $\pm$3 degrees F. Measurement to determine expansion expressed as a percentage of original length shall be made at age 7 days. This length at age 7 days shall be the base length for drying shrinkage calculations ("0" days drying age). Specimens then shall be stored immediately in a humidity control room maintained at 73 degrees F $\pm$3 degrees F and 50 percent $\pm$4 percent relative humidity for the remainder of the test. Measurements to determine shrinkage expressed as percentage of base length shall be made and reported separately for 7, 14, 21, and 28 days of drying after initial 7 days of moist curing.

3. The drying shrinkage deformation of each specimen shall be computed as the difference between the base length (at "0" days drying age) and the length after drying at each test age. The average drying shrinkage deformation of the specimens shall be computed to the nearest 0.0001 inch at each test age. If the drying shrinkage of any specimen departs from the average of that test age by more than 0.0004-inch, the results obtained from that specimen shall be disregarded. Results of the shrinkage test shall be reported to the nearest 0.001 percent of shrinkage.

Compression test specimens shall be taken in each case from the same concrete used for preparing drying shrinkage specimens. These tests shall be considered a part of the normal compression tests for the project. Allowable shrinkage limitations shall be as specified in Part 2, herein.

1.07 SUBMITTALS

A. General:

1. A new mix design shall be submitted to the Engineer for approval. Prior to changing the brand, type, size or source of cementitious materials, aggregates, water, ice or admixtures, new historical field strength test data, data from new trial mixtures or evidence which indicates that the change will not adversely affect the relevant properties of the concrete shall be submitted. Proposed mix proportions and all related data, in a format acceptable to the Engineer, shall be submitted to the Engineer for review six (6) weeks before the start of any concreting operations. The complete mix design shall include all components of concrete, including admixtures. Mix designs shall be prepared, signed and sealed by a Professional Engineer licensed in the State of New York.

2. Materials, equipment and aggregates approved by the Materials Bureau of the New York State Department of Transportation (NYSDOT), in the most recent NYSDOT approved lists mentioned below, are acceptable for use without a detailed submission. Submittal is required stating the particular material, equipment or aggregate source to be used with approval identification number, and/or page number.

   a. Materials and Equipment NYSDOT Approved Materials List

   b. Approved List Sources of Fine and Coarse Aggregates

B. Certifications:

1. All materials used in the manufacture of concrete shall be accompanied by a certificate from the manufacturer or fabricator or supplier indicating test results of current production stockpiles or shipments.

2. Submit notarized certification of conformance to referenced standards when requested by Engineer.

3. All mix designs shall be accompanied by an Environmental Product Declaration (EPD) in compliance with Article 2.03.

C. Delivery Tickets:

1. The Contractor shall submit to the Engineer a copy of the delivery ticket for each load of concrete delivered to the Site. Delivery tickets shall contain all information specified in ASTM C94 Section 14.1.

2. Provide batch tickets for each batch of job-site mixed concrete as specified.

D. Submit samples of materials as specified and as otherwise may be requested by the Engineer, including names, sources, and descriptions.

E. Shop Drawings:

1. Manufacturer's specifications with application and installation instructions for proprietary materials and items, including admixtures and bonding agents.

2. All information pertinent to a concrete plant to be erected at the site as required by the CPMB Publication "Concrete Plant Standards of the Concrete Plant Manufacturers Bureau."

3. Detailed description of conveying equipment.

4. Detailed description of concrete placement methods.

5. Proposed procedures for bonding new concrete work to existing including manufacturer's information on proposed bonding agents.

6. Proposed normal procedures for protection and curing of concrete including manufacturer's literature for proposed curing compounds.

7. Proposed special procedures for protection of concrete under wet weather placement conditions.

8. Proposed special procedures for protection and curing of concrete under hot and cold weather conditions.

9. Proposed method of measuring concrete surface temperature changes.

10. Detailed procedures and materials for repair of defective concrete.

11. Detailed procedures for removing stains, rust, efflorescence, and surface deposits.

12. Materials and procedures to be used to plug tie holes, other than for Portland cement mortar.

13. Proposed methods to measure concrete compressive strength by means other than field cured cylinders for termination of curing, such as maturity, penetration resistance, pulse velocity, rebound hammer, or pullout strength.

14. The following information, if ready-mixed concrete is used.

a. Identification of Ready-Mixed Concrete Supplier including the plant location and all pertinent information required by the CPMB Publication "Concrete Plant Standards of the Plant Manufacturers Bureau."

b. Locations of sources of materials for cement, fine and coarse aggregates, and water, and the brands and types of admixtures to be used.

c. Physical capacity of mixing plant.

d. Trucking facilities available.

e. Estimated average amount which can be produced and delivered to the site during a normal 8-hour day, excluding the output to other customers.

15. Requests and Notifications:

a. Request to use the volumetric batching method.

b. Request for acceptance of preplacement activities: This request is to ensure that the pre-placement activities are complete and have been properly inspected. The Contractor shall sign-off on a Concrete Placement Card indicating that the Work is complete and is ready for placement. A sample of the required Concrete Placement Card is attached at the end of this Section. The Supervising Engineer for Concrete Construction will sign-off on the items to be inspected but this does not relieve the Contractor from coordinating the concrete placement properly and meeting all requirements of the Contract. The Contractor shall submit the completed Concrete Placement Card to the Supervising Engineer for Concrete Construction in accordance with Article 3.01, Paragraph B - Preparation for Concrete of this Section, and with sufficient time to obtain receipt of authorization from DEP to place concrete in conformance with the latest DEP concrete placing guidelines.

c. Advance notification of forthcoming placement including arrangements to coordinate tests and inspection.

d. Requests to exceed the ASTM C 94 required time of discharge.

F. Test and Inspection Reports:

1. Information on types, classes, procedures, names and plant locations for cementitious materials; types, pit or quarry locations, producers' names, gradations and properties required by ASTM C 33 for aggregates; types, brand names, producers' names for admixtures; and source of supply for water and ice.

2. Except for admixtures and water, test results not more than 90 days old confirming the conformance of all concrete materials with applicable specifications.

3. Testing agencies shall submit the results of all tests and inspections performed during the course of the work to the Supervising Engineer for Concrete Construction. Reports from the Testing Agency shall be on forms acceptable to the Supervising Engineer for Concrete Inspection.

4. Submit copies of laboratory test reports for concrete cylinders, materials and mix design tests. Engineer's review will be for information only. Production of concrete to comply with the specified requirements is the responsibility of the Contractor.

5. A complete record of the date and details of each concrete placement including the exact location thereof and the date of removal of forms. This record shall be coordinated with and in addition to that maintained by the Supervising Engineer for concrete inspection.

6. Mixture Proportions:

   a. Mixture proportions conforming to the requirements of the New York City Administrative Building Code and this Section for water/cement ratio, cement content, slump, maximum size of coarse aggregate, air content, admixtures, and chloride concentration, as well as compressive strength.

   b. Method and test data used to establish proportions.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Cement shall be stored in weather tight buildings, bins or silos which will provide protection from dampness and contamination and will minimize warehouse set.

B. Aggregate stockpiles shall be arranged and used in a manner to avoid excessive segregation or contamination with other materials or with any other sizes of like aggregates. To insure that this condition is met, any test for determining conformance to requirements for cleanliness and grading shall be performed on samples secured from the aggregates at the point of batching. Frozen or partially frozen particles shall not be used.

C. Stockpiles of natural sand shall be allowed to drain freely to minimize variations in moisture content throughout the stockpile.

D. Admixtures shall be stored in such a manner as to avoid contamination, evaporation or damage. For those used in the form of suspensions or non-stable solutions, suitable agitating equipment shall be provided to assure uniform distribution of the ingredients. Liquid admixtures shall be protected from freezing and other temperature changes which would adversely affect their characteristics. All admixture containers shall be clearly marked with paint as to their content and dosage.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Cementitious Materials

1. Silica fume shall be one of the following:

a. MasterLife SF100 as manufactured by Master Builders Solutions, Beachwood, OH;

b. Force 10,000 D as manufactured by GCP Applied Technologies, Cambridge, MA.;

c. Sikacrete 950 DP as manufactured by Sika Corp., Lyndhurst, NJ;

d. Eucon MSA as manufactured by the Euclid Chemical Company, Cleveland, OH;

e. Or approved equal.

B. Concrete Admixtures:

1. Shrinkage reducing admixtures shall be one of the following:

a. Eclipse as manufactured by GCP Applied Technologies, Cambridge, MA;

b. MasterLife SRA 035 and MasterLife CRA 007, as manufactured by Master Builders Solutions, Beachwood, OH;

c. Or approved equal.

2. Corrosion inhibiting admixture shall be one of the following:

a. DCI or DCI-S, as manufactured by GCP Applied Technologies, Cambridge, MA;

b. MasterLife CI 30 as manufactured by Master Builders Solutions, Beachwood, OH;

c. Eucon CIA, as manufactured by Euclid Chemical Company, Cleveland, OH;

d. Or approved equal.

C. Concrete bonding agent

1. Two component epoxy-resin bonding agent shall be one of the following:

a. Sikadur 32, Hi Mod LPL, as manufactured Sika Corp., Lyndhurst, NJ;

b. Dural LPL MV as manufactured by the Euclid Chemical Company, Cleveland, OH;

c. Pro-Poxy 200 as manufactured by Dayton-Superior, Miamisburg, OH;

d. FX-752 as manufactured by Simpson Strong-Tie, Pleasanton, CA;

e. Or approved equal.

2. Three component epoxy modified cementitious bonding agent shall be one of the following:

a. Sika Armatec 110 EpoCem, as manufactured by Sika Corporation.

b. Or approved equal.

D. Finishing Aids:

1. Evaporation retardant shall be one of the following:

a. MasterKure ER 50, as manufactured by Master Builders Solutions, Beachwood, OH;

b. Eucobar, as manufactured by Euclid Chemical Company, Cleveland, OH;

c. SikaFilm, as manufactured by Sika Corp., Lyndhurst, NJ;

d. Or approved equal.

E. Curing and Protection Materials:

1. Curing compounds shall be one of the following:

a. Super Aqua Cure VOX, as manufactured by Euclid Chemical Company, Cleveland, OH;

b. Sealtight 1100, as manufactured by W.R. Meadows, Inc., Hampshire, IL;

c. MasterKure, as manufactured by Master Builders Solutions, Shakopee, MN;

d. Or approved equal.

2. Temperature Monitoring Equipment:

a. IQT-Meter or IQM-Meter as manufactured by James Instruments Inc., Chicago, IL;

b. Or approved equal.

F. Crack Injection Materials:

1. Epoxy:

a. Epoxies for injection shall be one of the following:

1) Sikadur 35, Hi Mod L.V. and Sikadur 31, Hi-Mod Gel, as manufactured by Sika Corp., Lyndhurst, NJ;

2) Dural Injection Gel, as manufactured by Euclid Chemical Company, Cleveland, OH;

3) Or approved equal.

2. Hydrophilic Resin:

a. Hydrophilic resins shall be one of the following:

1) Sika Inject 215, as manufactured by Sika Corp., Lyndhurst, NJ;

2) Or approved equal.

G. Concrete Repair Materials:

1. Concrete repair mortar shall be one of the following:

a. Five Star Structural Concrete, as manufactured by Five Star Products, Inc., Shelton, CT;

b. SikaTop 122 Plus, SikaTop 123 Plus, SikaTop 111 Plus, or Sikacem 133, as manufactured by Sika Corp., Lyndhurst, NJ;

c. MasterEmaco S 488CI or S 466-CI, as manufactured by Master Builders Solutions, Shakopee, MN;

d. Verticoat or Verticoat Supreme, as manufactured by the Euclid Chemical Company, Cleveland, OH;

e. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Materials listed in this Section apply to all concrete unless specified otherwise in the Contract.

B. Cementitious Materials

1. Cement:
   a. Portland cement, ASTM C 150, Type II; or blended hydraulic cement, ASTM C595 Type IP (MS). Cement type used shall be appropriate for site exposures.
      1) NYCBC 1904.4
   b. Portland cement shall be produced by an acceptable, recognized manufacturer. The cement shall be produced by one plant only per mix design. Alternate cement sources may be used provided that a mix design has been accepted and a trial batch verifying performance has been made.
   c. Cement which has deteriorated because of improper storage or handling shall be rejected.
2. Fly Ash and Natural Pozzolans:
   a. Fly ash mineral admixture, when used, shall meet the requirements of ASTM C 618 Class F, except as follows:
      1) The loss on ignition shall be a maximum of 4%.
      2) The maximum percent of sulfur trioxide (SO_3) shall be 4.0.
   b. Natural pozzolan mineral admixture, when used, shall meet the requirements of ASTM C 618 Class N.
3. Ground Granulated Blast Furnace Slag:
   a. Ground granulated blast furnace slag (GGBF) mineral admixture, when used, shall meet the requirements of ASTM C 989, Grade 100 or better.
   b. GGBF slag will be permitted as a substitute for fly ash or natural pozzolans, at no additional cost to the City, in the event that Class F Fly Ash or Class N natural pozzolans are not available. The slag substitution shall be in the same proportions and percentages of the total cementitious material as indicated for Fly Ash. A higher percentage of GGBF slag of the total cementitious material in concrete shall be permitted as approved by the Engineer to suit the project needs.
   c. Laboratory trial batches will be tested to determine compliance with strength requirements, times of setting, slump, slump loss, and shrinkage characteristics.
4. Silica Fume:

a. Silica fume mineral admixture shall be the dry compacted or slurry form and shall meet the requirements of ASTM C 1240. Silica Fume shall be considered to be a cementitious material. Application rate shall be 7 percent by weight of cement, unless indicated otherwise.

5. Ground Glass Pozzolan:

a. Ground glass pozzolan (GGP), when used, shall meet the requirements of ASTM C 1866 and ASTM C618 Class N.

b. To be used only for non-environmental engineering concrete structure concrete (e.g. concrete pavement, sidewalks, ductbank, concrete fill, building façade panels, etc) and not in concrete contacting process, ground or reservoir water.

c. GGP will be permitted only where accompanied by Class F Fly Ash, GGBS, or other Class N Natural Pozzolans in the mix to create a ternary mix.

d. Provide SCM replacement in accordance with maximum 3.0 pcy alkali loading and ASR Prevention Level Y in accordance with ASTM C1778 to mitigate alkali-silica reactivity for the high alkalies in GGP.

e. Cement alkali content for mixes including GGP shall not exceed 1.0 Na2Oeq.

C. Aggregate

1. Coarse and fine aggregates shall meet the requirements of ASTM C 33 with the requirements of Table 3, Class 4S. Soundness shall be tested using magnesium sulfate. Abrasion resistance shall be tested using the Los Angeles Abrasion Test. For testing requirements, concrete shall be assumed to be subject to abrasion.

2. Do not use aggregates containing soluble salts or other substances such as iron sulfides, pyrite, marcasite, ochre, or other materials that can cause stains on exposed concrete surfaces. Marine dredged aggregates shall not be used.

3. The loading, storing, unloading, and batching of aggregates shall be done in such a manner as to prevent segregation, intermingling, or the inclusion of foreign materials. All aggregates shall remain in free drainage storage until a stable moisture content is attained prior to placement in the batching plant bins. Each size of coarse aggregate and the fine aggregate shall be kept in separate hoppers or bins. All aggregates shall be delivered to the batching plant bins by a belt conveyor or other approved means; and the operation thereof shall be controlled so as to prevent the mixing of the sizes and kinds of

aggregates with each other. Any mixture of fine and coarse aggregates or of the two sizes of coarse aggregate in the batching plant bins or prior thereto shall be cause for rejection of such materials, and the affected bin or bins shall be emptied and inspected prior to refilling with the correctly graded aggregate.

4. Fine Aggregates:

   a. Fine aggregate shall be composed of clean, sharp, hard, strong, durable, insoluble, uncoated, natural sand free from loam, clay lumps or other deleterious substances.

   b. Dune sand, bank run sand and manufactured sand are not acceptable.

   c. Sand having FM less than 2.40 or greater than 3.00 shall not be allowed.

   d. Fine aggregate shall meet the requirements of ASTM C 33 except that loss when tested for soundness using magnesium sulfate shall not exceed 12 percent.

5. Coarse Aggregates:

   a. Coarse aggregate shall be crushed stone processed from natural rock or stone and shall consist of clean, hard, strong, durable, insoluble, unweathered, and uncoated pieces of uniform quality throughout; and shall be free from such alkali, decomposed minerals, organic material, clay, mica, schist, or other foreign matter that will render it unsuitable.

   b. Use of slag and pit or bank run gravel is not permitted.

   c. Coarse aggregate gradations shall be as specified in Table 1 - Concrete Mix Requirements and shall meet the requirements of ASTM C 33. All aggregate gradations listed for each concrete class shall be used.

   d. Coarse aggregate shall meet the requirements of ASTM C 33, Table 3, Class 4S, with the following additional requirements.

      1) Clay lumps shall not exceed 1.0 percent by weight of coarse aggregate.

      2) Shale and other soft particles shall not exceed 3.0 percent by weight of coarse aggregate.

      3) Thin, elongated, or laminated particles shall not exceed 3.0 percent by weight of coarse aggregate.

      4) Loss when tested for soundness using magnesium sulfate shall not exceed 12 percent.

e. Coarse aggregate for Lightweight Concrete shall conform to ASTM C 330 and shall meet the gradation requirements for ¾" to No. 4.

f. Nominal maximum size of coarse aggregate shall be not larger than:

1) 1/5 the narrowest dimension between sides of forms, nor

2) 1/3 the depth of slabs, nor

3) 3/4 the maximum clear spacing between individual reinforcing bars or wires, bundles of bars, individual tendons, bundled tendons or ducts.

g. The requirements of Article 2.02, Paragraph C.5.f, shall not apply if, in the judgment of the Engineer, workability and methods of construction are such that concrete can be placed without honeycombs or voids.

6. Combined Aggregate:

a. Aggregate gradations shall be determined during trial batch testing and shall be based upon the combined gradation and particle distribution in the mixture of coarse and fine aggregates.

b. Fine aggregate and coarse aggregate sizes specified shall be combined to produce a workable and cohesive concrete mix that is appropriate for its specific application. Coarse aggregate contents shall be based on Table 6.3.3 of ACI 211.1. Adjust the content required for pumping applications as specified in ACI 211.1.

c. The total quantity of fine aggregate shall be not more than 45 percent nor less than 32.5 percent by weight of the total aggregate for Normal Weight Concrete. Using a total quantity of fine aggregate which does not meet this specified range shall only be acceptable when approved by the Engineer. The total quantity of fine aggregate shall be not more than 45 percent nor less than 32.5 percent by weight of the total aggregate for Normal Weight Concrete. Using a total quantity of fine aggregate which does not meet this specified range shall only be acceptable when approved by the Engineer

d. Gradations of combined aggregate shall be plotted and submitted on:

1) A combined grading chart (percent passing versus sieve size).

2) An aggregate Particle Distribution Chart (percent retained versus sieve size).

D. Concrete Admixtures

1. Provide admixtures produced by established reputable manufacturers, and use in compliance with the manufacturer's printed instructions. All admixtures shall be compatible and by a single manufacturer capable of providing qualified field service representation. Do not use admixtures which have not been incorporated and tested in the accepted mixes, unless otherwise authorized in writing by Engineer.

2. Air entraining admixtures shall conform to the NYS DOT Materials Bureau approved list and ASTM C 260.

3. Normal range or midrange water reducing admixture shall be in conformance with ASTM C 494 Type A, and comply with the NYS DOT Materials Bureau approved list.

4. High-Range Water Reducing Admixture:

   a. High range water reducer shall conform to ASTM C 494, Type F or G and comply with the NYS DOT Materials Bureau approved list.

   b. The high range water-reducing admixture shall be accurately measured and added at the batch plant facility. The Contractor may redose the concrete no more than 2 times with the high range water reducer at the site, provided that a calibrated dispenser system and containers of high range water reducer sealed and labeled by the manufacturer are used.

5. Set Controlling Admixture:

   a. Set controlling admixture shall be either with or without water-reducing properties.

   b. Where the air temperature at the time of placement is expected to be consistently over 90 degrees Fahrenheit, a water-reducing set controlled admixture conforming to ASTM C 494, Type D and the NYS DOT Materials Bureau approved list.

   c. Where the air temperature at the time of placement is expected to be consistently under 40 degrees Fahrenheit, except for mass concrete placement, a non-corrosive, non-chloride accelerator conforming to ASTM C 494, Type C and the NYS DOT Materials Bureau approved list shall be used.

6. Shrinkage Reducing Admixture:

a. A shrinkage-reducing admixture is permitted to be used in the mix design where necessary to meet specified shrinkage limitations provided that specified strength requirements are met and there is no reduction in sulfate resistance and no increase in permeability.

7. Corrosion Inhibiting Admixture:

a. Corrosion inhibiting admixture shall be a calcium nitrite solution containing a minimum of 30 percent calcium nitrite.

b. The quantity of mix water shall be adjusted to account for the water portion of the calcium nitrite solution.

c. As the calcium nitrite solution accelerates setting time, retarding admixtures shall be provided as needed, unless the admixture has been formulated to not accelerate setting.

8. Calcium chloride, admixtures containing thiocyanate, or admixtures containing more than 0.05 percent chloride ions shall not be used.

9. Crystalline Waterproofing, added crystalline based permeability reducing admixture. Crystalline waterproofing admixture use appropriate manufacturer's product for specific contract work.

E. Water

1. Water for concrete, mortar, and grout shall be clean and free from objectionable mineral salts and from injurious amounts of oils, acids, alkalis, organic materials, or other substances that may be deleterious to concrete or steel. Water shall meet the requirements of ASTM C 94.

F. Bonding Agent

1. Provide a two component epoxy-resin bonding agent conforming to ASTM C 881.

2. Provide three component epoxy modified cementitious bonding agent where two component bonding agent does not provide sufficient open time.

G. Finishing Aids

1. Evaporation Retardant:

a. Evaporation retardant shall be a material which seals the surface of plastic concrete to prevent moisture loss. The material shall be able to be worked into the concrete surface by subsequent finishing operations with no adverse effect on finishing effort and no discoloration of the finished concrete.

H. Curing and Protection Materials

1. Absorptive covers shall consist of burlap cloth made from jute or kenaf, weighing approximately 10 ounces per square yard and complying with AASHTO M 182, Class 3.
2. Curing mats shall be heavy carpets or cotton mats, quilted at 4 inches on center. Curing mats shall weigh a minimum of 12 ounces per square yard when dry.
3. Moisture retaining covers shall conform to ASTM C 171 and consist of one of the following materials.
    a. Waterproof paper.
    b. Polyethylene film.
    c. White burlap-polyethylene sheet.
4. Curing compounds shall conform to the requirements of ASTM C 309 Type 1-D (water retention requirements):
    a. Provide fugitive dye when requested by Engineer.
5. Insulation Blankets:
    a. Closed cell flexible foam sheet material such as polystyrene or urethane. Foam sheet material which is capable of being bent 90 degrees without breaking or tearing shall be provided at corners. The foam insulation blankets shall be 1/2-inch thick.
    b. Quilted, flexible insulation blankets that retain their insulating value when wet and which retard the evaporation of water.
6. Temperature Monitoring Equipment:
    a. Thermocouples or thermistors shall be as manufactured by James Instruments Inc. or equal. They shall be suitable for embedment in concrete and capable of registering temperatures within the accuracy of 0.5 degrees Fahrenheit over a minimum temperature range of 20 to 200 degrees Fahrenheit.
    b. Temperature monitoring and recording equipment shall consist of rechargeable battery-powered recording thermometers with microprocessors The equipment shall be capable of taking and recording temperature readings at each temperature sensor at preset time intervals. The thermometer units shall be compatible with the temperature sensors used, shall have a non-volatile memory capacity of at least 120 readings per sensor, and shall be designed to be connected to a battery-powered compatible printer unit. Time periods shall be able to be set over a minimum range of 10 to 60 minutes. The thermometer unit shall be designed and constructed for construction conditions. Sufficient

thermometer units shall be provided to take readings from all temperature sensors plus one additional backup unit for every ten units in service. One printer unit shall be provided for every 20 thermometer units with sufficient paper supply to record all readings taken.

I. Crack Injection Materials

1. Epoxy:

a. Epoxy for injection shall be a low viscosity, high modulus moisture insensitive type.

2. Hydrophilic Resin:

a. Hydrophilic resin shall be an acrylic-ester based resin with a maximum viscosity of 50 cps. It shall cure into a flexible rubber-like material which has the potential for unrestrained increase in volume in excess of 100 percent in the presence of water.

J. Concrete Repair Materials

1. Concrete repair mortar shall be a prepackaged polymer-modified cementitious repair mortar with the following minimum properties:

a. Compressive strength at one day: 2000 psi (ASTM C 109).

b. Compressive strength at 28 days: 6000 psi (ASTM C 109).

c. Bond strength at 28 days: 1800 psi (ASTM C 882 modified).

2. Cement mortar shall consist of a mix of 1 part cement to 1 1/2 parts sand with sufficient water to form a trowelable consistency. Minimum compressive strength at 28 days shall be 4000 psi. Where required to match the color of adjacent concrete surfaces, white portland cement shall be blended with standard portland cement so that, when dry, the patching mortar shall match the color of the surrounding concrete.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Proportioning and Mixing

1. Prepare concrete design mixes subject to the limitations listed in Table 1 and specified herein so as to create a homogeneous mix and a concrete which meets the specified strength requirements and, of equal importance, provides a concrete which is water tight and durable against deterioration and abrasion. The mix design shall produce a concrete of a consistency which can be placed so as to meet the required finished appearance. The minimum cement necessary to produce the required strength shall be used. This Section applies to concrete mixes using ½ inch and larger nominal maximum aggregate. For mixes using smaller aggregate sizes, see Section 03 60 00 - Grouting. The mix design shall

be submitted using the Mix Design Submittal Form at the end of this Section.

2. Global Warming Potential Limits

   a. Submit an EPD for ready-mix concrete, for approval by the Engineer.

      1) If an EPD for a concrete mix is available, the value given for the Global Warming Potential (GWP) of a mix will be the A1 GWP listed on the EPD.

         a) All ready-mix concrete supplied to the construction site shall be delivered with an EPD. Failure to submit an EPD will exclude the mix from being used.

         b) EPDs shall be submitted using the project Web-Based Project Management Information System in accordance with Section 01 31 25 - Web-Based Project Management Information System. EPDs shall be submitted together with the relevant material submittal for approval by the Engineer.

3. Air Content:

   a. All concrete shall be air entrained unless indicated otherwise.

   b. Air content for Normal Weight Concrete shall be as follows:

Nominal Maximum Aggregate Size (in.)	Total Air Content, percent by Volume (+/- 1.5%)
1/2	7
3/4	6
1	6
1-1/2	5.5

4. Slump:

   a. Slump for all concrete shall be 3 +/- 1 inches, unless indicated otherwise.

   b. Where high range water reducing admixture is used, the specified water-cementitious material ratio shall be reduced by

0.02 and concrete shall be proportioned for no higher than 3-inch slump. The slump after addition of the high range water reducing admixture shall not exceed 8 inches when measured at the point of placement.

c. A tolerance of up to 2 inch above the maximum indicated slump shall be allowed for one batch in any five consecutive batches tested provided that it can be demonstrated that the specified water-cementitious material ratio is not exceeded.

5. Shrinkage Limitation:

a. The maximum concrete shrinkage for specimens cast in the laboratory from the trial batch, as measured at 21-day drying age or at 28-day drying age shall be 0.039 percent or 0.045 percent, respectively. The Contractor shall only use a mix design for construction that has first met the trial batch shrinkage requirements.

b. If the trial batch results fail to meet the shrinkage limitation, the mix shall be redesigned to reduce shrinkage. Alternately, the Contractor may use a higher shrinkage mix when acceptable to the Engineer, provided that the amount of shrinkage reinforcement in the structures is increased as determined by the Engineer to resist the higher levels of shrinkage stresses. The additional reinforcing shall be provided at the Contractor's expense.

6. The percentage of mortar in the concrete mix shall not exceed 60 percent for Class 50, 45 and 45F concrete. Exceeding this specified mortar percentage shall only be acceptable when approved by the Engineer.

7. Proportioning: Concrete proportions shall be determined in accordance with the provisions of Sections 1905.2.1 through 1905.2.3 of the NYCBC.

a. Proportions of materials for concrete shall be established to provide

1) The proportioning of ingredients shall produce a mixture that will provide workability and consistency to permit concrete to be worked readily into the corners and angles of the forms and around reinforcement by the methods of placing and consolidation employed on the work, but without permitting the materials to segregate or excessive bleeding. Yield of all mixes as designed shall not exceed 27.2 cu.ft./cu.yd.

2) Resistance to special exposures is required by NYCBC Section 1904.

3) Conformance with the strength test requirements of Sections 1905.6

b. Concrete is to meet the durability requirements of Section 1904 of NYCBC.

c. Where different materials are to be used for different portions of proposed work, each combination shall be evaluated.

d. Concrete proportions shall be established in accordance with NYCBC Section 1905.3 or Section 1905.4 and shall comply with the applicable requirements of Section 1904.

1) NYCBC Section 1905.3 - Proportioning on the basis of field experience/or trial mixtures. Concrete proportioning determined on the basis of field experience or trial mixtures shall be done in accordance with ACI 318, Section 5.3. If the required f'_c is obtained for trial batch mixed prior to the date specified, the trial mix design may be approved. All mixes shall be approved by the Engineer prior to construction.

2) NYCBC Section 1905.4 - Proportioning without field experience. Concrete proportioning determined without field experience or trial mixtures shall be done in accordance with ACI 318, Section 5.4. This method of proportioning shall not be permitted for load-carrying structural concrete or concrete mix proportions that are required to conform to NYCBC Section 1904.

e. Proportioning on the basis of field experience and/or trial mixtures using a mix design employing the same ingredients proposed for use, and used successfully on a previous project, or projects, may be used provided the following are submitted by a licensed concrete testing laboratory and approved by the Design Engineer of record in conformance with NYCBC 1905.3 and ACI 318 Section 5.3.

1) The name and location of the plant from which the concrete will be batched.

2) The concrete mix design including detailed data and analysis of the ingredients proposed for use as specified herein.

3) Reports for at least 30 (thirty) consecutive tests of 7 day and 28 day concrete strength tests of the proposed mix

made during the previous twelve months of concrete batched and delivered from the same plant that is to furnish this job. These data shall include an evaluation in accordance with ACI 214R to determine the average strengths, moving averages and the coefficients of variation. In addition, the results of a minimum of 3 shrinkage tests for this mix made during the previous twelve months and using the same materials to be used on this project.

4) Reports of compliance tests of fine and coarse aggregates made during the above tests.

f. Average strength reduction. As data becomes available during construction, it is permissible to reduce the amount by which the average compressive strength (f'_c) is required to exceed the specified value of f'_c in accordance with ACI 318, Section 5.5

g. Evaluation and acceptance of concrete. The criteria for evaluation and acceptance of concrete shall be as specified in NYCBC Sections 1905.6.3.3 through 1905.6.5.5.

h. Qualified technicians. Concrete frequency and testing shall be tested in accordance with the requirements of NYCBC Section 1905.6.2 thru 1905.6.5.5. An agency shall perform tests on fresh concrete at the job site, prepare specimens required for curing under field conditions, prepare specimens required for testing in the laboratory and record the temperature of the fresh concrete when preparing specimens for strength tests. All field sampling and testing, including the testing of aggregates, concrete mixes, and strength testing of specimens, shall be subject to special inspection by an approved agency. All testing laboratories shall be approved testing agencies and shall employ qualified special inspectors to perform all required laboratory tests. Test results from the testing laboratory shall be promptly distributed by the Contractor to the concrete producer and the Engineer.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Inspection

1. The Contractor and its installer shall examine the substrate and the conditions under which Work is to be performed and notify Engineer in writing of unsatisfactory conditions. Do not proceed with the Work until unsatisfactory conditions have been corrected in a manner acceptable to the Engineer.

B. Preparation for Concrete

1. All reinforcement, installation of waterstop, positioning of embedded items, and condition of formwork shall be inspected and approved by the Supervising Engineer for Concrete Construction prior to concrete placement. Contractor shall provide written notice of intention to place concrete a minimum of one (1) working day prior to placement.

2. The Contractor shall provide the following preparation before placing of concrete.

   a. Hardened concrete and foreign materials shall be removed from the inner surfaces of the conveying equipment.

   b. Formwork shall have been completed in conformance with Section 03 10 00 - Concrete Forming and Accessories; ice and standing water shall have been removed; reinforcement shall have been secured in place in conformance with Section 03 21 00 - Reinforcing Steel; expansion joint material, anchors and other embedded items shall have been positioned. Concrete shall not be placed on frozen ground.

   c. Subgrade shall be watered sufficiently to achieve surface saturated density of subgrade materials.

   d. Soft spots in subgrade shall be removed and replaced with approved backfill materials.

   e. No concrete shall be placed until the entire preparation has been approved by the Supervising Engineer for Concrete Construction or his authorized representative.

   f. When high ambient temperatures necessitate protection of concrete immediately after placing or finishing, make provisions in advance of concrete placement for windbreaks, shading, fogging, sprinkling, ponding, or wet covering with a light-colored material.

   g. During cold weather, make provisions in advance of concrete placement to maintain the temperature of the concrete above 55ºF. Use heating, covering or other means adequate to maintain the required temperature without injury to concrete due to concentration of heat. Do not use combustion heaters during the

first 24 hours unless precautions are taken to prevent exposure of the concrete to exhaust gases containing carbon dioxide.

3.02 IMPLEMENTATION

A. Mixing and Transporting Concrete

1. General:

a. The Contractor shall provide the production of concrete which includes batching, mixing, delivering, and discharging of concrete according to the following requirements.

2. Ready-Mixed Concrete:

a. Ready-Mixed concrete shall be batched, mixed and transported in accordance with the appropriate sections of "Specifications for Ready-Mixed Concrete" (ASTM C 94 or ASTM C685). Follow the detailed recommendations given in Guide for Measuring, Mixing, Transporting, and Placing Concrete (ACI 304R), where applicable.

b. Each truck mixer or agitator shall have attached thereto in a prominent place a metal plate issued by the Truck Mixer's Manufacturer's Bureau by the manufacturer complying with Section 11.1.2 of ASTM C 94 for that truck mixer and the limitations thereon shall be strictly adhered to.

c. Ready-mixed concrete shall only be batched in plants which meet the following:

1) Concrete plants shall be certified by the National Ready Mixed Concrete Association (NRMCA) and shall comply with the rules of the department.

2) Upon written application by the producer, accompanied by a detailed report on how the facilities compare with the standards of the NRMCA, the above requirements may be waived, in writing by the Engineer.

3) If the detailed report mentioned above is issued by the testing agency which will perform the inspection of the batching and mixing of the concrete and indicates that satisfactory quality concrete can be produced by the plant in question, based on prior job performance records, then the above requirement will be waived, in writing, by the Supervising Engineer for Concrete Construction.

d. Approval of plants as outlined above is subject to the continuous checking and acceptance by the Commissioner or his duly authorized representative.

e. Only plants meeting the requirements for certification of the NRMCA for automatic batching and automatic recording will be permitted.

1) If at any time automatic proportioning or recording instruments become inoperative, the plant may be allowed to batch concrete manually or operate with manual recording for a period of not more than 48 working hours from the time of breakdown.

2) If at the end of 48 working hours, the plant is still not in operating order, the following shall be complied with:

a) DEP shall be contacted and an independent inspector, other than the regular plant inspector shall be assigned to each batching operation at the plant, at no additional cost to the City.

b) Additional inspectors shall observe and record the weight of each component of the batch.

c) The manually recorded batch weights shall appear on a ticket presented to inspection personnel at the project site.

f. Concrete producers shall have their plants inspected quarterly by NYSDOT.

g. Concrete producers shall have their scales and trucks certified quarterly by NYSDOT.

3. Batch Mixing at Site:

a. The concrete shall be produced in a plant conforming to the requirements of the "Concrete Plant Standards" of the Concrete Plant Manufacturer's Bureau and ACI 318, Section 5.8.3. Prior to erection of such plant at the site, the Contractor shall submit to the Supervising Engineer for Concrete Construction, for approval, all pertinent data relative to the plant.

b. All components of the plant must bear the proper rating plates issued by the Concrete Plant Manufacturers Bureau and the limitations thereon shall be strictly adhered to.

c. On job site plants for jobs requiring less than 1000 cubic yards of structural concrete or a job site plant that would operate for less than 30 working days duration, the requirements of Article

3.02 Paragraph A.2.e. for automatic batching and automatic recording will be waived. If at any time automatic proportioning devices or recording instruments become inoperative, follow the provisions of Article 3.02, Paragraphs A.2.e.1 and A.2.e.2.

d. The batch shall be so charged into mixer that some water will enter in advance of the cement and aggregates. Water shall continue to flow for a period which may extend to the end of the first 25 percent of the specified mixing time. Controls shall be provided to insure that the batch cannot be discharged until the required mixing time has elapsed. When concrete of normal weight is specified, controls shall be provided to insure that no additional water may be added during mixing. The entire batch shall be discharged before the mixer is recharged.

e. Each batch of 2 cu.yd. or less shall be mixed for not less than 1 1/2 minutes. The mixing time shall be increased 15 seconds for each additional cubic yard or fraction thereof. Shorter mixing time may be permitted provided performance tests made in accordance with ASTM C 94 indicate that the time is sufficient to produce uniform concrete. At least three quarters of the required mixing time shall take place after the last of the mixing water has been added. The interior of the mixer shall be free of accumulations that will interfere with mixing action. Replace mixer blades when they have lost 10 percent of their original weight.

f. When small quantities of concrete are produced on the site, measure solid materials by weight, and liquid or paste materials by weight or by volume. Mix all materials in a mechanical mixer. If packaged dry combined materials are used, they shall conform to the requirements of ASTM C 387, and shall be capable of satisfying the requirements of this Standard Specification.

4. Control of Admixtures:

a. Air entraining and chemical admixtures shall be charged into the mixture as a solution and shall be dispensed by an automatic dispenser or similar measuring device. The accuracy of measurement of any admixture shall be within ±3 percent. Admixtures shall be charged into the mixer in such manner as not to come into direct contact with the cement.

b. Two or more admixtures may be used in the same concrete provided such admixtures are added separately during the batching sequence and provided further that evidence is

submitted to show that the admixtures used in that combination retain full efficiency and have no deleterious effect on the concrete or on the properties of each other.

c. All admixtures shall be added prior to mixing.

5. Tempering and Control of Mixing Water:

a. Concrete shall be mixed only at the mix plants or at the job site. Concrete shall be mixed in quantities not to exceed immediate job placement requirements.

b. The addition of any water to the mix while the truck is en route from plant to job site is strictly prohibited. Mixing in transit is strictly prohibited. Agitating in transit is permitted, but shall be kept to a minimum.

c. When concrete arrives at the point of delivery with a slump below that which will result in the specified slump at the point of placement and is unsuitable for placing at that slump, the slump may be adjusted to the specified value by adding water if all the water required in the accepted mixture proportions has not been added at the start of mixing and if permitted by the Engineer. Addition of water shall be in accordance with ASTM C 94. Neither the specified water-cement ratio nor slump shall be exceeded. Do not make slump adjustments after 15 percent of the batch has been unloaded. Do not add water to concrete containing a plasticizing or a high range water reducing admixture. Do not add water to concrete in delivery equipment not acceptable for mixing. Measure air content of air-entrained concrete, after slump adjustment, to verify compliance to specified requirements.

d. Each increment of water added at the job site must be incorporated by additional mixing by turning the drum not less than 30 revolutions. The addition of the increments of water and the start of the mixing procedures shall not be commenced earlier than one-half hour prior to the beginning of discharge. From the time the batch or load has been mixed to the specified slump, no further water shall be added to the concrete.

e. Discharge of the concrete shall be completed within the limits set out in the following table. Time and drum revolution limits shall be measured from the introduction of any mixing water to the cement and aggregates or the introduction of the cement to the aggregates (ribbon loading).

CONCRETE DISCHARGE REQUIREMENTS	
Concrete Temperature	**Limit**
Over 90 degrees F	Concrete shall be removed from site and discarded
85° to 90 degrees F	1 hour or 300 revolutions, whichever comes first
80° to 85 degrees F	1 hour 15 minutes or 300 revolutions, whichever comes first
70° to 80 degrees F	1 hour 30 minutes or 300 revolutions, whichever comes first
Below 70 degrees F	2 hours or 300 revolutions, whichever comes first

6. Weather Conditions:

   a. Cold Weather:

      1) To maintain the temperature of the concrete above the minimum placing temperature required by Article 3.02, Paragraph B.4.c, the as-mixed temperature shall not be less than 55 degrees F when the mean temperature falls below 40 degrees F. Follow the detailed recommendations given in "Cold Weather Concreting" (ACI 306R), where applicable.

      2) If water or aggregate has been heated above 100 degrees F, the water shall be combined with the aggregate in the mixer before cement is added. Cement shall not be added to mixtures of water and aggregate when the temperature of the mixture is greater than 90 degrees F.

   b. Hot Weather:

      1) The ingredients shall be cooled before mixing if necessary to maintain the temperature of the concrete below the maximum placing temperature required by Article 3.02, Paragraph B.4.c. The temperature of the concrete at initial discharge shall not exceed 85 degrees F. Follow the detailed recommendations given in "Hot Weather Concreting" (ACI 305R), where applicable.

   c. Under special circumstances, and with written approval of the Supervising Engineer for Concrete Construction, the above provisions as to the initial discharge temperature of the concrete may be modified.

d. Accelerators or retarders may be used with the approval of the Supervising Engineer for Concrete Construction. When permitted, they shall be used in accordance with "Hot Weather Concreting" (ACI 305R).

7. Mixing Small Quantities of Concrete:

a. Only when permitted by the Supervising Engineer for Concrete Construction, small quantities of concrete may be mixed either by a small manually controlled portable mixer or by hand. In such cases, volumetric measurement of aggregates will be permitted.

b. Concrete shall be hand mixed on a watertight platform. Cement and aggregates shall first be mixed dry until a uniform color is obtained. Water shall then be added and the entire mass turned over at least six times, or until the mixture is uniform and of the required consistency. Not more than one-half cubic yard of concrete shall be hand mixed in any batch.

B. Concrete Placement

1. General:

a. The Contractor shall provide concrete placement including preparation before placing, conveying, depositing, consolidation, weather protection, bonding, underwater concreting, and placing of grout and mortar according to the following requirements.

2. Conveying:

a. Concrete shall be handled from the mixer to the place of final deposit as rapidly as practicable by methods which will prevent separation or loss of ingredients and in a manner which will assure that the required quality of the concrete is obtained. Follow the detailed recommendations given in ACI 304R, where applicable.

b. Conveying equipment shall be of size and design to insure a continuous flow of concrete at the delivery end and shall be approved. Conveying equipment and operations shall conform to the following requirements:

1) Conveying equipment shall contain no aluminum components.

2) Truck mixers, agitators, and non-agitating units and their manner of operation shall conform to the applicable requirements of Article 3.02.A.

3) Belt conveyors shall be horizontal or at a slope which will not cause segregation or loss. Protect concrete to minimize drying and effects of temperature rise. Use an acceptable discharge hopper at the discharge end to prevent segregation. Do not allow mortar to adhere to the return length of the belt.

4) Chutes shall be metal or metal-lined having rounded bottoms and shall have a slope not exceeding 1 vertical to 2 horizontal and not less than 1 vertical to 3 horizontal. Chutes more than 20 feet long and chutes not meeting the slope requirements may be used provided they discharge into a hopper before distribution.

5) Pump equipment shall be of suitable kind and adequate pumping capacity and shall be subject to approval by the Supervising Engineer for Concrete Construction. Placement shall be controlled so that segregation does not occur in the discharged concrete. Test cylinders for strength and tests for slump, temperature, and air content shall be made on samples of concrete taken at point of discharge from the pump line.

6) The provisions of Article 3.02, Paragraph B.2.b.4 shall apply to placement methods delivering concrete through lines using pneumatic air pressure.

7) The provisions of Article 3.02, Paragraphs B.2.b.4 and B.2.b.5 are not applicable to gunned mortar applications.

3. Depositing:

a. Concrete shall be deposited continuously, or in lifts not to exceed 18 inches in thickness such that no concrete will be deposited on concrete which has hardened sufficiently to cause the formation of seams or planes of weakness within the section. If a section cannot be placed continuously, construction joints shall be located at points as provided for in the drawings or as approved. Placing shall be carried on at such a rate that the concrete which is being integrated with fresh concrete is still plastic. Concrete which has partially hardened or has been contaminated by foreign materials shall not be deposited. Temporary spreaders in forms shall be removed when the concrete placing has reached an elevation rendering their service unnecessary. They may remain embedded in the concrete only if made of metal or concrete and if prior approval has been

obtained. Detailed recommendations are given in ACI 304R, where applicable.

b. Placing of concrete in supported elements shall not be started until the concrete previously placed in columns and walls is no longer plastic and has been in place at least two hours.

c. Concrete shall be deposited as nearly as practicable in its final position to avoid segregation due to rehandling or flowing. Concrete shall not be subjected to any procedure which will cause segregation.

d. Place concrete for beams, girders, brackets, column capitals, haunches, and drop panels at the same time as concrete for slabs.

e. Where a surface mortar is to be the basis of the finish, the coarse aggregate shall be worked back from the forms with a suitable tool so as to bring a full surface of mortar against the form, without the formation of excessive surface voids. All concrete shall be consolidated by internal vibration, spading, rodding, or forking so that the concrete is thoroughly worked around the reinforcement, around embedded items and into corners of forms, eliminating all air or stone pockets which may cause honeycombing, pitting or planes of weakness. Use internal vibrators of the largest size and power that can properly be used in the Work. Over-vibrating and use of vibrators to transport concrete within forms shall not be allowed. Vibrators shall be inserted and withdrawn at many points, approximately 18 in. apart. At each insertion, the duration shall be sufficient to consolidate the concrete but not sufficient to cause segregation, generally from 5 to 15 sec. duration. A spare vibrator shall be kept on the job site during all concrete placing operations. Follow the detailed recommendations given in of ACI 309R, where applicable. Workers shall be experienced in use of the vibrators.

    1) External vibration shall only be used when explicitly permitted by the Supervising Engineer for Concrete Construction. Vibrating operations shall be continuous throughout the entire section where concrete is being deposited. Vibrators shall be clamped to the studs or wales or in pairs so that while one is vibrating the other can be shifted to insure constant vibration. External vibration shall conform to the requirements of ACI 309R.

f. Self-Supporting Floors and Roofs:

1) Reinforced Concrete Beams and Girders shall be cast monolithically with adjoining arches.

4. Protection, Weather, Placing and Preparation of Forms:

a. Concrete placed during rain, sleet or snow, or when the mean daily temperature falls below 40 degrees F or is expected to be below 40 degrees F during placing or within 24 hours thereafter or rises above 90 degrees F shall be adequately protected as provided in Article 3.02, Paragraph C. and approval for placement shall be obtained from the Supervising Engineer for Concrete Construction.

b. Rainwater shall not be allowed to increase the mixing water nor to damage the surface finish.

c. Placing temperature:

1) When the mean daily temperature falls below 40 degrees F, the minimum temperature of concrete as placed shall be 50 degrees F. Follow the detailed recommendations given in "Cold Weather Concreting" (ACI 306R), and in accordance with NYCBC Section 1905.12, where applicable.

2) Concrete deposited in hot weather shall have a placing temperature which will not cause difficulty from loss of slump, flash set, or cold joints. The temperature of the concrete preferably should be less than 80 degrees F and shall not exceed 90 degrees F unless permitted by the Supervising Engineer for Concrete Construction. Loss of slump, flash set, or cold joints due to the temperature of the concrete as placed will not be acceptable. When the temperature of the steel is greater than 120 degrees F, fog the steel forms and the reinforcement with water just prior to placing the concrete. Follow the detailed recommendations given in "Hot Weather Concreting" (ACI 305R) and in accordance with NYCBC Section 1905.13, where applicable.

d. Placing:

1) Adequate skilled personnel and equipment shall be available to handle and place the concrete immediately upon delivery.

2) Dry surfaces shall be wet down before commencing placement of concrete.

3) Temperature of surfaces to receive concrete (earth, forms, reinforcing steel, etc.), should approximate the temperature of the concrete being placed.

4) Evaporation rate of water from freshly placed concrete should be held to a minimum by:

   a) Shading of operations.

   b) Reducing air circulation in area of operations.

   c) Maintaining fog spray during operations.

5) Cold Joints shall be avoided. This can be accomplished by:

   a) Providing adequate skilled personnel to handle and place the concrete immediately after its delivery to the forms at an acceptable temperature.

   b) Placing in layers thin enough and areas small enough so that vibration or working of the concrete will insure complete union of adjacent layers.

   c) Lengthening of setting time by use of approved water reducing retarders.

   d) Placing a bulkhead at a suitable point where placement is stopped temporarily.

6) Loss of slump shall be kept at a minimum. This can be accomplished by:

   a) Minimum lapse of time between mixing and placing.

   b) Avoiding delays in batch mixing and truck dispatching.

   c) Job conditions and equipment (chutes, access runs, etc.) being organized to prevent additional mixing.

   d) Use of approved water reducing retarders.

e. Preparation of forms:

1) All forms or surfaces (subgrades, reinforcing steel) to receive concrete, in addition to the normal requirements of tightness, soundness, being free of debris, etc., shall be:

a) Protected against excessive air currents.

b) Sprinkled systematically with cool water.

2) Note: Wetting down around the work will cool the surrounding air and increase the humidity, thus reducing temperatures and evaporation from the concrete.

5. Bonding:

a. When specified, the surface of joints shall be prepared in accordance with Section 03 32 00 - Joints in Concrete.

b. The hardened concrete of joints between footings and walls or columns, between walls or columns and beams or floors they support, joints in unexposed walls and all other not mentioned below shall be dampened (but not saturated) immediately prior to placing of fresh concrete.

c. The hardened concrete of horizontal construction joints in exposed work; horizontal construction joints in the middle of beams, girders or joints, and slabs; and horizontal construction joints in work designed to contain liquids shall be dampened (but not saturated) then thoroughly covered with a coat of neat cement mortar of similar proportions on vertical surfaces and at least 1/2 in. thick on horizontal surfaces. The fresh concrete shall be placed before the mortar has attained its initial set.

d. Joints receiving an adhesive shall have been prepared and adhesive applied in accordance with the manufacturer's recommendations prior to placing of fresh concrete.

e. Surfaces of joints which have been obtained by the use of a chemical retarder shall have been prepared in accordance with the manufacturer's recommendations prior to placing of fresh concrete.

6. Protection and Cleaning of Exposed Structural Steel:

a. The Contractor shall take all necessary precautions to prevent mortar and concrete splashes on the steel. The Contractor shall exercise care to prevent abrasion or scuffing of the paint on the structural steel while concrete is being formed, placed or stripped.

b. The Contractor shall thoroughly clean the structural steel of all concrete drippings or other foreign matter that may have been deposited on the steel or on any other part of the structure as a result of his operations. All the work involved in thoroughly cleaning the steel shall proceed before concrete drippings have

hardened. Immediately after the concrete has been placed, the Contractor shall clean the steel with water and/or such other additional means subject to the approval of the Supervising Engineer for Concrete Construction as may be necessary to remove all mortar, concrete and other foreign matter that has been dropped, dripped, splashed or otherwise deposited on the steel as a result of his operations. It will be the Contractor's obligation and responsibility to remove all foreign matter to the satisfaction of the Supervising Engineer for Concrete Construction.

c. After formwork has been removed, any concrete or other foreign material that may have been previously missed and that still remains on the steel shall be removed.

7. Concrete finishes shall conform to the requirements of Section 03 35 00 - Concrete Finishing.

C. Concrete Curing and Protection

1. General:

a. Protect all freshly deposited concrete from premature drying, from weather elements, from defacement, from flowing water, and from mechanical injury. The concrete shall be maintained with minimal moisture loss at a relatively constant temperature for a period of time necessary for the hydration of the cement and proper hardening of the concrete in accordance with the requirements specified herein.

b. As soon as the concrete has been placed and horizontal top surfaces have received their required finish, provision shall be made for maintaining the concrete in a moist condition for at least a 7-day period thereafter except for high early strength concrete, for which the period shall be at least the first three days after placement. Horizontal surfaces shall be kept covered, and intermittent, localized drying will not be permitted.

c. Concrete curing shall be in accordance with NYCBC Section 1905.11.

2. Curing Methods:

a. The Contractor shall use one of the following methods to insure that the concrete remains in a moist condition for the minimum period stated above.

1) Ponding or continuous fogging or sprinkling.

2) Application of mats or fabric kept continuously wet.

3) Continuous application of steam (under 150 degrees F).

4) Application of sheet materials conforming to ASTM C 171.

5) If approved by the Engineer, application of a curing compound in accordance with Article 3.02, Paragraph C.7.

6) High Early Strength concrete shall be maintained above 50 degrees F and in a moist condition for at least the first 3 days. Accelerated curing of concrete shall comply with ACI 318, Section 5.11.3.

3. The Contractor shall keep absorbent wood forms wet until they are removed. After form removal, the concrete shall be cured by one of the methods in Article 3.02, Paragraph C.2.

4. Any of the curing procedures used in Article 3.02, Paragraph C.2 may be replaced by one of the other curing procedures listed in Article 3.02, Paragraph C.2 after the concrete is one-day old. However, the concrete surface shall not be permitted to become dry at any time.

5. Curing Concrete under Cold Weather Conditions:

   a. Curing under cold weather conditions shall conform to the requirements of ACI 306.

   b. Stripping time for forms and supports shall be increased as necessary to allow for retardation in concrete strength caused by colder temperatures. This retardation is magnified when using concrete made with blended cements or containing fly ash or ground granulated blast furnace slag. Therefore, curing times and stripping times shall be further increased as necessary when using these types of concrete.

   c. The methods of protecting the concrete shall be approved by the Engineer and shall prevent local drying. Equipment and materials approved for this purpose shall be on the site in sufficient quantity before the work begins. The Contractor shall assist the Engineer by providing holes in the forms and the concrete in which thermometers can be placed to determine the adequacy of heating and protection. All such thermometers shall be furnished by the Contractor in quantity and type which the Engineer directs.

6. Curing Concrete under Hot Weather Conditions:

   a. When air temperatures exceed 85ºF, the Contractor shall take extra care in placing and finishing techniques to avoid formation

of cold joints and plastic shrinkage cracking. If ordered by the Engineer, temporary sun shades and/or windbreakers shall be erected to guard against such developments, in addition to generous use of wet burlap coverings and fog sprays to prevent drying out of the exposed concrete surfaces.

b. Curing and protection of the concrete shall begin immediately after completion of the finishing operation. Continuous moist-curing, consisting of methods listed in Article 3.02, Paragraph C.2.a.1 or C.2.a.2, is mandatory for at least the first 24 hours. Method specified in Article 3.02, Paragraph C.2.a.2. may be used only if the finished surface is not marred or blemished during contact with the coverings.

c. At the end of the initial 24-hour period, curing and protection of the concrete shall continue for at least four (4) additional days using one of the methods listed in Article 3.02, Paragraph C.2.

d. Curing procedures during hot weather conditions shall conform to the requirements of ACI 305.

7. Use of Curing Compound:

a. Curing compound shall not be used on surfaces to receive subsequent coatings. Curing compound shall not be used on surfaces exposed to water in potable water storage tanks and treatment plants unless curing compound is certified in accordance with ANSI/NSF Standard 61.

b. When permitted, the curing compound shall maintain the concrete in a moist condition for the required time period, and the subsequent appearance of the concrete surface shall not be affected.

c. The compound shall be applied in accordance with the manufacturer's recommendations after water sheen has disappeared from the concrete surface and after finishing operations. The rate of application shall not exceed 300 square feet per gallon. For rough surfaces, apply in two directions at right angles to each other.

8. Early Termination of Curing:

a. Moisture retention measures may be terminated earlier than the specified times only when at least one of the following conditions is met:

1) The strength of the concrete reaches 85 percent of the specified 28-day compressive strength in laboratory-cured cylinders representative of the concrete in place,

and the temperature of the in-place concrete has been constantly maintained at 50 degrees Fahrenheit or higher.

2) The strength of concrete reaches the specified 28-day compressive strength as determined by accepted nondestructive methods or laboratory-cured cylinder test results.

3) Tests are made of cylinders kept adjacent to the structure and cured by the same methods and reach 70 percent of the specified compressive strength f'_c as determined in accordance with ASTM C 39.

9. Protection:

a. Floors which have received their final finish shall be closed to all traffic for at least 48 hours following the completion of trowelling. Thereafter, before the floor is subjected to any traffic, it shall be covered with paper covering meeting the requirements of ASTM C 171. This protection shall be maintained as long as necessary to avoid damage to the floor.

b. During the curing period, and thereafter as conditions may require, the concrete shall be protected from damaging mechanical disturbances, particularly excessive load stresses, heavy shock, and excess vibration. All finished concrete surfaces shall be protected from damage caused by construction equipment, materials, or methods, and by rain or running water. Self-supporting structures shall not be loaded in such a way as to overstress the concrete.

c. Following removal of protective paper, the surface shall be protected from painting and other work. All stains shall be removed.

D. Concrete Repairs

1. Repair of Formed Surfaces:

a. The following defects shall be repaired in all types of formed finishes:

1) Spalls, air bubbles, rock pockets, form depressions, and other defects which are more than 1/4 inch in depth.

2) Holes from tie rods and other form tie systems.

3) Fins, offsets and other projections which extend more than 1/4" beyond the designated member surface.

4) Structural cracks, as defined by the Engineer.

5) Non-structural cracks, as defined by the Engineer, which are greater than 0.010 inches wide. In water retaining members, elevated slabs subject to rainfall and washdown, and below grade members, any crack which shows any amount of leakage. Where it is not possible to verify that a crack is not leaking, it shall be repaired.

6) Stains and substances marring the surface.

b. The following defects shall be repaired in smooth finish surfaces, in addition to those listed above:

1) Spalls, air bubbles, rock pockets, form depressions, and other defects which extend to more than 1/2" in width in any direction, no matter how deep.

2) Spalls, air bubbles, rock pockets, form depressions, and other defects of any size which exceed 3 in number in a 12 inch square or 12 in number in a 3 foot square.

3) Fins, offsets and other projections shall be completely removed and smoothed.

4) Scratches and gouges in the surface.

5) Surfaces that exceed allowable tolerances.

6) Texture and color irregularities. At water retaining surfaces, texture and color irregularities need not be repaired when greater than 12 inches below the minimum normal operating water surface except where such defects are indicative of reduced durability.

c. Where a smooth rubbed or grout cleaned finish is specified, minor surface defects repairable by the finishing process need not be repaired prior to the finish application, when approved by the Engineer.

2. Method of Repair of Formed Surfaces:

a. Repair and patch defective areas with cement mortar or concrete repair mortar immediately after removal of forms and as directed by the Engineer.

b. Repairs made to water bearing and below grade surfaces shall be made with repair mortar only. Repairs of form tie holes in water bearing or buried surfaces shall be made with non-shrink grout as specified in Section 03 60 00 - Grouting.

c. Cut out honeycomb, rock pockets, voids, and holes left by tie rods and bolts, down to solid concrete but, in no case, to a depth of less than 1 inch for cement mortar and 1/2 inch for repair mortar. Make edges of cuts perpendicular to the concrete surface. Before placing the cement mortar, thoroughly clean and brush-coat the area to be patched with the specified bonding agent. Where concrete repair mortar is used, the surface shall be prepared and mortar placed per manufacturers recommendations. Compact mortar in place and strike off slightly higher than the surrounding surface. Cure as specified.

d. Repairs to surfaces exposed to public view shall match the color and texture of surrounding concrete.

e. Provide test areas at inconspicuous locations to verify mixture, texture and color match before proceeding with the patching.

f. Structural cracks shall be pressure grouted using epoxy injection in accordance with the manufacturer's directions and recommendations.

g. Non-structural cracks shall be pressure grouted using hydrophilic resin in accordance with the manufacturer's directions and recommendations.

h. Fill holes extending through concrete by means of a plunger- type gun or other suitable device from the least exposed face, using a flush stop held at the exposed face to ensure completely filling.

i. Remove stains, grout accumulations, sealing compounds, and other substances marring surfaces by scrubbing, power washing, or abrasive blast using sand finer than No. 30 and air pressure from 15 to 25 psi.

3. Repair of Unformed Surfaces:

a. Test unformed surfaces, such as monolithic slabs, for smoothness and to verify surface plane to the tolerances specified for each surface and finish according to ACI 117. Correct low and high areas as herein specified.

b. Test unformed surfaces sloped to drain for trueness of slope, in addition to smoothness, using a template having the required slope. Correct high and low areas as herein specified.

c. Repair finish of unformed surfaces that contain defects which adversely affect the durability of the concrete. Surface defects include crazing, spalling, popouts, honeycomb, rock pockets, and other objectionable conditions.

d. Repair structural cracks as defined by the Engineer in all structures.

e. Repair non-structural cracks as defined by the Engineer which are greater than 0.01 inches wide, which are in below grade structures, or which are exposed to public view. In water retaining structures, repair any crack which shows any amount of leakage and all cracks where leakage potential cannot be determined.

4. Methods of Repair of Unformed Surfaces:

a. Correct high areas in unformed surfaces by grinding, after the concrete has cured sufficiently so that repairs can be made without damage to adjacent areas.

b. Correct low areas in unformed surfaces during, or immediately after completion of surface finishing operations by cutting out the low areas and replacing with fresh concrete. Finish repaired areas to blend into adjacent concrete. Where the concrete has already set and repairs are required, sawcut around the perimeter of the area to be repaired to a 1/2-inch depth and remove concrete so that the minimum thickness of the repair is 1/2 inch. Apply specified concrete repair mortar in accordance with the manufacturer's directions and recommendations.

c. Remove defective areas to sound concrete with clean, square cuts, to a minimum depth of 1.5 inches. Provide 3/4-inch clearance all around exposed reinforcing steel. Clean and dampen all concrete surfaces in contact with patching concrete and brush with the specified bonding agent. Place patching concrete while the bonding agent is still tacky. Mix patching concrete of the same materials and proportions to provide concrete of the same type or class and color as the adjacent finished concrete. Place, compact and finish as required to blend with adjacent finished concrete. Cure in the same manner as adjacent concrete.

d. Repair isolated random non-structural cracks in members which are not below grade or water retaining, and single holes not over 1 inch diameter, by the dry-pack method. Groove the top of cracks, and cut out holes to sound concrete and clean of dust, dirt and loose particles. Dampen all cleaned concrete surfaces and brush with the specified bonding agent. Place dry-pack grout before the cement grout takes its initial set. Mix dry-pack grout as specified in Section 03 60 00 - Grouting, Grout. Compact dry-pack mixture in place and finish to match adjacent concrete.

Keep patched areas continuously moist for not less than 72 hours.

e. Structural cracks shall be pressure grouted using an epoxy injection system. Apply in accordance with the manufacturer's directions and recommendations.

f. Non-structural cracks in below grade and water retaining structures shall be pressure grouted using hydrophilic resin. Apply in accordance with the manufacturer's directions and recommendations.

g. Where flooring material is to be installed, assure that surface is acceptable for flooring material to be installed in accordance with manufacturer's recommendations.

5. Other Methods of Repair:

a. Repair methods not specified above may be used with written approval of the Engineer.

3.03 FIELD TESTING / QUALITY CONTROL

A. Field Quality Control Testing:

1. General:

a. Unless required otherwise by the Contract, all field quality control testing of materials and the resulting concrete for compliance with the technical requirements of the specifications shall be performed by the Division of Design Services of the Bureau of Engineering Design and Construction and/or it's QA/QC Consultant.

b. The use of these, or any, testing services shall in no way relieve the Contractor of his responsibility to furnish materials and construction in full compliance with the Contract. The Contractor shall provide concrete of the quality specified and it is hereby emphasized that the responsibility for so doing is solely and completely his. It shall be the Contractor's responsibility to work with the Supervising Engineer for Concrete Construction and the DEP designated Testing Laboratory and to keep himself fully informed of the Evaluation of the Compression Test results as described in Paragraph 3.03 B.

2. Testing Provided by DEP – at DEP's discretion, the following testing and inspection shall be provided.

a. Secure production samples of materials at plants or stockpiles during the course of the work and test for compliance with the

specifications unless otherwise noted in the Schedule of Mixes Proportioning and Testing stipulated in the Contract.

b. Provide the services of a qualified concrete technician at each location on the job site where concrete is being mixed and discharged from the mixer for the duration of the concrete placement.

c. Strength Tests: The Concrete Testing Laboratory provided by DEP shall conduct all strength tests (in accordance with ASTM C39). Strength tests of the concrete shall be conducted in accordance with the following procedures.

1) Secure composite samples in accordance with ASTM C 172.

2) Each strength test shall be obtained from a different batch of concrete on a representative, truly random basis, avoiding any selection of the test batch other than by a number selected at random before commencement of concrete placement.

3) Additional concrete test cylinders shall be made from concrete taken out of the bucket, hopper or forms as directed by the Supervising Engineer for Concrete Construction. These test cylinders shall be separate and distinct from those made from the mixer and shall be made from the same batch as the sample taken from the mixer. Where concrete is placed directly from the mixer into forms, without any intermediate conveyance, these additional cylinders will not be required.

4) When pumping or pneumatic equipment is used, samples shall be taken at the discharge end.

5) Compressive strength tests shall be conducted on a set of four specimens molded from each sample in accordance with ASTM C 31, and cured under standard moisture and temperature conditions in accordance with ASTM C 31.

6) Test two specimens at 7 days in accordance with ASTM C 39. Test two specimen at 3 days instead of 7 days when high early strength is required.

7) Test three specimens at 28 days in accordance with ASTM C 39. The 28-day test result shall be the average of the strengths of the three specimens, except that if one specimen in a test manifests evidence of improper sampling, molding or testing, it shall be discarded and

the remaining two strengths averaged. Should more than one specimen in a test show any of the above defects, the entire test shall be discarded. When high early strength is required, the specimens shall be tested at 7 days instead of 28 days.

8) When the 7-day test results (3-day for high early strength) are below 65% of the specified strength and/or whenever the 28-day test results (7-day for high early strength) are below the specified strength, the specimens shall be kept intact and stored for a minimum of 30 days or until inspected by both the Supervising Engineer for Concrete Construction or his authorized representative and the Contractor.

9) Written results of the compression test results shall be posted on the DEP's concrete database 24 hours following the test date on the following business day. The test results are available to the Supervising Engineer for Concrete Construction, the Engineer, Contractor and concrete supplier. A hard copy of the final result will be sent to the Resident Engineer.

10) Unless otherwise directed, all cylinders shall only be handled by DEP designated personnel.

d. Other Required Tests:

1) Check the slump, air content, concrete temperature, unit weight, yield, and water content of each sample of concrete to be used in molding strength test specimens.

2) Perform all other field testing of concrete as required by the New York City Building Code.

3) Slump testing shall be conducted in accordance with ASTM C 143.

4) Air content testing shall be conducted in accordance with either ASTM C 231 (Pressure Method) or ASTM C 173 (Volumetric Method) on concrete samples from which the compressive strength test specimens are made. Note that the chase indicator is not the approved ASTM volumetric test method. Air content testing of Lightweight Concrete shall be in accordance with ASTM C 173.

5) Additional tests of air content shall be performed on a regular and frequent basis for control as directed by the

Supervising Engineer for Concrete Construction. A Chase indicator, calibrated at least once daily against the readings for air content obtained by methods outlined in Article 3.03, Paragraph A.2.d.4, may be used for additional testing. Use of the Chase Indicator alone will not be considered as having met the requirements of Article 3.03, Paragraph A.2.d.1 for checking air content.

6) Measurements of concrete temperature shall be performed in accordance with ASTM C 1064.

7) Unit Weight tests shall be made with a calibrated one-half (1/2) cubic foot bucket in accordance with ASTM C 138. On obtaining the unit weight, the yield shall be immediately computed as the ratio; weight of all the ingredients batched including the water added per cubic yard (from the batching ticket) divided by the unit weight determined times 27. Over-yielding or under-yielding by more than 2% are cause for concern and should be immediately investigated.

8) Water content testing shall be conducted in accordance with AASHTO TP 23.

9) Properly note and record the time of day when all tests were made and the corresponding results. Also, record from what truckloads the samples were taken, the class of concrete which the samples represent and exactly where the concrete represented by the sample was deposited in the structure.

e. Frequency of Testing:

1) For buildings, make one strength test for each 50 Cu. Yd. or fraction thereof for each mix design placed in any one day except that a minimum of two tests will be made for each day's placement.

2) The minimum number of tests shown in the following table will be made for concrete used for all structures other than buildings.

Total Cubic Yards of Concrete Placed During Day	Minimum Number of Strength Tests
Up to 100	One for each 50 Cu. Yds.*
OVER 100 CU. YDS.	One for each 100 Cu.Yds.*
* or fraction thereof.	

3) The Supervising Engineer for Concrete Construction may require that additional tests be made.

f. Additional Services: The DEP provided testing agency shall provide additional services to the extent deemed necessary by DEP and shall also perform the following services.

1) Inspect concrete batching, mixing, and delivery operations in accordance with Inspection Requirements of the administrative building code of the City of New York.

2) Check batching and mixing operations.

3) Review the manufacturer's report of each shipment of cement, aggregates and reinforcing steel and/or conduct laboratory spot checks of these materials as received.

4) Inspect the location and dimension of the forms, the placing of the reinforcing steel and the placing, conveying and depositing of the concrete.

5) Sample concrete at point of placement and other locations directed by the Supervising Engineer for Concrete Construction and perform required tests.

6) Additional testing and inspection required because of changes in materials or mixture proportions requested by the Contractor. When required, such testing shall be performed at the Contractor's expense.

7) Additional testing of materials or concrete occasioned by failure to meet specification requirements. When required, such testing shall be performed at the Contractor's expense.

3. Authority and Duties of the DEP provided Special Inspection Testing Agency:

a. Special Inspections of concrete shall be in accordance with NYCBC Table 1704.4.

b. Technicians representing the testing agency shall inspect the materials and the manufacture of concrete and shall report their findings to the Supervising Engineer for Concrete Construction or his authorized representative and the Contractor.

c. When it appears that the material furnished or work performed by the Contractor fails to fulfill specification requirements, the technician shall immediately notify the Supervising Engineer for Concrete Construction or his authorized representative, and the Contractor of such failure.

d. The technician shall not act as foreman or perform other duties for the Contractor.

e. Technicians are not authorized to revoke, alter, relax, enlarge or release any requirement of the specifications, nor to approve or accept any portion of the work.

4. Responsibilities and Duties of the Contractor:

a. Submit data and test documentation on materials and design mixtures including trial batch and shrinkage test results to the Engineer at least 60 days prior to the start of field operations.

b. Submittal to the Supervising Engineer for Concrete Construction the procedures, methods and concrete mix designs, the name and location of the proposed concrete plant. Submit the quality assurance programs of the concrete suppliers and provide copies of all test reports to the Engineer.

c. Provide all materials, labor and equipment necessary to assist the representatives of the Owner's testing agency in obtaining, preparing and handling test samples at the project site or at other sources of material. When directed by the Engineer, the Contractor shall be responsible for transferring strength test specimens from point of casting to curing boxes and/or to testing agency vehicles.

d. Advise the Resident Engineer and the Supervising Engineer for Concrete Construction and the DEP provided Testing Agency sufficiently in advance of operations to allow for completion of quality tests and for the assignment of personnel.

e. Provide and maintain for the sole use of the testing agency adequate facilities for safe storage and proper curing of concrete test cylinders on the project site for the first 24 hours, as required by ASTM C 31. The Contractor shall provide an insulated box

of substantial construction for use in storing cylinders on the site until such time as they are transported to the testing laboratory. The box shall be large enough to accommodate the maximum number of test cylinders which may be required for any day's concrete placement, and shall have an insulated hinged cover. Heating facilities shall be installed in the box such that the temperature within the box may be maintained at the limits specified by ASTM C 31. The box shall be of such dimensions as to permit placing the cylinders in the box one (1) high only. No stacking of cylinders will be permitted. A high-low thermometer shall be placed in the storage box and the maximum and minimum temperatures noted shall be recorded on an appropriate identification card for each test. To minimize the hazard of disturbance during curing, the storage box shall be located in an area free from vibration such as pile driving and traffic of all kinds. No concrete shall be delivered on the site until such storage curing box has been provided and any identified problems with the box addressed to the satisfaction of the Engineer. Cylinders shall remain in the curing box until ready for delivery to the testing laboratory but not less than 24 hours. Sufficient box storage capacity shall be provided by the Contractor to allow for up to 72 hours of cylinder storage.

f. The DEP provided Testing Agency shall deliver concrete test cylinders to the DEP designated testing laboratory, or such other location as designated in the Contract. Delivery methods shall be in accordance with the requirements of ASTM C 31. Deliveries shall be made such that cylinders remain at the job site (in the boxes provided for their storage) no less than 24 hours and no more than 72 hours after the casting.

g. The Contractor shall furnish copies of mill test reports of all shipments of cement, aggregates and reinforcing steel being used to Supervising Engineer for Concrete Construction and the testing agency.

h. The Contractor shall be responsible for:

1) All testing associated with the evaluation proposed mix designs including required trial batch and shrinkage testing.

2) Establishing and controlling the mix proportions during the entire progress of the work in accordance with Article 2.02, Paragraph E.

3) Testing required because of changes in materials or proportions of the mix requested by the Contractor, as well as, any extra testing of concrete or materials occasioned by failure to meet specification requirements.

B. Evaluation of Concrete Quality:

1. General:

a. Concrete quality shall include but not be limited to satisfactory strength, durability, density (air entrainment), wearing quality, shrinkage cracks, color, physical appearance etc.

b. Wherever there is evidence that any of the concrete in place does not appear to produce the results required by the specifications, such concrete shall be considered questionable and evaluations shall be made as detailed below.

2. Evaluation of Compressive Test Results:

a. Test results shall be evaluated separately, for each type and each specified strength of concrete. Evaluation shall be in accordance with the ACI 214R.

b. The strength level of an individual class of concrete shall be considered satisfactory if both of the following requirements are met:

1) Every arithmetic average of any three consecutive compressive strength tests equals or exceeds the specified compressive strength f'c.

2) No individual strength test (average of two cylinders) falls below the specified compressive strength f'c by more than 500 psi when f'c is 5,000 psi or less, or by more than 0.10 f'c when f'c is more than 5,000 psi. The strength level of the concrete will be considered satisfactory as long as the averages of all sets of three consecutive compressive strength test results equal or exceed the specified compressive strength f'c and no individual strength test result falls below the specified compressive strength f'c by more than 500 psi.

c. For evaluation of the control of the quality and uniformity, each type and specified strength of the concrete shall be represented by at least five (5) tests.

d. If results of a number of consecutive seven (7) day tests at any stage of the work indicate abnormalities or results of a number of twenty-eight (28) day tests are below the specified strengths,

the production and testing of the concrete shall be immediately investigated and reported upon by the Evaluation Committee noted in Article 3.03, Paragraph B.5. It is emphasized that the report of the Evaluation Committee is advisory. The responsibility for the production of the concrete and the decision as to how to proceed with the work remain with the Contractor. However, the decision as to how to proceed is subject to review and approval by the Commissioner.

3. Evaluation of Questionable In-Place Concrete Construction by Non-destructive Methods:

   a. Visual inspection, impact hammers, sonoscopes, microscopic examination, chemical analysis of the hardened concrete, probes or other nondestructive testing devices may be used as an indicator of the relative quality and uniformity of various areas of the structure, as an aide in evaluating concrete in place, or in determining locations of areas to be cored. Any program of nondestructive testing shall be performed as directed by and under the supervision of the Evaluation Committee noted in Article 3.03, Paragraph B.5. Test results of any program of nondestructive testing and recommendations based thereon shall be reported by the Committee to the Commissioner prior to the commencement of any other program of further testing, if recommended or required. All viewpoints if there is no complete agreement, shall be noted in the report.

   b. Nondestructive Tests:

      1) Test results shall be evaluated and shall be valid only if tests have been conducted by properly calibrated equipment in accordance with recognized standard procedures.

      2) Nondestructive tests shall not be used as the sole basis for accepting or rejecting concrete.

4. Evaluation of Questionable In-Place Concrete Construction from Core Tests:

   a. Core tests shall be conducted only as recommended and directed by the Evaluation Committee noted in Article 3.03,Paragraph B.5 and only after a program of nondestructive testing as noted in Article 3.03,Paragraph B.3. Core tests shall be evaluated and shall be valid only if tests have been conducted in accordance with specified procedures.

b. When core testing is required, cores shall be obtained and tested in accordance with ASTM C 42. Cores shall be tested saturated-surface-dry or shall be tested air-dry depending as to whether the area where the questionable concrete is located shall be wet or dry under service conditions. Such determination shall be made by the Committee and they shall direct the condition of the cores at the time of testing. If the cores are to be tested dry, they shall be air dried (temperature 60 to 70 degrees F and relative humidity less than 60 percent) for seven (7) days before the test. If the cores are to be tested wet, they shall be tested after moisture conditioning in accordance with ASTM C 42. The laboratory report shall state whether the cores were tested saturated-surface-dry or surface-dry.

c. At least three representative cores shall be taken from each member or area of concrete in place that is considered potentially deficient. The location of cores will be determined by the Committee so as to least impair the strength of the structure.

d. If, before testing, one or more of the cores shows evidence of having been damaged subsequent to or during removal from the structure, or is obviously defective, replacement cores shall be taken.

e. Concrete in the area represented by a core test, made and tested in accordance with the specified requirements above will be considered adequate for structural strength if the average strength of the three cores taken from the immediate area of the questionable concrete is equal to or greater than the specified strength and no single core strength is less than 85 percent of the specified strength (f'c).

f. The Committee shall determine the area where the cores are to be taken and they shall determine the number of cores to demonstrate the adequacy of the questionable concrete. Corrections to the strength values shall be made if the length to the diameter ratio is different from two. No strength correction shall be made for the age of the concrete cores.

g. If the average strength of the cores as tested is less than the required value, the Committee will make a recommendation as to whether the values obtained are acceptable or they will recommend that the values obtained be checked against a structural analysis as covered in Paragraph 3.03 C.

h. Core holes shall be plugged solid as specified.

5. Evaluation Committee:

   a. The following shall constitute a Committee for the investigation and the evaluation of the quality of the concrete when there are indications that the requirements of Paragraph 3.03 B are not being met. The Resident Engineer (who shall act as Chairman of the Committee), the Supervising Engineer for Concrete Construction or authorized representative, representatives of the Contractor, the Concrete Producer, the Testing Agency, the Architect/Engineer responsible for the design and such other members as the Commissioner may designate. Such members of the Committee as designated by the Chairman shall meet whenever request for such meeting is made by any member and/or as otherwise specified. Reports and recommendations of the Committee shall be submitted to the Contractor and the Commissioner. All viewpoints, if there is no complete agreement shall be noted in the report and reports shall be countersigned by all participating members of the Committee. The Contractor shall be responsible for the preparation and submission of reports.

   b. The functions of the Committee and any reports, recommendations, etc., it submits shall be advisory in nature. The responsibility for the production and quality of the concrete remains solely and completely with the Contractor.

   c. All expenses incurred due to the functioning of the Committee shall be borne by the Contractor except that all members of the Committee shall serve without fee.

6. Additional Curing:

   a. If the concrete fails to meet the specified compressive strength requirement, additional curing as specified by the Supervising Engineer for Concrete Construction may be required and modifications may be required in the concrete mix design for the remaining concrete work, at the expense of the Contractor, in addition to the measures outlined in Article 3.03, Paragraph B.

7. Acceptance of Concrete:

   a. Concrete Strength:

      1) Concrete not meeting the requirements of Article 3.03, Paragraph B.2 shall be considered potentially deficient. Steps shall be taken to increase the strength to ensure that the strength level will be satisfactory. For potentially deficient concrete, see Article 3.03, Paragraph C.

b. Air Content:

1) Concrete not within the specified limits of air entrainment and tested in accordance with Article 3.03, Paragraph B shall be rejected.

2) Steps must be made to control the proper air content.

c. Slump:

1) Concrete not within the specified slump limits at the point of placement may be rejected.

2) When the concrete is tested and found to be out of specifications the Contractor shall immediately adjust the mix to bring the mixture within the specified slump limits.

C. Acceptance of Structure:

1. General:

a. Notwithstanding the provisions of any section of this Contract, all concrete shall conform to the requirements of the New York City Building Code.

b. Completed concrete work which meets all applicable requirements will be accepted without qualification.

c. Completed Concrete work which fails to meet one or more requirements shall be considered potentially deficient. Potentially deficient concrete which has been repaired to bring it into compliance will be accepted without qualification. The decision as to whether it has been brought into compliance except as otherwise noted in this Section shall rest with the Supervising Engineer for Inspection subject to approval of the Commissioner and the Building Department.

d. Potentially deficient concrete which cannot be brought into compliance shall be evaluated by the Committee noted in Article 3.03, Paragraph B and a report submitted to the Commissioner. The Commissioner will then, in writing, either accept without qualification or accept subject to Retainage (as outlined in Article 3.03, Paragraph .C.8) or direct that the concrete be reinforced or supplemented with additional construction to bring it into compliance after which it may be resubmitted to the Commissioner.

e. Repair potentially deficient concrete work by removing and replacing or by reinforcing with additional construction as required by the Engineer. To bring the rejected work into

compliance, use repair methods that will maintain the strength of the structure and meet all other applicable requirements for function, durability, dimensional tolerances, and appearance.

f. Obtain acceptance by the Engineer for repair methods and materials and for modifications needed to assure that concrete work complies with requirements in the Contract Documents.

g. The Contractor shall pay all costs incurred including redesign and reverification in bringing the concrete work into compliance and acceptance.

2. Dimensional Tolerances:

a. Formed surfaces resulting in concrete outlines smaller than required by an amount exceeding the requirements of Section 3.3 of ACI 347R shall be considered deficient in strength and subject to the provisions of Article 3.03, Paragraph C.4.

b. Formed surfaces resulting in concrete outlines larger than required, by an amount exceeding the requirements of Section 3.3 of ACI 347R may be rejected and the excess material shall be subject to removal. If removal of the excess material is permitted, it shall be accomplished in such a manner as to maintain the strength of the section and to meet all other applicable requirements of function and appearance.

c. Concrete members cast in the wrong location may be rejected if the strength, appearance or function of the structure is adversely affected or misplaced items interfere with other construction.

d. Inaccurately formed concrete surfaces exceeding the requirements of Section 3.3 ACI 347R and which are exposed to view may be rejected and shall be repaired or removed and replaced if required.

3. Appearance:

a. Concrete exposed to view with defects which adversely affect the appearance of the specified finish may be repaired, if possible. If, in the opinion of the Supervising Engineer for Concrete Construction, the defects cannot be repaired, the concrete shall be considered potentially deficient, such concrete shall be evaluated by the Committee noted in Article 3.03.B and a report submitted to the Commissioner. The Commissioner will then in writing, either accept without qualification or accept subject to Retainage (as outlined in Article 3.03, Paragraph C.8) or direct that other remedial measures be taken after which it may be resubmitted to the Commissioner.

4. Strength of Structure:

   a. The strength of the structure in place will be considered potentially deficient if it fails to comply with any requirements which control the strength of the structure, including but not necessarily limited to the following conditions:

      1) Low concrete compression test strength as evaluated by Article 3.03, Paragraph B above. However, in those areas or members containing such concrete, if a structural analysis by the architect/engineer indicates the completed structure will be suitable for its intended use, i.e., that the stresses which will be developed under design load in the members containing below-strength concrete are less than the design stress permitted for the actual compression test strengths reported and the analysis is approved by the Building Department, the member or members will be accepted without qualification.

      2) Low concrete core tests as evaluated by Article 3.03, Paragraph B above. However, in those areas or members where core tests are made in accordance with Article 3.03, Paragraph B.4, if a structural analysis by the architect/engineer indicates the suitability of the structure for its intended use, i.e., that the stresses which will be developed under design load in the members containing below-strength concrete are less than the design stress permitted for the actual core test strengths reported, and the analysis is approved by the Building Department, the areas or members will be accepted without qualification.

      3) Reinforcing steel size, quantity, strength, position or arrangement at variance with the specified requirements or the Contract Drawings.

      4) Concrete which differs from the required dimensions or location in such a manner as to reduce the strength.

      5) Curing less than specified.

      6) Inadequate protection of concrete from extremes of temperature during early stages of hardening and strength development.

7) Mechanical injury, construction fires, accidents or premature removal of formwork likely to result in deficient strength.

8) Poor workmanship likely to result in deficient strength.

5. Action Required When Strength Is Potentially Deficient:

a. When the strength of the structure is considered potentially deficient, the following actions may be required by the Engineer/Architect:

1) Structural analysis or additional testing or both may be required.

2) Core tests may be required.

3) If testing is inconclusive or impractical or if structural analysis does not confirm the Safety of the structure, load tests may be required and their results evaluated in accordance with ACI 318.

4) Concrete Work rejected by structural analysis or by results of a load test shall be reinforced with additional construction as required by the Engineer/Architect, or replaced.

5) Document all repair work performed to bring strength-deficient concrete work into compliance with Contract Documents, and submit the documentation to the Engineer/Architect for acceptance.

6. Durability:

a. The durability of the concrete work will be considered deficient and therefore the concrete work shall be rejected, if it fails to comply with any of the requirements which control the durability of the structure, including, but not necessarily limited to, the following conditions:

1) Strength failing to comply with Article 3.03, Paragraph B above.

2) Materials for concrete not conforming with the specified requirements of Article 3.03, Paragraph C.2. above.

3) Concrete not conforming with either the specified air-entrainment requirements or the air content limits.

4) Curing not accomplished in accordance with Contract Documents.

5) Inadequate protection of concrete from extremes of temperature during early stages of hardening and strength development.

7. Withholding:

a. Where concrete is placed which is considered to be deficient, whether in strength, appearance, durability or any other quality defined, payment may be withheld at the discretion of the Supervising Engineer for Concrete Construction. If such concrete is subsequently accepted without qualification, then payment shall be made for such concrete including return of all monies withheld.

8. Retainage:

a. Deficient concrete which cannot be brought into compliance and is nevertheless accepted by the Commissioner shall be subject to the following permanent retainage. For every cubic yard of concrete so placed, an amount equal to 10% of the unit price for concrete in place for unit price contracts or 10% of the price established in the detailed estimate for concrete in place for lump sum contracts shall be permanently retained.

9. Rejected Concrete:

a. Concrete which has been rejected, in writing, by the Commissioner, shall be removed and replaced. The cost of all such removed and replaced concrete shall be borne by the Contractor.

10. Protection of In-Place Concrete:

a. Loading and Support of Concrete:

1) Do not allow construction loads to exceed the superimposed load which the member, with necessary supplemental support, is capable of carrying safely and without damage. Submit for acceptance data on the amount of loading, method of distributing load, and any proposed supplemental support during construction.

b. Protection from Mechanical Injury:

1) During the curing period, protect, the Contractor shall protect the concrete and its shoring from damaging mechanical equipment inducing shock and vibrations at all times. Protect all concrete surfaces from damage by construction traffic, equipment, materials, rain or running water, and other adverse weather conditions.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

SECTION 03 32 00 - JOINTS IN CONCRETE
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Work specified in this Section consists of providing all labor, materials, and incidentals necessary to furnish and install joints, joint materials, waterstops and embedded items as indicated on the Contract Drawings, specified herein and as needed for a complete installation.

B. Joints shall comply with the requirements of Section 03 10 00 - Concrete Forming and Accessories.

C. Types of joints in concrete shall be as follows:

1. Construction Joints - Joints between adjacent concrete placements continuously connected with reinforcement.

2. Control Joints - Joints formed in concrete to provide a weakened plane in the concrete section to control formation of shrinkage cracks.

3. Expansion Joints - Joints in concrete which allow thermal expansion and contraction of concrete. Reinforcement terminates within concrete on each side of joint.

D. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. The Contractor shall install joint material per the construction schedule submitted to and approved by the Engineer in a sequence and manner that will not damage the Work.

1.06 QUALITY ASSURANCE

A. Reviews of Shop Drawings shall be obtained before custom fabrication is started and before delivery of materials to the project site.

B. Work of this Section shall be coordinated with the work of other trades so that construction is not delayed.

C. Joint installation procedures and health and safety of the work force shall be the responsibility of the Contractor. The requirements of authorities having jurisdiction shall be complied with.

D. The final responsibility for constructing a watertight condition at expansion joints and construction joints remains with the Contractor as part of the Work under this Contract. Errors of detailing and fabrication and for the correct fit of the work shall be the responsibility of the Contractor.

E. Defective Work, as determined by the Engineer, shall be remedied by cutting and rebuilding the concrete walls and slabs, replacing the waterstop assemblies or other methods as approved by the Engineer.

1.07 SUBMITTALS

A. Contractor shall submit Shop drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. Information as shown on the Contract Drawings and at the site, where necessary.

2. Sizes, sections, reinforcement and dimension of units, the jointing, dowels, anchors, etc., and all other necessary details.

3. Installation of joints, including various connections, anchorage details, special jointing, the Contractor's proposed construction and control joints, and other accessories as required to complete the work.

4. Prior to installation, the Contractor shall submit layout drawings for approval, showing the extent of the waterstop installations that are proposed to ensure that all construction and expansion joints, in water-containing structures, will be watertight. The drawings shall include elevations, sections, etc., and all details to show that a continuous watertight installation is provided.

5. Equipment pad layout drawings.

B. Manufacturer's specifications and installation instructions for each type of required joint and accessory shall be submitted. These include expansion joint fillers, expansion joint sealers, waterstops, shapes of waterstops, chemical retarders, adhesives, sleeves, inserts, anchors, embedded items, and similar items.

C. The Contractor shall submit to the Engineer one sample of each type of waterstop. Each sample shall include a splice.

D. Method to be used to roughen construction joints and achieve bond including product identification as applicable.

E. Applicator's Qualifications.

F. Proof of satisfactory field service of sealants.

G. Sustainability Submittals:

1. Environmental Product Declarations

a. The Contractor shall provide product-specific type III Environmental Product Declaration (EPD) conforming to ISO 14025, 14044.

2. Envision Submittals

a. The Contractor shall report information pertaining to the sustainable procurement, regional sourcing, and/or recycled content of new materials to be procured during the Work, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall coordinate with its vendor on sustainable product requirements as stipulated by the Contractor's approved New Materials Sustainable Implementation Plan, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall submit vendor shop drawings for review by the Engineer that clearly illustrate the vendor is meeting the requirements as approved in the Contractor's New Materials Sustainable Implementation Plan.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Materials shall be delivered to the site in an undamaged condition and at such intervals as will avoid delay in the Work.

B. Materials shall be stored and protected in a clean, properly drained location and shall be kept off the ground under a weather-tight covering permitting good air circulation. Materials shall be stored on dry wood sleepers, pallets, platforms or other appropriate supports which have slope for positive drainage. Materials shall be protected from distortion, excessive stresses, corrosion and other damage. Materials shall not be stored on the structure in a manner that might cause distortion or damage to the supporting structure. The maximum uniform distributed storage load shall not exceed 20 pounds per square foot.

C. Materials shall be protected before, during and after installation to ensure acceptable finished Work. In-place materials and other Work in connection with the joint installations shall be protected.

D. Material shall be handled safely in a manner that will prevent distortion or other damage. Care shall be exercised at all times to avoid damage through careless handling during unloading, storing and installing.

E. In the event of damage to the Work, necessary repairs or replacements shall be performed until satisfactory work is met at no expense to the City.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Concrete Bonding Agent

1. The concrete bonding agent shall be:

a. Corr-Bond, as manufactured by Euclid Chemical, East Brunswick, NJ.

b. Armatec 110, as manufactured by Sika Chemical Company, Lyndhurst, NJ

c. Or approved equal

B. Expansion joint fillers (Type I) shall be:

1. Type FF-7 cross-linked, closed cell polyethylene, as manufactured by Progress Unlimited Inc., Lynbrook, NY.
2. Type W, cross-linked, closed cell polyethylene, as manufactured by Hydrozo/Jeene, Inc, Lincoln, NE.
3. Or approved equal

C. Joint Sealants:

1. Type A shall be
   a. Sikaflex-2C NS/SL as manufactured by Sika Corporation, Lyndhurst, NY.
   b. Sonolastic SL-1, as manufactured by Sonneborn/Master Business Solution, Parsippany, NJ.,
   c. Permapol RC-270 Resevoir Sealant, as manufactured by Products Research and Chemical Company, (now is Courtaulds, PLC,) London W1A2BB, England.
   d. Or approved equal.
2. Type B shall be
   a. Magnum NS-100, as manufactured by Tamms Industries, Kirkland, IL.
   b. Sikaflex 1A, Sika Corporation, Lyndhurst, NY.
   c. Or approved equal.
3. Type C shall be
   a. Sonolastic Two-part, as manufactured by Sonneborn/Master Business Solution, Parsippany, NJ.
   b. Hornflex-L, as manufactured by Tamms Industries, Kirkland, IL.
   c. Cormax PSC, as manufactured by DuPont, (Multiple locations in USA).
   d. Or approved equal.

D. PVC waterstops shall be:

1. Model 679 for construction joints and Model 738 for expansion joints, as manufactured by Greenstreak/Sika Corp USA, Lyndhurst, NJ.
2. Or approved equal.

E. Hydrophilic Rubber Waterstops shall be:

1. Duroseal Gasket, Type 2010, as manufactured by BBZ USA, Inc, St. Louis, MO

2. Adeka Ultraseal MC-2010M, as manufactured by Asahi Denka Kogyo KK, Japan

3. Or approved equal.

F. Hydrophilic Sealant shall be:

1. Duroseal Paste, by BBZ USA, Inc, St. Louis, MO.

2. Adeka Ultraseal P-201, by Asahi Denka Kogyo K.K, Japan.

3. Sika Swell S, by Sika Corporation, Lyndhurst, NJ.

4. Or approved equal.

G. Hydrophilic Injection Resin shall be:

1. Duroseal Inject 1K/2K, by BBZ, USA, Inc., St. Louis, MO.

2. Sika Injection 29 by Sika Corporation, Lyndhurst, NJ.

3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

1. Concrete Bonding Agent

a. The concrete bonding agent product and manufacturer shall be as specified in this Section.

b. Surface preparation, application and curing shall be performed in strict accordance with the manufacturer's directions.

B. Performed Expansion Joint Filler

1. Preformed expansion joint filler shall be nonextruding, and shall be of the following types:

a. Type I Sponge Rubber, conforming to ASTM D 1752, Type I.

b. Type II Cork, Conforming to ASTM Designation D 1752, Type II.

c. Type III Self-expanding cork, conforming to ASTM Designation D 1752, Type III.

d. Type IV Bituminous Fiber, conforming to ASTM Designation D 1751.

2. Expansion joint fillers (Type I) product and manufacturer shall be as specified in this Section.

3. Unless otherwise specified, Type II and Type III shall conform to the requirements of the Standard Highway Specifications of the NYC Department of Transportation..

4. Asphaltic blown joint filler for sealing joints over Type IV preformed joint filler shall comply with the requirements of Section 2.16 of the Standard Highway Specifications of the NYC Department of Transportation.

C. Joint Sealants

1. Type A: Multi-component, non-sag, low-modulus polyurethane rubber sealant meeting ASTM C 920, Type M, Grade NS, Class 25, use NT, M, A, and O Capable of withstanding 50% in extension or compression shall be as specified in this Section

2. Type B: Single component polyurethane sealant meeting ASTM C 920, Type S, Grade NS, Class 25, Use NT, M, A, and O, capable of withstanding 25% in extension or compression shall be as specified in this Section.

3. Type C: Multi-component chemical resistant polysulfide sealant conforming to ASTM C 920, Type M, Grade NS, Class 25 shall be as specified in this Section

D. Backer Rod

1. Backer rod shall be an extruded closed-cell polyethylene foam rod. The material shall be compatible with the sealant material used and shall have a tensile strength of not less than 40 psi and a compression deflection of approximately 25 percent at 8 psi. The rod shall be 1/8-inch larger in diameter than the joint width at joints less than 3/4-inch wide and 1/4-inch larger in diameter at joints 3/4-inch end wider.

E. PVC Waterstops

1. PVC waterstops shall be manufactured from virgin polyvinylchloride and shall meet or exceed all requirements set forth in the U.S. Army Corps of Engineers Specification CRD C 572.

2. All PVC waterstops shall be of polyvinylchloride extruded from an elastomeric plastic compound of which the basis resin shall be polyvinylchloride. The compound shall contain any additional resins, plasticizers, stabilizers or other materials needed to ensure qualities which will meet the requirements herein specified.

3. The required minimum physical characteristics for this material are:

   a. Tensile strength 1,750 psi

   b. Ultimate elongation not less than 280%.

4. No reclaimed PVC materials shall be used for manufacture of the waterstops. The Contractor shall furnish certification that the proposed waterstops meet the above requirements.

5. PVC waterstops for construction joints shall be flat ribbed type, 6 inches wide unless otherwise shown on the Contract Drawings, with a minimum thickness at any point of 3/8 inches.

6. PVC waterstops for expansion joints shall be ribbed with a center bulb, 9 inches wide with a minimum thickness at any point of 3/8 inches. The center bulb shall have an O.D. not less than 1-3/8 inches.

7. All PVC waterstops shall have an integral fastening system consisting of hog rings and grommets.

8. PVC waterstops product and manufacturer shall be as specified in this Section.

F. Hydrophilic Rubber Waterstop

1. Hydrophilic rubber waterstop materials shall be bentonite-free and shall expand by a minimum of 80 percent of dry volume in the presence of water to form a watertight joint seal without damaging the concrete in which it is cast. For location, see the Contract Drawings.

2. The material shall be composed of resins and polymers which absorb water and cause an increase in volume in a completely reversible and repeatable process. The waterstop material shall be dimensionally stable after repeated wet-dry cycles with no deterioration of swelling potential.

3. Hydrophilic rubber waterstop shall be solid rectangular shape with minimum cross sectional dimensions of 3/8-inch by 3/4-inch.

4. Hydrophilic Rubber Waterstops product and manufacturer shall be as specified in this Section.

G. Hydrophilic Sealant

1. The Hydrophilic Sealants shall adhere firmly to concrete, metal and PVC in dry or damp conditions. When cured, it shall be elastic indefinitely.

2. Hydrophilic Sealants product and manufacturer shall be as specified in this Section.

H. Hydrophilic Injection Resin

1. Hydrophilic injection resin shall be acrylate-ester based. Its viscosity shall be less than 50 cps. It shall be water soluble in its uncured state, solvent free, and non-water reactive. In the cured state, it shall form a solid hydrophilic flexible material which is resistant to permanent water pressure and shall not attack bitumen, joint sealants or concrete.

2. Hydrophilic Injection Resin product and manufacturer shall be as specified in this Section.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Field Measurements

1. Prior to commencement of the Work, existing dimensions, elevations, locations and conditions applicable to the work shall be field verified. Variances and discrepancies from the Contract Drawings and potential interferences shall be reported promptly to the Engineer.
2. Sufficient field measurements shall be taken prior to preparation of Shop Drawings and fabrication of construction materials, where possible, to ensure proper fitting of the work. However, job progress shall not be delayed. Allow for adjustments and fittings wherever the taking of field measurements before fabrication may not be possible or might delay the work.
3. Actual field-verified conditions may require modifications to the fabrication and/or erection details indicated on the Contract Drawings. The Work shall be performed to meet actual field conditions encountered.

B. Preparation

1. The Contractor shall examine the areas and conditions under which the Work of this Section is to be performed. Conditions detrimental to the proper and timely completion of the Work shall be corrected. Work shall not be proceeded until unsatisfactory conditions have been corrected.
2. All new placement of concrete shall be in accordance with Section 03 30 10 – Low Carbon Cast-In-Place Concrete.
3. Concrete shall not be allowed to enter the joint or the space for the sealant and destroy the proper functions of the joint.
4. The surface of the concrete at all joints shall be thoroughly cleaned and all laitance removed by wire brushing, air or light sand blasting.
5. The joint shall be thoroughly clean and free from dirt and debris before the primer and the sealant are applied. Where the finished joint will be visible, masking of the adjoining surfaces shall be carried out to avoid their discoloration. The sealant shall be neatly tooled into place and its finished surface shall present a clean and even appearance.
6. All joints shall be sealed as shown on the Contract Drawings.

C. Not Used

3.02 IMPLEMENTATION

A. Construction Joints

1. Construction joints shall be as shown on the Contract Drawings where structural integrity is affected, otherwise, Contractor shall submit description of the joint and its location to the Engineer for approval.
2. Unless noted otherwise on the Contract Drawings, construction joints shall be located near the middle of the spans of slabs, beams, and girders unless a beam intersects a girder at this point. In this case, the joints in the girders shall be offset a distance equal to twice the width of the beam. Joints in

walls and columns shall be at the underside of floors, slabs, beams, or girders and the top of footings or floor slabs unless noted otherwise on the Contract Drawings. Beams, girders, brackets, column capitals, haunches, and drop panels shall be placed at the same time as slabs. Joints shall be perpendicular to the main reinforcement.

3. Maximum distance between horizontal joints in slabs and vertical joints in walls shall be 45'-0" unless otherwise indicated on the Contract Drawings.

4. All corners shall be part of a continuous placement, and should a construction joint be required, the joint shall not be located closer than five feet from a corner.

5. Waterstop shall be provided at all joints in water retaining structures. Waterstop shall be provided at all joints below grade in walls or slabs which enclose an accessible area.

6. All reinforcing steel and welded wire fabric shall be continued across joints. Inclined dowels shall be provided as detailed or directed by the Engineer.

7. The surface of the concrete at all joints shall be thoroughly cleaned and all laitance removed. Following methods are acceptable:

   a. The use of an approved chemical retarder applied in accordance with the manufacturer's recommendations which delays but does not prevent the setting of the surface mortar. Retarded mortar shall be removed within 24 hours after placing to produce a clean exposed aggregate bonding surface.

   b. By roughening the surface of the concrete in an approved manner which will expose the aggregate uniformly and will not leave laitance, loosened particles of aggregate or damaged concrete at the surface.

8. All construction joints shall be bonded by one of the following methods:

   a. The use of an approved adhesive applied in accordance with the manufacturer's recommendations.

   b. Use of Portland cement grout of similar proportions to the mortar in the concrete in an acceptable manner.

B. Control Joints

1. Location of control joints shall be as shown on the Contract Drawings.

2. Control joints shall be formed with control joint inserts.

3. Sawcutting of control joints in lieu of forming shall not be allowed unless otherwise noted on the Contract Drawings. Where sawcutting is allowed, joints shall be sawed as soon as the concrete can support foot traffic without leaving any impression, normally the same day as concrete is placed and in no case longer than 24 hours after concrete is placed.

4. Unless noted otherwise on the Contract Drawings, depth of control joints shall be 1-1/2 inches in reinforced concrete and 1/3 of concrete thickness in unreinforced concrete.

C. Expansion Joints

1. Size and location of expansion joints shall be as shown on the Contract Drawings.

2. A center-bulb type waterstop shall be provided at all expansion joints in water-retaining structures. A center-bulb type waterstop shall be provided at all expansion joints below grade in walls or slabs which enclose an accessible area. Waterstop shall be as shown on the Contract Drawings and specified herein.

3. Expansion joint filler for use in concrete pavements and structures shall be Types I, II, or III. Expansion joint filler-for use in sidewalk and curbing shall be Type IV.

4. Reinforcement or other embedded items bonded to the concrete (except dowels in floors bonded on only one side of joint) shall not be permitted to extend continuously through any expansion joint.

D. Installation of Joints and Joint Filter

1. Type B joint sealant shall be used in all expansion and control joints in concrete except Type A joint sealant shall be used in all concrete pavements and floors subject to heavy traffic and Type C joint sealant shall be used in high corrosive areas unless otherwise specified or shown on the Contract Drawings.

2. Joint fillers and sealants shall be installed in accordance with manufacturer's recommended procedures and as shown on the Contract Drawings. Prior to sealant installation, the Contractor shall arrange to have a representative of the sealant manufacturer instruct the crew doing the work as to the proper methods of surface preparation, mixing and application of the sealant. The joint filler shall be furnished with a pressure sensitive adhesive or a separate adhesive as recommended by the manufacturer.

3. Joint filler that will be exposed after removal of forms shall be cut and trimmed to ensure a neat appearance and shall completely fill the joint except for the space required for the sealant. The filler shall be held securely in place and no concrete shall be allowed to enter the joint or the space for the sealant and destroy the proper functions of the joint.

4. A bond breaker of polyethylene film shall be used between filler and sealant. The joint shall be thoroughly clean and free from dirt and debris and shall receive a light sand blasting before the primer and the sealant are applied. Where the finished joint will be visible, masking of the adjoining surfaces shall be carried out to avoid their discoloration.

5. The primer and sealant used shall be supplied by the same manufacturer. Sealant shall not be placed without the use of a primer.

6. The sealant shall be neatly tooled into place and its finished surface shall present a clean and even appearance.

7. The depth of the sealant shall not exceed the width of the joint.

8. All sealants used in water retaining structures shall achieve final cure at least seven (7) days before the structure is filled with water.

E. PVC Waterstops

1. The design and location of PVC waterstops in construction joints and expansion joints shall be as specified herein and shown on the Contract Drawings. Splices in PVC waterstops shall be made, and molded pieces used, as recommended by the manufacturer.

2. Each piece of premolded PVC waterstop shall be of maximum practicable length in order that the number of end joints will be held to a minimum.

3. Joints shall develop effective watertightness fully equal to that of the continuous PVC waterstop material and shall permanently develop not less than 80 percent of the mechanical strength of the parent section and shall permanently retain its flexibility.

4. PVC waterstops shall be installed in the Work so that they are embedded to an equal depth in concrete on both sides of the joint in keyways as shown on the Contract Drawings and shall be kept free from oil, grease, mortar or other foreign matter. PVC waterstops shall be adequately secured against movement during the pouring of concrete. Contractor shall submit methods of PVC waterstop installation to the Engineer for approval prior to placing the concrete. Concrete adjacent to PVC waterstops shall be placed in 12 inch lifts and power vibrated to prevent honeycombing, voids and separation of aggregates at the surfaces of concrete separation joints.

   a. PVC waterstop fabrications for all changes of direction, intersections and transitions shall be made in the shop, leaving only straight butt joint splices for the field.

   b. Butt joint splices of PVC waterstop runs shall be made by heat sealing the adjacent surfaces in accordance with the manufacturer's recommendations using a thermostatically controlled electric source of heat. At least three satisfactory field splices shall be made as samples on site. The Engineer may require tests on these splices by an approved laboratory, at the Contractor's expense, to certify the tensile strength of the joint. The strength attained shall be at least 80% of the unspliced material before any is used in the work.

F. Hydrophilic Waterstop

1. Hydrophilic rubber waterstop or sealant shall be installed in accordance with the manufacturer's instructions and recommendations, except as modified herein.
2. The manufacturer shall provide technical assistance in the field.
3. The waterstop or sealant shall be located as near as possible to the center of the joint and shall be continuous around the entire joint. The minimum distance from the edge of the waterstop to the face of the member shall be 3 inches.
4. Where a hydrophilic rubber waterstop is used in combination with PVC waterstop, the hydrophilic rubber waterstop shall overlap the PVC waterstop for a minimum of 6 inches. The contact surface between the hydrophilic rubber waterstop, and the PVC waterstop shall be filled with hydrophilic sealant.
5. The hydrophilic rubber waterstop shall be installed in a bed of hydrophilic sealant, before skinning and curing begins, so that any irregularities in the concrete surface are completely filled and the waterstop is bonded to the sealant. After the sealant has cured, concrete nails, with washers of a diameter equal to the waterstop width shall be placed to secure the waterstop to the concrete at a maximum spacing of 18 inches.
6. Prior to installation of hydrophilic sealant, the concrete surface shall be wire brushed or sand blasted to remove any laitance or other materials that may interfere with the bonding. Surfaces of metal or PVC to receive sealant shall be cleaned of paint and any material that may interfere with bond. When sealant alone is shown on the Contract Documents, it shall be placed in a built-up bead which has a triangle cross section with each side of the triangle at least 3/4 inch in length, unless indicated otherwise. Concrete shall not be placed until the sealant has cured in accordance with the manufacturer's recommendations.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. PROTECTION

1. Joints and accessories shall be protected from damaging from traffic during the entire construction period. Waterstops provided for adjoining future structures shall be protected from corrosion as shown on the Contract Drawings.

END OF SECTION

SECTION 03 35 00 - CONCRETE FINISHING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Furnish all materials, labor, and equipment required to provide finishes of all concrete surfaces specified herein and shown on the Drawings.

1.06 QUALITY ASSURANCE

A. Perform work in accordance with ACI 301, ACI 302.1R, ACI 308.1, ACI 318 and ACI 347R and other applicable codes.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. Material certifications and technical data sheets.
2. Manufacturer's literature containing instructions and recommendations on the mixing, handling, placement, and appropriate uses for each type of material used in the Work.

B. Sustainability Submittals:

1. Environmental Product Declarations
   a. The Contractor shall provide product-specific type III Environmental Product Declaration (EPD) conforming to ISO 14025, 14044.
2. Envision Submittals
   a. The Contractor shall report information pertaining to the sustainable procurement, regional sourcing, and/or recycled content of new materials to be procured during the Work, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall coordinate with its vendor on sustainable product requirements as stipulated by the Contractor’s approved New Materials Sustainable Implementation

Plan, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall submit vendor shop drawings for review by the Engineer that clearly illustrate the vendor is meeting the requirements as approved in the Contractor's New Materials Sustainable Implementation Plan.

1.08 DELIVERY, STORAGE, AND HANDLING

A. General: Failure to comply with the following shall be sufficient cause for rejection of materials by the Engineer and his requiring its removal from the Site. Upon determination by the Engineer that the material is subject to rejection, the Contractor shall supply new material at no additional expense to the City.

B. Delivery of Materials:

1. Deliver materials in manufacturer's original unopened and undamaged containers, with all labels intact and legible at the time of use.

2. The label shall include:

a. Name of material and manufacturer.

b. Installation, handling and protection requirements.

c. Safety Data Sheet as required.

3. Deliver materials in sufficient quantities to allow uninterrupted continuity of the work, minimizing the amount of time stored prior to being used on the Site.

C. Storage of Materials:

1. Store only approved materials on project site.

2. Store materials in original, undamaged containers with manufacturer's labels and seals intact.

3. Store all materials in secure, enclosed, dry area, off the ground and away from all possible contact with water and in a location where temperature can be maintained above freezing. Protect stored materials as per manufacturer's instructions.

4. Prevent damage to materials during storage primarily by minimizing the amount of time they are stored at the Site before being incorporated into construction systems.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Concrete Floor Sealer

1. Floor sealer shall be:

a. MasterTop TC 493 330 as manufactured by Master Builders Solutions by BASF, Florham Park, NJ;

b. Superior Diamond Clear VOX as manufactured by Euclid Chemical, Cleveland, OH;

c. ArmorSeal Rexthane I as manufactured by Sherwin Williams,

d. Masterseal 330 as manufactured by Master Builders Solutions, Shakopee, MN.

e. Eucothane as manufactured by Euclid Chemical, East Brunswick, NJ.

f. Or approved equal.

B. Concrete Floor Hardener

1. Liquid Floor hardener shall be:

a. MasterKure 300 WB (Lapidolith) as manufactured by BASF, Florham Park, NJ;

b. Liquid Hard as manufactured by W.R. Meadows, Hampshire, IL;

c. Diamond Hard as manufactured by Euclid Chemical Company, Cleveland, OH;

d. Or approved equal.

2. Aggregate floor hardener shall be:

a. MasterTop 110ABR as manufactured by Master Builders Solutions, Shakopee, MN;

b. Surflex as manufactured by Euclid Chemical, East Brunswick, NJ.

c. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Concrete Floor Sealer:

1. Sealer shall be aliphatic urethane or epoxy coating with resistance to abrasion and chemical attack.

B. Concrete Floor Hardener

1. Liquid Floor hardener product and manufacturer shall be as specified in this Section.

2. Aggregate floor hardener product and manufacturer shall be non-metallic and shall be as specified in this Section.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examine substrates, areas, and conditions where concrete finishing products will be installed, with installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

C. Prepare cementitious substrates according to manufacturer's published installation instructions prior to application of concrete finishing products.

3.02 IMPLEMENTATION

A. Finishes on Formed Concrete Surfaces

1. After removal of forms, the finishes described below shall be applied in accordance with – "Concrete Finish Schedule" included in this Section. Unless specified in the Contract, all surfaces shall receive at least a Type I finish. The Engineer shall be the sole judge of acceptability of all concrete finish work.

Type II - Smooth Form Finish: Concrete shall be cast against forms constructed of plywood not less than 5/8 inch thick, or of boards lined with tempered hardboard not less than 3/16 inch thick, or other approved materials. Form material shall not have torn grain, worn edges, patches of holes from previous use, or other defects which would impair the texture of the concrete surface. Form material shall utilize sheets as large as practicable in an orderly and symmetric configuration. Other aspects of the finish shall conform to the requirements of the rough form finish.

B. Slab and Floor Finishes

1. The finishes described below shall be applied to floors, slabs, flow channels and top of walls in accordance with – "Concrete Finish Schedule" included in this Section. The Engineer shall be the sole judge of acceptability of all such finish work.

a. Type "D" - Troweled: Following completion of a Type "C" finish and sufficient hardening of the concrete to prevent excess fine

material from working to the surface, the surface shall be compacted and smoothed with a power trowel. Following the power trowel, hand trowel to provide a smooth, dense surface, free from defects, trowel marks, and blemishes. For surfaces exposed to wear as indicated in the Contract Documents, continue hand troweling until a ringing sound is produced as the floor is troweled.

C. Sealing of Concrete Floor

1. After installation of all equipment and piping, and after completion of other related construction activities, all floor slabs which are to remain unpainted and not intended to be immersed, and all equipment pads, shall be sealed with a floor sealer unless the slab has had liquid hardener applied or stated otherwise. Remove all dirt, droppage, grease, asphalt or other foreign matter with caustics and detergents as required prior to application. Sealer shall be applied in accordance with the manufacturer's recommendations.

D. Finishes on Equipment Pads

1. Formed surfaces of equipment pads shall receive a Type II finish.

2. Top surfaces of equipment pads, except those surfaces subsequently required to receive non-shrink grout and support equipment bases, shall receive a Type "D" finish, unless otherwise noted. Surfaces which will later receive non-shrink grout shall, before the concrete takes its final set, be made rough by removing the sand and cement that accumulates on the top to the extent that the aggregate will be exposed with irregular indentations in the surface up to 1/2 inch deep.

E. Concrete Finish Schedule

Item	Finish Type
All concrete surfaces not exposed to public view including utility spaces	I
All exterior surfaces and interior vertical surfaces exposed to public view	IV
All interior overhead surfaces exposed to public view and interior walls of tanks	II
Surfaces to be painted	III
Surfaces to receive bonded cementitious mixtures	B
Drives, interior stairs, surfaces to receive waterproofing, roofing insulation, or terrazzo, and floors of tanks	C
Floors for walking surfaces in manufacturing, storage, and warehousing areas, and floors to receive coverings	D

Item	Finish Type
Sidewalks	E
Garage and storage area floors	F or G
Exterior stairs, platforms, landings and ramps and interior ramps	E or H

3.03 FIELD TESTING / QUALITY CONTROL

SECTION 03 42 00 – PRECAST CONCRETE UNDERGROUND UTILITY TRENCH SYSTEM
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish and install the complete precast concrete underground utility trench system as indicated on the Contract Drawings. Work shall include all labor, materials, hardware, equipment, transportation, and services required for the proper fabrication, delivery, placement, alignment, and connection of precast trench components. This includes all joint sealing, anchoring, and any special work necessary to ensure structural integrity, watertightness, and compliance with project requirements. The Contractor shall provide all accessories, covers, frames, and fittings required for a fully functional trench system, and shall perform all work in accordance with this Section and as approved by the Engineer for a complete installation.

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the

applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Not Used.

1.04 REFERENCES

A. ASTM A283 - Low and Intermediate Tensile Strength Carbon Steel Plates

B. ASTM A1011 - Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, and Ultra-High Strength

1.05 DESCRIPTION

A. A. Design Requirements

1. 1. Concrete shall conform to Sections 03 30 00 – Cast-in-Place Concrete and 03 41 00 – Precast Structural Concrete, and when tested at the end of 28 days shall have the following minimum compressive strengths:

a. CONCRETE TRENCH BOXES - 5,000 psi

1.06 QUALITY ASSURANCE

A. General: Provide concrete fittings and specials that are precast or machine made and are the product of a company that can demonstrate by tests and installation records satisfactory experience in manufacturing concrete pipe of the quality and type specified.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. All sizes and classes of fittings and specials and for concrete sills showing dimensions, strength and materials specifications and standards, joint details and reinforcement position

2. Area of all cages of reinforcing steel

3. Angle of the joint

4. Length and thickness of joint

5. Manufacturer, size and type of gasket

6. Manufacturer's recommendations for gap dimension and tolerance for a properly installed joint

7. Signature and title of authorized representative of the manufacturer

8. All requirements of the latest ASTM Specifications as called for in these specifications will be complied with in the manufacture of the trench box

B. Quality Control: Submit certified results of all shop tests for approval.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Trenwa, Inc., Fort Thomas, KY;

B. Concast, Inc., Zumbrota, MN;

C. Oldcastle Infrastructure, Middle Island, NY;

D. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Steel Protective Plate Cover over Trench Box:

1. Protective plates are required for all new chemical piping installations.

2. Each plate size shall be 1/4" x 4' x 8'.

3. All protective plates and cover shall be overlapped a minimum of 3-inches.

B. Sikaflex-1a One Part Polyurethane, Elastomeric Sealant/Adhesive

1. Or approved equal.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Reinforced Concrete Fittings and Specials

1. General: Provide reinforced concrete fittings and specials where shown, specified or required, and manufactured in accordance with the applicable sections of the respective standard.

2. Strength: Retain a Registered Professional Engineer, licensed in the State of New York to prepare, sign and seal all designs for fittings and specials.

B. Concrete Trench Boxes for Chemical Pipe Protection:

1. The trench system will consist of precast concrete U-shaped bases and removable covers, installed in earth trenches with covers.
2. All sections of trench designated for road crossing use will be designed to carry HS40, 64,000 pounds axle loading.
3. The trench shall have an interior clear cross-sectional area as shown in drawings.
4. The precast U-shaped bases for the trench will be furnished in standard 10 foot lengths, except that special lengths will be furnished where required by the layout on the drawings. The U-shaped bases will be solid bottom. The trench shall not require cross braces to support the walls during backfilling.
5. The covers will have slots for lifting tools and will be made of Fiber and Steel Reinforced Concrete.
6. The precast trench system shall be designed and constructed so that neither the covers, nor temporary side-to-side braces need to be installed to facilitate installation or subsequent machine backfilling and tamping.
7. Trench boxes will be sealed along all joints to prevent water from entering.
8. Double containment piping should be installed such that any joints are located toward the middle of each trench box, keeping at least 12” away from the edge of the trench box. Contractor should provide an as-built drawing of the location of joints.
9. Piping and conduit supports shall be furnished within the trench boxes.

SECTION 03 45 00 – PRECAST ARCHITECTURAL CONCRETE
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Precast architectural concrete and cast stone as specified herein shall include precast concrete wall panels, and all accessories necessary.

B. Precast architectural concrete and cast stone wall panels shall be provided where shown on the Contract Drawings, specified in the Contract, or as required for a complete installation.

Design Handbook," latest edition

1.05 DESCRIPTION

A. Load Calculations: Precast and cast stone units shall be detailed and fabricated to withstand loads as calculated in accordance with the Building Code of the City of New York, and erection forces. Structural properties of the units shall be calculated in accordance with ACI 318.

B. Dimensions and Tolerances: Cast stone units shall be fabricated to dimensional tolerances in accordance with Cast Stone Institute Design Manual.

C. Design of wall panels shall account for all openings shown on the Contract Drawings. Design shall also allow for field trimming of up to ½ inch around openings and edges of wall panels if needed for clearance during installation.

1.06 QUALITY ASSURANCE

A. Cast Stone Manufacturer:

1. A current producer member of Cast Stone Institute, with a minimum of 10 years of experience in producing cast stone of types required for project.

2. Manufacturer shall have sufficient plant facilities to produce the shapes, quantities and size of cast stone required in accordance with the project schedule.

3. Manufacturer shall submit a written list of projects similar in scope and at least three (3) years of age, along with owner, architect and contractor references.

4. Standards: Comply with the requirements of the Cast Stone Institute Technical Manual and the project specifications. Where a conflict may occur, the contract documents shall prevail.

5. Mock-up:

a. Provide full size unit(s) for use in construction of sample wall. The approved mock-up shall become the standard for appearance and workmanship for the project.

B. Quality-Control Standard: Comply with Cast Stone institute Technical Manual.

C. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code--Steel"; and AWS D1.4, "Structural Welding Code--Reinforcing Steel".

1.07 SUBMITTALS

A. The Contractor shall prepare and submit Shop Drawings and reference materials for the approval of the Engineer. Submittals shall include, but not be limited to:

1. Fabricator Qualifications: Cast stone fabricator shall submit producer member of Cast Stone Institute documentation and a list of five successfully completed precast jobs in the least five years old. Include a detailed

description of the fabricated item, project name, location, general contractor, and architect or engineer.

2. Installer Qualifications: Submit a list of five successfully completed cast stone jobs in the least five years old similar to those required for this Contract.
3. Catalog cuts, drawings,
4. Shop Drawing: Placing drawings, including checked Shop Drawings for manufacture and erection of cast stone wall panels shall indicate:
5. Unit shapes, including elevations and sections, member piece marks and dimensions
6. Plans and elevations locating and defining all products furnished by the manufacturer
7. Finishes
8. Relationship to adjacent materials
9. Reinforcement, joint and connection details
10. Erection sequence and handling requirements
11. Lifting and erection inserts
12. All dead, live and applicable loads used in the design
13. Location, dimensional tolerances, and details of anchorage devices that are embedded in or attached to structure or other construction
14. Other items cast into panels
15. Handling procedures, plans and/or elevations showing panel location and sequence of erection for special conditions
    a. Location where field drilling or cored opening are permitted

B. Samples: The following shall be submitted:

1. Samples shall be representative of finished exposed face showing typical range of color and texture. Samples shall be submitted and approved prior to commencement of manufacture.
2. Building Base Sample size: 12 inches wide by full height by thickness indicated on the Contract Drawings, representative of the proposed finished product

C. Quality Control Submittals: The following items shall be submitted:

1. Concrete mix designs
2. Test reports for laboratory cured concrete cylinders
3. Air content tests in accordance with ASTM C 138 submitted with mix design

4. Product Data: For each type of product indicated. Include technical data and tested physical and performance properties.

D. Mock-up:

1. Supply initial production for job site assembly showing each finish, corner and special condition for cast stone unit in wall. Minimum size 8 foot 0 inches wide by 12 foot 0 inches high of complete wall assembly (Cast stone, CMU, Metal Wall Panel, and Brick). Assembly shall be approved by the Engineer prior to fabrication of remaining panels. Remove mock-up after completion and approval of cast stone work on building by Engineer.

E. Sustainability Submittals:

1. Environmental Product Declarations

a. The Contractor shall provide product-specific type III Environmental Product Declaration (EPD) conforming to ISO 14025, 14044.

2. Envision Submittals

a. The Contractor shall report information pertaining to the sustainable procurement, regional sourcing, and/or recycled content of new materials to be procured during the Work, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall coordinate with its vendor on sustainable product requirements as stipulated by the Contractor's approved New Materials Sustainable Implementation Plan, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall submit vendor shop drawings for review by the Engineer that clearly illustrate the vendor is meeting the requirements as approved in the Contractor's New Materials Sustainable Implementation Plan.

1.08 DELIVERY, STORAGE, AND HANDLING

A. All cast stone materials and appurtenances shall be properly protected in accordance with the manufacturer's requirements so that no damage or deterioration will occur from the time of shipment until installation is completed. All products and materials shall be delivered, stored and handled as follows:

1. Delivery: All cast stone units shall be delivered to the project site in such quantities and at such times to maintain continuity of erection.

a. Mark production units with the identification marks as shown on the shop drawings.

b. Package units and protect them from staining or damage during shipping and storage.

c. Provide an itemized list of product to support the bill of lading.

2. Orientation During Transport: Units shall be handled and transported in a position consistent with their shape and design in order to avoid stresses which could cause cracking or damage.

3. Equipment and Personnel: Transportation, site handling and erection shall be accomplished using acceptable equipment and methods by qualified personnel so that units shall not be damaged.

4. Lifting: Units shall be lifted or supported only at the points shown on the Shop Drawings.

5. Spacers: Nonstaining resilient spacers of even thickness shall be placed between each unit.

6. Support: Units shall be supported during shipment and storage on nonstaining shock-absorbing material.

7. Storage: Units shall be stored and protected so as to prevent contact with soil, staining, or physical damage.

   a. Units shall be stored on firm, level, and smooth surfaces to prevent cracking, distortion, warping or other physical damage.

   b. Stored units shall be placed so that identification marks are discernible, and so that product can be inspected.

   c. Units shall not be placed directly on ground.

   d. Stacked cast stone units shall be separated by battens across full width of each bearing point.

   e. The top of tier stack shall not be used as storage.

B. Factory assembled parts and components shall not be dismantled for shipment unless written permission is received from the Engineer.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Manufacturer shall warrant that cast stone wall panel units will not spall or show evidence of visible cracking beyond accepted industry standards, splitting, deformation, or loosening resulting from inferior materials or workmanship by this trade for a period of one (1) year effective from the date of the substantial completion of the cast stone erection. Cast stone units showing such defects will be repaired or replaced at the Engineer's option and made acceptable to industry standards.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Provide cast stone units and panels as manufactured by:

1. American Artstone Company, New Ulm, MN.
2. Advanced Cast Stone, Forth Worth, TX.
3. Or approved equal

2.02 MATERIALS / EQUIPMENT

A. Stone Materials:

1. Portland cement - Type I or Type III, white and/or grey, ASTM C 150.
2. Coarse aggregates - Granite, quartz or limestone, ASTM C 33, except for gradation.
3. Fine aggregates - Manufactured or natural sands, ASTM C 33, except for gradation.
4. Colors - Inorganic iron oxide pigments, ASTM C 979 except that carbon black pigments shall not be used.
5. Admixtures - Comply with the following:
    a. ASTM C 260 for air-entraining admixtures.
    b. ASTM C 494/C 495M Types A - G for water reducing, retarding, accelerating and high range admixtures.
    c. Other admixtures: integral water repellents and other chemicals, for which no ASTM Standard exists, shall be previously established as suitable for use in concrete by proven field performance or through laboratory testing.
    d. ASTM C 618 mineral admixtures of dark and variable colors shall not be used in surfaces intended to be exposed to view.
    e. ASTM C 989 granulated blast furnace slag may be used to improve physical properties. Tests are required to verify these features.
6. Water – Potable
7. Reinforcing bars:

B. Reinforcing

1. Reinforce the units as required by the drawings and for safe handling and structural stress.
2. Minimum reinforcing shall be 0.25 percent of the cross section area.
3. Reinforcement shall be non-corrosive where faces exposed to weather are covered with less than 1.5 inches of concrete material. All reinforcement shall have minimum coverage of twice the diameter of the bars.
4. Panels, soffits and similar stones greater than 24 inches in one direction shall be reinforced in that direction. Units less than 24 inches in both their length and width dimension shall be non-reinforced unless otherwise specified.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. General: Cast stone shall be manufactured in accordance with ACI-533. Fabricate panels straight, smooth and true to size and shape with exposed edges and corners precise and square.

B. Physical Properties: Provide the following:

1. Compressive Strength - ASTM C 1194: 6,500 psi minimum for products at 28 days.

2. Absorption - ASTM C 1195: 6% maximum by the cold-water method, or 10% maximum by the boiling method for products at 28 days.

3. Air Content – ASTM C173 or C 231, for wet cast product shall be 4-8% for units exposed to freeze-thaw environments. Air entrainment is not required for VDT products.

4. Freeze-Thaw – ASTM C 1364: The CPWL shall be less than 5% after 300 cycles of freezing and thawing.

5. Linear Shrinkage – ASTM C 426:

6. Shrinkage shall not exceed 0.065%.

C. Manufacturing Tolerances

1. Cross section dimensions shall not deviate by more than ±1/8 inches from approved dimensions.

2. Length of units shall not deviate by more than length/ 360 or ±1/8 inches, whichever is greater, not to exceed ±1/4 inches.

a. Maximum length of any unit shall not exceed 15 times the average thickness of such unit unless otherwise agreed by the manufacturer.

3. Warp, bow or twist of units shall not exceed length/ 360 or ±1/8 inches, whichever is greater.

4. Location of dowel holes, anchor slots, flashing grooves, false joints and similar features – On formed sides of unit, 1/8 inches, on unformed sides of unit, 3/8inches maximum deviation.

D. Curing:

1. Cure units in a warm curing chamber approximately 100ºF at 95 percent relative humidity for approximately 12 hours, or cure in a 95 percent moist environment at a minimum 70ºF for 16 hours after casting. Additional yard curing at 95 percent relative humidity shall be 350 degree-days (i.e. 7 days @ 50°F or 5 days @ 70°F) prior to shipping. Form cured units shall be protected from moisture evaporation with curing blankets or curing compounds after casting.

E. Color and Finish:

1. Match sample on file in architect’s office.

a. Match Cast Stone Institute color Cream, unless otherwise noted.

2. All surfaces intend to be exposed to view shall have a fine-grained texture similar to natural stone, with no air voids in excess of 1/32 in. (0.8 mm) and the density of such voids shall be less than 3 occurrences per any 1 square inches and not obvious under direct daylight illumination at a 5 feet distance.

3. Units shall exhibit a texture approximately equal to the approved sample when viewed under direct daylight illumination at a 10 ft distance.

a. ASTM D 2244 permissible variation in color between units of comparable age subjected to similar weathering exposure.

1) Total color difference – not greater than 6 units.

2) Total hue difference – not greater than 2 units.

4. Minor chipping resulting from shipment and delivery shall not be grounds for rejection. Minor chips shall not be obvious under direct daylight illumination from a 20-ft distance.

5. The occurrence of crazing or efflorescence shall not constitute a cause for rejection.

6. Remove cement film, if required, from exposed surfaces prior to packaging for shipment.

F. Openings:

1. Other openings shall be located and field drilled or cut by the trade after erection. Openings shall be approved by both Engineer and precaster before drilling or cutting.

G. Patching: Shall be acceptable providing the structural adequacy of the product and the appearance are not impaired.

H. Damaged, chipped or discolored units shall be replaced, patched or refinished as directed by the Engineer, and to their approval.

I. Testing.

1. Test compressive strength and absorption from specimens selected at random from plant production.

2. Samples shall be taken and tested from every 500 cubic feet of product produced.

3. Perform tests in accordance ASTM C 1194 and C 1195.

4. New and existing mix designs shall be tested for strength and absorption compliance prior to producing units.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. The Contractor shall verify that areas to receive cast stone units and panels are properly prepared and completed to final elevations as shown on the Contract Drawings.

1. Installing contractor shall check cast stone materials for fit and finish prior to installation. Do not set unacceptable units.

B. Examine substrates and conditions for compliance with requirements for installation tolerances, true and level bearing surfaces, and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. General: Cast stone shall be installed in accordance with the manufacturer's recommendations and approved Working Drawings.

B. Tolerances:

1. Comply with Cast Stone Institute Technical Manual.

2. Set stones 1/8 inches or less, within the plane of adjacent units.

3. Joints, plus - 1/16 inches, minus - 1/8 inches.

C. Jointing:

1. Joint size:

a. stone/brick joints 3/8 inches.

b. At stone/stone joints in vertical position 3/8inches.

c. Stone/stone joints exposed on top 3/8 inches.

2. Joint materials:

a. Mortar, Type N, ASTM C 270.

b. Use a full bed of mortar at all bed joints.

c. Flush vertical joints full with mortar.

d. Leave all joints with exposed tops or under relieving angles open for sealant.

e. Leave head joints in copings and projecting components open for sealant.

3. Location of joints:

a. As shown on shop drawings.

b. At control and expansion joints unless otherwise shown.

D. Setting:

1. Drench units with clean water prior to setting.
2. Fill dowel holes and anchor slots completely with mortar or non-shrink grout.
3. Set units in full bed of mortar, unless otherwise detailed.
4. Rake mortar joints 3/4 inches in. for pointing.
5. Remove excess mortar from unit faces immediately after setting.
6. Tuck point unit joints to a slight concave profile.

E. Temporary Supports: Temporary supports and bracing shall be provided as required to maintain position, stability and alignment as units are being permanently connected.

F. Setting Units: Non-loadbearing units shall be set dry without mortar. Specified joint dimensions shall be attained with 300 series stainless steel or plastic spacing shims.

G. Removal of Temporary Devices: Temporary lifting and handling devices cast into the cast stone units shall be completely removed. If protectively treated, however, devices not visible in the finished Work may be left in place only where they do not interfere with the work of any other trade.

H. All anchors, cramps, dowels and similar ties shall be furnished and set for proper erection.

I. All joints shall be a uniform thickness.

J. Site access: General contractor shall be responsible for providing suitable access to the building, proper drainage and firm, level bearing for the hauling and erection equipment to operate under their own power.

K. Anchor cast stone units in position by doweling, clip angles, grouting, or as otherwise indicated.

L. Clean exposed surfaces of cast stone units after erection to remove weld marks, other markings, dirt, and stains caused by the erector. If other trades cause damage, marks, dirt, or stains they shall be liable for the costs of cleaning or repair.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Repair

1. Repair chips with touchup materials furnished by manufacturer.
2. Saturate units to be cleaned prior to applying an approved masonry cleaner.

3. Consult with manufacturer for appropriate cleaners.

B. Protection

1. Protect precast cast stone units from all damage and abuse from all other Contractors and installers involved in the Work until Final Acceptance by the City.

C. Cleaning

1. After installation and joint treatment, cast stone surfaces shall be cleaned with detergent and water, using soft fiber brushes and sponges. Units shall be rinsed thoroughly with clean water in accordance with the cast stone manufacturer's recommendation. Cleaning materials and processes shall be used which will not change the character or color of exposed concrete finishes.

SECTION 03 60 00 - GROUTING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish all materials, labor, and equipment required to provide all grout used in concrete work and as bearing surfaces for base plates as specified herein and shown on the Contract Drawings.

B. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. Services of Manufacturer’s Representative

1. The Contractor shall provide the services of a qualified manufacturer's technical representative who shall instruct the Contractor's personnel in the mixing, proper use and application of the non-shrink grout and epoxy grout.

2. The manufacturer's representative shall provide written certification that materials have been mixed and applied properly and surfaces to receive these products have been prepared properly, all in conformance with manufacturer's requirements.

3. The on-site time required for the manufacturer's representative to achieve a successful installation shall be at the expense of the Contractor. The manufacturer's representative shall sign in and out at the office of the

Resident Engineer and provide written verification of the areas he has approved on each day he is at the project.

B. Grout Uses

1. The different types of grout shall be used for the applications stated below unless noted otherwise specified herein or on the Contract Drawings. Where grout is called for in this Section or on the Contract Drawings which does not fall under any of the applications stated below, non-shrink grout shall be used.

   a. Cement grout shall be used for grout toppings and for patching of fresh concrete.

   b. Non-shrink grout shall be used for grouting beneath base plates of equipment and structural metal framing.

   c. Epoxy grout shall be used for bonding new concrete to hardened concrete.

2. New concrete surfaces to receive cement grout shall be as specified in Section 03 30 00 – Cast-in-Place Concrete, and shall be cleaned of all dirt, grease and oil-like films.

   a. Existing concrete surfaces shall likewise be cleaned of all similar contamination and debris, 4 protection of cement grout shall be as specified in Section 03 30 00 – Cast-in-Place Concrete.

   b. Curing and protection of cement grout shall be as specified in Section 03 30 00 – Cast-in-Place Concrete.

3. All mixing, surface preparation, handling, placing, consolidation, and other means of execution for prepackaged grouts shall be done according to the instructions and recommendations of the manufacturer.

1.06 QUALITY ASSURANCE

A. Testing Agency:

1. Testing of materials and of resulting grout for compliance with the technical requirements of the specification will be performed by QA/QC consultant employed and paid by the City.

   a. The Contractor shall be charged by the City for the cost of any additional tests and investigation on work performed which does not meet the specifications.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Shop drawings shall include, but not be limited to:

1. Material certifications and technical data sheets.

2. Samples of all materials to be used.

B. The Contractor shall also submit the following:

1. Certified test results verifying the compressive strength, shrinkage and expansion requirements specified herein.

2. Manufacturer's literature containing instructions and recommendations on the mixing, handling, placement and appropriate uses for each type of grout used in the work.

C. Sustainability Submittals:

1. Environmental Product Declarations

a. The Contractor shall provide product-specific type III Environmental Product Declaration (EPD) conforming to ISO 14025, 14044.

2. Envision Submittals

a. The Contractor shall report information pertaining to the sustainable procurement, regional sourcing, and/or recycled content of new materials to be procured during the Work, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall coordinate with its vendor on sustainable product requirements as stipulated by the Contractor's approved New Materials Sustainable Implementation Plan, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall submit vendor shop drawings for review by the Engineer that clearly illustrate the vendor is meeting the requirements as approved in the Contractor's New Materials Sustainable Implementation Plan.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Epoxy grout:

1. Sikadur 32 Hi-Mod as manufactured by Sika Corporation, Lyndhurst, NJ.

2. Euco #452 as manufactured by Euclid Chemical, East Brunswick, NJ.

3. Duralcrete LV as manufactured by Tamms Industries, Kirkland, IL.

4. Or approved equal.

B. Non-shrink grout shall be:

1. Euco N-S as manufactured by Euclid Chemical Company, East Brunswick, NJ.

2. Masterflow 713 as manufactured by Master Builders Solutions, Shakopee, MN.

3. Sikagrout 212 as manufactured by Sika Corporation, Lyndhurst, NJ.

4. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Cement Grout

1. Cement grout shall be composed of Portland cement, sand and water. The sand to be used shall be selected to suit the spacing for placement. Where sand is not usable, the grout shall be composed of cement and water only.

2. Gradation of sand and mix proportioning shall be in accordance with the following table for grouts using natural sands and having a minimum 28-day compressive strength of 4,000 psi. For higher strength grouts or those using manufactured sands, strength shall be established by trial mixes.

a. Gradation for Natural Sand:

Sieve Size	Spaces less than one (1) inch	Spaces one (1) inch or more
Passing 3/8		100
Passing 4	100	95-100
Passing 8	95-100	80-100
Passing 16	70-100	50-85
Passing 30	40-75	25-60
Passing 50	10-35	10-30
Passing 100	2-15	2-10
Passing 200	--	--

b. Mix Proportioning:

By Weight	Non-Air Entrained Grouts (Maximum 4 Percent Entrapped Air)		Air Entrained Grouts (Air 8 Percent to 10 Percent)	
	Spaces less than one (1) inch	Spaces one (1) inch or more	Spaces less than one (1) inch	Spaces one (1) inch or more
Cement (bags)	10.8	10.5	11.3	11.0
Sand (lb)	2150	2240	1930	1990
Maximum water (gals)	59.5	57.8	57.5	55.8
Maximum water (gals per bag)	5.5	5.5	5.1	5.1

By Volume	Non-Air Entrained Grouts (Maximum 4 Percent Entrapped Air)		Air Entrained Grouts (Air 8 Percent to 10 Percent)	
	Spaces less than one (1) inch	Spaces one (1) inch or more	Spaces less than one (1) inch	Spaces one (1) inch or more
Cement	1	1	1	1
Sand (dry rodded)	1.85	2.10	1.6	1.7
Sand (damp & loose)	2.30	2.35	2.0	2.1
Maximum water (gals per bag)	5.5	5.5	5.1	5.1

3. Water shall be kept to a minimum, the amounts noted in the preceding table are the maximum for grout. Proportioning by volume shall be limited to small quantities mixed at the job site.

4. White Portland cement shall be mixed with the Portland cement as required to match the color of adjacent concrete.

B. Non-Shrink grout

1. The grout material shall be an approved ready to use mixture requiring only water for use at the job site. The compressive strength of 2-inch cubes shall be 3,000 psi at 7 days.

2. Non-shrink grout shall conform to CRD-C 621 and ASTM C1107, Grade B or C when tested at a maximum fluid consistency of 30 seconds per ASTM C939 at temperature extremes of 45 degrees Fahrenheit and 90 degrees Fahrenheit and an extended working time of 15 minutes.

3. Non-shrink grout product and manufacturer shall be as specified in this Section.

4. Non-shrink grouts depending on oxidation to limit shrinkage and containing additives such as iron or steel particles shall not be used.

C. Epoxy Grout

1. Epoxy grout shall be modified as required for each particular application with aggregate per manufacturer's instructions.

2. Epoxy grout product and manufacturer shall be as specified in this Section.

D. Dry Pack

1. Dry pack (to be packed or tamped in place) shall be made at no slump consistency.

2. When mixing the batch, only enough water shall be added to the dry materials to produce a rather stiff mixture, then additions of water may be made in small increments until the desired consistency is obtained.

E. Curing Materials

1. Curing materials for cement grout shall be as specified in Section 03 30 00 – Cast-in-Place Concrete and as recommended by the manufacturer for prepackaged grouts.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 IMPLEMENTATION

A. Installation

1. The consistency of grouts shall be that necessary to completely fill the space to be grouted for the particular application. Dry pack consistency shall be such that the grout is plastic and moldable but will not flow.
2. Measurements for cement grout shall be made accurately by weight or by volume using containers. All measurements shall be made in a manner satisfactory to the Engineer. Prepackaged grouts shall have ingredients measured by means recommended by the manufacturer.
3. Grout shall be placed quickly and continuously, shall completely fill the space to be grouted, be thoroughly compacted and free of air pockets. The grout may be poured in place, pressure grouted by gravity, or pumped.
4. For grouting beneath base plates, grout shall be poured from one side only and shall flow across to the open side to avoid air-entrapment.
5. The use of pneumatic pressure or dry-packed grouting requires approval of the Engineer.

3.03 FIELD TESTING / QUALITY CONTROL

A. Field Tests:

1. Compression test specimens will be taken during construction from the first placement of each type of grout and at intervals thereafter as selected by the Engineer to insure continued compliance with these Specifications.
2. Compression tests and fabrication of specimens for cement grout and non-shrink grout will be performed as specified in ASTM C109 at intervals during construction as selected by the Engineer. A set of three specimens will be made for testing at seven days, 28 days and any additional time period as appropriate.
3. Compression tests and fabrication of specimens for epoxy grout shall be performed as specified in ASTM C579, Method B, at intervals during construction as selected by the Engineer. A set of three specimens will be made for testing at seven days and any other time period as appropriate.

B. All grout which has already been placed and which fails to meet the requirements of this Section is subject to removal and replacement by the Contractor at no additional cost to the City.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

SECTION 04 05 00 – COMMON WORK RESULT FOR MASONRY
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Mortar and masonry grout as specified herein include, but are not limited to, Portland Cement, lime, sand, coarse aggregate, admixtures for use in mortar and masonry grout, and appurtenances.

B. Mortar and masonry grout shall be provided as indicated on the Contract Drawings, specified herein, or as required for a complete installation.

C. The Contractor shall implement practices and procedures to meet the project's sustainability goals as identified in the Contract Documents. The Contractor shall ensure that the sustainability requirements of this Section are implemented to the fullest extent.

D. The following index of this Section is presented for convenience:

K.	ASTM C1019	-	Standard Test Method for Sampling and Testing Grout
L.	NYCBC	-	Section BC 2103 Masonry Construction Materials, BC 2104 Construction

1.05 DESCRIPTION

A. Where questions of compliance with the requirements of this Section arise, the specifications for mortar properties shall take precedence over the specification for mortar proportions.

B. No change shall be made in the proportions established for mortar approved under the specifications for mortar properties nor shall material with different physical characteristics be utilized in mortar used in the work unless compliance with the specifications for mortar properties are re-established by Shop Drawing data submission to Engineer.

C. Two different air-entraining materials shall not be combined in mortar or grout.

D. Sustainable Design Requirements:

1. Recycled Content of Mortar and Masonry Grout Products: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 15 percent.

E. Project-specific system/ design requirements will be provided in the Contract, if necessary, to supplement requirements given herein or Contract Drawings.

1.06 QUALITY ASSURANCE

A. Source Limitations for Masonry Units: Obtain exposed masonry units of a uniform texture and color, or a uniform blend within the ranges accepted for these characteristics, from single source from single manufacturer for each product required.

B. Source Limitations for Mortar Materials: Obtain mortar ingredients of a uniform quality, including color for exposed masonry, from single manufacturer for each cementitious component and from single source or producer for each aggregate.

C. The Contractor shall engage an independent testing agency to conduct tests specified herein and as follows:

1. Mortar: Mortar tests shall be performed in accordance with ASTM C270.

2. Grout: Grout tests shall be performed in accordance with ASTM C1019.

D. Requirements of Regulatory Agencies: Wherever a fire-resistance classification is shown or scheduled for unit masonry construction (4-hour, 3-hour and similar designations), proportion mortar and masonry grouts to comply with the requirements established by UL and other governing authorities having jurisdiction at the Project Site

1.07 SUBMITTALS

A. The Contractor shall submit the Shop Drawings for the approval of the Engineer. Submittals shall include, but not be limited to:

1. Product Data: Manufacturer's specifications and installation instructions for proprietary materials.

2. Certificates: Notarized certificates that the following comply with the specified requirements:

a. Portland Cement

b. Hydrated lime

c. Mortar and grout aggregates

3. Design Mix: Certified design mix for mortar and grout.

4. Test Results: Results of mortar and grout tests as specified herein and as specified in referenced standards.

5. Samples:

a. Each type of colored mortar in metal channels at least 6-inches long, showing the range of color that can be expected in the finished work.

b. Complete selection of standard and custom colors of epoxy grout used for pointing mortar, for final selection by Engineer.

c. Label samples to indicate type and amount of colorant used. Engineer's review will be for color only. Compliance with all other requirements is the responsibility of Contractor.

6. Construction: Weight slips for grout materials at time of delivery.

7. Schedule of locations where each mortar and grout type will be used in the work.

B. Sustainable Design Submittals:

1. Environmental Materials Reporting Form (EMRF) Recycled Content. Provide the following information:

a. Name of Product and Manufacturer.

b. Material cost breakdowns. Cost breakdowns must include total material-only cost (excluding installation, labor and equipment).

c. The percentage (by weight) of post-consumer and pre-consumer recycled content.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery of Materials:

1. Materials shall not be delivered to the Site before the time of installation.

2. Materials delivered and stored at the Site shall be from approved manufacturers and sources only.

3. Materials shall be delivered in sufficient quantities to allow continuity of the work.

B. Storage of Materials:

1. Materials shall be stored in original, undamaged containers with manufacturer's labels and seals intact.

2. Cement shall be stored in weathertight containers that exclude moisture and contaminants.

3. Hydrated lime shall be stored in weathertight containers that exclude moisture and contaminants.

4. Aggregates shall be kept clean and free from other materials during transportation and handling. Aggregate shall be stockpiled in a manner to prevent segregation.

5. Damage to materials during storage shall be prevented primarily by minimizing the amount of time they are stored at the Site before being incorporated into construction systems.

C. Handling of Materials:

1. Materials shall be handled in such a manner to avoid damage or breakage.

2. Materials shall not be exposed to detrimental conditions or physical damage. Materials which are so exposed shall be removed from the Site and shall not be incorporated into the work.

3. Materials shall be handled in such a manner to prevent inclusion of contaminants.

4. Packages or containers shall not be opened until all preparatory work is complete and installation is to begin immediately. Materials shall not be allowed to become wet or soiled or covered with ice or snow.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Mortar and masonry grout materials shall be as manufactured by:

1. Spec Mix, Minneapolis, MN.

2. Amerimix, Atlanta, GA.

3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Portland Cement:

1. Provide Type I or III Portland Cement that conforms to the requirements of ASTM C150.

2. Provide nonstaining Portland Cement of natural color or of the color required to be compatible with the required colored mortar pigment selected by Engineer.

B. Hydrated Lime: Provide Type S hydrated lime that conforms to the requirements of ASTM C207.

C. Sand for Mortar: Provide natural sand that conforms to the requirements of the following:

1. ASTM C144, except for joints less than 1/4 inch use aggregate graded with 100 percent passing the No. 16 sieve.

2. White Mortar Aggregates: Provide natural white sand or ground white stone for Portland cement-lime mortars, as required for compatibility with mortar colors selected by Engineer.

3. Colored Mortar Aggregates: Provide ground marble, granite or other sound stone, as required to match the sample approved by Engineer for Portland Cement-lime mortars.

D. Aggregates for Grout: Provide fine and coarse aggregates that conform to the requirements of ASTM C404, ASTM C476.

E. Coloring Additive: A mineral-oxide pigment, harmless to mortar set and strength shall be provided. Colors shall be as selected by the Engineer.

F. Epoxy Pointing Mortar:

1. Provide a two-component non-sag epoxy resin and hardener with mineral filler complying with ANSI A118.3.

2. Colors: Complete selection of standard and custom colors for final selection by Engineer.

3. Provide epoxy mortar capable of water-cleanup during installation but which, after curing, is waterproof.

G. Water: Provide clean and potable water from approved sources.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Mixes for Mortar: Provide mortar that conforms to the requirements of ASTM C270, except as modified herein, and of the type and color specified in the Contract.

1. Provide a cement-lime mortar; masonry cement mortars are not acceptable.

2. Calcium chlorides are not permitted.

3. Admixtures shall not be used unless specifically directed by the Contract.

4. Grout: Provide grout that conforms to the requirements of ASTM C476, ASTM C404 for fine or coarse grout.

B. Mixes for Grout: Provide grout that conforms to the requirements of ASTM C476, ASTM C404 for fine or coarse grout.

1. Fine grout shall be used for filling spaces with openings less than 2 inches.

2. Course grout shall be used for filling spaces with openings greater than 2 inches.

C. Measurement of Materials:

1. Cement and Hydrated Lime: Batched by the bag.

2. Sand: Batched by volume in suitably calibrated containers. Make allowance for bulking and consolidation, and for weight per cubic foot of contained moisture.

3. Proportion of Volumetric Mixtures: One 94-pound sack of Portland cement and one 50-pound sack of hydrated lime constitute nominal one cubic foot.

4. Shovel measurement: Not permitted.

D. Mortar:

1. All cementitious materials and aggregates shall be mixed between three and five minutes in a mechanical batch mixer with a sufficient amount of water to produce a workable consistency. Mortar shall not be hand mixed.
2. When required, cement and pigment shall be mixed for colored mortar prior to mixing in mortar. The maximum percentage by weight of cement for pigment shall be limited to 10 percent.
3. Limit batch size to avoid retempering.
4. Mortar that has begun to stiffen or is not used within two hours after initial mixing shall not be used.
5. The mixer drum shall be completely emptied before recharging the next batch.

E. Mortar Temperature:

1. For temperatures below 40 degrees F mortar materials shall be heated to protect both mortar and completed work from freezing.
2. When outside air temperature is:
   a. 25 to 40 degrees F: Mixing water and sand shall be heated to produce mortar temperature between 40 and 120 degrees F. Temperatures of mortar on boards shall be maintained above freezing.
   b. Below 25 degrees F: Masonry shall not be installed.
3. Ideal mortar temperature is 70 degrees F $\pm$10 degrees F. Mixing temperature selected shall be maintained within 10 degrees F.
4. Antifreeze compounds or calcium chloride in mortars shall not be used to lower the freezing point or accelerate setting.

F. Grout: Grout shall be mixed in accordance with the requirements of ASTM C476.

G. Epoxy Pointing Mortar: Epoxy pointing mortar shall be mixed in strict accordance with the manufacturer's instructions.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Prior to placing mortar or grout, remove laitance, loose aggregate and any substance that may prevent mortar or grout from bonding to the foundation.

3.02 INSTALLATION

A. Installation of mortar and grout shall be in accordance with the requirements of Section 04 22 00 – Concrete Unit Masonry

B. Installation of epoxy grout shall be in accordance with the manufacturer's instructions and recommendations.

3.03 FIELD TESTING / QUALITY CONTROL

A. Mortar shall be prepared and tested for preconstruction and construction evaluation in accordance with the requirements of ASTM C780. Specimens for construction evaluation shall be prepared a minimum of every 500 square feet of masonry construction.

B. Grout shall be prepared and tested for construction evaluation in accordance with the requirements specified in ASTM C1019 and NYCBC Section BC 2104. Specimens shall be prepared a minimum of every 100 cubic feet of grout placed.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. If any adjustment are needed after installation, the Contractor shall make those adjustments with care, to maintain consistency with the work completed.

B. It is the Contractor's responsibility to protect all completed work in and around the site. Any damage done to the completed work during construction shall be fixed at no extra charge to the City.

C. The Contractor is also responsible for cleaning up after the work under this Section has been completed, to maintain a clean and neat site.

END OF SECTION

PART 1 GENERAL

1.01 SUMMARY

A. Unit masonry as specified herein includes, but is not limited to, glazed brick, concrete masonry units, reinforcement, anchorage, and all accessories and appurtenances.

B. Unit masonry shall be provided as indicated on the Contract Drawings, specified herein, or as required for a complete installation.

C. The Contractor shall implement practices and procedures to meet the project's sustainability goals as identified in the Contract Documents. The Contractor shall ensure that the sustainability requirements of this Section are implemented to the fullest extent.

D. The following index of this Section is presented for convenience:

2. TMS 602/ACI 530.1/ASCE 6 - Specification for Masonry Structures

E. New York City Building Code Section BC 2103 Masonry Construction Materials, BC 2104 Construction

1.05 DESCRIPTION

A. Provide masonry accessories of sizes, dimensions and configurations coordinated with unit masonry construction system component sizes, dimensions and configurations.

B. Where continuous horizontal cavity wall reinforcement is specified as providing restraint for cavity wall insulation, coordinate dimensions with thickness of cavity wall insulation specified for proper clearances.

C. Where structural steel will be provided with fireproofing do not use welded-on channel slots. Coordinate required offset of welded-on wire ties with depth of fireproofing.

D. Concrete Masonry Units: Limit total moisture absorption until time of installation to the maximum percentage specified for Type I units for the average annual relative humidity as reported by the United States Weather Bureau Station nearest the Site and the corresponding percentage of total linear drying shrinkage of the concrete masonry units.

E. Comply with ASTM C90 Climatic Map establishing criteria for percent annual mean relative humidity.

F. Structural elements of masonry shall conform to the requirements of TMS 402/ ACI 530/ASCE 5 for materials and installation.

G. Masonry materials and installation shall conform to the requirements of TMS 602/ACI 530.1/ASCE 6.

H. Sustainable Design Requirements:

1. Recycled Content of Unit Masonry: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 15 percent.

2. Regional Materials: Unit Masonry shall be manufactured within 500 miles of Project site, from materials that have been extracted, harvested, or recovered within 500 miles of Project site.

I. Project-specific system design requirements will be provided in the Contract, if necessary, to supplement requirements given herein or Contract Drawings.

1.06 QUALITY ASSURANCE

A. Requirements of Regulatory Agencies: Wherever a fire-resistance classification is shown or scheduled for unit masonry construction (4-hour, 3-hour and similar designations), provide masonry accessories, masonry units and unit masonry construction complying with the requirements established by UL and other governing authorities having jurisdiction at the Project Site.

B. Source Quality Control: Provide all metal sheet, wire, plate and bar stock masonry accessories from the same manufacturer.

C. Sample Panel: The Contractor shall erect a composite 4 feet long by 3 feet high sample panel.

1. The sample panel shall include facing veneer, bond pattern, mortar color, tooled joints, insulation, reinforcing, and backup.

2. Upon approval, the sample panel shall remain in place for the duration of masonry construction and shall be used as a basis of comparison for all masonry work.

3. After final approval of finished masonry work by the Engineer, the Contractor shall demolish the sample panel, and shall perform all site restoration work.

4. Masonry work shall not be started until the specified sample panel has been approved. The sample panel shall be used as a standard for comparison of masonry work. Sample panel shall be destroyed only after all masonry work has been completed and approved by the Engineer.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings and other material for the approval of the Engineer. Submittals shall include, but not be limited to:

1. Catalog cuts, drawings and reference materials.

2. Samples: The Contractor shall submit three samples each of glazed brick, that are representative of the full range of color, shading and texture of the material to be provided.

3. Test Reports: The Contractor shall submit material test reports or manufacturer's certificate of compliance for glazed brick, concrete masonry units.

B. Shop Drawings: Submit for approval the following:

1. Copies of manufacturer's specifications and installation instructions for each masonry accessory required. Include data substantiating that materials comply with specified requirements.

2. Provide drawings and material schedules showing all dimensions and sizes of masonry accessories coordinated with unit masonry construction work, and other work in which masonry accessories will be embedded, be supported from, or restrain.

3. Indicate methods for identifying and coordinating, at the Site, the location and accurate placement of each masonry accessory in unit masonry construction as the work progresses. Indicate by letter of transmittal that items which must be installed in the shop have been received in time for proper sequencing of the work to avoid delays.

4. Explanation of where each masonry accessory will be used in the work, quantities purchased and intended spacings indicating compliance with code requirements.

5. Complete layout of all glazed brick walls and veneers showing modular planning and all special shapes to be used in the work. Show all details for each condition encountered in the work. Provide plan and elevation views drawn at 1/4-inch scale and details drawn at 1-1/2-inch scale. Show all items required to be built into unit masonry construction.

6. Masonry control joint locations and details.

7. Drawings showing the location, extent and accurate configuration and profile of all items shown, specified and required by this and other Sections to be built into the unit masonry construction as the work progresses. Provide elevations drawn at 1/4-inch scale and all details drawn at 1-1/2-inch scale.

8. Drawings for fabrication, bending, and placement of reinforcing bars. Show bar schedules, diagrams of bent bars, stirrup spacing, lateral ties and other arrangements and assemblies as required for fabrication and placement of reinforcing for unit masonry construction.

C. Sustainable Design Submittals:

1. Environmental Materials Reporting Form (EMRF) Recycled Content and Regional Materials. Provide the following information:

   a. Name of Product and Manufacturer.

   b. Material cost breakdowns. Cost breakdowns must include total material-only cost (excluding installation, labor and equipment).

   c. The percentage (by weight) of post-consumer and pre-consumer recycled content for the submitted product.

d. Indicate the location and distance from Project of material manufacturer and point of extraction, harvest, or recovery for each raw material.

1.08 DELIVERY, STORAGE, AND HANDLING

A. General: All products and materials shall be delivered, stored, and handled as follows.

B. Delivery and Storage: Masonry materials delivered and stored at the site shall be from approved manufacturers and sources only.

C. Masonry Units:

1. Masonry units shall be handled in a manner which prevents undue breakage or chipping.

2. Face brick and concrete masonry units shall be unloaded using brick clamps.

3. All masonry units shall be stored on platforms under shelter or in another approved manner so as to protect these materials from soil and weather.

D. Rejection: Glazed bricks, and concrete masonry units that are warped, cracked or of inferior quality will be rejected. Such items shall be removed from the site and not offered again for inspection.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Manufacturers of unit masonry items shall be:

1. York Building Products, Stewart Company
York, PA

2. Consolidated Brick
Avon, MA

3. Nitterhouse Masonry Products, LLC
Chambersburg, PA

4. Or approved equal.

B. Manufacturers of glazed unit masonry items shall be:

1. Beldan Brick Company,
   Canton, Ohio.
2. Elgin Butter Company
   Elgin, Texas.
3. Or approved equal. .

2.02 MATERIALS / EQUIPMENT

A. Glazed Brick: Glazed brick shall meet the requirements of ASTM C-1405, Grade S, Type I & II, Class Exterior, Division Solid, or H40V. Face dimensions and custom colors shall be as specified in the Contract.

1. Brick Size: Modular.
2. Brick Colors:
   a. Belden Brick Company:
      1) Salt Creek Glaze, 30%.
      2) Wrangler Blue, 70%.
   b. Elgin Butler Company:
      1) Dove #7400 Glossy, 30%.
      2) Cobalt Blue #2200A Glossy, 70%.

B. Concrete Masonry Units: Concrete masonry units shall be manufactured with lightweight aggregate and shall be provided as follows:

1. Hollow Load-Bearing Units: Hollow load-bearing units shall conform to ASTM C90, Type I for exterior walls, foundation walls, interior load-bearing and non-load-bearing walls and partitions. Units shall have a compressive strength of 3,000 psi over the net area.
2. Solid Load-Bearing Units: Solid load-bearing units shall conform to ASTM C90, Type I, except units exposed to weather shall be Grade U. Solid units shall be provided for masonry bearing under structural framing members and for fireproofing of steel structural members. Units shall have a compressive strength of 3,000 psi over the net area.
3. Special Shapes: Special shapes, such as closures, header units, and jamb units shall be provided as necessary to complete the work. Special shape units shall conform to the applicable provisions for the units with which they are used.

C. Metal Accessories:

1. For interior walls and partitions, and as required to secure masonry to adjoining construction, the Contractor shall provide hot-dipped galvanized metal anchors, ties and reinforcements conforming to ASTM A153/A153M, Class B2 that are galvanized after cutting.

2. For exterior walls, the Contractor shall provide Type 316 stainless steel for anchors, anchor slots, ties and horizontal reinforcement.

D. Deformed reinforcing bars shall conform to ASTM A615/A615M Grade 60.

E. Horizontal Joint Reinforcement: Horizontal reinforcing shall be 2 inches less in width than the actual thickness of the wall or partition in which it is to be placed.

1. Solid interior or exterior masonry walls: Walls shall be reinforced horizontally with truss type, standard 9 gauge (.148-inch) by 9 gauge (.148-inch). Reinforcing shall be spaced at 16-inch centers vertically.

2. Exterior Cavity Walls: Walls shall be reinforced horizontally with truss type 9 gauge (.148-inch) by 9 gauge (.148-inch) reinforcing in the inner wythe with rectangular pintle and seismic clip to continuous 9 gauge wire reinforcing in the outer wythe. Reinforcing system shall include insulation clip washers. Reinforcing shall be spaced at a minimum of 16-inch centers vertically.

3. Corners: Corners shall be reinforced with the same type as wall reinforcing, standard 9 gauge (.148 inch) by 9 gauge (.148-inch), spaced in the same course as the wall reinforcing.

4. Intersections: Intersections between walls and partitions shall be reinforced horizontally with same type as wall reinforcing, standard 9 gauge (.148-inch) by 9 gauge (.148-inch), spaced in the same course as the wall reinforcing.

F. Rebar Positioners: The Contractor shall provide vertical and horizontal rebar positioners spaced at 48-inch centers maximum.

G. Dovetail Anchors: Dovetail anchors shall be 1/8-inch by 1-inch by 2-inch with 3/16-inch diameter wire.

H. Rigid Anchors: Rigid steel anchors shall be 1 inch wide (minimum), 3/16 inch thick, and 18 inches long between bent ends. Each end shall be bent down 3 inches (minimum) into mortar filled masonry cells.

I. Column Anchors: Masonry shall be anchored to columns at 24-inch centers with stainless steel anchors.

J. Metal Fastenings: Bolts, metal wall plugs or other approved metal fastenings for securing items to masonry and elsewhere shall be provided and installed as necessary.

K. Weep Holes: Weep holes shall be provided where shown, and shall consist of clear polyethylene, medium density plastic, rectangular tubes, 3/8 inch wide, 1-1/2 inches high, 3-1/2 inches deep.

L. Weep Vents: Weep vents shall be provided where shown and shall be an offset T-shaped vent injection molded from flexible polyvinyl chloride. The vents shall be provided in a custom size and color to match brick and mortar as specified in the Contract.

M. Mortar Net: Mortar net shall be of high-density polyethylene and shall be one inch nominal thickness.

N. Mortar Materials: Mortar materials shall be in accordance with Section 04 05 00 – Common Work Results for Masonry.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

1. Environmental Conditions: Materials and surrounding air temperature shall be maintained at a minimum 50 degrees F prior to, during, and 72 hours after completion of masonry work. Masonry shall not be erected when the ambient temperature is below 32 degrees F with a rising or falling temperature, or when there is a probability of such a condition existing within 48 hours, unless special provisions are made for heating the materials and protecting the work from freezing. Work will not be permitted with or on frozen materials. Use of masonry units having a film of frost on their surfaces will not be permitted.

3.02 INSTALLATION

A. General

1. Build chases and recesses as shown or required by others. Provide not less than 8 inches of masonry between chase or recess and jamb of openings, and between adjacent chases and recesses.

2. Leave openings for equipment, piping, ducts, and other items to be installed subsequent to starting of unit masonry construction. After installation of said items, complete unit masonry construction to match work immediately adjacent to openings.

3. Use full size units without cutting wherever possible. Provide special unit masonry shapes for all transitions and intersections. Do not field-cut special shapes from regular unit masonry shapes or substitute other alternatives for the use of special unit masonry shapes.

4. Build interior masonry walls, visible from both sides in the finished work, using two wythes of masonry. Masonry units shall be continuous over the entire plan of the wall including walls which continue behind fixtures, equipment, furniture, lockers and similar items.

5. Coursing: Masonry walls shall be carried up level and plumb all around. Do not carry up one section of the walls in advance of the others, unless specifically approved. Heights of masonry shall be checked with an instrument at each floor, and at sills and heads of openings, to maintain the

level of walls. Masonry courses shall be maintained to a uniform dimension. Vertical and horizontal joints shall be formed to a uniform thickness. Concrete masonry units shall be laid in running bond. One unit and one mortar joint shall be coursed to equal 8 inches. Mortar joints shall be tooled to be concave.

6. Placing and Bonding: Solid masonry units shall be placed in a full bed of mortar, with full head joints, and shall be uniformly jointed with other work.

   a. Mortar Removal: Excess mortar shall be removed as the installation progresses.

   b. Corners and Intersections: Intersections and external corners shall be interlocked. Horizontal reinforcing shall be spliced at intersections and corners with a 6-inch overlap of side rods.

   c. Adjustment: Do not shift or tap masonry units after mortar has achieved initial set. Where adjustment must be made, mortar shall be removed and replaced with new mortar.

   d. Cutting: Job site cutting of exposed masonry units shall be performed with power masonry saws to provide straight, clean, unchipped edges. All glazed brick and glazed structural tile shall be cut using a continuous rim wet cutting diamond blade suitable for cutting these material types. Broken masonry unit corners or edges shall not be allowed.

   e. Flush Joints: Mortar joints shall be cut flush where ceramic wall tile is to be installed.

   f. Control Joints: Non-load-bearing masonry partitions shall be isolated from vertical and horizontal structural framing members with control joints.

   g. Placing Metalwork: Structural steelwork, bolts, anchors, inserts, plugs, ties, lintels and miscellaneous metalwork specified in other Sections, shall be placed and built into position as the installation progresses.

   h. Extent of Masonry: Masonry partitions and walls shall extend from the floor to the bottom of floor or roof construction above, unless otherwise indicated.

   i. Bonding and Anchoring: Walls and partitions shall be structurally bonded or anchored to each other and to concrete walls, beams, columns, and wall and roof diaphragms. Non-load-bearing walls and partitions shall be anchored to construction above in a manner that provides appropriate lateral stability and vertical movement of floor and roof construction above.

   j. Preparation for New Work: Unfinished masonry shall be stepped back for joining with new masonry. Toothing will not be permitted.

7. Weeps and Mortar Nets: Weep holes shall be installed in veneer at bottom of walls at spacing indicated in the Contract Documents. Mortar nets shall be installed at bottom of cavities to maintain open weeps.

8. Horizontal Joint Reinforcement and Anchorages: Horizontal joint reinforcement and anchorages shall be constructed as follows:

   a. Reinforcement Spacing: Horizontal joint reinforcement shall be spaced at a minimum of 16 inches on center, measured vertically.

   b. Reinforcement Placing: Masonry joint reinforcement shall be placed in the first horizontal joint above and below openings. Reinforcement shall be extended a minimum of 16 inches on each side of openings. Joint reinforcement shall be placed continuously in the first joint below the top of all walls. Joint reinforcement ends shall be lapped a minimum of 6 inches. Joints at corners and intersections shall be reinforced with strap anchors at 16-inch centers.

   c. Veneer Anchorage: Dovetail anchorage shall be provided in concrete for bonding veneer at a maximum of 16-inch centers vertically and horizontally. Anchors shall be placed within 8 inches of all openings.

9. Waterproofing Course: A waterproofing course of flashing as specified in Section 07 62 00 - Sheet Metal Flashing and Trim, and as shown on the Contract Drawings, and at the following locations: at the bottom of masonry walls, at points where roofs adjoin exterior masonry walls, at lintels, below louver sills and window sills, and at other locations shown on the Contract Drawings.

   a. Surface Condition: Surfaces to receive waterproofing course shall be smooth, dry, and free from loose material before applying the waterproofing course.

   b. Application: Flashing shall project 2 inch from the outside face of the wall and shall be built into the walls as indicated. Flashing shall extend a minimum of 8 inches beyond the line of the jamb, with the ends turned up 2 inches to form a pan at the heads and sills of louver and window openings, and at the heads of door openings.

10. Control Joints: Preformed control joint material shall be installed in continuous lengths. Butt and corner joints shall be sealed in accordance with manufacturer's instructions. Control joints shall be sized as indicated on the Contract Drawings. Horizontal joint reinforcement shall not continue through control joints.

11. Built-In Work: Metal door and window frames, fabricated metal frames, louvered openings, anchor bolts, pipes, ducts, conduits, plates and items specified in other sections shall be built in as the work progresses. Items shall be built in plumb and level. Frame voids shall be filled solid with grout. Adjacent masonry cores shall be filled with grout for a minimum of

12 inches beyond the framed openings. Do not build in organic materials subject to deterioration.

12. Tolerances: Masonry work shall meet the tolerances specified in ACI 530.1/ASCE 6-95/TMS 602.

13. Cutting and Fitting: Masonry shall be cut and fit for chases, pipes, conduit, sleeves, grounds, and other items specified elsewhere. The work shall be coordinated to provide correct size, shape, and location.

B. Laying Masonry Walls, General

1. Mortar Types: Unless otherwise indicated, use mortar as specified in Section 04 05 00 – Common Work Results for Masonry and as follows:

a. Use Type M mortar for all structural reinforced masonry walls.

b. Use Type S mortar for all exterior and all load-bearing walls.

c. Use Type N mortar for all interior non-load-bearing walls.

d. Use epoxy pointing mortar for all glazed brick unit joints.

e. Use grout fill for structural requirements and for grouting reinforcing steel in unit masonry construction.

f. Do not use mortar which has begun to set or if more than 2 hour has elapsed since initial mixing. Retemper mortar during the 2-hour period only as required to restore workability.

2. Lay out walls in advance for accurate spacing of surface pattern bond with uniform joint widths and to properly locate openings, masonry control joints, returns and offsets. Avoid the use of less than half size units at corners, jambs and wherever possible at other locations.

3. Lay-up walls plumb and true to comply with specified tolerances, with courses level, accurately spaced and coordinated with other work.

4. Mortar Color and Texture:

a. Lay all concrete unit masonry using mortar of natural color.

b. Lay all glazed brick using epoxy mortar colors selected by Engineer at time of sample panel erection.

C. Glazed Brick

1. Bond: Glazed brick shall be laid in bond as indicated on the Contract Drawings and as specified in the Contract.

2. Joints: All joints between bricks shall be completely filled with mortar. Bed joints shall comprise a thick layer of mortar, smoothed or furrowed lightly. Head joints shall be formed by applying, to the brick to be laid, a full coat of mortar on the entire end, or on the entire side, as the case requires, and then shoving the mortar-covered end or side of the brick tightly against the brick laid previously.

3. Joint Treatment: Mortar joints shall be tooled or struck when they are thumb print hard. All mortar joints in glazed brick shall be tooled concave using a non-metallic tool of a size as specified in the Contract.

4. Special Joints: Special joints in glazed brick shall consist of control joints, which shall be constructed as detailed and specified, and accent joints, which shall have mortar raked back 2 inch, and shall then be caulked to match the appearance of control joints. Control and accent joints shall be installed where shown on the Contract Drawings.

5. Weep and Mortar Nets: Provide rows of weep vents in the head joints of the first and third courses of masonry immediately above all concealed flashings. Space weep vents 16 inches on centers horizontally. Provide rows 8 inches on center vertically. Stagger rows.

6. Horizontal Joint Reinforcement and Anchorages.

7. Closure Brick: Closure brick shall be laid with a bed joint and with head joints. Brick shall be carefully placed so as not to disturb the brick previously laid.

D. Reinforcement Spacing: Continuous horizontal joint reinforcement shall be spaced as follows:

E. For multi-wythe walls, solid or cavity, where continuous horizontal reinforcing also acts as structural bond or tie between wythes, space reinforcing as required by governing authorities having jurisdiction at the Project Site, but not more than 24-inches on centers, vertically.

F. For single wythe walls, space reinforcing at 16 inches on centers vertically.

G. For parapets, space reinforcing at 8 inches on centers vertically for large square glazed brick.

1. Reinforce all walls with continuous horizontal joint reinforcement unless specifically noted or specified to be omitted.

H. Application: Flashing shall terminate flush with outside face of walls and shall be built into the walls as indicated. Flashing shall extend a minimum of 8 inches beyond the line of the jamb, with the ends turned up 2 inches to form a pan at the heads and sills of louvers and window openings, and at the heads of door openings in masonry.

I. Place through-wall flashing on bed of mortar and cover with mortar.

J. Interlock metal 3-way sawtooth flashings and overlap at seams as recommended by the manufacturer, with minimum lap of 4 inches.

K. Lintels and Bond Beams

1. Provide stainless steel lintels where shown and as specified in Section 05 50 00 - Metal Fabrications.

L. Provide masonry lintels and bond beams where shown and wherever openings of 16 inches or more are shown without structural stainless steel lintels. Provide

formed-in-place masonry lintels and bond beams. Temporarily support formed-in-place lintels and bond beams.

M. Provide minimum bearing at each jamb, of 4 inches for openings less than 6 feet wide, and 8 inches for wider openings.

N. On concrete and clay unit masonry walls where pattern bond remains visually exposed, increase minimum bearing of masonry lintels to maintain continuity of joint pattern of wall and install to be indistinguishable from surrounding masonry.

O. Collar Joints: Fill the vertical space between wythes solidly with mortar by parging the in-place wythe and shoving units into the parging, for all exterior multi-wythe walls (except do not fill cavity of cavity wall construction) and interior multi-wythe walls and partitions.

P. Concrete Masonry Units

1. Bed and Head Joints: The first course of concrete masonry units shall be laid in a full bed of mortar for the full width of the unit. Bed joints of concrete masonry units shall be formed by applying the mortar to the entire top surfaces of the inner and outer face shells, and head joints shall be formed by applying the mortar for a width of about 1 inch to the ends of the adjoining units laid previously. Joints shall be mortared smooth, not furrowed, and of such thickness that mortar will be forced out of the joints as the units are being placed in position. Where anchors, bolts, reinforcing and ties occur within the cells of the units, such cells shall be filled solid with grout as the work progresses.

2. Concrete Brick: Concrete brick shall be used for topping out walls under sloping slabs, distributing concentrated loads, backing brick headers, and elsewhere as indicated.

3. Unit Condition: Concrete masonry units shall be placed dry with no previous wetting.

Q. Cavity Walls

1. Construction: Cavity walls shall be constructed using a masonry backing separated from a masonry exterior wythe by a continuous air space and insulation as indicated. The two wythes shall be securely tied together with a seismic horizontal joint reinforcement system, placed as indicated.

2. Insulation: Insulation board shall be secured to the backup construction using insulation clip washers as specified to hold the insulation in place. The insulation board shall be job fabricated as necessary, using a knife or saw, to fit around obstructions, such as reinforcing and vents. Joints between the obstructions and the insulation shall be sealed with mastic. All joints in the insulation shall be shoved tight. Insulation shall be installed in strict compliance with the manufacturer's recommendations.

3. Cavity: The space between the wythes shall be kept clear and clean of mortar droppings by use of wood strips, slightly narrower than the cavity, laid on horizontal reinforcing. The wood strips shall be lifted out and

cleaned when horizontal joint reinforcing is placed. Mortar shall not be allowed to drop into cavity while cleaning wood strips. Weep holes shall be provided at the base of the wall cavity, where the cavity is closed over with masonry or flashing, and at other locations as indicated. A continuous mortar net shall be set on top of the base flashing.

R. Reinforced Masonry

1. Setting Masonry: Masonry for vertically reinforced masonry units shall be laid with core cells vertically aligned. Core cells shall be clear of mortar and unobstructed. Mortar shall be placed in masonry unit bed joints and shall be back 1/4 inch from the edge of the unit grout spaces, and beveled back and upward. Mortar shall be cured 7 days before placing grout.

2. Reinforcing: Concrete masonry unit cores shall be reinforced with reinforcement bars and grout as shown. Vertical reinforcement shall be kept in position using rebar positioners at top and bottom of cells and at intervals not exceeding 48 inches. Reinforcement shall be spliced in accordance with ACI 530/ASCE 5-95/TMS 402, but splice lap shall be not less than 24 bar diameters.

3. Grouting: Masonry unit surfaces in contact with grout shall be wetted just prior to grout placement. Spaces less than 2 inches in width shall be grouted with fine grout using low lift grouting techniques. Spaces 2 inches or greater in width shall be grouted with coarse grout using high or low lift grouting techniques. When grouting is stopped for more than one hour, grout shall be terminated 1-1/2 inches below top of upper masonry unit to form a positive key for subsequent grout placement.

4. Low Lift Grouting: The first lift of grout shall be placed to a height of 16 inches and then shall be rodded for grout consolidation. Subsequent lifts shall be placed in 8-inch increments and rodded for grout consolidation.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjusting

1. During the tooling of joints, enlarge any voids or holes, except weep holes, and completely fill with mortar. Point up all joints at corners, openings and adjacent work to provide a neat, uniform appearance, properly prepared for application of sealant compounds.

B. Protection

1. Protection of Finished Work: Protective boards shall be provided at exposed external corners susceptible to damage by construction activities, without damaging completed work.

2. Remove and replace masonry units that are loose, chipped, broken, stained or otherwise damaged, or if units do not match adjoining units as intended. Provide new units to match adjoining units and install in fresh mortar or grout, pointed to eliminate evidence of replacement.

3. At all times, surfaces of masonry on which work is not being performed shall be protected. When rain or snow is imminent and work is discontinued, tops of exposed masonry walls and similar surfaces shall be covered with a strong waterproof membrane, well secured in place.

C. Cleanup

1. General: After mortar has set, new masonry work shall be cleaned as follows:

a. All masonry: All excess mortar and mortar smears shall be removed. Any defective mortar shall be removed and replaced, matching adjacent work. Nonmetallic tools shall be used in all cleaning operations.

SECTION 05 05 13 – SHOP APPLIED COATINGS FOR METALS
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. This Section furnishes requirements for metals that shall be shop-applied coatings for metals as shown on the Contract Drawings or as specified in other specifications.

B. The following index of this Section is presented for convenience:

Article	Title	Section Page

1.05 DESCRIPTION

A. Not Used

1.06 QUALITY ASSURANCE

A. Coordination of Shop-Applied Coating Systems:

1. Coordinate submittal and selection procedures for metal products to receive shop-applied coating systems.

2. Where products are indicated to match coatings selected for other products, adjust formulations as required to achieve match.

3. Submit samples for verification, indicating compliance with matching requirements

B. Manufacturer's Qualifications: Manufacturer regularly engaged, for minimum of 10 years, in the manufacturing of shop-applied coating systems of similar type to that specified.

C. Applicator's Qualifications:

1. Applicator regularly engaged in application of shop-applied coating systems of similar type to that specified.

a. Certified by AAMA and listed on AAMA Verified Components List or

b. Approved by manufacturer.

2. Employ persons trained for application of shop-applied coating systems.

3. Equipped, trained, and approved for application of shop-applied coating systems required for this Project.

4. Approved to provide warranty specified in this Section.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings for approval by the Engineer. The submittals shall include, but not be limited to:

1. Product Data: Submit manufacturer's product data for each coating system specified, including:

a. Type of coating system.

b. Type of substrates.

c. AAMA compliance.

d. DFT of each coat.

e. Total DFT.

f. Physical properties.

g. Application characteristics.

h. Accelerated test data.

i. Field performance.

B. Samples: Submit manufacturer's samples of each color and gloss specified for each coating system specified for:

1. Sample size shall be minimum of 2" x 2".

2. Selection.

3. Verification on each specified metal substrate.

C. Manufacturer's Certification: Submit manufacturer's certification that coating systems comply with specified requirements and are suitable for intended application.

D. Manufacturer's Project References: Submit manufacturer's list of recently completed shop-applied coating system projects, including project name and location, name of architect, type of metal products receiving shop-applied coating systems, and type and quantity of shop-applied coating systems furnished.

E. Applicator's Project References: Submit applicator's list of recently completed shop-applied coating system projects, including project name and location, name of architect, type of metal products receiving shop-applied coating systems, and type and quantity of shop-applied coating systems applied.

F. Cleaning and Maintenance Instructions: Submit manufacturer's cleaning and maintenance instructions for shop-applied coating systems, including:

1. Graffiti removal instructions.

G. Warranty Documentation: Submit manufacturer's standard warranty

H. A report of the test results shall be furnished to the Engineer.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Shop-Applied Coating Systems:

1. Delivery Requirements: Deliver coating systems to applicator in manufacturer's original, unopened containers and packaging, with labels clearly identifying:

a. Coating system name.

b. Manufacturer.

c. Color.

d. Weight.

e. Gallons.

f. Batch number.

2. Storage and Handling Requirements:

a. Store and handle coating systems in accordance with manufacturer's instructions.

b. Keep coating systems in manufacturer's original, unopened containers and packaging until shop application.

c. Protect coating systems during storage, handling, and shop application to prevent contamination or damage.

B. Metal Products to Receive Shop-Applied Coating Systems:

1. Delivery Requirements: Refer to sections specifying metal products to receive shop-applied coating systems.

2. Storage and Handling Requirements:

a. Refer to sections specifying metal products to receive shop-applied coating systems.

b. Package and protect metal product finish during storage, handling, and installation.

c. Protect metal product finish from damage from standing water.

d. Protect metal product finish from contact with materials that could damage or adversely affect shop-applied coating systems.

e. Protect metal product finish with temporary protective coverings until after installation.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Applicator's Warranty:

1. Applicator agrees to repair finish or replace coated metal products that demonstrate deterioration of shop-applied coating systems within warranty period.

2. Exposed Coating Systems: Deterioration includes, but is not limited to:

a. Solid Colors: Color fading in excess of 5 delta E Hunter color units in accordance with ASTM D 2244, Appendix XI.1.

b. Peeling, checking, or cracking of coating adhesion to metal.

c. Chalking in excess of a No. 8 in accordance with ASTM D 4214, Method A.

B. Manufacturer's Warranty: The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in materials and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. Not Used

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Shop-Applied, High-Performance Organic Finish Materials – Aluminum Extrusions

1. Liquid Fluoropolymer Aluminum Extrusion Coatings, AAMA 2605: Minimum 70 percent PVDF resin by weight, in color coat and clear topcoat.

a. Pencil Hardness, ASTM D 3363: F minimum.

b. Prohesion, ASTM G 85: 2,000 hours.

c. Humidity Resistance, ASTM D 2247: 4,000 hours.

d. South Florida Exposure:

1) Color, ASTM D 2244.

2) Chalk, ASTM D 4214, Method A.

e. Primer Coat: 0.20 to 0.40 mil.

1) Color Coat: 0.70 to 0.90 mil.

2) Clear Coat: 0.40 to 0.50 mil.

3) Total Thickness: 1.30 to 1.60 mils.

2. Liquid Fluoropolymer Aluminum Extrusion Coatings, AAMA 2604: Minimum 50 percent PVDF resin by weight, in color coat.

a. Pencil Hardness, ASTM D 3363: F minimum.

b. Humidity Resistance, ASTM D 2247 or D 4585: 3,000 hours.

c. Dry Film Thickness, ASTM D 7091:

1) Primer Coat: 0.20 to 0.40 mil.

2) Color Coat: 1.00 to 1.70 mils.

3) Total Thickness: 1.20 to 1.90 mils..

B. Shop-Applied, High-Performance Organic Finish Materials – Coil Coatings

1. Liquid Fluoropolymer Aluminum Sheet Coil Coatings, AAMA 2605: Minimum 70 percent PVDF resin by weight, in color coat and clear topcoat.

a. Pencil Hardness, ASTM D 3363: HB to H.

b. Salt Spray Resistance, ASTM G 85: 4,000 hours.

c. Humidity Resistance, ASTM D 2247: 4,000 hours.

d. South Florida Exposure:

1) Color, ASTM D 2244.

2) Chalk, ASTM D 4214, Method A.

e. Dry Film Thickness, ASTM D 7091:

1) Primer Coat: 0.2 to 0.30 mil.

2) Color Coat: 0.70 to 0.80 mil.

3) Clear Coat: 0.40 to 0.50 mil.

4) Total Thickness: 1.30 to 1.60 mils.

2. Liquid Fluoropolymer Steel Sheet Coil Coatings, AAMA 621: FEVE resin.

a. Pencil Hardness, ASTM D 3363: HB to H.

b. Salt Spray Resistance, ASTM B 117: 750 hours.

c. Humidity Resistance, ASTM D 2247: 1,000 hours.

d. Dry Film Thickness, ASTM D 7091:

1) Primer Coat: 0.40 to 0.50 mil.

2) Color Coat: 0.70 to 0.90 mil.

3) Total Thickness: 1.10 to 1.40 mils.

C. Shop Finishing Methods

1. Pretreatment: Mechanically clean and chemically pretreat metal fabricated items in accordance with requirements of the following for finish indicated:

a. Chemical pretreatment manufacturer.

b. Coating manufacturer.

c. AAMA.

2. Coating Application: Apply coatings in accordance with requirements of the following for finish indicated:

a. Coating manufacturer.

b. AAMA.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Shop Finishing Quality Control

1. Tests and Inspections: Applicator is responsible for performing all physical property testing as prescribed in the appropriate AAMA standard.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 APPLICATION

A. Not Used

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Touch up minor scratches and abrasions in finishes in accordance with finish manufacturer's instructions; replace components having damage that cannot be successfully touched up. Replacement shall occur to the following condition but not limited to these conditions:

1. Scratches over 2" in length and abrasions larger than 1 square inch shall be cause for replacement of component.
2. Pitting of finish to base material shall be cause for replacement of component.

B. Clean finished surfaces after installation in accordance with finish manufacturer's instructions.

END OF SECTION

PART 1 GENERAL

1.01 SUMMARY

A. This Section furnishes requirements for all iron or steel materials which are to be galvanized as shown on the Contract Drawings.

B. All galvanizing shall be done by the hot-dip process.

C. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. Tests

1. General: Samples of galvanized articles shall be taken as specified in the appropriate ASTMs listed in Table 1. Galvanized articles shall be tested to determine the following qualities of the coating:
   a. Thickness of coating
   b. Adherence
   c. Uniformity.
2. Thickness of the zinc coating may be tested either by the weighing or stripping methods in conformity with the requirements set forth in Table 1.
3. Adherence of zinc coating shall be tested by the method indicated in the appropriate ASTMs listed in Table 1.
4. Uniformity:
   a. Galvanized articles will be subjected to visual examination to determine uniformity of work.
   b. In the event the Engineer determines that such examination is not conclusive, the article shall be given the Preece test in conformity with ASTM A239.

1.06 QUALITY ASSURANCE

A. Qualifications

1. Galvanizing shall be done in a plant having sufficient facilities to produce the quality of coatings herein specified and ample capacity for the volume of work required.
2. The plant shall follow the procedures in the Quality Assurance Manual of the AGA.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings for approval by the Engineer. The submittals shall include, but not be limited to:

1. The producer's or supplier's certification that the galvanized articles were manufactured, sampled, tested and inspected in accordance with the applicable standards specified herein and that the articles meet these requirements.

B. A report of the test results shall be furnished to the Engineer.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Handling

1. Galvanized articles shall be shipped and handled in a manner which will avoid damage to the zinc coating.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. Zinc used for galvanizing shall conform to ASTM B6, and shall be at least equal to the grade designated as Prime Western.

B. Maximum amount of aluminum added to a galvanizing bath shall not exceed 0.01 percent.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Preparation of Materials

1. Structural steel products shall be safeguarded against embrittlement in accordance with ASTM A143.

2. Casting surfaces to be galvanized shall be sand blasted or ground smooth. When a smooth cast is required, castings shall be tumbled and all high spots ground flush. Castings shall be normalized to prevent cracking. Malleable iron shall be safeguarded against embrittlement by pre-annealling.

3. Steel work shall be pre-cleaned utilizing a caustic bath, acid pickle and flux or shall be blast cleaned and fluxed to obtain an acceptable surface for quality hot dip galvanizing.

3.02 IMPLEMENTATION

A. Hot-Dip Galvanizing Requirements

1. The Work shall conform to the requirements in Table 1 - Schedule of Hot-Dip Galvanizing Requirements.

2. Quality of Coating:

a. The zinc coating shall meet the standards set forth in Table 1, ASTM A385. The coating shall adhere firmly to the surface of the base metal, be continuous, uniform in thickness, and of the quality of finish specified.

b. When special galvanizing, such as heavier coating, flexibility to permit forming operations and similar work is required, it shall be so specified in the Contract.

c. All rejected materials shall be stripped and regalvanized before resubmitting for inspection and test.

B. Repair of Galvanized Coating

1. Galvanized coatings that are abraded or damaged shall be repaired in accordance with ASTM A780.

2. The extent of the area to be repaired and the method of repair to be used shall be approved by the Engineer.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

PIPE	B6, E536	A53	--	A90	A53	--	1.8 oz. per sq. ft
ELECTRICAL CONDUIT (Rigid Steel)	Shall comply with ANSI C80.1 - Rigid Steel Conduit, Zinc Coated.						

Notes Applicable to Table1:
1. Prefixes A, B and E identify ASTM Specifications; prefix G identifies CSA Standard.
2. Galvanized articles shall not be subject to wiping or scraping processes which may reduce the thickness of zinc coating.
3. Small hardware items shall be centrifuged to remove excess bath metal.

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials and equipment required to perform all structural welding as specified herein, and as indicated on the Contract Drawings. The Work shall include, but not limited to, the following items:

1. Procedure specifications.
2. Procedure qualifications.
3. Welder, welding operator and tacker qualifications.
4. Inspection.
5. Testing and repair of defective welds.

B. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 05 12 00 - Structural Steel Framing

1.04 REFERENCES

A. Definitions

1. Definitions of welding terms shall be in accordance with ANSI/AWS A3.0.

B. Reference Standards:

1. AISC-04 - Specification for Structural Steel Buildings - Allowable Stress Design and Plastic Design
2. ANSI/AWS A2.4 - Standard Symbols for Welding, Brazing and Nondestructive Examination
3. ANSI/AWS A3.0 - Standard Welding Terms and Definitions
4. ANSI/AWS D1.1 - Structural Welding Code - Steel
5. ANSI/AWS D1.4 - Structural Welding Code - Reinforcing Steel
6. AWS Z49.1 - Safety in Welding and Cutting and Allied Processes
7. American Institute of Steel Construction (AISC)
8. American Welding Society (AWS)
9. New York City Building Code (NYCBC)

1.05 DESCRIPTION

A. All welding shall be performed in accordance with ANSI/AWS D1.1 and ANSI/AWS D1.4. No welding shall be performed when the base metal temperature is lower than 32 degrees Fahrenheit.

B. Welding shall not be started until welding procedures, welders, welding operators and tackers have been qualified and copies of all records and reports submitted and approved by the Engineer.

C. The Contractor shall be responsible for the quality of welding and shall maintain records of the test results obtained from the welding procedure, welder, welding operator and tackers performance qualifications.

D. Each weld shown or indicated on the Contract Drawings shall be made as specified on the approved procedure specifications provided to cover each type of weld. Welding of any special steel shall conform to the written instructions of the steel manufacturer.

E. Test specimens shall be prepared by the Contractor for each type of welded joint as designated in Article 1.08, Welding Procedure Qualifications. Destructive tests of specimens for procedure and welder qualifications shall be conducted in accordance with ANSI/AWS D1.1, Section 4, Qualifications, and the requirements specified herein.

F. Symbols

1. Symbols on the Contract Drawings, shop drawings and erection drawings shall be in accordance with ANSI/AWS A2.4.

G. Safety Precautions

1. Safety precautions during welding shall conform to AWS Z49.1.

H. Welding Requirements

1. Contract Drawings will include the following information:

   a. Size, length, type and location of welds.

   b. Location of welds for which non-destructive testing is required. When location of non-destructive testing is not shown, it will be indicated by the Engineer in the field.

2. Workmanship and techniques for welded construction shall conform to the requirements of ANSI/AWS D1.1 and AISC-04. When ANSI/AWS D1.1 and AISC-04 are in conflict, the requirements of ANSI.AWS D1.1 shall govern.

3. Welding of steel reinforcing bars shall conform to the requirements of ANSI/AWS D1.4 and the Contract Documents. Welds shall develop a minimum of 85,000 psi tensile strength. Bars to be welded shall be cut by means of an oxyacetylene torch or by sawing. Ends shall be free of dirt, oxide scale, oil, grease, or other foreign matter. Sheared ends of bars shall be trimmed back at least 1/2-inch by sawing or flame cutting. Preheat and interpass temperature shall conform to ANSI/AWS D1.4. Bars having a carbon equivalent content in excess of 0.50 percent shall not be welded.

4. Where dissimilar strengths of steel are welded together, the procedure used shall be the same as the one used for the lower strength steel.

5. All groove welds shall be 100 percent complete penetration welds as defined in ANSI/AWS D1.1 or shown in ANSI/AWS D1.4 for reinforcing steel, regardless of whether a backup plate is shown or whether the supplementary backing weld or melt-through symbol is included, in each groove-weld symbol shown unless partial penetration is included in the weld symbol.

6. Gun welded studs shall conform to the requirements of ANSI/AWS D1.1, Section 7.

7. Upon completion of welding, all weld splatter, flux, slag and burrs left by attachments shall be removed. Welds shall be repaired to produce a workmanlike appearance with uniform weld contours and dimensions. All sharp corners of material which is to be painted or coated shall be ground to a minimum of 1/32-inch on the flat.

I. Standard of Acceptance

1. Dimensional tolerances for welded construction, details of welds, and quality of welds shall be in accordance with the applicable requirements of ANSI/AWS D1.1, ANSI/AWS D1.4 and the Contract Drawings.
2. The welding shall be subject to inspection and tests in the shop and at the Project Site. Inspection and tests in the shop will not relieve the Contractor of the responsibility to furnish weldments of satisfactory quality.
3. All welding exhibiting any cracks, either in the weld metal or the parent metal, will be rejected.
4. Incomplete fusion or lack of penetration will not be allowed, and the weld will be rejected.
5. Welds, other than stud welds, are acceptable if inspection indicates conformance within the following limitations:
    a. Undercut shall not be more than 1/32-inch deep.
    b. Convexity or reinforcement of a weld face shall not exceed the limits shown in ANSI/AWS D1.1, Section 3 and there shall be no overlap.
    c. Slag inclusions, porosity and other fusion defects less than 1/16-inch in greatest dimension will be allowed if well dispersed and the sum of the greatest dimensions in any linear inch of welded joint does not exceed 3/8-inch.
    d. Slag inclusions, porosity and other fusion defects 1/16-inch or larger in greatest dimension will be allowed providing such defects do not exceed the limits specified in ANSI/AWS D1.1.
6. When materials or workmanship do not conform to the acceptance requirements, the Engineer reserves the right to reject material or workmanship or both at any time before final acceptance of the structure containing the weldment.

J. Corrections and Repairs

1. General: In lieu of rejection of an entire piece or member containing welding which is unsatisfactory or which indicates inferior workmanship, the corrective measures listed hereinafter may be permitted by the Engineer. The Engineer's specific approval must be obtained before making each correction. Corrective measures shall be made at the Contractor's expense and to the satisfaction of the Engineer and/or to the satisfaction of an independent testing lab.
2. Defective or unsound welds or base metal shall be corrected either by removing and replacing the entire welds, or as follows:
    a. Excessive convexity and overlap shall be reduced by removal of excess weld metal.
    b. Any concavity of weld, crater, undersize welds or undercutting shall be corrected by cleaning and depositing additional weld metal.

c. Excessive weld porosity, slag, inclusions or incomplete fusion shall be repaired by removing defective portions and rewelding.

d. Cracks in weld or base metal shall be repaired by removing crack throughout its length, including sound weld metal 2 inches beyond each end of the crack and rewelding.

3. The removal of defective weld metal or portions of the base metal shall be done by chipping, grinding, oxygen cutting, oxygen gouging, or air carbon-arc and in such a manner that the remaining weld metal or base metal is not nicked or undercut. Defective portions of the weld shall be removed without removal of the base metal.

4. Additional weld metal shall be deposited using an electrode smaller than that used for making the original weld, and not more than 5/32-inch diameter. The surface shall be cleaned thoroughly before welding.

5. Caulking of welds shall not be permitted.

6. Improperly fitted parts may be cut apart and rewelded. Members distorted by welding shall be straightened by mechanical means or by carefully supervised application of a limited amount of localized heat.

a. The temperature of heated areas shall not exceed 1,200 degrees Fahrenheit (a dull red color). Temperature shall be carefully measured with temperature indicating crayons during the heating operation.

b. Parts to be heated for straightening shall be substantially free of stress and from external forces, except those stresses resulting from mechanical means used in conjunction with the application of heat.

7. No peening shall be done on the root or surface layers of a weld. Peening of intermediate weld layers may be used only if authorized by the Engineer and directed by him. Care shall be exercised to prevent overpeening which may cause overlapping, scaling, cracking, flaking, or excessive cold working of weld and base metal.

1.06 QUALITY ASSURANCE

A. Welding Procedure Qualifications

1. General: Except for prequalified or previously qualified procedures, the Contractor shall qualify the welding procedure specifications for any welding procedure performed in the fabrication of weldments. Qualifications of welding procedures shall conform to ANSI/AWS D1.1 and ANSI/AWS D1.4.

2. Welding procedure specification and the results of the procedure qualification test for each type of welding, which requires procedure qualifications, shall be submitted for approval. Approval of any procedure, however, will not relieve the Contractor of the sole responsibility for producing a finished structure meeting all the requirements of these

Specifications. This information shall be submitted on the forms in Annex E of ANSI/AWS D1.1.

a. Procedures, when qualified, become the welding procedure specifications and are to be followed in making welds on the subject materials and provide a means of assuring reproducible results and quality control.

b. Separate procedure specifications shall be prepared for each type of weld.

c. Welding procedure specifications shall be individually identified and shall be referenced on the Shop Drawings and erection drawings, or shall be suitably keyed to the Contract Drawings.

3. Previous Qualifications: Welding procedures previously qualified by test may be acceptable for this Contract without requalification if the following conditions are met:

a. Testing was performed by an approved testing laboratory.

b. The qualified welding procedure conforms to the requirements of this Section and is applicable to welding conditions encountered under this Contract.

c. The welder, welding operator and tacker qualification tests conform to the requirements of this Section and are applicable to welding conditions encountered under this Contract.

4. Prequalified Procedures: Welding procedures which are considered prequalified as specified in ANSI/AWS D1.1 and ANSI/AWS D1.4, will be accepted without further qualification.

a. The Contractor shall submit for approval a listing and an annotated drawing to indicate the joints not prequalified.

b. Procedure qualification shall be required for the joints not prequalified.

5. Retests: If welding procedure fails to meet the requirements of ANSI/AWS D1.1 or ANSI/AWS D1.4, the procedure specification shall be revised and requalified.

a. At the Contractor's option, with the Engineer's approval, welding procedure may be retested in accordance with the standards.

b. If the welding procedure is qualified through retesting, all test results, including those of test welds that failed to meet the requirements, shall be submitted with the welding procedure.

B. Welder, Welding Operator and Tacker Qualification

1. General Information: Each welder, welding operator and tacker assigned to work on this Contract shall be certified in conformance with ANSI/AWS

D1.1, Section 4. Welders shall also be New York City certified, and all welding shall be done in conformity with the NYCBC.

2. Certificates: Before assigning any welder, welding operator or tacker to work under this Contract, the Contractor shall submit to the Engineer the names of the welders, welding operators and tackers to be employed and certification that each individual is qualified as specified.

   a. The certification shall state the type of welding and positions for which the welder, welding operator or tacker is qualified, the code and procedure under which the individual is qualified, the date qualified, and the name of the firm and person certifying the qualification tests.

   b. The certification shall be kept on file at the job Site by the Contractor. The certification shall be kept current for the duration of the Contract.

3. Identification of Welds: The Contractor shall assign each welder, welding operator or tacker an identifying number, letter or symbol which shall be used to identify all welds made by that person. For identification, the welder, welding operator or tacker shall apply the assigned symbol adjacent to the weld by means of a rubber stamp, felt tipped marker with waterproof ink or other methods that do not cause an indentation in the metal. Identification with die stamps or electric etches shall not be allowed.

4. Record of Welds: The Contractor shall maintain a record of all welders, welding operators and tackers employed on the Contract showing the date and results of tests and the identification mark assigned to each person. These records shall be certified by the Contractor and copies of the records shall be furnished to the Engineer.

5. Previous Qualifications: At the discretion of the Engineer, welders, welding operators and tackers qualified by test within the previous 6 months may be accepted for this Contract without requalification if all of the following conditions are met:

   a. Copies of the welding procedure specifications, the procedure qualification test records, and the welder, welding operator, and tacker qualification test records are submitted and approved in accordance with the requirements shown on the Contract Drawings.

   b. Testing was performed by an approved testing laboratory.

   c. The previously-qualified welding procedure conforms to the requirements of this Section and is applicable to welding conditions encountered under this Contract.

   d. The welder, welding operator and tacker qualification tests conform to the requirements of this Section and are applicable to welding conditions encountered under this Contract.

6. Renewal of Qualifications: Requalification of a welder or welding operator shall be required under any of the following conditions:

   a. It has been more than 6 months since the welder or welding operator has used the specific welding process for which the welder or welding operator is qualified.

   b. There is specific reason to question the welder or welding operator's ability to make welds that meet the requirements of these Specifications.

   c. The welder or welding operator was qualified by an employer other than those firms performing Work under this Contract, and a qualification test has not been taken within the past 12 months. Records showing periods of employment, name of employer where welder, or welding operator, was last employed, and the process for which qualified shall be submitted as evidence of conformance.

   d. A tacker who passes the qualification test shall be considered eligible to perform tack welding indefinitely in the positions and with the processes for which he is qualified, unless there is some specific reason to question the tacker's ability. In such a case, the tacker shall be required to pass the prescribed tack welding test.

1.07 SUBMITTALS

A. The Contractor shall prepare and submit Shop Drawings for approval of the Engineer. Submittals shall include, but not be limited to, the following:

1. Erection drawings, and catalog data on welding equipment and materials.
2. Welding procedure specifications.
3. Welding procedure qualifications and test records.
4. Welder, welding operator and tacker qualifications and test records.
5. Records of tests and inspections of installed welds.
6. Testing or inspection agency selection.

1.08 DELIVERY, STORAGE, AND HANDLING

3.03 FIELD TESTING / QUALITY CONTROL

A. Supervision

1. All shop and field welding shall be under the immediate supervision of a representative of a standard testing agency or an approved inspection agency reporting directly to, and under the control of, the Department of Environmental Protection.

2. Procedures and techniques for inspection shall be in accordance with the applicable requirements of ANSI/AWS D1.1. The Contractor shall submit the name of such agency to the Commissioner for approval before starting Work.

3. The costs of all welding inspections and tests shall be borne by the Contractor.

B. Inspection and Tests

1. The Engineer will make periodic checks of each welder to determine that welds are being made as specified in the approved procedure specifications. Welding speed may be estimated.

2. All welds will receive 100 percent visual inspection to determine weld size and profile, surface cracks, overlap, and undercut.
3. Welds shall receive non-destructive testing as required in Section 05 12 00 - Structural Steel Framing.
4. The Engineer reserves the right to perform any additional test on any weld, including liquid penetrant, magnetic particle, radiographic, and ultrasonic. The costs of such testing will be borne by the Contractor if unsatisfactory welds are discovered, or by the City if the welds are satisfactory.

1.05 DESCRIPTION

A. Not Used

1.06 QUALITY ASSURANCE

A. Fasteners not manufactured in the United States shall be tested and certification provided with respect to specified quality and strength standards. Certifications of origin shall be submitted for all U.S. fasteners supplied on the project. Fasteners to be tested shall be randomly selected by the Engineer in the field.

B. All welding shall be performed by welders certified in accordance with AWS. Certifications of field welders shall be submitted prior to performing any field welds as per Section 05 05 23.01 – Welding. Welding shall comply with, but not limited to the following:

1. AWS D1.1 for Steel

C. Inadequate welds shall be corrected or redone and retested to the satisfaction of the Engineer, at no additional cost to the City.

D. Fasteners and concrete anchors will be inspected in accordance with the Inspection Article in Part 3.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings and material specifications for approval by the Engineer. Submittals shall include, but not be limited, to the following:

1. Shop Drawings providing the manufacturer, fastener type, certification of the fastener's material and capacity and product data such as:
   a. Product information
   b. Technical information
   c. Manufacturer’s Installation Instructions (MPII)
   d. ICC-ES Evaluation Report.
2. Copy of valid AWS certification for each person who is to perform field welding.
3. Certified weld inspection reports, when required.
4. Adhesive Anchors
   a. For all adhesive anchors, submit anchor sizes and location plan
   b. Testing methods, procedures and equipment.
   c. In the event that any adhesive anchors fail field testing, submit a detailed procedure for the removal and replacement of those anchors.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Materials stored outdoors shall be supported above ground surfaces and protected with approved effective and durable covers.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer’s standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Expansion anchors shall be:

1. Power-Stud+SD1 as manufactured by DeWalt, Brewster, NY;
2. Kwik Bolt 3 (KB3) expansion anchor as manufactured by Hilti, Plano, TX;
3. Strong-Bolt 2 Wedge Anchor as manufactured by Simpson Strong-Tie, Pleasanton, CA;
4. Or approved equal.

B. Screw anchors shall be:

1. Type 316 stainless steel KH-EZ screw anchor as manufactured by Hilti, Plano, TX;
2. Type 316 stainless steel Wedge-Bolt screw anchor as manufactured by DeWalt, Brewster, NY;
3. Type 316 stainless steel Titen-HD screw anchor as manufactured by Simpson Strong-Tie, Pleasanton, CA;
4. Or approved equal.

C. Sleeve or drop-in anchors shall be as manufactured by:

1. Hilti Inc., Plano, TX;
2. DeWalt, Brewster, NY;
3. Simpson Strong-Tie, Pleasanton, CA;
4. Or approved equal.

D. Adhesive Anchors

1. Epoxy adhesive anchor system shall be:
   a. Pure 110+ as manufactured by DeWalt, Brewster, NY;
   b. HIT-RE 500-V3 as manufactured by Hilti, Plano, TX;
   c. Or approved equal.
2. Vinylester adhesive anchor system shall be:
   a. AC200+ as manufactured by DeWalt, Brewster, NY;
   b. HIT HY-200 as manufactured by Hilti, Plano, TX;
   c. A7+ as manufactured by ITW Ramset/Redhead, Glendale Height, IL;
   d. AT-XP as manufactured by Simpson Strong-Tie, Pleasnaton, CA;
   e. Or approved equal.

E. The wedge inserts shall be as manufactured by:

a. Hohmann & Barnard, Inc., Hauppauge, NY;

b. Or approved equal.

F. Anchor channel shall be as manufactured by:

a. Halfen Anchoring Systems, Tampa, FL;

b. Or approved equal.

G. Masonry Anchors

1. The adhesive system shall be as manufactured by:

a. Hit HY-70 by Hilti Inc., Plano, TX;

b. AC100+ Gold by DeWalt, Brewster, NY;

c. AT (acrylic) or SET (epoxy) by Simpson Strong-Tie, Pleasanton, CA;

d. Or approved equal.

H. Expansion Bolts in Structural Steel Connections shall be:

1. Type HB Hollo-Bolt as manufactured by Lindapter, Syracuse, NY;

2. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Anchor Bolts

1. Anchor bolts for miscellaneous framing and architectural elements attachments shall conform to ASTM A36 or ASTM A307 Grade A except where stainless steel or other approved anchor bolts are shown on the Contract Drawings. Anchor bolts shall be of the size and configuration shown on the Contract Drawings and shall be supplied with hexagonal nuts meeting the requirements of ASTM A563 Grade A.

2. Anchor bolts for equipment attachment shall be of stainless steel Type 316 with nitronic 60 stainless steel nuts and locknuts.

3. All underwater anchor bolts shall be Type 316 stainless steel with nitronic 60 stainless steel nuts.

4. Pipe sleeves around anchor bolts shall be of the size and configuration shown on the Contract Drawings.

5. Material for anchor bolts submerged in salt water or corrosive liquids for which stainless steel Type 316 is not suitable shall be as indicated in the Contract.

B. Bolts

1. Bolts, nuts and washers for miscellaneous framing and for attachment of architectural elements shall conform to Section 05 12 00 - Structural Steel Framing.

2. Where bolts are used to connect galvanized steel or are otherwise specified to be galvanized, bolts, nuts, and washers shall be hot-dip galvanized in accordance with Section 05 05 13.01 - Galvanizing.

C. Stainless Steel Bolts

1. Stainless steel bolts shall conform to ASTM F593. All underwater fasteners shall be Type 316 stainless steel. Unless otherwise specified, fasteners for aluminum members shall be Type 304 stainless steel. Fasteners for stainless steel members shall be of matching grade.

2. Stainless steel bolts shall have hexagonal heads with a raised letter or symbol on the bolts indicating the manufacturer, and be supplied with hexagonal nuts meeting the requirements of ASTM F594. Nuts shall be of the same alloy as the bolts and shall have a raised letter or symbol indicating the manufacturer.

3. Nuts for stainless steel bolts for elements which are indicated on the Contract Drawings to be removable shall be made of nitronic 60 alloy.

4. Material for bolts submerged in salt water or corrosive liquids for which stainless steel Type 316 is not suitable shall be as indicated in the Contract.

D. Post-Installed Anchors

1. Concrete anchors shall be one of the types listed below as indicated on the Contract Drawings. Unless otherwise noted, all concrete anchors which are submerged, or which are subject to vibration from equipment such as pumps and generators, shall be injected, adhesive anchors. The determination of anchors equivalent to those listed below shall be based on test data performed by a commercial testing laboratory.

   a. Mechanical Anchors

      1) Expansion anchors shall be wedge, sleeve, or drop-in mechanical anchors.

      2) Screw anchors shall be one-piece threaded anchor with a finished hexagonal head.

   b. Adhesive anchors shall be two part injection type.

   c. Where anchor type is not indicated on the Contract Drawings, the wedge expansion anchor shall be used.

2. Expansion anchors shall be fully threaded, medium duty, Type 316 stainless steel anchors. Shall be sized and embedded to depths as shown on the Contract Drawings. If embedment depth is not given, the standard embedment depth as recommended by the manufacturer shall be used.

   a. Manufacturer for Expansion anchor shall be as specified in this Section.

3. Screw anchors shall be a one piece, heavy duty anchor with a finished hexagonal head. Screw anchors shall be sized and embedded to depths as

shown on the Contract Drawings. If embedment depth is not given, the standard embedment depth as recommended by the manufacturer shall be used.

a. Manufacturer for screw anchor shall be as specified in this Section.

4. Adhesive anchors shall consist of Grade 60 reinforcing steel ASTM A 615, or Type 316 stainless steel ASTM F593 or Grade B7 high strength carbon ASTM A193 threaded rods or bolts anchored with a two-part injection type adhesive system into hardened concrete or grout-filled masonry. The adhesive system shall use a two-component adhesive mix and shall be injected with a static mixing nozzle following manufacturer's instructions. The anchor diameter, type, and embedment depth shall be as shown on the Contract Drawings.

   a. The embedment depth of the rod/bolt shall provide a minimum allowable bond strength that is equal to the allowable tensile capacity of the rod/bolt (see Table 1) unless noted otherwise on the Contract Drawings.

   b. Manufacturer for Epoxy adhesive and Vinylester adhesive anchor systems and shall be as specified in this Section.

   c. Adhesive anchoring system shall have an ICC-ES Evaluation Service Report issued in accordance with AC308.

   d. Adhesive for the anchors must qualify under ACI 355.4.

Table 1
Allowable Tensile Capacity (Kips) for Standard Manufacturer Embedment

Size	Concrete Anchors Wedge Type	Concrete Anchors with Injection Adhesive System
3/8"	1.3	2.1
1/2"	2.4	3.8
5/8"	3.3	5.9
3/4"	4.8	8.4
7/8"	5.6	11.0
1"	7.1	15.0

5. Concrete anchors shall be of Stainless Steel Type 316 unless noted otherwise. Concrete anchors for stainless steel attachments shall be of matching grade.

6. All underwater concrete anchors shall be Type 316 stainless steel and shall have nitronic 60 stainless steel nuts.

7. Material for concrete anchors submerged in salt water or other corrosive liquids for which stainless steel Type 316 is not suitable shall be as indicated in the Contract.

E. Concrete Inserts

1. Wedge Type Inserts:

a. The concrete inserts for attachment of shelf angles or brick relieving angles to the reinforced concrete beams or concrete encased steel beams, shall be wedge type inserts. The inserts shall have an askew head bolt to produce an automatic tightening action when a load is placed on the bolt.

b. The wedge inserts shall be of malleable iron, hot dipped galvanized. The askew bolt and the horseshoe shim plates shall be of stainless steel Type 304 or 316. The type of insert and size of bolts shall be as shown on the Contract Drawings.

c. Manufacturer for wedge inserts shall be as specified in this Section.

2. Anchor Channel Inserts: for the top attachment of the masonry wall panels to steel encased or concrete structures, the inserts shall be:

a. Manufacturer for anchor channel inserts shall be as specified in this Section.

b. The anchor channel shall be made from channel profiles with "I" anchors shop welded to the back of channels. Anchor channels shall be furnished with the head bolts, channel nuts, etc., for a complete installation. All material shall be stainless steel type 304.

c. The type and series of the anchor channel shall be as shown on the Contract Drawings.

d. Anchor channels can be used for other attachments if detailed on the Contract Drawings.

F. Masonry Anchors

1. Masonry anchors shall be injection adhesive anchors with screen tube for fastening to hollow block, clay tiles and brick with holes (see Table 2).

2. Manufacturer for adhesive system shall be as specified in this Section.

3. Masonry anchors shall be of stainless steel type 304 unless noted otherwise. Masonry anchors for stainless steel attachments shall be of the matching grade.

Table 2 Allowable Tensile Masonry (lbs) in Hollow Concrete Block	
Size	Masonry Anchors with Injection Adhesive System
1/4"	255
5/16"	370
3/8"	525
1/2"	525

G. Electrodes for Welding

1. Electrodes for welding carbon steel shall comply with Section 05 12 00 - Structural Steel Framing.

H. Eye Bolts

1. Eyebolts shall be of the size indicated on the Contract Drawings and shall conform to ASTM A489 unless noted otherwise.

2. Carbon steel eyebolts shall be galvanized in accordance with Section 05 05 13.01 - Galvanizing.

I. Expansion Bolts in Structural Steel Connections

1. Expansion bolts for connecting to hollow section steel or where access is restricted (blind-bolts) shall be Type 316 stainless steel with a hex head such as specified in this Section.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. The Contractor shall field verify all dimensions and condition of the materials to be connected, review the Drawings and report any discrepancies to the Engineer for clarification prior to starting fabrication.

3.02 INSTALLATION

A. Anchor Bolts and Concrete Anchors:

1. Anchor bolts shall be installed in accordance with AISC "Code of Standard Practice" by setting in concrete while it is being placed and positioned by means of a rigidly held template.
2. The installation of concrete anchors shall be done in strict conformance with the manufacturer's field demonstration and recommendations.
3. The holes drilled for adhesive anchors shall be cleaned by use of a fiber bristle brush and dry compressed air. The anchors shall be supported in the correct position until the adhesive sets and gains enough strength to prevent any dislocation. Adhesive anchors shall not be tightened or loaded until the adhesive has fully cured as recommended by the manufacturer.
4. No concrete anchor shall be installed before base concrete has attained specified 28-day strength.
5. Concrete anchors shall not be used in place of anchor bolts without Engineer's approval.

B. Bolts:

1. All steel bolts shall be installed in conformance with Section 05 12 00 - Structural Steel Framing.
2. Unless otherwise specified, where aluminum and steel members are connected together they shall be fastened with Type 304 stainless steel bolts and isolated with micarta, nylon, rubber, or approved equal.

C. Concrete Inserts: Provide concrete inserts where shown on the Contract Drawings. Inserts shall be firmly held in position in the forms and sealed from intrusion of concrete mortar during concrete placement.

D. Adhesive Anchors

1. Concrete is to be a minimum of 21 days old at time of anchor installation
2. Work shall be performed by certified ACI/CRSI Adhesive Anchor Installers under continuous special inspection
3. Shall be installed in accordance with Manufacturer’s Published Installation Instructions (MPII), the applicable ICC-ES ESR and in accordance with NYC Buildings Bulletin 2009-019
4. Adhesive anchoring installation shall be subject to special inspection requirements of NYCBC section BC 1704.32.
5. Adhesive anchor shall be identified by labels on the packaging including manufacturer’s name, product designation and the requirements specified in ICC-ES AC308, Annex A.

E. Welding

1. Welding shall comply with the requirements of Sections 05 12 00 - Structural Steel Framing and 05 05 23.01 - Welding.

3.03 FIELD TESTING / QUALITY CONTROL

A. Inspection

1. Inspection for high strength bolted connections shall conform to the requirements of Section 05 12 00 - Structural Steel Framing.
2. At least 25 percent of the concrete anchors required to be installed shall be proof tested to 1.33 times the allowable load specified by the manufacturer of the system.
3. Welding inspection shall be done in accordance with the requirements of Sections 05 12 00 - Structural Steel Framing and 05 05 23.01 - Welding.
4. Adhesive Anchors: Adhesive anchoring installation shall be subject to special inspection requirements of NYCBC section BC 1704.32.

B. Testing of Adhesive Anchors

1. Field testing:
   a. Testing to be performed by a NYC Buildings Department approved special inspection agency to perform field testing of the installed anchors in accordance with NYCBC BC 1704.32 and ICC-ES ESR and the applicable sections of ASTM E488 in the presence of the Engineer.
   b. Anchors that are to be tested are as indicated on the Contract Drawings.
2. Pull-out testing:
   a. A total of 15% of the adhesive anchors designated for testing are to be tested and no more than one (1) bolt is to be tested per connection.
   b. The Engineer will randomly choose the anchors to be tested.
   c. Testing of the adhesive anchors shall not begin until all the anchors are installed.
   d. If only one anchor fails, all the adhesive anchors will be accepted. If a second anchor fails, an additional 5% of the anchors shall be tested. If more than 20% of the total anchors tested fail, all the anchors shall be removed and replaced.
3. Removal and replacement of failed test anchors:
   a. Remove all anchors that fail the field test without damage to the surrounding concrete.
   b. Redrill holes to remove adhesive bonding material residue and clean in accordance with MPII.
   c. Reinstall new anchors that are the same size as the removed anchors and install the new anchors in the same exact location as the

removed anchor. Do not reuse the failed anchors, they shall be discarded.

d. Assign reinstalled anchors into batches only containing reinstalled anchors of the same diameter, embedment length and adhesive bonding material system, and field test in accordance with the above sections.

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish, install and erect the stainless steel work as specified herein and shown on the Contract Drawings.

B. Stainless steel work shall be furnished complete with all accessories, mountings and appurtenances of the type of stainless steel and finish as specified or required for a satisfactory installation.

The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. Tests

1. All stainless steel materials including stainless test welds, shall be checked for compliance with tests for susceptibility to intergranular attack. Such tests shall be Practices A, B and E of ASTM A262.

Detailed procedures for the tests shall be submitted to the Engineer for approval prior to start of work. Practice A shall be used only for acceptance of materials but not for rejection of materials, and shall be used for screening material intended for testing in Practice B and Practice E. The maximum acceptable corrosion rate under Practice B shall be 0.004 inch per month, rounded off to the third decimal place. If the certified mill report indicates that such test has been satisfactory performed, the fabricator may not be required to repeat the test. Material passing Practice E shall be acceptable.

2. Sample selection for the susceptibility to intergranular attack tests shall be as follows:

   a. One (1) sample per each heat treatment lot for plates and forgings;

   b. One (1) sample per each Welding Procedure Qualification regardless of the joint design;

   c. If tests indicate a reduction in corrosion resistance, welding procedure shall be adjusted or heat treatment determined as needed to restore required corrosion resistance;

   d. The samples so chosen shall have received all the post-weld heat treatments identical to the finished part.

1.06 QUALITY ASSURANCE

A. Shop inspections may be made by the City representatives. The Contractor shall give ample notice to the Engineer prior to the beginning of any stainless steel fabrication work so that inspection may be provided. The Contractor shall furnish all facilities for the inspection of materials and workmanship in the shop, and the inspectors shall be allowed free access to the necessary parts of the works.

B. Inspectors shall have the authority to reject any materials or work which does not meet the requirements specified herein or of the Contract Drawings.

C. Inspection at the shop is intended as a means of facilitating the work and avoiding errors, but is expressly understood that it will in no way relieve the Contractor from his responsibility for furnishing proper materials or workmanship.

1.07 SUBMITTALS

A. The Contractor shall prepare and submit Shop Drawings for all stainless steel fabrication for approval by the Engineer. Submittals shall include, but not be limited to, the following:

   1. Certified test reports for susceptibility to intergranular attack.

2. Affidavit of compliance with type of stainless steel shown on the Contract Drawings or specified herein.

3. Certified weld inspection reports.

4. Cleaning and handling of stainless steel in accordance with Article "Cleaning and Handling" in this Section.

B. Samples of finish, on each type of stainless steel to be furnished, shall be submitted in accordance with the Quality Assurance requirements of the Contract.

C. Sustainability Submittals:

1. Environmental Product Declarations

a. The Contractor shall provide product-specific type III Environmental Product Declaration (EPD) conforming to ISO 14025, 14044.

2. Envision Submittals

a. The Contractor shall report information pertaining to the sustainable procurement, regional sourcing, and/or recycled content of new materials to be procured during the Work, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall coordinate with its vendor on sustainable product requirements as stipulated by the Contractor's approved New Materials Sustainable Implementation Plan, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall submit vendor shop drawings for review by the Engineer that clearly illustrate the vendor is meeting the requirements as approved in the Contractor's New Materials Sustainable Implementation Plan.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Mechanical damage (e.g., scratches and gouges) to the stainless steel material can occur during handling. Care shall be taken in the material handling since such mechanical damage will result in the passive oxide film being "punctured" leading to a possible lower resistance to the initiation of corrosion than the surrounding chemically-passivated surface. Corrosion in such areas can be accelerated by the galvanic corrosion effect due to the unfavorable relative area ratios which would exist.

B. Stainless steel plates and sheets shall be stored vertically in racks and not be dragged out of the racks or over one another. Racks shall be protected to prevent iron contamination.

C. Heavy stainless steel plates shall be carefully separated and chocked with wooden blocks so that the forks of a fork-lift could be inserted between plates without mechanically damaging the surface.

D. Stainless steel plates and sheets laid out for use shall be off the floor and be divided by wooden planks to prevent surface damage and to facilitate subsequent handling.

E. Plate clamps, if used, shall be used with care as the serrated faces can dig in, indent and gouge the surface.

F. Stainless steel fabrications shall be loaded in such a manner that they may be transported and unloaded without being overstressed, deformed or otherwise damaged.

G. Stainless steel fabrications and packaged materials shall be protected from corrosion and deterioration and shall be stored in a dry area. Materials stored outdoors shall be supported above ground surfaces on wood runners and protected with approved effective and durable covers.

H. Stainless steel fabrications shall not be placed in or on a structure in a manner that might cause distortion or damage to the fabrication. The Contractor shall repair or replace damaged stainless steel fabrications or materials as directed by the Engineer.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. Materials and Finishes

1. Type and finish of stainless steel to be utilized for fabrication shall be the type and finish indicated on the Contract Drawings or as specified herein for the intended service and conforming to the applicable ASTM standard.

2. The basic mill forms (sheet, strip, plate and bar) are classified by size as shown on Table 1. Tables 2, 3 and 4 identify finishes and conditions in which sheet, bar and plate are available.

3. Tables 2, 3 and 4 show numbered finishes and conditions for sheet, bar and plate. While there are no specific designations for polished finishes on bar or plate, the sheet finish designations are used to describe the desired effect. This also applies to finishes on ornamental tubing.

4. There are three standard finished for strip, which are broadly described by the finishing operations employed:

   a. No. 1 Strip Finish is approximately the same as No. 2D Sheet Finish. It varies in appearance from dull gray matte to a fairly reflective surface, depending largely on alloy composition and amount of cold reduction.

   b. No. 2 Strip Finish is approximately the same as a No. 2B sheet finish. It is smoother, more reflective than No. 1, and likewise varies with alloy composition.

   c. Bright annealed finish is a highly reflective finish that is retained by final annealing in a controlled atmosphere furnace.

Table 1
CLASSIFICATION OF STAINLESS STEEL PRODUCT FORM

Item	Description	Dimensions		
		Thickness	Width	Diameter or Size
Sheet	Coils and cut length: Mill finishes Nos. 1, 2D and 2B Polished finishes Nos. 3, 4, 6, 7 & 8	 under 3/16" under 3/16"	 24" and over all widths	 -- --
Strip	Cold finished, coils or cut lengths Polished finishes Nos. 3, 4, 6,7 & 8	under 3/16" under 3/16"	under 24" all widths	-- --
Plate	Flat rolled or forged	3/16" and over	over 10"	--
Bar	Hot finished rounds, squares, octagons and hexagons Hot finished flats Cold finished rounds, squares, octagons and hexagons Cold finished flats	-- 1/8" to 8" incl. -- 1/8" to 4-1/2"	-- 1/4" to 10" incl. -- 3/8" to 4-1/2"	1/4" and over -- over 1/8" --
Wire	Cold finishes only: (in coil) Round, square, octagon, hexagon and flat wire	 under 3/16"	 under 3/8"	 --
Pipe and Tubing	Several different classifications, with differing specifications, are available.			
Extrusion	Not considered “standard” shapes. Currently limited in size to approximately 6-1/2" diameter or structurals.			

Table 2
STANDARD MECHANICAL SHEET FINISHES

Unpolished or Rolled Finishes: No. 1 A rough dull surface which results from hot rolling to the specified thickness followed by annealing and descaling.	No. 4 A polished surface obtained by finishing with a 120-150 mesh abrasive, following initial grinding with coarser abrasives. This is a general purpose bright finish with a visible "grain" which prevents mirror reflection.
No. 2D A dull finish which results from cold rolling followed by annealing and descaling, and may perhaps get a final light roll pass through unpolished rolls. A 2D finish is used where appearance is of no concern.	No. 6 A dull satin finish having lower reflectivity than No. 4 finish. It is produced by Tampico brushing the No. 4 finish in a medium of abrasive and oil. It is used for architectural applications and ornamentation where a high luster is undesirable, and to contrast with brighter finishes.
No. 2B A bright cold-rolled finish resulting in the same manner as No. 2D finish, except that the annealed and descaled sheet receives a final light roll pass through polished rolls. This is the general purpose cold-rolled finish that can be used as is, or as a preliminary step to polishing.	No. 7 A high reflective finish that is obtained by buffing finely ground surfaces but not to the extent of completely removing the "grit" lines. It is used chiefly for architectural and ornamental purposes.
Polished Finishes: No. 3 An intermediate polish surface obtained by finishing with a 100 grit abrasive. Generally used where a semi-finished polished surface is required. A No. 3 finish usually receives additional polishing during fabrication.	No. 8 The most reflective surface, which is obtained by polishing with successively finer abrasives and buffing extensively until all grit lines from preliminary grinding operations are removed. It is used for applications such as mirrors and reflectors.

Table 3
CONDITIONS AND FINISHES FOR BAR

Conditions	Surface Finishes[1]
Hot worked only	(a) Scale not removed (excluding spot conditioning) (b) Rough turned[2] (c) Pickled or blast cleaned and pickled.
Annealed or otherwise heat treated.	(a) Scale not removed (excluding spot conditioning) (b) Rough turned (c) Pickled or blast cleaned and pickled (d) Cold drawn or cold rolled (e) Centerless ground (f) Polished
Annealed and cold worked to high tensile strength[3]	(d) Cold drawn or cold rolled (e) Centerless ground (f) Polished

Table 4
CONDITIONS AND FINISHES FOR PLATE

Condition and Finish	Description and Remarks
Hot rolled	Scale not removed. Not heat treated. Plates not recommended for final use in this condition.[4]
Hot rolled, annealed or heat treated	Scale not removed. Use of plates in this condition is generally confined to heat resisting applications. Scale impairs corrosion resistance.[1]
Hot rolled, annealed or heat treated, blast cleaned or pickled	Condition and finish commonly preferred for corrosion resisting and most heat resisting applications.
Hot rolled, annealed, descaled and temper passed	Smoother finish for specialized applications.
Hot rolled, annealed, descaled cold rolled, annealed, descaled, optionally temper passed	Smooth finish with greater freedom from surface imperfection than the above.
Hot rolled, annealed or heat treated, surface cleaned and polished	Polished finishes refer to Table 2.
Notes: 1. Surface finishes (b), (e) and (f) are applicable to round bars only.	
2. Bars of the 4xx series stainless steels which are highly hardenable, such as Types 414, 420, 420F, 431, 440A, 440B and 440C, are annealed before rough turning. Other hardenable grades, such as Types 403, 410, 416 and 416Se, may also require annealing depending on their composition and size.	
3. Produced in Types 302, 303Se, 304 and 316.	
4. Surface inspection is not practicable on plates which have not been pickled or otherwise descaled.	

B. Fasteners

1. Stainless steel fasteners shall be used for joining stainless steel work.

2. Stainless steel fasteners shall be made of alloys that are equal to or more corrosion resistant than the materials they join.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Fabrication

1. Holes for bolts and screws shall be drilled. Fastenings shall be concealed where practicable. Joints exposed to the weather shall be formed to exclude water.
2. As far as practicable, all fabricated units shall be fitted and assembled in the shop, with all cuts and bends made to precision measurements in accordance with details shown on approved shop drawings.
3. Work shall be fabricated so that it is installed in a manner that will provide for expansion and contraction, prevent the shearing of bolts, screws and other fastenings, ensure rigidity, and provide close fitting of sections.
4. All finished and/or machined faces shall be true to line and level. Stainless steel sections shall be well formed to shape and size with sharp lines and angles; curved work shall be sprung evenly to curves.
5. All work shall be fitted together at the shop as far as possible, and delivered complete and ready for erection. Proper care shall be exercised in handling all work so as not to injure the finished surfaces.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Field Measurements

1. The Contractor shall verify all dimensions and shall make any field measurements necessary and shall be fully responsible for accuracy and layout of the work.
2. The Contractor shall review the Contract Drawings and any discrepancies shall be reported to the Engineer for clarification prior to starting fabrication.

3.02 IMPLEMENTATION

A. Installation

1. All stainless steel fabrications shall be erected square, plumb and true, accurately fitted, adequately anchored in place, set at proper elevations and positions.
2. All inserts, anchor bolts and all other miscellaneous work specified herein or shown on the Contract Drawings or required for the proper completion of the work, which are embedded in concrete, shall be properly set and securely held in position in the forms before the concrete is placed.

3. All stainless steel fabrications shall be installed in conformance with details shown on the Contract Drawings or on the approved shop drawings.

B. Welding

1. Welding shall be done in a manner that will prevent buckling and in accordance with Section 05 05 23.01 - Welding, and as modified hereinafter.

2. All welds exposed in the work shall be ground smooth and finished to match the finish of the adjacent stainless steel surfaces.

3. Select weld rods that provide weld filler metal having corrosion resistant properties as nearly identical or better than the base metal to insure preservation of the corrosion-resistant properties. Provide heat treatment at welds where testing of weld procedure indicates it is required to restore the corrosion resistance.

4. Thermal conductivity of stainless steel is about half that of other steels; and the following methods may be used to accommodate this situation:

   a. Use lower weld current setting.

   b. Use skip-weld techniques to minimize heat concentration.

   c. Use back-up chill bars or other cooling techniques to dissipate heat.

5. Edges of the stainless steel to be welded shall be cleaned of contaminants.

C. Cleaning and Handling

1. All stainless steel surfaces shall be precleaned, descaled, passivated and inspected before, during and after fabrication in accordance with the applicable sections of ASTM A380 and as detailed in the procedures to be submitted to the Engineer for approval prior to start of work. Degreasing and passivation of stainless steel articles shall be conducted as the last step after fabrication.

2. Measures to protect cleaned surfaces shall be taken as soon as final cleaning is completed and shall be maintained during all subsequent handling, storage and shipping.

   a. The Contractor shall submit for approval specific procedures listing all the steps to be followed in detecting contamination and in descaling, cleaning, passivation and protecting of all stainless steel.

   b. Area showing clear indications of contamination shall be recleaned, repassivated and reinspected.

3. At approved stages in the shop operations, contaminants such as scale, embedded iron, rust, dirts, oil, grease and any other foreign matter shall be

removed from the metal, as directed or approved by the Engineer. The adequacy of these operations shall be checked by the Engineer. Operations in the shop shall be conducted so as to avoid contamination of the stainless steel and to keep the metal surfaces free from dirt and foreign matter.

4. In order to prevent incipient corrosion during fabrication, special efforts shall be made at all times to keep all stainless steel surfaces from coming in contact with other metals.

   a. Stainless steel and stainless steel welds shall be cleaned with clean sand, stainless steel wool, stainless steel brushes, or other approved means and shall be protected at all times from contamination by any materials, including carbon steel, that shall impair its resistance to corrosion.

   b. Approved methods of cutting grinding and handling shall be used to prevent contamination. If air-arc, or carbon-arc cutting is used, additional metal shall be removed by approved mechanical means so as to provide clean, weldable edges. All grinding of stainless steel shall be performed with aluminum oxide or silicon carbide grinding wheels bonded with resin or rubber. Grinding wheels used on carbon steel shall not be used on stainless steel.

   c. Sand, grinding wheels, brushes and other materials used for cleaning stainless steel shall be checked periodically by the Engineer for contaminants. Cleaning aids found to contain contaminants shall not be used on the work.

SECTION 05 12 00 - STRUCTURAL STEEL FRAMING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish all equipment, materials, and services for the fabrication, delivery, unloading, handling, storing, and erection of all structural steel Work as shown on the Contract Drawings and called for herein.

B. Unless otherwise shown, specified or required, design, workmanship and erection shall conform to or exceed the applicable requirements of the documents listed hereinafter in Article "References" included in this Section to the extent that the provisions of such documents are not in conflict with the requirements of this Section.

C. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. Definition

1. Structural Steel: The term structural steel shall be as defined in the Codes of Standard Practice for Steel Buildings and Bridges of the AISC. Included as structural steel shall be all stiffeners, plates, sag rods and other miscellaneous metal required for a complete installation.

1.06 QUALITY ASSURANCE

A. All fabrication and erection shall be performed by AISC Quality Certified Companies.

B. Shop inspections may be made by the City representatives. The Contractor shall give ample notice to the Engineer prior to the beginning of any fabrication Work so that inspection may be provided. The Contractor shall furnish all facilities for the inspection of materials and workmanship in the shop, and the inspectors shall be allowed free access to the necessary parts of the works.

1. Inspectors shall have the authority to reject any materials or work which does not meet the requirements of these Specifications.

2. Inspection at the shop is intended as a means of facilitating the work and avoiding errors, but is expressly understood that it will in no way relieve the Contractor from his responsibility for furnishing proper materials or workmanship under this Specification.

3. Obtain copies of Certified Materials Test Reports (both chemical and physical) and Manufacturer Certificates of Conformance.

C. All welding shall be performed by certified welders under the immediate supervision of a representative of a standard testing agency or a special inspection agency reporting directly to and under the control of the City and meeting the requirements of Section 05 05 23.01 – Welding.

D. The Contractor shall submit the name of such testing agency to the Commissioner for approval before starting Work.

1. All shop and field welds in structural steel shall be visually inspected by an AWS qualified welding inspector. The Contractor shall furnish a letter of certification for each welded connection stating that these requirements have been met.

2. The costs of all welding supervision and inspections shall be borne by the Contractor. The Contractor shall engage inspectors to inspect welded connections and to perform tests and prepare test reports.

3. Nondestructive testing such as radiographic testing or ultrasonic testing, when required, shall be as specified by the Engineer and performed in accordance with the applicable AWS or ASME code. Frequency of such testing shall also be as specified by the Engineer or indicated on the Contract Drawings.

4. Welds that are required by the Engineer and/or inspectors to be corrected shall be corrected or redone and retested as directed, at the Contractor's expense and to the satisfaction of the Engineer and/or an acceptable independent testing lab.

E. The Contractor shall engage an independent testing and inspection agency to inspect high-strength bolted connections. The agency shall report directly and be under the control of the City. The costs of all high-strength bolt inspections shall be borne by the Contractor.

1. Rejected bolts shall be either replaced or retightened as required. In cases of disputed bolt installation, the bolts in question shall be checked by a

calibrated wrench certified by an independent testing laboratory. The certification shall be at the Contractor's expense.

F. The Contractor shall be solely responsible for the correctness of all shop and field fabrication and fit.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. Layout drawings indicating all materials, structural shapes, sizes, and dimensions.
2. Beam and column schedules.
3. Detail drawings indicating connection and anchoring details.
4. Anchor bolts and setting plans.
5. Erection drawings

B. No fabrication shall be started until Shop Drawings have been approved in writing by the Engineer.

C. The Contractor shall also submit the following:

1. Certified mill test reports
2. Affidavit of compliance with grade specified
3. Certified weld inspection reports
4. Certification for bolts
5. Paint certification
6. Quality certifications for fabricators and erectors.

D. The Contractor shall furnish samples for testing, if required by the Contract.

E. Sustainability Submittals:

1. Environmental Product Declarations
   a. The Contractor shall provide product-specific type III Environmental Product Declaration (EPD) conforming to ISO 14025, 14044.
2. Envision Submittals
   a. The Contractor shall report information pertaining to the sustainable procurement, regional sourcing, and/or recycled content of new materials to be procured during the Work, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall coordinate with its vendor on sustainable product requirements as stipulated by the Contractor’s approved New Materials Sustainable Implementation Plan, in

accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall submit vendor shop drawings for review by the Engineer that clearly illustrate the vendor is meeting the requirements as approved in the Contractor's New Materials Sustainable Implementation Plan.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Structural members shall be loaded in such a manner that they may be transported and unloaded without being over-stressed, deformed or otherwise damaged.

B. Structural steel members and packaged materials shall be protected from corrosion and deterioration. Material shall be stored in a dry area.

C. Materials stored outdoors shall be supported above ground surfaces on wood runners and protected with approved effective and durable covers.

D. Materials shall not be placed on the structure in a manner that might cause distortion or damage to the members or the supporting structures. The Contractor shall repair or replace damaged materials or structures as directed by the Engineer.

2.02 MATERIALS / EQUIPMENT

A. Structural Steel

1. The fabricator shall provide an affidavit stating that the structural steel furnished meets the requirements of the grade specified. All unidentified steel will be rejected and shall be removed from the site and replaced by the Contractor, at no additional cost to the City.

2. Structural steel for W shapes shall conform to ASTM A992 unless otherwise indicated.

3. Structural steel for S, M, and HP shapes and channels shall conform to ASTM A572 Grade 50 unless otherwise indicated.

4. Structural steel for angles and plates shall conform to ASTM A36 unless otherwise indicated.

5. Certified mill test reports or certified reports of tests made by the fabricator or a testing laboratory for structural steel in accordance with ASTM A6 and

the governing specification shall constitute evidence of conformity with the ASTM Specification.

6. Steel pipe shall be ASTM A53, Type E or S, Grade B.

7. Structural tubing shall be ASTM A500, Grade B. All members shall be furnished full length without splices unless otherwise noted or accepted by the Engineer.

8. Low alloy, high strength, high corrosion resistant steel shall conform to ASTM A 588.

9. High strength Columbium-Vanadium structural steel shall conform to ASTM A 572, Grade 50.

B. Bolts

1. High strength bolts shall conform to ASTM F3125. Other bolts shall conform to ASTM A307. Unless otherwise indicated, all bolts shall be ASTM F3125.

2. Galvanized high strength bolts shall conform to ASTM F3125, Type 1, nuts shall conform to ASTM A563. Galvanizing shall be by the hot-dip process and in accordance with Section 05 05 13.01 - Galvanizing.

   a. Nuts shall meet the requirements of either ASTM A563 for Grade DH, or ASTM A194 for Grade 2H.

   b. Flat circular washers and square or rectangular beveled washers shall conform to the requirements of ASTM F436.

   c. Bolt dimensions shall conform to the requirements for regular semi-finished hexagon bolts, ANSI B18.2.1., unless otherwise specified.

   d. Nut dimensions shall conform to requirements for heavy hexagon semi-finished nuts ANSI/ASME B18.2.2. Washers shall be flat and smooth and their dimensions shall conform to the requirements for heavy plain washers, ANSI B18.22.1.

3. Bolts used to connect dissimilar metals or located in a corrosive atmosphere, as indicated on the Contract Drawings or specified herein, shall be Type 316 stainless steel conforming to ASTM A193 and A194.

4. Bolts not manufactured in the United States shall be tested and certification provided with respect to specified and required quality and strength standards. Certification of origin shall be provided for all United States fasteners. Bolts to be tested will be randomly selected in the field by the Engineer.

C. Anchor Bolts

1. Anchor bolts for structural steel shall be of the size and configuration shown on the Contract Drawings and shall conform to ASTM A307 unless shown or noted otherwise on the Contract Drawings.

D. Welding Electrodes

1. Welding electrodes for ASTM A36 steel shall comply with ANSI/AWS A5.1 (minimum tensile strength of 72,000 psi) and shall be E70XX.

2. Welding electrodes for ASTM A588, ASTM A572, and ASTM A992 steel shall comply with ANSI/AWS A5.17 (tensile strength range of 70,000 psi to 95,000 psi) or ANSI/AWS A5.23 wire and flux, and shall be F7XX-EXXX or F7XX-EXX-XX.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Fabrication shall be in accordance with the AISC Code of Standard Practice for Steel Buildings and Bridges.

B. Anchor Bolts:

1. All anchor bolts for structural steel erection and other incidental items of the structural steel required to be built into concrete shall be properly set and securely held in position in the forms before the concrete is placed.

2. Anchor bolts and setting plans for steel columns shall be provided at the site, marked or tagged for ready identification.

3. Anchor bolts shall be accurately set to template and at elevation to provide suitable projection above concrete and/or grout as specified in AISC Code of Practice. Anchor bolts shall be set perpendicular to the theoretical bearing surface.

4. All holes in structural steel members required for anchors, anchor bolts, bolt holes, connection angles, supports and braces for stair stringers, equipment apparatus, sag rods, or other members noted on the Contract Drawings shall be provided by the fabricator and detailed on the shop drawings.

5. Where misalignment between anchor bolts and bolt holes in steel members is encountered, the Engineer shall be immediately notified. The Contractor shall submit a method to remedy the misalignment for review by the Engineer.

C. All materials shall be properly worked and match-marked for field assembly. Where finishing is required, assembly shall be completed including bolting of units before start of finishing operations.

D. Connections:

1. Unless noted otherwise on the Contract Drawings, all beam connections shall be designed for reaction values indicated on the Contract Drawings. Wherever beam reaction values or connection details are not shown, the connection shall be designed to support half the total uniform load capacity tabulated in the AISC tables for allowable loads for laterally supported beams for the given shape, span, and steel specified for the beam in question.

2. Unless noted otherwise on the Contract Drawings, all beam connections designed by the fabricator shall conform to tables for Framed Beam Connections in AISC Manual of Steel Construction.

3. Except where otherwise noted on the Contract Drawings or in this Specification, all shop connections shall be welded.

E. Where shop assembly of field connections is shown, specified or required, the unmatched holes shall be reamed and the pieces matchmarked before disassembly. The interchange of matching parts will not be permitted.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Field Measurement

1. The Contractor shall verify all dimensions and shall make any field measurements necessary and shall be fully responsible for accuracy and layout of the work.

2. The Contractor shall review the Contract Drawings and any discrepancies shall be reported to the Engineer for clarification prior to starting fabrication.

3.02 IMPLEMENTATION

A. Erection

1. The erection of all structural steel shall conform to the applicable requirements of the Specifications for the Design, Fabrication and Erection of Structural Steel for Buildings of the AISC.

a. All temporary bracing, guys and bolts as may be necessary to ensure the safety of the structure until the permanent connections have been made shall be provided by the Contractor.

b. High strength steel bolts shall conform to the AISC Specifications for Structural Joints Using High-Strength Bolts.

2. All field connections shall be accurately fitted up before being bolted. Drifting shall be only such as will bring the parts into position and shall not be sufficient to enlarge the holes or to distort the metal. All unfair holes shall be drilled or reamed.

3. High Strength Steel Bolts

a. The furnishing and installation of high-strength bolts, washers and nuts shall be in conformity with:

1) Relevant sections of the NYCBC.

2) Latest issue of Rules Relating to High-Strength Bolts by the NYCDOB.

b. All bolted connections shall use high strength bolts in bearing-type connections according to the AISC Specification for Structural Joints Using High-Strength Bolts.

c. Where indicated, high strength bolts in slip-critical connections shall be used according to AISC Specification for Structural Joints Using High-Strength Bolts. The Engineer shall approve the procedure for calibration of wrenches and installation of bolts and, in general, shall satisfy himself that all requirements of the Specifications for Structural Joints Using High-Strength Bolts are met.

4. Cutting and Burning: The use of a gas cutting torch in the field for correcting fabrication errors will not be permitted on any major member in the structural framing. Its use may be permitted on minor members if the member is not under stress, and only after the written approval of the Engineer has been obtained.

a. No cutting of structural steel members in the field will be allowed except by written approval of the Engineer.

b. All cutting shall be done with an oxyacetylene torch in conformity with the NYCBC and AWS.

5. Grouting of Base Plates and Bearing Plates: All loose column base plates and billets shall be accurately set to the designated levels on steel wedges or angle screeds in preparation for grouting under this Section. Leveling plates grouted in place shall be installed under all structural steel columns.

a. Prior to the placement of non-shrink grout beneath base and bearing plates, the bottom surface of the plates shall be cleaned of all foreign materials, and concrete and masonry bearing surface shall also be cleaned of all foreign materials and roughened to improve bonding.

b. Anchor bolts shall be tightened after the supported members have been positioned and plumbed and the non-shrink grout has attained its specified strength.

c. Baseplates shall be grouted with non-shrink grout to assure full uniform bearing. Grouting shall be done prior to placing loads on the structure.

6. Welding:

a. Welding, where required, shall be performed in accordance with the requirements of:

1) Section 05 05 23.01 – Welding.

2) AWS D1.1 Structural Welding Code.

3) Relevant sections of the NYCBC when applicable.

b. In assembly and during welding the component parts of built-up Work shall be held in place by sufficient clamps, temporary bolts or other adequate means to keep parts in proper position. Where temporary bolts are used, to hold the parts together in steel plates or similar work, the temporary bolts shall be removed and the holes shall be filled with welding material where practical. Otherwise, the nuts shall be tightened and the bolt threads outside the unit shall be burned and the bolt peened to prevent the nut from loosening.

7. Misfits at Bolted Connections:

a. Where misfits in erection bolting are encountered, the Engineer shall be immediately notified. The Contractor shall submit a method to remedy the misfit for review by the Engineer. The Engineer will determine whether the remedy is acceptable or if the member must be refabricated.

b. Incorrectly sized or misaligned holes in members shall not be enlarged by burning or by the use of drift pins. The Contractor shall notify the Engineer immediately and shall submit a proposed method of remedy for review by the Engineer.

B. Frame Assembly

1. Structural frames shall be set accurately to the lines and elevations indicated on the Contract Drawings. The various members shall be aligned and adjusted to form a part of a complete frame or structure before being permanently fastened. Bearing surfaces and other surfaces which will be in permanent contact shall be cleaned before assembly. Necessary adjustments to compensate for discrepancies in elevations and alignments shall be performed.

2. Individual members of the structure shall be leveled and plumbed within AISC tolerances. The Contractor shall provide and install all temporary bracing required until structure is complete.

C. Painting

1. General Requirements:

a. Structural steel work shall be painted in accordance with Section 09 91 00 - Painting. All painting performed at the fabricator's shop shall be subject to inspection by the Engineer, and all parts of the work shall be made accessible to the Engineer.

1) All structural steel shall be given one prime coat before shipment to the field.

2) Structural steel encased in concrete shall not be painted.

3) Structural steel encased in masonry or which will be otherwise inaccessible in the finished work, shall receive two shop coats. After erection and before the steel is enclosed, all damaged surfaces shall be prepared and touched-up.

4) No paint shall be permitted on faying surfaces of slip critical joints unless it is qualified by test in accordance with AISC "Test Methods to Determine the Slip Coefficient for Coatings used in Bolted Joints" as adopted by the Research Council on Structural connections. Manufacturer's certification shall include a certified copy of the test report.

5) Prime coat shall be compatible with fireproofing system.

b. All structural steel work specified to be painted shall be sand blasted or wheel abraded by the fabricator, of loose mill scale, loose rust, weld slag or flux deposit, dirt and other foreign matter to satisfy the following specifications of the SSPC:

1) SSPC SP-6, Commercial Blast Cleaning, for all steel except steel subject to immersion.

2) SSPC SP-10, Near-White Blast Cleaning, for steels subject to immersion.

c. Cleaned steels shall be primed within 6 hours after cleaning to prevent formation of new rust.

2. Finished Surfaces: Machine finished surfaces with zero clearance metal to metal contact shall be protected against corrosion by rust-inhibiting coating that can be easily removed prior to erection or which has characteristics that make removal unnecessary prior to erection.

3. Field Welds: Surfaces within 2 inches of any field weld location shall be free of materials that would prevent proper welding or produce objectionable fumes while welding is being done.

4. Defective Work: The Contractor shall correct such work as found to be defective under this Article of the Sections.

D. Galvanizing

1. All steel noted to be galvanized on the Contract Drawings or specified herein shall be galvanized in accordance with Section 05 05 13.01 - Galvanizing.

2. All bolts and anchor bolts connecting galvanized steel members shall be galvanized.

3. Shop paint primer shall be omitted from steel to be galvanized.

3.03 FIELD TESTING / QUALITY CONTROL

SECTION 05 21 00 - STEEL JOIST FRAMING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. This Section describes the requirements for steel joists and joist girders and related items. Steel joists and joist girders shall conform to the requirements specified herein and as shown on the Contract Drawings.

B. Unless otherwise shown, specified or required, design, workmanship and erection shall conform to or exceed the applicable requirements of the documents listed hereinafter in Article titled "References" in this Section, to the extent that the provisions of such documents are not in conflict with the requirements of this Section.

C. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. Design

1. General: Steel joists and joist girders shall be as designated on the Contract Drawings in accordance with the standard designations of the Steel Joist Institute. The depth of steel joists and joist girders, for purpose of design, in all cases shall be the depth at the center of the span.
2. Steel joists shall be designed to develop the total and service live load uniformly distributed load-carrying capacities shown in the SJI "Standard Load Table for Open Web Steel Joists, K-Series, "for the spans and loadings indicated on the Contract Drawings. The furnished steel joists shall be capable of resisting the design service loads at the joist spacing indicated on the Contract Drawings. Live load deflection shall be limited to 1/360 of the span.
3. Joist girders shall be designed as simply supported primary members to support panel point loadings. All imposed loads shall be applied through joist girders and shall be equal in magnitude and evenly spaced along joist girder top chord unless otherwise indicated on the Contract Drawings. The furnished joist girders shall be capable of resisting, within allowable unit stress limits, all imposed concentrated service loads. Joist girders shall be designed to account for the magnitude and location of all loads and forces, other than equal concentrated gravity loadings, indicated on the Contract Drawings. Joist girders shall be proportioned such that they can be erected without bridging. Joist girders shall be cambered to account for full dead load as indicated on the Contract Drawings. Unless a roof surface is provided with sufficient slope toward points of free drainage or adequate

drains to prevent the accumulation of rainwater, the joist girder shall be investigated to assure stability under ponding conditions in accordance with Section 1.13.3 of the AISC Specification. Live load deflection shall be limited to 1/360 of the clear span. The slope of the top chord shall be provided as indicated on the Contract Drawings after dead load deflection has been taken into consideration. The nominal depth of sloping chord joist girders shall be the depth at mid-span.

4. The design of joists and joist girders chords and web sections shall be based on a yield strength of at least 36,000 psi, but not greater than 50,000 psi and shall conform to Steel Joist Institute requirements.

5. Accessories and fittings, including end supports and bridging, shall be designed and provided in accordance with the manufacturer's standard Specifications under which the joists and joist girders were designed.

6. Vertical or diagonal members shall be designed, and provided at all concentrated loads, where shown on the Contract Drawings.

7. Extended ends shall be designed in accordance with the magnitude and location of uniform or concentrated loads shown on the Contract Drawings. Where such design loads are not indicated, extended ends shall be designed in accordance with SJI requirements.

8. Ends of joist girders resting on the steel supports shall be attached thereto in accordance with SJI requirements and shall be anchored to resist uplift forces indicated on the Contract Drawings.

1.06 QUALITY ASSURANCE

A. Qualification of Manufacturer: Steel joists and joist girders shall be the product of an experienced manufacturer who is regularly engaged in the manufacturing and distribution of steel joists and joist girders and accessories.

B. Qualification of Welders: Welds shall be made only by welders, tackers and welding operators who have been previously qualified by tests, as prescribed in the Structural Welding Code, AWS D1.1, to perform the type of work required. Any welder shall be retested and recertified when the work of the welder creates a reasonable doubt as to his proficiency. Such tests shall be conducted at no additional expense to the City. Recertification of the welder shall be submitted only after the welder has taken and passed the required retest.

C. All shop and field welding shall be performed by certificated welders under the immediate supervision of a representative of a standard testing agency or an inspection agency reporting directly to and under the control of the City.

1. The name of such testing agency shall be submitted to the Engineer for approval before starting the work.

2. The costs of all welding supervision and inspections shall be borne by the Contractor. Inspectors shall be engaged to inspect welded connections and to perform tests and prepare test reports.

D. Responsibility for Errors: Responsibility for errors of detailing and fabrication and for the correct fit of the steel joist and joist girder units shall be borne by the Contractor.

E. Remedial Action: Materials, fabrications and workmanship found defective shall be promptly removed and replaced with new acceptable work in accordance with Contract requirements. The expense of removing and replacing welds of the steel joists and joist girders for testing purposes will be borne by the City if welds are found satisfactory.

F. Coordination: Work of this Section shall be coordinated with the work of other trades so that construction is not delayed.

G. Safety: Steel joist and joist girder erection procedures and health and safety of the work force shall be the total responsibility of the Contractor. The requirements of all authorities having jurisdiction shall be compiled with.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited, to:

1. Shop Drawings shall depict complete shop and erection details for fabrication and installation of all primary members and accessories. All connections, fasteners, holes, welds (both shop and field), camber, fabrication and erection tolerances, material designations, Joist and joist girder weights, critical clearances, types of surface preparation and surface finishes, and other pertinent data shall be indicated. Welds shall be indicated by AWS symbols, which show size, length and type of weld.

2. Shop Drawings showing the layout of joist and joist girder units and accessories, special connections, anchorage and jointing details, including mark, member, type, location and spacing of joist and joist girder units and bridging shall be submitted.

3. Setting diagrams, templates and directions for installation of anchor bolts, bearing plates and other fastening items shall be furnished.

4. Shop Drawings shall be reviewed and approved for Specification compliance. However irrespective of Shop Drawing review determination, final Specification compliance with requirements for materials, fabrication and erection shall be the exclusive responsibility of the Contractor.

B. Design Calculations: Complete engineering design and calculations for the joists and joist girders shall be prepared and stamped by a registered Professional Engineer in the State of New York certifying that the joists and joist girders have been designed in accordance with the SJI Load Tables and Specifications. For standard steel joists, K-series, certification that the engineering design and calculations have been investigated by the Steel Joist Institute and were found to conform to the standard Specifications may be submitted in lieu of the specified design computations.

C. Certifications:

1. General: Test requirements for materials as stated herein or incorporated in reference documents may be waived, except for specified field tests, provided that certified copies of test reports from approved laboratories performed on previously manufactured material are submitted.

2. Manufacturer's Certification shall be as follows:

a. Steel: Certification as required by the SJI Standard Specifications regarding the steel used shall be furnished for all joists and joist girders. Copies of mill test reports, covering the chemical and physical properties of the steel to show compliance with these Specifications, and specified standards shall be submitted. These reports shall include the names and locations of the mills and shops. Test reports shall be accompanied by notarized certificates from the manufacturer certifying that the previously tested material is of the same type, quality and manufacturer as that proposed for this project.

b. Joists and Joist Girders: Manufacturer's certifications that the joist and joist girder comply with SJI Specifications shall be submitted.

3. Welders: Certification that each welder has been qualified in accordance with AWS Code D1.1 within the previous 12 months shall be submitted.

D. Manufacturer's Data: For information only, producer's or manufacturer's specifications include painting, installation instructions for each type of joist and joist girder and accessories, quantity and marking of units, size and location of anchorages, erection procedures, including schedules, procedures and diagrams showing sequence of erection and bridging shall be submitted.

E. Sustainability Submittals:

1. Environmental Product Declarations

a. The Contractor shall provide product-specific type III Environmental Product Declaration (EPD) conforming to ISO 14025, 14044.

2. Envision Submittals

a. The Contractor shall report information pertaining to the sustainable procurement, regional sourcing, and/or recycled content of new materials to be procured during the Work, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall coordinate with its vendor on sustainable product requirements as stipulated by the Contractor’s approved New Materials Sustainable Implementation Plan, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall submit vendor shop drawings for review by the Engineer that clearly illustrate the vendor

is meeting the requirements as approved in the Contractor's New Materials Sustainable Implementation Plan.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Structural members shall be loaded in such a manner that they may be transported and unloaded without being over-stressed, deformed or otherwise damaged.

B. Structural members and packaged materials shall be protected from corrosion and deterioration. Material shall be stored in a dry area.

C. Materials stored outdoors shall be supported above ground surfaces on wood runners and protected with approved effective and durable covers.

D. Materials shall not be placed on the structure in a manner that might cause distortion or damage to the members or the supporting structures. Damaged materials or structures shall be repaired or replaced as directed by the Engineer.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Steel Joists and Joist Girders: open web steel joists, K-series and joist girders, G-Series, shall be furnished in accordance with SJI Standard Specifications, as manufactured by:

1. Vulcraft Division of Nucor Corporation, Charlotte, NC;
2. Ceco Corporation, Rocky Mount, NC;
3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Steel Joists and Joist Girders: open web steel joists, K-series and joist girders, G-Series, shall be furnished in accordance with SJI Standard Specifications, as specified in this Section.

B. Steel used for chords and web sections shall be based on a yield strength of at least 36,000 psi, but not greater than 50,000 psi and shall conform to applicable ASTM requirements.

C. Bridging, bridging anchors, joist leg extension and end anchorage shall conform to the requirements of ASTM A36.

D. Bolts:

1. High strength bolts shall conform to ASTM A325, other bolts shall conform to ASTM A307.

E. Shear Stud Connectors shall conform to ASTM A108, Grade 1015, hooked or headed stud and shall be uncoated.

F. Welding Electrodes: Welding electrodes for manual shielded metal arc welding shall conform to the following:

1. Welding electrodes for ASTM A36 steel shall comply with ANSI/AWS A5.1 and shall be E60XX.

2. Welding electrodes for ASTM A572 and A588 steel shall comply with ANSI/AWS A5.1 or A5.5 and shall be E70XX.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Fabrication

1. General: Fabrication shall be in accordance with the AISC Specification for the Design, Fabrication and Erection of Structural Steel for Buildings, American Iron and Steel Institute Specification for the Design of Cold-Formed Steel Structural Members and the SJI Standard Specifications and Load Tables.

2. Joist girders shall be furnished with pitched top chords where shown on the Contract Drawings.

3. Extended Ends: Top chord extended ends on joists and joist girders where shown on the Contract Drawings shall be provided in compliance with the manufacturer's standards and the requirements of SJI Specifications and Load Tables.

4. Holes in Chord Members: Holes in chord members shall be provided where shown on the Contract Drawings for securing other work to the steel joists and joist girders; however, the area of the chord shall be deducted when calculating the strength of the member.

5. Camber: Steel joists and joist girders shall be cambered in accordance with Steel Joist Institute recommendations.

6. Steel bridging for all steel joints and joist girders shall be provided in compliance with the more stringent requirements of the type, size, configuration and spacing shown on the Contract Drawings or as required by the SJI Standard Specification. In no case shall the number of rows of bridging be less than that specified therein, and shall not be less than three rows with diagonal bridging at the center of the span.

7. End Anchorage: End anchorages shall be provided to secure joists and joist girders to adjacent construction as shown on the Contract Drawings, but not less than the minimum anchorage specified by SJI. Positive anchorage shall be provided at the ends of each bridging line at both top and bottom chords.

Where uplift forces are indicated as a design consideration, steel joists and joist girders shall be adequately anchored to resist such forces.

8. Welding operations shall be in accordance with AWS D-1.1.

9. Shop Inspection: Joist and joist girder assemblies and accessories shall be inspected by the manufacturer before shipment to insure compliance of materials and workmanship with the requirements of these Specifications.

10. Material: All materials shall be properly worked and match-marked for field assembly. Where finishing is required, assembly shall be completed including bolting and welding of units before start of finishing operations.

11. Shop Assembly: Where shop assembly of field connections is shown on the Contract Drawings, specified or required, the unmatched holes shall be reamed and the pieces match marked before disassembly. The interchange of matching parts shall not be permitted.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Field Measurements

1. All dimensions shall be verified and any field measurements necessary shall be made. Accuracy and layout of the work shall be the full responsibility of the Contractor.

2. The Contract Drawings shall be reviewed and any discrepancies shall be reported to the Engineer for clarification prior to starting fabrication.

3.02 IMPLEMENTATION

A. Erection

1. General: Steel joists and joist girders shall be placed and secured in accordance with SJI Specifications, approved Shop Drawings and as herein specified.

2. Placing Joists: Placement of steel joists shall not be started until supporting girders are in place and secured. Joists shall be placed on supporting work, and shall be adjusted and aligned in accurate locations and spacing before permanently fastening. Shoes of joists shall be adjusted for uniform bearing within the limits of the AISC Code of Standard Practice. End anchorages shall be in accordance with the manufacturer's standard specification under which the joists were produced and in compliance with SJI Standard Specifications. Deviations from a straight line between ends of any installed joist shall not exceed 3/8-inch in 10 feet.

3. Placing Joist Girders: Means for the adequate distribution of concentrated loads shall be provided so that the load-carrying capacity is not exceeded.

Other loads shall not be placed on the joist girders until the steel joist bearing on the girder are in place and welded to the girder. If the ends of the bottom chord are not strutted between columns, bracing shall be provided near the first bottom chord panel points whenever uplift due to wind forces is a design consideration. Joist girders at column lines shall be field bolted to the column supports to provide lateral stability during construction.

4. Safety:

   a. Temporary bridging, connections and anchors shall be provided to ensure lateral stability during construction. Erection procedures, health and safety shall be responsibility of the Contractor. Requirements of all authorities having jurisdiction shall be complied with.

   b. Any temporary bridging loads shall be adequately distributed such that the load-carrying capacity of any joists and joist girders is not exceeded.

   c. Loads shall not be applied to bridging.

5. Bridging:

   a. Permanent bridging and anchoring shall be installed simultaneously with joist and joist girder erection and before any construction loads are applied. Ends of bridging lines shall be anchored at top and bottom chords where terminating at walls or beams.

6. Fastening Joists and Joist Girders: Joists and joist girders shall be field welded to supporting steel in accordance with SJI Standard Specifications. Welding sequence and procedure shall be coordinated with the placing of joists and joist girders.

7. Damage:

   a. Joists and joist girders shall be handled in such a manner as to avoid damaging the joists and joist girders. Damaged joists and joist girders shall be removed from the site, except when field repair is approved by the Inspection and Testing Agency or the Engineer and such repairs are satisfactorily made in accordance with the manufacturer's recommendations.

   b. The joists and joist girders shall not be damaged by the field welding. The total length of weld at any one cross-section on cold-formed members whose yield strength has been attained by cold working, and whose as-formed strength is used in the design, shall not exceed 50 percent of the overall developed width of the cold-formed section.

c. Cleaning and spot repair of field welds, abraded areas and rust spots shall be the responsibility of the Contractor. Painting surfaces shall be adequately protected until final acceptance of the work.

B. Painting

1. General Requirements:

a. Steel joists and joist girders shall be painted in accordance with Section 09 91 00 - Painting. All painting shall be performed at the fabricator's shop shall be subject to inspection by the Engineer, and all parts of the work shall be made accessible to the Engineer.

1) All steel joists and joist girders shall be given one prime coat before shipment to the field.

2) Steel joists and joist girders which are not embedded, but which are encased in concrete or other masonry or those which will be otherwise inaccessible in the finished work, shall receive two shop coats. After erection and before the steel is enclosed, all damaged surfaces shall be prepared and touched up.

b. All steel joists and joist girders specified to be painted shall be sand blasted or wheel abraded by the fabricator of loose mill scale, loose rust, weld slag, flux deposit, dirt and other foreign matter to satisfy SSPC SP-6, Commercial Blast Cleaning for all steel.

c. Cleaned steels shall be primed within 6 hours after cleaning to prevent formation of new rust.

2. Contact Surfaces: Contact surfaces shall be cleaned and primed in accordance with Paragraphs 3.02 B.1. b. and c, above, but shall not be painted.

3. Finished Surfaces: Machine finished surfaces with zero clearance metal to metal contact shall be protected against corrosion by rust-inhibiting coating that can be easily removed prior to erection or which has characteristics that make removal unnecessary prior to erection.

4. Field Welds: Surfaces within two inches of any field weld location shall be free of material that would prevent proper welding or produce objectionable fumes while welding is being done.

5. Painting Weld Surfaces (clean and paint): One shop coat over prime in the shop and one final coat in the field shall be provided.

6. Defective Work: Such work as found defective under this Section shall be corrected at no additional cost to the City.

3.03 FIELD TESTING / QUALITY CONTROL

A. Welded connections shall be inspected and tests and test reports shall be prepared by the Testing Laboratory. All testing shall be retained and paid for by the Contractor.

B. Inspection and Testing: Steel joist and joist girders shall be inspected and tested by the Testing Laboratory as follows:

1. Perform visual inspection of welds and bolts.

2. Check conformance of joists and joist girders in place with the accepted allowable tolerances indicated in the AISC Code of Standard Practice and in ASTM A6.

C. Such corrections as the Testing Laboratory may indicate shall be made at no additional cost to the City.

D. Cutting and Burning: The use of a gas cutting torch in the field for correcting fabrication errors shall not be permitted on any major member in the structural framing. Its use shall be permitted on minor members if the member is not under stress, and then only after the written approval of the Engineer has been obtained.

1. No cutting of structural steel members in the field shall be allowed except by the written approval of the Engineer.

2. All cutting shall be done with an oxyacetylene torch in conformance with the NYBC and the latest rules of the BS&A.

E. Misfits at Bolted Connections:

1. Where misfits in erection bolting are encountered, the Engineer shall be immediately notified. A method to remedy the misfit shall be submitted for review by the Engineer. The Engineer shall determine whether the remedy is acceptable or if the member must be refabricated.

2. Incorrectly sized or misaligned holes in members shall not be enlarged by burning or by the use of drift pins. The Engineer shall be notified immediately and a proposed method of remedy shall be submitted for review.

3.04 STARTUP / DEMONSTRATION

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

END OF SECTION

PART 1 GENERAL

1.01 SUMMARY

A. The work specified in this Section consists of furnishing, fabricating and installation of cellular, non-cellular steel roof decking and appurtenant items. The work shall be completed in place as shown on the Contract Drawings and as specified herein.

B. The Work shall include all incidental and miscellaneous items not specified under another Section but required for completing the work of this Section, whether or not specifically required herein.

C. Unless otherwise shown, specified or required, design, workmanship and erection shall conform to or exceed the applicable reference standards listed hereinafter in this Section to the extent that the provisions of such documents are not in conflict with the requirements of this Section.

D. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. Design

1. The steel deck shall be designed in accordance with AISI Specification for the Design of Cold-Formed Steel Structural Members, except as specified otherwise herein. Deck units shall have ribbed sections providing a satisfactory surface for the reception of design loads. Wherever practicable, units shall have sufficient length to span three or more supports. The depth and gage of deck shall be as specified on the Contract Drawings.

2. Allowable Deflection: Roof deck shall be designed to support the superimposed dead load and design live load as indicated on the Contract Drawings with maximum deflection not to exceed 1/240 of the span under the following loading conditions:

   a. Uniform design live load.

   b. 200-pound concentrated load at midspan on a 1 foot wide section of deck during construction.

3. Attachments: Roof deck units shall be installed and anchored to supporting members to provide lateral stability and resist design horizontal and uplift loadings indicated on the Contract Drawings. Fastening requirements to resist horizontal loads shall be in accordance with SDI "Diaphragm Design Manual."

4. Section properties shall be determined in accordance with AISI "Specification for the Design of Cold-Formed Steel Structural Members." The properties of steel deck section shall be computed on the basis of the effective design width as limited by the provisions of the AISI Specifications. The section properties not less than shown on the Contract Drawings shall be provided for the specified steel deck section, including section modulus and moment of inertia per foot of width.

1.06 QUALITY ASSURANCE

A. Except as otherwise specified, the SDI "Design Manual" cited herein shall govern the work.

B. Qualification of Manufacturer: Steel roof deck units and accessories shall be provided where indicated on the Contract Drawings and shall be the products of a manufacturer who is regularly engaged in the manufacture of steel decking.

C. Qualification of Welders: Each welder shall be qualified in accordance with AWS D1.1. A welder shall be retested and recertified when the work of the welder creates a reasonable doubt as to his or her proficiency. Such tests when required, shall be conducted at no additional expense to the City. Recertification of the welder shall be submitted only after the welder has taken and passed the required retest.

D. Testing and Inspection: Material and fabrication procedures are subject to inspection and tests in the mill, shop and field. These tests shall be conducted by the Testing Laboratory in accordance with the requirements of General Conditions.

Such inspection and tests shall not relieve the Contractor of responsibility of providing materials and fabrication procedures in compliance with specified requirements.

E. Factory Inspection: Except as specified otherwise in this paragraph, factory tests and inspections of materials will not be required provided that certified copies of factory test reports are submitted to the Engineer for approval. These shall include manufacturer's certificates of compliance with all requirements of these specifications. When the test reports are on materials previously manufactured they shall be accompanied by notarized statements from the manufacturer certifying that the materials being furnished are identical with previously manufactured materials on which the factory test reports are based.

F. Shop Drawings Reviews: Such reviews shall be obtained before custom fabrication is started and before delivery of materials to the project site.

G. Coordination: Work of this Section shall be coordinated with the work of other trades so that construction is not delayed.

H. Safety: Steel roof deck erection procedures and health and safety of the work force shall be the responsibility of the Contractor. The requirements of authorities having jurisdiction shall be complied with.

I. Responsibility for Errors: Errors of detailing and fabrication and for the correct fit of the steel deck units shall be the responsibility of the Contractor.

J. Remedial Action: Materials, fabrications and workmanship found defective shall be promptly removed and replaced and new acceptable work shall be provided in accordance with Contract requirements at no additional expense to the City.

K. Design of roof deck layout, spans, fastenings, joints, and framed openings shall be under the direct supervision of a Professional Engineer experienced in structural design of decking and licensed in the State of New York.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. Shop Drawings: Detailed Shop Drawings which indicate for each type of steel decking required, the material, steel thickness, designation and finish, a dimensional cross-sectional profile, and computed structural properties to verify compliance with the project requirements shall be submitted. Details of fabrication and erection, including various connections, layouts of deck units placement directions, bearing on structural supports, anchorage details, attachment of accessories, each condition requiring closure panels, supplementary framing, cut opening, special jointing and other accessories as required to complete the work shall be shown on the Shop Drawings. Details and layout shall show location of supporting members, quantity and marking of decking units, size and location of holes and openings to be cut and the location, type and sequence of welded connections.

2. Shop Drawings shall be reviewed and approved for Specification compliance. However irrespective of Shop Drawing review determination, final Specification compliance with requirements for materials, fabrication and erection shall be the exclusive responsibility of the Contractor.

B. Certifications:

1. General: Test requirements for materials as stated herein or incorporated in reference documents may be waived, provided that certified copies of test reports from approved laboratories performed on previously manufactured material are submitted.

2. Manufacturer's Certifications: Manufacturer's certifications as required to show compliance with these specifications shall be submitted. Copies of mill test reports, including names and locations of mills and shops, covering the chemical and physical properties of the steel sheet to show compliance with these specifications shall be submitted. Test reports shall be accompanied by notarized certificates of compliance from the manufacturer certifying that the previously tested material is of the same type, quality and manufacture as that proposed for this project.

3. Certification for Welders: Certification that each welder has been qualified within the previous 12 month period shall be provided in accordance with AWS D1.1.

C. Manufacturer's Data: Manufacturer's specifications and installation instructions for each type of required decking and accessory shall be submitted. These include sheet steel, steel deck units, galvanized mill finish, finished repair paint, welding electrodes, welding washers, fasteners, depressed steel roof deck pans, closure strips, cover plates, and similar items.

D. Sustainability Submittals:

1. Environmental Product Declarations

a. The Contractor shall provide product-specific type III Environmental Product Declaration (EPD) conforming to ISO 14025, 14044.

2. Envision Submittals

a. The Contractor shall report information pertaining to the sustainable procurement, regional sourcing, and/or recycled content of new materials to be procured during the Work, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall coordinate with its vendor on sustainable product requirements as stipulated by the Contractor’s approved New Materials Sustainable Implementation Plan, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall submit vendor shop drawings for review by the Engineer that clearly illustrate the vendor

is meeting the requirements as approved in the Contractor's New Materials Sustainable Implementation Plan.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery: Materials shall be delivered to the site in an undamaged condition and at such intervals as will avoid delay in the work.

B. Storage: Material shall be stored and protected in a clean, properly drained location. Material shall be kept off the ground under a weather-tight covering permitting good air circulation. Decking shall be stored on dry wood sleepers, pallets, platforms or other appropriate supports which have slope for positive drainage. Decking shall be protected from distortion, excessive stresses, corrosion and other damage.

1. Caution: Materials shall not be stored on the structure in a manner that might cause distortion or damage to the supporting structure. The maximum uniform distributed storage load shall not exceed 20 pounds per square foot.

C. Handling: Material shall be handled safely in a manner that will prevent distortion or other damage. Care shall be exercised at all times to avoid damage through careless handling during unloading, storing and erecting.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Steel roof deck units shall be as manufactured by:

1. United Steel Deck, Inc., Summit, NJ;

2. Vulcraft Corporation, Springfield, OH;

3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Galvanized Steel Roof Deck: ASTM A653, Grade 33, Coating Designation G90, type and thickness as shown on Contract Drawings but not less than 20 gage.

1. Galvanizing: ASTM A924, Commercial quality.

2. Galvanizing Repair Paint: ASTM A780, high zinc-dust/zinc oxide content paint for repair of damaged galvanized surfaces and field touch-up of welds.

3. Steel Closure Strips or Plates: ASTM A653, minimum 20 gage, galvanized (except as otherwise indicated).

4. Steel Cover Plates: ASTM A653, minimum 20 gage but not less than the steel deck thickness, galvanized.

5. Sheet Steel Accessories: ASTM A653, commercial quality, galvanized (thickness indicated or as suitable for use intended).

6. Ridge and Valley Plates: ASTM A653, galvanized (thickness not less than that of steel deck units).

7. Recessed Steel Roof Deck Pans: ASTM A653, galvanized, minimum 14 gage (0.071 inch).

B. Welding Washers: Standard type compatible with decking furnished.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. General: Deck units shall be manufactured in lengths to span three or more supports, where possible, with flush, telescoped or nested 2-inch end laps and nested side laps, unless otherwise indicated. End laps shall occur over supports. Deck configurations shall comply with SDI requirements and as specified herein.

B. Metal Roof Deck:

1. Galvanized Steel Roof Deck Units shall be manufactured from mill coated, extra heavy duty galvanized sheet steel conforming to ASTM A653. Configuration of roof deck units shall conform to standard SDI wide-rib fluted profile, of the depth, steel thickness or gage and section properties as indicated on the Contract Drawings.

C. Manufacturers for steel roof deck shall be as specified in this Section.

D. Steel Closure Strips: Steel closure strips of not less than 20 gage sheet steel of the same quality and material as the deck units shall be provided and shall form to the configuration required to provide tight-fitting closures at open ends and sides of decking.

E. Ridge and Valley Plates: Ridge and valley plates of sheet steel of the same quality and material as the deck units with each leg not less than 2-1/4 inches wide shall be provided and bent to provide tight-fitting closure with deck units. Plates shall be provided in 10-foot lengths where possible.

F. Recessed Roof Deck Pans shall be fabricated from a single piece of not less than 14 gage sheet steel of the same quality and material as the deck units, with level bottoms and sloping sides to direct water flow to the drain, unless otherwise shown on the Contract Drawings. Deck pans shall be of adequate size to receive roof drains, at least 2 feet by 2 feet, and have bearing flanges not less than 3 inches wide. Pans shall be recessed not less than 1-1/2 inches below the roof deck surface, unless otherwise shown or required by deck configuration. Holes for drains shall be cut in the field.

G. Painting of Deck: On the steel deck surface to be painted in the field, the galvanized surface shall be primed in accordance with the requirements of Section 09 91 00 - Painting.

H. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Field Measurements

1. Prior to commencement of the work, existing dimensions, elevations, locations and conditions applicable to the work shall be field verified. Variances and discrepancies from the Contract Drawings and potential interferences shall be reported promptly to the Engineer.

2. Sufficient field measurements shall be taken prior to preparation of Shop Drawings and fabrication of construction materials, where possible, to ensure proper fitting of the work. However, job progress shall not be delayed. Allow for adjustments and fittings wherever the taking of field measurements before fabrication may not be possible or might delay the work.

3. Actual field-verified conditions may require modifications to the fabrication and/or erection details indicated on the Contract Drawings. The work shall be performed to meet actual field conditions encountered.

B. Inspection

1. The areas and conditions under which work of this Section is to be performed shall be examined. Conditions detrimental to the proper and timely completion of the work shall be corrected. Work shall not be proceeded until satisfactory conditions have been corrected.

3.02 IMPLEMENTATION

A. Installation

1. General: Deck units and accessories shall be installed in accordance with manufacturer's recommendations, approved Shop Drawings and as specified herein.

a. Deck bundles shall be coordinated with structural steel erector in locating decking bundles to prevent overloading of structural members.

b. Deck Storage: Deck units shall not be used for storage or working platform until permanently secured.

2. Placing of Deck Units: Deck units shall be placed on supporting framework with edges up and flutes at right angles to supports. Decking shall be adjusted to final position with ends bearing lying at least 3 inches on supporting members. Also the decking ends shall be accurately aligned before being permanently fastened. Lap end shall not be less than 2 inches for welded construction of all roof decks. Side laps shall be one-half corrugation. The side lap interlock shall not be stretched or contracted. Deck units shall be placed flat and square, and shall be secured to adjacent framing without warp or excessive deflection and with close alignment between cells at ends of abutting deck units.

3. Cutting and Framing: Roof deck units and accessories shall be cut and fitted around other work projecting through or adjacent to the roof decking, as shown on the Contract Drawings. Neat, square and trim cuts shall be provided.

4. Welding: Steel roof deck units shall be permanently fastened to steel supporting members by not less than 5/8-inch-diameter fusion (puddle) welds or elongated welds of equal strength. Welding washer shall be used where recommended by the deck manufacturer. AWS requirements and procedures for manual shielded metal-arc welding appearance, quality and methods used in correcting welding work shall be complied with. The ambient temperature when welding is performed shall be 35 degree Fahrenheit or higher. Welds shall be free of cracks, craters and other defects. Units with burned holes or any other damage shall be replaced promptly with satisfactory units at no additional cost to the City. Steel accessories shall be securely welded in place.

5. Attachments: Steel roof deck units shall be fastened to the supporting members to resist horizontal and uplift loadings as indicated on the Contract Drawings in accordance with SDI "Diaphragm Design Manual." In no case shall the fastening requirements be less than the following:

   a. End Laps and Edge Supports: End laps and all edge supports shall be fastened at 6 inches on center.

   b. Intermediate Supports: Each sheet shall be anchored by welding at each intermediate support not less than 12 inches on center and at closer spacing where required for lateral force resistance, unless otherwise shown on the Contract Drawings.

   c. Side Laps: Side laps between adjacent deck units shall be locked at intervals not exceeding 18 inches on center by welding, unless otherwise shown on the Contract Drawings.

6. Steel Closure Strips: Steel closure strips shall be provided at all open uncovered ends, at edges of roof decking and at voids between decking and other construction and shall be welded into position to provide a complete decking installation.

7. Steel Cover Plates: Steel joint covers shall be provided at abutting ends of deck units, except where taped joints are required or permitted.

8. Reinforcement at Openings:

   a. Additional steel reinforcement and closure pieces required for strength, continuity of decking, and support of other work shall be provided, unless otherwise shown or specified.

   b. Roof decking around openings less than 6 inches in any dimension shall be provided by means of a steel sheet of the same profile as the deck placed over the opening and fusion welded to the top surface of the deck. Steel sheet of the same quality and material as the deck units, not less than 18 gage and at least 14 inches wider and longer than the opening shall be provided. Welds at each corner shall be provided and spaced not more than 6 inches on centers along each side.

   c. Openings larger than 6 inches in steel roof deck, where framing around the opening is not shown on the Contract Drawings, shall be reinforced by steel angles on each side of the opening. The design of the framing angles shall be based on the design live load of that floor area and in no case shall the angles be less than 3-1/2 x 3-1/2 x 3/8 inches. The angles parallel to the deck span shall be connected to the structural steel framing and to the angles on the other two sides of the opening by welding. The angles shall also be anchored to the deck by welding as required for supports.

9. Roof Insulation Support: Steel closure strips shall be provided for the support of roof insulation where the rib opening in the top surface of roof decking occur adjacent to edges and opening. These strips shall be welded into position.

10. Ridge and Valley Plates: Ridge and valley plates shall be welded to the top surface of the roof decking. End joints shall be lapped not less than 3 inches with laps made in the direction of water flow.

11. Recessed Roof Deck Pans: Roof deck pans shall be placed over openings provided in the roof decking. Pans with flanges bearing on top surface of deck shall be positioned and welded to the top deck surface. Each deck flute shall be fusion welded with at least one weld at each corner. Openings in the bottom of the roof deck pan shall be cut to accommodate the drain size required.

B. Galvanizing Repair

1. Decking and accessories shall be cleaned and touched-up where field cut, welded, burned or otherwise damaged. Spot repairs to galvanized or painting finish shall be made in accordance with ASTM A780 where required at no cost to the City.

C. Finish Painting

1. Exposed to view surfaces of steel roof deck units shall be field painted in accordance with the requirements of Section09 91 00 - Painting.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Protection

1. During installation, the steel decking shall not be used as a storage platform nor as a working platform until the deck have units been permanently fastened in position.
2. The surface of installed steel decking shall not be overloaded during the entire construction period.
3. Mechanical equipment or other loads, either temporarily or permanently, shall not be hung from steel roof decking unless otherwise detailed or permitted.

END OF SECTION

SECTION 05 50 00 - METAL FABRICATIONS
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish all labor, materials and equipment required to fabricate and install all metal fabrications not specifically included in other Sections and required for the completion of the Work as shown on the Contract Drawings and as specified herein.

B. Metal fabrications shall be provided complete with all accessories, base attachments, fastenings and other appurtenances as specified and as may be required for a satisfactory installation.

C. Unless otherwise shown, specified or required, design, workmanship and erection shall conform to or exceed the applicable requirements of the documents listed hereinafter in Article 1.04 to the extent that the provisions of such documents are not in conflict with the requirements of this Section.

D. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. Not Used

1.06 QUALITY ASSURANCE

A. Shop inspections may be made by the City's representatives. The Contractor shall give ample notice to the Engineer prior to the beginning of any fabrication Work so that inspection may be provided. The Contractor shall furnish all facilities for the inspection of materials and workmanship in the shop, and the inspectors shall be allowed free access to the necessary parts of the works.

1. Inspectors shall have the authority to reject any materials or Work which does not meet the requirements of these Specifications.

2. Inspection at the shop is intended as a means of facilitating the Work and avoiding errors, but is expressly understood that it will in no way relieve the Contractor from his responsibility for furnishing proper materials or workmanship under this Section.

3. Obtain copies of Certified Materials Test Reports (both chemical and physical) and Manufacturer Certificates of Conformance.

B. Design of Members and Connections:

1. All details shown are typical; similar details shall apply to similar conditions, unless otherwise shown or specified. Dimensions shall be verified at the Site without causing delay in the Work.

2. Each fabricator shall be responsible for the structural design of miscellaneous metal work within the requirements established by these Specifications.

C. Complete design calculation and Shop Drawings shall be prepared, signed and stamped with the seal of a Professional Engineer, licensed to practice in the State of New York with a minimum of 10 years of experience and recognized as an expert in the required work unless the design and details have been shown on the Contract Drawings.

D. "Pencil-line" thin butt joints shall be provided.

E. Shop Assembly: Items in the shop shall be preassembled to the greatest extent possible, so as to minimize field splicing and assembly of units at the Site. Units shall be disassembled only to the extent necessary for shipping and handling limitations. Units shall be clearly marked for reassembly and coordinated installation.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings and other materials for the approval by the Engineer. Shop Drawings shall include, but not be limited to, the following:

1. Layout drawings shall indicate all structural shapes, sizes and dimensions.

2. Certifications, schedules, design calculations, detailed drawings, plans, elevations, and details of sections and connections
3. Detail drawings shall indicate jointing and anchoring details.
4. Anchor bolts and setting plans
5. Erection drawings

B. No fabrication shall be started until Shop Drawings have been approved by the Engineer.

C. The following shall also be submitted:

1. Manufacturer’s specifications, load table, installation instructions, setting drawings and templates for location and installation of miscellaneous metal items, appurtenances and anchorage devices.
2. Certified weld inspection reports.

D. Representative samples of bolts, anchors and inserts shall be submitted as requested by the Engineer. The Engineer's review shall be for type and finish only. Compliance with all other requirements shall be the exclusive responsibility of the Contractor.

E. Record Drawings: During progress of the Work, an up to date set of drawings showing field and Shop Drawing modifications shall be kept. Immediately upon completion of Work, Record Drawings showing the actual in-place installation of all Work constructed and/or installed under this Section shall be submitted to the Engineer. Drawings shall include all necessary plans, sections and details, with all reference dimensions and elevations required for complete Record Drawings of the Work.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Metal fabrications shall be handled in such a manner that they may be transported and unloaded without being over-stressed, deformed or otherwise damaged.

B. Metal fabrications and packaged materials shall be protected from corrosion and deterioration and shall be stored in a dry area. Materials stored outdoors shall be supported above ground surfaces on wood runners and protected with effective and durable covers approved by the Engineer.

C. Metal fabrications shall not be placed in or on a structure in a manner that might cause distortion or damage to the fabrication. The Contractor shall repair or replace damaged metal fabrications or materials as directed by the Engineer.

D. Materials shall be delivered to the Site at such intervals to insure uninterrupted progress of the Work. Anchor bolts and anchorage devices, which are to be embedded in cast-in-place concrete or masonry shall be delivered, in ample time not to delay that Work.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Fall Prevention System

1. Ladder safety system shall be:

a. PeakWorks 2000 Series Climb-Rite Fixed Rail Ladder Safety System as manufactured by SureWerx.

b. Miller Saf-T-Climb System as manufactured by Honeywell.

c. Or approved equal.

2. Full body Harness shall be:

a. PeakPro Harness as manufactured by SureWerx;

b. Miller Saf-T-Climb Harness as manufactured by Honeywell;

c. Or approved equal.

3. Shuttle/Trolley shall be:

a. PeakWorks 2000 Climb-Rite Trolley as manufactured by SureWerx.

b. Miller Saf-T-Grip Shuttle as manufactured by Honeywell.

c. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Materials

1. Structural steel shapes shall be fabricated in accordance with the details shown on the Contract Drawings and shall conform to the requirements of Section 05 12 00 - Structural Steel Framing and ASTM A36 unless otherwise indicated. All steel shall be galvanized in accordance with the requirements of Section 05 05 13.01 - Galvanizing, and shop painted in accordance with Section 09 91 00 - Painting.

2. Aluminum shapes and plate shall be 6061-T6 aluminum alloy with mill finishes, and shall be fabricated into finished products with welded or bolted connections as detailed on the Contract Drawings. Extruded shapes shall conform to the requirements of ASTM B221 and ASTM B308; plate and sheets shall conform to ASTM B209.

3. Stainless steel shapes and plate shall be Type 316 stainless steel for bolted constructions and 316L for welded construction as detailed on the Contract

Drawings. Shapes shall conform to ASTM A276. Stainless steel plates shall conform to ASTM A480 and ASTM A666.

4. Bolting hardware shall be as specified in Section 05 05 23.02 - Miscellaneous Metal Fastenings.

5. Concrete anchors shall be as specified in Section 05 05 23.02 - Miscellaneous Metal Fastenings.

B. Access Stairs, Ship Ladders and Platforms

1. Platforms, associated access stairs and ship ladders shall have galvanized steel or aluminum structural members, aluminum stair treads, and aluminum platform gratings as specified herein unless shown otherwise on the Contract Drawings.

2. Structural steel sections shall conform to ASTM A36 and all work shall conform to the AISC Manual of Steel Construction.

3. Aluminum platform and stair tread gratings pattern shall be as specified in Section 05 53 01.03 - Aluminum Floor Gratings. Stair treads shall be designed to support a uniform live load of 175 pounds per square foot with a maximum deflection of 1/240 of the span. The stair treads shall have an abrasive nosing as shown on the Contract Drawings.

4. Aluminum platform grating shall be designed for the loads as specified herein or as shown on the Contract Drawings.

C. Galvanized Accessories

1. Galvanized lintel and shelf angles, angle door guards, floor curb, sill angles and guard posts (bollards), and brackets shall be fabricated from structural steel. Work shall conform to the details on the Contract Drawings and approved shop drawings. Where the material for lintels and shelf angles is not shown on the Contract Drawings, they shall conform to the requirements for “Stainless Steel Lintels and Shelf Angles” as specified herein.

2. Materials and fabrication shall conform to Section 05 12 00 - Structural Steel Framing and ASTM A36. All galvanizing shall be done after fabrication and shall conform to the requirements of Section 05 05 13.01 - Galvanizing.

D. Stainless Steel Lintels and Shelf Angles

1. Lintels and shelf angles shall be bent or rolled angles, fabricated of stainless steel Type 316. All angles shall conform to the sizes, shapes, dimensions and details as noted on the Contract Drawings. The lintels assembled by welding shall be fabricated of stainless steel Type 316L.

2. All mounting and assembly hardware shall be Type 316 stainless steel.

E. Anchor Bolts

1. Anchor bolts shall be as specified in Section 05 05 23.02 - Miscellaneous Metal Fastenings.

F. Vertical Ladders

1. Aluminum ladders shall be fabricated from aluminum 6061-T6 as detailed on the Contract Drawings.
2. Stainless steel ladders shall be fabricated from Type 316L stainless steel as detailed on the Contract Drawings.
3. Wall mounted ladders shall have welded brackets attached to the wall with concrete or masonry anchors.
4. Ladders shall comply with OSHA 1910.23.
5. A personal fall arrest system or ladder safety system shall be required on all fixed ladders that extend more than twenty-four feet above a lower level as specified in OSHA 1910.28.
6. The third rail required for the fall prevention system shall be of the same material as the ladder.

G. Fall Prevention System

1. All fixed ladders that extend more than twenty-four feet above a lower level shall be provided with a fall prevention system.
2. Fall prevention systems shall comply with OSHA 1910.28, OSHA 1910.29, and ANSI Z359.16.
3. All necessary components of the fall prevention system shall be furnished, including two trolley/shuttle and two full-body harnesses for each fall prevention installation, to provide a complete and fully operational fall prevention system. Full-body harnesses shall be size medium where not universally sized.

H. Stair Nosings

1. Provide non-slip nosings on all treads of interior stairs that are not scheduled for resilient flooring or rubber tile finishes.
2. Non-slip nosings shall be as manufactured by one of the following manufacturers:
   a. Wooster Products, Inc., Wooster, OH.
   b. Safe-T-Metal Co., Syracuse NY.
   c. Or approved equal.
3. Nosings shall be four inches wide and six inches less in length than the length of the tread.
4. Nosings shall be installed at the edge of each tread, landing, and platform. Top of surface shall be flush with concrete finish.

5. Each nosing shall utilize a minimum of three anchors into the concrete.

6. Nosings shall be cast aluminum, Alloy 356-T6.

I. Steel Bollards

1. Galvanized steel pipe bollards shall be fabricated to dimensions and details indicated in the Contract Drawings. Bollards shall be fabricated from 8-inch nominal outside diameter pipe, extra strong.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Fabrication of steel and stainless steel shall be in accordance with the Specification for the Design Fabrication and Erection of Structural Steel for Building of the AISC. Fabrication of aluminum shall be in accordance with the Aluminum Association Specifications for Aluminum Structures.

B. Holes for bolts and screws shall be drilled. Fastenings shall be concealed where practicable. Joints exposed to the weather shall be formed to exclude water.

C. As far as practicable, all fabricated units shall be fitted and assembled in the shop, with all cuts and bends made to precision measurements in accordance with details shown on approved Shop Drawings.

D. Work shall be fabricated so that it is installed in a manner that will provide for expansion and contraction, prevent the shearing of bolts, screws and other fastenings, ensure rigidity, and provide close fitting of sections.

E. Welding of carbon and low alloy steel shall conform to the applicable requirements of ANSI/AWS D1.1, and Section 05 05 23.01 - Welding. Welding of aluminum shall conform to the applicable recommendations of the Aluminum Company of America publication, "Welding and Brazing Aluminum"; ANSI/AWS D1.2 and Aluminum Association Specification for Aluminum Constructions. Welding shall be done in a manner that will prevent permanent buckling and all welds exposed in the finished Work shall be ground smooth.

F. All finished and/or machined faces shall be true to line and level. Steel and aluminum shall be standard, and well finished. Sections shall be well formed to shape and size with sharp lines and angles; curved work shall be sprung evenly to curves.

G. All Work shall be fitted together at the shop as far as possible, and delivered complete and ready for erection. Proper care shall be exercised in handling all Work so as not to damage the finished surfaces.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Field Measurements

1. The Contractor shall verify all dimensions and shall make any field measurements necessary and shall be fully responsible for accuracy and layout of the Work.

2. The Contractor shall review the Contract Drawings and any discrepancies shall be reported to the Engineer for clarification prior to starting fabrication.

B. Inspection

1. The Contractor shall examine the alignment of the substrate and conditions under which metal fabrication Work is to be performed and notify the Engineer in writing of unsatisfactory conditions. Do not proceed with the metal fabrication and installation Work until unsatisfactory conditions have been corrected in a manner acceptable to the Engineer.

3.02 IMPLEMENTATION

A. Installation

1. All metal fabrications shall be erected square, plumb and true, accurately fitted, adequately anchored in place, set at proper elevations and positions.

2. All inserts, anchor bolts and all other miscellaneous metal work specified herein or shown on the Contract Drawings or required for the proper completion of the Work, which are embedded in concrete, shall be properly set and securely held in position in the forms before the concrete is placed.

3. All miscellaneous metal fabrications shall be installed in conformance with details shown on the Contract Drawings or on the approved Shop Drawings.

B. Galvanizing

1. All miscellaneous steel fabrications shall be galvanized after fabrication in accordance with Section 05 05 13.01 - Galvanizing.

2. Galvanized surfaces damaged during installation shall be touched up with a galvanizing repair paint applied in accordance with the manufacturer's instructions.

C. Painting

1. All miscellaneous metal fabrications other than aluminum or stainless steel, shall be painted in accordance with the requirements of Section 09 91 00 - Painting.

2. All galvanized metal fabrications, that have the surfaces exposed in the finish work, shall be painted in accordance with Section 09 91 00 - Painting.

3. Aluminum surfaces in contact with concrete or dissimilar metals shall be thoroughly protected with two coats of an epoxy paint with a total thickness of 16 mils or other approved isolating material.

4. Surface preparation shall be done in accordance with Section 09 91 00 - Painting.

END OF SECTION

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish, fabricate, assemble and install all metal stairs, steel pan or steel stairs for the Work as required in the Contract Drawings and Specifications.

B. Metal stairs shall be furnished complete with all accessories, base attachments, fastening and other appurtenances as specified or as may be required for a satisfactory installation.

1.04 REFERENCES

A. Not Used

1.05 DESCRIPTION

A. Provide all labor, materials, equipment and incidentals as shown, specified and required to design, furnish and install aluminum stairs including treads and landings outside of chemical rooms.

1.06 QUALITY ASSURANCE

A. Quality Assurance Inspections:

1. Quality Assurance inspections may be made by NYC DEP Bureau of Engineering Design and Construction, Quality Assurance Section or its representative at the manufacturer's facility.

2. Quality Assurance inspections shall be in accordance with the requirements of the Contract Documents.

3. The Contract shall give ample notice to the Engineer prior to the beginning of any fabrication, so that Quality Assurance inspection may be made.

4. Quality Assurance inspections shall include (but are not limited to) the following activities:

a. Obtain copies of Certified Materials Test Reports (both chemical and physical) and Manufacturer Certificates of Conformance.

b. Perform visual inspection of welding, as per applicable welding code.

c. Perform visual and dimensional inspection of completed work.

B. Design of Members and Connections:

1) All details shown are typical; similar details shall apply to similar conditions, unless otherwise shown or specified. Dimensions shall be verified at the site without causing delay in the work.

2) Each fabricator shall be responsible for the structural design of miscellaneous metal work within the requirements established by these Specifications.

C. Complete design calculation and Shop Drawings shall be prepared, signed and stamped with the seal of a Licensed Professional Engineer, licensed and registered to practice in the State of New York and recognized as an expert in the required work unless the design and details have been shown on the Contract Drawings.

D. Shop Assembly: Items in the shop shall be preassembled to the greatest extent possible, so as to minimize field splicing and assembly of units at the site. Units shall be disassembled only to the extent necessary for shipping and handling limitations. Units shall be clearly marked for reassembly and coordinated installation.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings and material specifications of the metal stairs for the approval of the Engineer. Submittals shall include, but not be limited to:

1. Complete layout and installation drawings and schedules with clearly indicated dimensions for metal stairs.

2. All grating shop drawings shall clearly indicate the orientation of the bearing bars.

B. Samples shall include:

1. Aluminum stair nosings.

2. Metal stair treads.

1.08 DELIVERY, STORAGE, AND HANDLING

A. All materials shall be boxed or crated and suitably protected against damage from handling and the elements prior to shipment from the place of fabrication.

B. All materials shall be protected on the site and/or incorporated in the work free from damage or marring of any kind.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. General:

1. All materials shall be of the very best quality and entirely suited for the service to which they will be subjected.

2. Welding shall conform to the applicable requirements of Section 05 05 23.01 - Welding.

3. Fastening: Bolts, nuts and inserts shall be of the best quality mild steel conforming to the applicable requirements of Section 05 05 23.02 - Miscellaneous Metal Fastenings. Bolts shall have hexagonal nuts. All threads shall be clean cut of the American Standard size.

    a. Expansion shield anchors shall be used only where shown on the Contract Drawings. Power driven "pin" or "stud" type fasteners shall not be permitted. Anchors shall be sized and installed to the proper depths as required by the loads in accordance with manufacturer's recommendations.

    b. Carbon steel fasteners shall be galvanized in accordance with Section 0508 - Galvanizing and painted in accordance with Section 09 91 00 - Painting.

4. Aluminum railings, stair treads and platforms shall be fabricated into finished products as detailed on the Contract Drawings. Aluminum railings shall conform to the requirements of Sections 05 52 13.07 - Aluminum Pipe Railings, and 05 53 01.03 - Aluminum Floor Gratings for the stair treads and platforms.

B. Metal Stairs

1. The metal stairs and platforms shall be of aluminum construction with aluminum treads, landings and railings constructed to conform to the sizes and arrangements as shown on the Contract Drawings, required by the Contract and specified herein.

2. Entire stair assembly shall be constructed to support a minimum live load of 100 pounds per square foot. Metal framing, hangers, columns, struts, clips, brackets, bearing plates and other components shall be provided as required for the support of stairs and platforms.

3. Brackets and bearing surfaces shall be provided as detailed on the Contract Drawings and as required to anchor and contain the stairs on the supporting structure.

4. Where masonry walls occur, supporting struts shall be provided and shall be designed for the erection and support of stair components before installation of masonry.

5. Framing stringers shall be fabricated of structural shapes as shown on the Contract Drawings. Closure pieces shall be provided for exposed ends of stringers.

6. Platforms shall be constructed of structural channel headers and miscellaneous framing members as shown on the Contract Drawings. Headers shall be bolted to stringers and framing members shall be bolted to stringers and headers. Aluminum surfaces in contact with steel or concrete shall be properly isolated.

7. Aluminum stair treads shall have a 1-1/4 inch wide abrasive nosing. Stair construction shall be coordinated with the railing fabricator for location of post supports.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Aluminum and steel shall be standard, well finished, structural or bar aluminum or bar steel. Sections shall be well formed to shape and size with sharp lines and angles; curved work shall be sprung evenly to curves.

B. Welding shall be used for joining pieces together unless otherwise shown or specified. Units shall be fabricated so that bolts and other fastenings do not appear on finished surfaces. All joints shall be true and tight, and connections between parts light-proof tight. Continuous welds shall be provided and ground smooth where exposed.

C. Welding shall be done in a manner that will prevent permanent buckling and all welds exposed in the finished and/or machined faces shall be true to line and level.

D. Holes for bolts and screws shall be drilled. Fastenings shall be concealed where practicable. Joints exposed to the weather shall be formed to exclude water. Work shall be fabricated and installed in a manner that will provide for expansion and contraction, prevent the shearing of bolts, screws and other fastenings, insure rigidity, and provide close fitting of sections.

E. All work shall be fitted together at the shop as far as possible, and delivered complete and ready for erection. Proper care shall be exercised in handling all work so as not to injure the finished surfaces.

F. Assembly of system components shall be performed in strict accordance with the fabricator's recommendations for installation.

G. All carbon steel work shall be galvanized in accordance with Section 05 05 13.01 - Galvanizing and painted in accordance with Section 09 91 00 - Painting.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

3.02 INSTALLATION

A. All inserts, anchor bolts, and all other miscellaneous metal work specified and shown on the Contract Drawings or required for the proper completion of the work, which are embedded in concrete, shall be properly set and securely held in position in the forms before the concrete is placed.

B. All metal stair work shall be erected square, plumb and true, accurately fitted, adequately anchored in place, and set at proper elevations and positions.

C. All aluminum surfaces in contact with concrete shall be given a heavy coat of bituminous paint. Aluminum surfaces in contact with other metals shall be properly isolated.

D. All galvanized and painted surfaces shall be touched up as required in accordance with the fabricator's instructions.

END OF SECTION

PART 1 GENERAL

1.01 SUMMARY

A. This Section describes the requirements for aluminum pipe railing systems. Aluminum pipe railing and auxiliary system components shall conform to the requirements specified herein and in the Contract, and shall be located and configured as shown on the Contract Drawings. Contractor shall provide all labor, materials, tools, equipment and incidentals as shown, specified and required to furnish and install all aluminum pipe railing.

B. Unless otherwise shown or specified, aluminum pipe railing shall consist of a system of two rails with totally concealed mechanical fasteners, internally threaded tubular rivets and adhesively bonded components fastened to posts spaced not more than 5 feet 0 inches on center and a system of handrails supported from adjacent construction by mounting brackets spaced at not more than 5 feet 0 inches on center.

1. All aluminum pipe railing system components shall be provided with an anodized finish after fabrication, as specified herein.

1.05 DESCRIPTION

A. Not Used

1.06 QUALITY ASSURANCE

A. Quality Assurance Inspections:

1. Quality Assurance inspections may be made by NYC DEP Bureau of Engineering Design and Construction, Quality Assurance Section or its representative at the manufacturer's facility.

2. Quality Assurance inspections shall be in accordance with the requirements of the Contract Documents.

3. The Contract shall give ample notice to the Engineer prior to the beginning of any fabrication, so that Quality Assurance inspection may be made.

4. Quality Assurance inspections shall include (but are not limited to) the following activities:

a. Obtain copies of Certified Materials Test Reports (both chemical and physical) and Manufacturer Certificates of Conformance.

b. Perform visual inspection of welding, as per applicable welding code.

c. Perform visual and dimensional inspection of completed work.

B. Manufacturer Qualifications:

1. Engage a single fabricator, with undivided responsibility for detailing and performance of the aluminum pipe railing systems.

2. Engage a firm which can show minimum of five years previous successful experience in detailing and fabrication of aluminum pipe railing systems of scope and type similar to the required work.

3. Materials and fabrication procedures shall be subject to inspection and tests in the mill, shop, and field, conducted by a qualified inspection agency in compliance with ASTM E329 and ASTM E548. Such inspections and tests shall not relieve the Contractor of responsibility for providing materials and fabrication procedures in compliance with specified requirements.

C. Installer Qualifications:

1. Engage a single installer skilled, trained and with successful and documented experience in the installation of aluminum pipe railing systems and with specific skill and successful experience in the erection of the types of materials required; and who agrees to employ only tradesmen with specific skill and successful experience in this type of work. Submit names and qualification to Engineer along with the following information on a minimum of three successful projects:

a. Names and telephone numbers of owner, architects or engineers responsible for projects.

b. Approximate contract cost of the aluminum pipe railing.

c. Amount of area installed.

D. Professional Engineer:

1. Engage a registered professional engineer legally qualified to practice in the State of New York and experienced in providing engineering services of the kind indicated.

2. Responsibilities include, but are not necessarily limited to, the following:

a. Carefully reviewing system performance and design criteria stated in the Contract Documents.

b. Preparing written requests for clarification or interpretation of performance or design criteria for submittal to Engineer by Contractor.

c. Preparing, or supervising the preparation of design calculations, and reviewing and approving related Shop Drawings prepared by the aluminum pipe railing system manufacturer prior to submission to Engineer; testing plan development, and test-result interpretations; and providing comprehensive engineering analyses verifying

compliance of the system with the requirements of the Contract Documents.

d. Signing and sealing all calculations and engineering analyses.

e. Certifying that:

1) It has performed the design of the aluminum pipe railing system in accordance with the performance and design criteria stated in the Contract Documents, and

2) The said design conforms to all applicable local, state and federal codes, rules and regulations and to the prevailing standards of practice.

E. Testing Agency Qualifications: To qualify for approval, an independent testing agency shall demonstrate to Engineer's satisfaction, based on evaluation of criteria submitted by testing agency, that it has the experience and capability to satisfactorily conduct the testing indicated without delaying the work in accordance with ASTM E329 and ASTM E548.

F. Performance Criteria:

1. Maintain the visual design concept shown, and the technical requirements specified, including modules, profiles, alignment of components and requirements for finish.

2. Contractor shall provide aluminum pipe handrail and railing system that conforms to the City of New York Building Code, ASTM E985 and CFR 29, Part 1910.23, including the 200 pound loading requirement, and including the requirement that specific types of occupancies and sizes of contributing protected areas shall incorporate greater design load resistance into aluminum pipe railing system, in compliance with ASTM E985, than that specified herein.

a. Completed handrail and railing shall withstand a uniform lateral force of 50 pounds per linear foot and a vertical uniform downward force of 50 pounds per linear foot, both applied simultaneously at the top of the handrail and railing, performance tested in accordance with Test Method A and B of ASTM E935.

b. Intermediate and bottom rails shall withstand simultaneously applied lateral uniform forces of 40 pounds per linear foot and a vertical load of 50 pounds per linear foot, however, lateral and vertical loads on intermediate and bottom railings need not be considered in the detailing and fabrication of posts and anchorages.

c. For railings having solid panels or picket balusters, the panels or picket balusters shall be detailed and fabricated to withstand a uniform lateral load of 50 pounds distributed over any round or square area of one square foot located anywhere within the infill area or a 50 pound per foot penetration cone, performance tested in accordance with Test Method C and D of ASTM E935.

d. Concentrated 200 pound load and uniform force conditions shall not be applied simultaneously.

e. Other pertinent requirements ceded to ANSI A1264.1 by governing authorities having jurisdiction at the Site.

f. Bending stresses shall not exceed 60 percent of the yield stress of the material. Applied loads shall not produce permanent residual deformation in the completed work when loads are removed. Load-deformation data shall be determined in accordance with ASTM E935.

g. Maximum allowable deflections shall be in accordance with ASTM E985.

h. Where computations make it possible to provide the needed information, testing, in compliance with ASTM E935, shall be performed for verification that aluminum pipe railing system and auxiliary system components comply with specified performance requirements and the requirements of governing authorities having jurisdiction.

3. Thermal Control: Provide adequate expansion within the fabricated system that allows for a thermal expansion and contraction caused by a material temperature range of 140 degrees F to -20 degrees F without warp or bow of system components. Distance between expansion joints shall be based on providing a 1/4 inch wide joint at 70 degrees F which accommodates a movement of 150 percent of the calculated amount of movement for the specified temperature range.

4. Provide expansion joints in handrail and railing system work where systems cross expansion joints in structure.

5. Configuration of all aluminum pipe handrail and railing systems shall be as shown on the Contract Drawings General Railing and Handrail Sheet. All details shown on the Contract Drawings are typical; similar details apply to similar conditions, unless specifically noted otherwise on the Contract Drawings.

6. Manufacturer is responsible for structural analysis and detailing of aluminum pipe handrail and railing system. Provide complete structural performance calculations and Shop Drawings for all aluminum pipe handrail and railing members, anchors and all other support system components prepared, signed and stamped with the seal of a registered professional engineer licensed to practice in the State of New York and recognized as an expert in the specialty involved.

G. Anchors and Supports:

1. Anchorage system shall be structurally analyzed based on results of tests in compliance with ASTM E488 and ASTM E894. Anchors shall be

tested for static, seismic, fatigue and shock loadings in series. Static tests shall include tension, shear, flexure, and torsion load resistance.

2. When the size, length or load carrying capacity of an anchor bolt, concrete anchor or concrete insert is not shown on the Contract Drawings, provide the size, length and capacity required to carry the design load times a minimum safety factor of four when installed in cast-in-place concrete and a minimum safety factor of six when installed in unit masonry construction.

3. Sizes shown on the Contract Drawings shall be considered minimum. Increase size to comply with design loadings and minimum safety factors specified.

4. All railing system posts shall be provided with a circular profile solid bar.

H. Allowable Tolerances:

1. Provide "pencil-line" thin butt joints.

2. Limit variation of cast-in-place inserts and sleeves to the following:

a. Spacing: ± 3/8 inch.

b. Alignment: ± 1/4 inch.

c. Plumb: ± 1/8 inch.

3. Minimum Railing System Plumb Criteria:

a. Limit variation of completed handrail and railing system alignment to 1/4 inch in 12 feet - 0 inches with posts set plumb to within 1/16 inch in 3 foot - 0 inches.

b. Align rails so variations from level for horizontal members and from parallel with rake of stairs and ramps for sloping members do not exceed 1/4 inch in 12 feet - 0 inches.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings for approval of the Engineer. Submittals shall include, but not be limited, to the following:

1. Samples:

a. Full size sample, 2 foot - 0 inches long, of assembled aluminum pipe railing system at post and rail intersections with all associated components including typical mechanical and adhesively fastened connections, mounted toe-board and sleeve, and handrail system at wall return complete with mounting brackets all with specified anodized finish.

b. Color Samples: Maximum range of anodized aluminum finish color variation that shall appear in finished work. Prepare range samples, to show the highest level of color control feasible for actual aluminum pipe railing and handrail system work, as determined by

the licensor of the finishing process selected, on actual extrusions and castings of the work.

c. Samples will be reviewed by Engineer for color, finish, joinery appearance and workmanship only. Compliance with all other requirements is the responsibility of Contractor.

2. Shop Drawings:

a. Drawings for the fabrication and erection of aluminum pipe railing and handrail systems with sizes of members, components and anchorage devices, all based on specified requirements. Indicate that Shop Drawings have been reviewed by the professional engineer preparing, signing and stamping its seal on design calculations and engineering analyses, verifying that the manufacturer's proposed fabrication, installation methods and details adequately translate the results of the design calculations and engineering analyses into the work, before submitting Shop Drawings to Engineer for review.

b. Include copies of manufacturer's specifications, standard and custom detail drawings and installation instructions and manufacturer's catalogs showing complete selection of standard and custom components, auxiliary system components and miscellaneous accessories for selection by Engineer. Include all plans and elevations identifying the location of all railing and handrails, and all expansion joints.

c. Profiles of aluminum pipe railing and handrail system components, and the details of forming, jointing, sections, connection, internal supports, trim, and accessories. Show details of the aluminum pipe railing and handrail drawn at 1-1/2 inch scale.

d. Calculations for the complete design and engineering analysis of the aluminum pipe railing and handrail system, auxiliary system components and anchorages, including calculations showing compliance with performance criteria specified, prepared, signed and stamped with the seal of a registered professional engineer licensed to practice in the State of New York and recognized as an expert in the required work.

3. Maintenance Manuals (O&M Manuals): Upon completion of the installation of the aluminum pipe railing and handrail systems, submit the following:

a. Product name and manufacturer.

b. Name, address and telephone number of manufacturer and local distributor.

c. Detailed procedures for routine maintenance and cleaning, including recommended cleaning materials, application methods and

precautions as to use of materials that may be detrimental to finish when improperly applied.

4. Certificates:

a. Copies of material purchase receipts, for this job, signed by a certified and licensed Notary Public, verifying that material purchased for the Work complies with material designations specified as confirmed by approved Shop Drawings.

b. Furnish certification that laboratory loading tests have been performed on the handrail, railing and anchorage systems verifying compliance with performance criteria specified, and that it conforms to all applicable CFR, ANSI and ASTM requirements for loads and deflections and that the data derived from such tests has been used by the registered professional engineer in the design calculations and engineering analyses of the aluminum pipe railing and auxiliary system components.

c. Registered professional engineer who prepares, signs and stamps its seal shall provide a written statement confirming responsibility for the design and attesting that the design prepared meets the performance criteria required by the Contract Documents, the requirements of governing authorities having jurisdiction, and conforms to prevailing standards of practice.

d. Finish: Furnish a written certificate confirming specified anodized coating film thickness, coating weight, sealing treatment and stain test performance.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery of Materials:

1. Deliver aluminum pipe railing and handrail and all accessories dry and undamaged, with manufacturer's protective coating intact, bearing original intact factory labels.

2. Aluminum pipe railing systems which are damaged during delivery or while being unloaded shall not be stored on Site. Remove such units from Site and replace panels with new, undamaged material.

B. Storage of Materials:

1. Store aluminum pipe railing and accessory materials in a dry location and in a manner that will protect strippable coating from exposure to sun and condensation; with good air circulation around each piece and with protection from windblown rain.

2. Store aluminum pipe railing and accessory materials under tarpaulin covers and in an area protected from dirt, damage, weather and from the construction activities of all Contractors. Do not store outside or allow items to become wet or soiled in any way while on Site.

3. Do not store in contact with concrete, earth or other materials that might cause corrosion, staining, scratching or damage to finish. Do not install system components which become dented, scratched or damaged in any way. Remove such components from Site and replace with new, undamaged material.

C. Handling of Materials:

1. Do not subject aluminum pipe railing and accessory materials to bending or stress.

2. Do not damage edges or handle material in a manner that will cause scratches, warps or dents.

3. Keep on-Site handling to a minimum.

4. Maintain protective covering on railings and handrails. All surface protective coverings such as non-adhesive papers, adhesive papers and strippable plastic films shall be removed after receipt at the Site as soon as there is no longer a need for the protection.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

1. Railings

a. Custom Fabricated Connectorail System as manufactured by Julius Blum & Company, Inc., Carlstadt, NJ.

b. Custom Fabricated Series 500 Non-Welded Aluminum Pipe Railing as manufactured by Superior Aluminum Products, Inc., Russia, OH.

c. Or approved equal.

2. Finishes

a. Alumilite 215 Clear as manufactured by Aluminum Company of America, Inc., New York, NY

b. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Extruded Aluminum Architectural and Ornamental Shapes: ASTM B221, Alloy 6063-T52.

B. Aluminum Forgings: ASTM B247.

C. Extruded or Drawn Aluminum Pipe and Tube:

1. ASTM B429 or ASTM B241, Alloy 6063-T5, 6063-T52 or 6063-T832 as required by loadings, deflections and post spacing's specified.

2. Provide Schedule 40 pipe minimum, unless conditions of detail and fabrication require extra heavy pipe to comply with performance criteria specified.

3. Provide all rails and posts with minimum outside diameter of 1.900-inches; nominal size of 1-1/2-inches.

D. Reinforcing Bars:

1. Solid 24-inch long 6061-T6 circular cross section aluminum reinforcing bars with outside diameter same as inside diameter of post.

E. Toe-boards:

1. Provide extruded ASTM B429 6063-T5 or T52 alloy aluminum toe-boards, unless railing is mounted on curbs or other construction of sufficient height and type to meet the requirements of 29 CFR 1910.23. Bars or plates are not acceptable and shall not be approved by Engineer.

2. Unless otherwise specified, toe-boards shall meet requirements of 29 CFR Part 1910.23, Section (e).

3. Securely fasten toe-board in place with not more than 1/4-inch clearance above floor level. Provide for thermal expansion and contraction in toe-boards over the entire range of temperatures specified. Thermal movement shall not cause warping or buckling of toe-boards.

4. Provide manufacturer's toe-board detail which accommodates storage for removable socket covers.

F. Anchors and Fastenings:

1. Type 316 stainless steel.

2. Provide minimum of four bolt fasteners per post where surface mounted posts are shown. Components shall be in accordance with manufacturer's recommendations and as acceptable to Engineer as shown on approved Shop Drawings.

3. Concrete and masonry anchors shall be as specified in Section 05 05 23.02 - Miscellaneous Metal Fastenings.

4. Anchors shall be of stainless steel Type 316 and a minimum size of 1/2-inch diameter.

5. Bolting Materials: As specified in Section 05 05 23.02 - Miscellaneous Metal Fastenings.

G. Castings:

1. Provide high strength aluminum alloy brackets, flanges and fittings suitable for anodizing as specified.

2. Aluminum-Alloy Sand Castings: ASTM B26.

H. Concealed Connector Sleeves: Schedule 40, 5-inches long by 1.610-inches diameter.

I. Brackets and Flanges: Provide manufacturers complete selection of standard and custom brackets and flanges for railing posts and for handrail supports.

J. Sockets: Provide 6-inch deep by 2-1/2-inch outside diameter aluminum sockets with 3-1/2-inch wide socket cover on bottom of all sockets and on top and bottom of removable post sockets.

K. Hinges: Provide two self-closing aluminum hinges for each railing system gate.

L. Gate Latches and Stops: Provide one latch and stop with rubber bumper and 1-inch diameter plastic knob for each railing system gate.

M. Chain, Snaps and Eye Bolts: Provide oblong 0.250-inch aluminum link, Type 316 stainless steel chain weighing 57 pounds per cubic foot, each link 1-1/8-inch by 7/16-inch. Provide stainless steel eyebolts, 1/4-inch stainless steel threaded quick links and heavy duty swivel snaps with spring loaded latch.

N. Custom Cover Flanges: Provide 1/4-inch high by 4-inch diameter aluminum cover flanges for all non-removal posts and 3-1/2-inch wide by 1-1/8-inch high aluminum pipe collars with 1/4-inch set screws for all removable posts.

O. Auxiliary System Components and Miscellaneous Accessories: Provide a complete selection of manufacturer's standard and custom aluminum handrail and railing components and miscellaneous accessories including, but not limited to, fascia flanges, post brackets, interlocking panel clips, clamps, end caps, post caps, adapters and similar items.

P. Adhesive: Two-part waterproof epoxy-type as recommended by railing and handrail manufacturer.

Q. Non-Shrink, Non-Metallic Grout:

1. Provide formulation that is resistant to erosion from water exposure without needing protection by a sealer or waterproof coating and is recommended by the manufacturer for exterior use.

2. Pre-mixed, factory-packaged, non-staining, non-corrosive, non-gaseous, cementitious grout, complying with ASTM C1107, requiring only the addition of water at the Site.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Fabrication

1. Unless otherwise shown or specified in the Contract Documents provide typical non-aluminum construction details and fabrication techniques as recommended by AMP/NAAMM publications specified.

2. Railings

a. Form exposed Work true to line and level with accurate angles, surfaces and straight edges. Fabricate all corners without the use of fittings. Form bent-metal corners to the radius shown without causing grain separation or otherwise impairing the Work. Form all change in handrail and railing direction with radius bends. Provide not less than 4 inch outside radius.

1) Form simple and compound curves by bending members in jigs to produce uniform curvature for each repetitive configuration required; maintain cylindrical cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of handrail or railing components.

b. Shear and punch metals cleanly and accurately. Remove burrs from exposed cut edges and ease exposed edges to a radius of approximately 1/32 inch.

c. Form elbow bends and wall returns to uniform radius, free from buckles and twists, with smooth finished surfaces, or use prefabricated bends.

d. Locate intermediate rails equally spaced between top rail and finished floor.

e. Close aluminum pipe ends by using prefabricated fittings.

3. Chains

a. Chains shall be provided across openings in aluminum pipe railing where shown on the Contract Drawings. One end of each chain shall be attached to a 1/4-inch eye bolt in the post and the other end shall be attached by means of an approved heavy stainless steel swivel eye snap hook to a similar eye bolt in the opposite post.

B. Weep Holes

1. Fabricate joints which will be exposed to the weather so as to exclude water.

2. Provide 15/64 inch diameter weep holes at the lowest possible point on all railing system posts.

3. Provide pressure relief holes at closed ends of handrails and railings.

C. Toe-boards

1. Provide toe-boards to the dimensions and details shown on the Contract Drawings and as follows:

a. Provide manufacturer's toe-board detail which accommodates movement caused by thermal change specified without warping or bowing toeboards.

b. Provide manufacturer's toe-board detail which accommodates storage for removable socket covers.

c. Coordinate and cope toe-board as required to accommodate cover flanges at posts.

d. Toe-boards shall follow curvature of aluminum pipe railing. Where aluminum pipe railing is shown to have curved contours at corners, or other locations, the toe-board shall likewise be curved to follow line of aluminum pipe railing system.

D. Reinforcing Bars

1. Provide circular profile solid reinforcing bar friction-fitted at all railing system posts. Extend reinforcing bars 6-inches into cast-in-place sleeves or other types of supporting brackets.

E. Mechanically Fitted Component Pipe Handrail and Railing

1. Use a nonaluminum pipe handrail and railing system with posts, top and intermediate rail(s) and flush joints.

2. Provide a top and two intermediate horizontal rails, equally spaced.

3. Blind rivets, pop rivets or other exposed fastening devices shall not be used in the Work. Fasteners used for side mounting fascia flanges where shown or specified may be exposed in the Work. Provide internally threaded tubular aluminum rivets, stainless steel through bolts with lock nuts, stainless steel sheet metal screws with lock-washers and epoxy adhesive for fastening all components of the Work.

4. Provide for expansion and contraction in the railing system as required by performance criteria. At each side of expansion joints located in the structure to which the railing system is attached, provide an end post and railing return located 16 inches from the joint. Separation between returns shall match the width of the structure expansion joint.

F. Finishes

1. General:

a. Prepare surfaces for finishing in accordance with recommendations of the aluminum producer and the finisher or processor.

b. Adjust and control the direction of mechanical finishes specified to achieve the best overall visual effect in the work.

c. Color and Texture Tolerance: Provide uniform color and continuous mechanical texture for all aluminum components of the work. Engineer reserves the right to reject aluminum materials because of color or texture variations, which are visually objectionable, but only where the variation exceeds the range of variations established by the manufacturer prior to the work, by means of range samples which have been accepted by Engineer.

d. Anodize all aluminum components of the work.

2. Mechanically finish aluminum by wheel or belt polishing with aluminum oxide grit of 180 to 220 size, using peripheral wheel speed of 6,000 feet per minute; Aluminum Association Designation - M32 Medium Satin Directional Texture.

a. Hand Rubbed Finish: Where required to complete the work and provide uniform, continuous texture, provide hand rubbed finish to match medium satin directional texture specified in order to even out and blend in satin finishes produced by other means.

3. Provide non-etching chemical cleaning by immersing the aluminum in an inhibited chemical solution, as recommended by the coating applicator, to remove all lard oil, fats, mineral grease and other contamination detrimental to providing specified finishes. Clean and rinse with water between steps as recommended by the aluminum manufacturer.

4. Exposed Aluminum Anodic Coating: Provide anodic coatings as specified which do not depend on dyes, organic or inorganic pigments, or impregnation processes to obtain color. Apply coatings using only the aluminum alloy, temperature, current density and acid electrolytes to obtain specified colors in compliance with the designation system and requirements of the Aluminum Association and AMP 501 of AMP/NAAMM. Comply with the following:

a. Provide Architectural Class I high density anodic treatment by immersing the components in a tank containing a solution of 15 percent sulfuric acid at 70 F with 12 amperes per square foot of direct current for minimum of sixty minutes; Aluminum Association Designation A41 - Clear (natural).

b. Physical Properties:

1) Anodic Coating Thickness, ASTM B244: Minimum of 0.7 mils thick.

2) Anodic Coating Weight, ASTM B137: Minimum of 32 mg/sq. in.

3) Resistance to Staining, ASTM B136: No stain after 5 minutes dye solution exposure.

4) Salt Spray, ASTM B117: 30,000 hours exposure with no corrosion or shade change.

c. Seal finished anodized coatings using deionized boiling water to seal the pores and prevent further absorption.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Source Quality Control:

1. Obtain all aluminum pipe railing and handrail system components and accessories from the same manufacturer.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. The Contractor shall examine the alignment of the substrate and conditions under which the aluminum pipe railing system work is to be performed and notify Engineer in writing of unsatisfactory conditions. Do not proceed with the aluminum pipe railing system work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

B. Protection: Protect cast-in-place sleeves and field-drilled holes from debris and water intrusion by use of temporary covers or removable foam inserts that completely fill the cast-in-place sleeve.

C. Coordinate installation of anchorages for handrails and railings. Furnish setting drawings, templates, and installation instructions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in cast-in-place concrete or masonry. Deliver to Site in time for installation.

D. Verify dimensions by taking measurements at the Site without causing delay in the work. Where measurements cannot be taken at the Site without delaying the work, establish dimensions and proceed with fabrication of handrails and railings without Site measurements. Coordinate construction to ensure that actual dimensions correspond to established dimensions.

E. Verify to Engineer gage of aluminum pipe railing posts and rails brought to the site by actual measurement of on-Site material in the presence of Engineer.

3.02 INSTALLATION

A. Fastening to In-Place Construction

1. General:

   a. Do not erect components which have become scarred, dented, chipped, discolored or otherwise damaged or defaced. Railing and handrail system components which have holes, cuts, gouges, deep scratches or dents of any kind shall be removed from the site before installation. Repairs to correct such Work shall not be approved by Engineer. Remove and replace with new material.

   b. Comply with installation and anchorage recommendations of AMP/NAAMM publications specified in addition to the requirements specified herein.

2. Posts and rail sections shall be brought into final alignment by aluminum pipe railing installer.

3. Provide anchorage devices and fasteners where necessary for securing railing and handrail items to in-place construction, including threaded fasteners for concrete and masonry inserts, through-bolts and other connectors as required. Use only Type 316 stainless steel devices and fasteners.

4. Flanged fittings shall be secured to steel with nuts, bolts and washers; to hollow glazed structural tile and masonry with masonry anchors; and to solid grouted masonry and concrete with concrete anchors. Flanges not bearing on metal shall be set in non-shrink grout.

5. Anchor posts in concrete by means of sockets and side mounted fascia flange brackets, set and anchored into the concrete floor slabs and sides of concrete walls and raised walkways. Provide closure secured to the bottom of sleeve. Before installing posts remove all debris and water from sleeves. Verify that reinforcing bars have been inserted into posts before installation. Do not install posts without reinforcing bar. For all non-removable railing sections, after the posts have been inserted into the sockets, fill the annular space between posts and sockets solid with grout.

6. Anchor posts to stair stringers with stringer or support flanges, angle type or floor type as required by conditions, shop connected to posts and bolted to the supporting members. Flanges shall be as recommended by manufacturer. Verify that reinforcing bars have been inserted into posts before installation. Do not install posts without reinforcing bar.

7. Provide removable railing sections where shown. Removable railing posts shall be provided with friction fitted reinforcing bar in each post. Provide sockets with socket covers stored in extruded toe-board. Provide aluminum pipe collars for all removable posts. Accurately locate sleeves to match post spacing's.

8. All posts set in concrete shall be provided with an aluminum floor cover flange.

9. Provide end posts and railing returns at 16-inches on each side of structural expansion joints. Separation between returns shall match the width of the structural expansion joint.

B. Cutting, Fitting and Placement

1. Perform cutting, drilling and fitting required for installation. Set the Work accurately in location, alignment and elevation, plumb, level, true and free of rack, measured from established lines and levels.

2. Fit exposed connections accurately together to form tight hairline joints. Do not cut or abrade the surface of units which have not been finished after fabrication, and are intended for field connections.

3. Permanent field splice connections shall be made using manufacturer's recommended epoxy adhesive and 5-inch minimum length connector sleeves. Tight press-fit all field splice connectors and install in accordance

with manufacturer's written instructions as provided on approved Shop Drawings. Follow epoxy manufacturer's recommendations for requirements of installation and conditions of use. Make all splices as near as possible to posts but not exceeding 12 inches from nearest post.

4. Handrails supported from walls, partitions and similar construction shall be supported by brackets located within 18 inches of handrail terminations and at intermediate points spaced not more than 5 feet on center. Drill wall plate portion of the mounting bracket to receive one bolt, unless otherwise shown on the Contract Drawings as concealed anchorage. Provide flush-type wall-return fittings with the same projection as that shown for mounting brackets. Secure mounting brackets and wall-return fittings to building construction as follows:

   a. For concrete and solid masonry anchorage, use bolt anchor expansion shields and lag bolts.

   b. For hollow masonry anchorage, use toggle bolts having square heads.

5. Space posts 5 feet - 0 inches on center and connect sections as shown on Shop Drawings approved by Engineer.

6. Provide expansion joints with slip joint internal sleeve extending 2 inches minimum beyond joint on each side. Fasten internal sleeve on only one side of expansion joint.

7. Where details show post location requirements at or near end of runs, uniformly space intermediate posts as required to meet loading and deflection criteria specified but not greater than maximum spacing specified.

   a. At walkways and other locations where welded pipe railing system is provided on each side, locate railing system posts aligned opposite each other and with the same on center spacing.

8. Provide hinged railing sections where shown on the Contract Drawings. Provide hinges and latch for connection to adjacent railing.

9. Provide chain sections as shown. Provide one chain length with fastening accessories for top and each intermediate railing.

10. Securely fasten toe-boards in place with not more than 1/4 inch clearance above floor level.

11. Drill one 15/64 inch diameter weep hole not more than 1/4 inch above the top of location of circular profile solid reinforcing bar in each post.

12. Protection from Dissimilar Materials:

    a. Coat all surfaces of aluminum in contact with dissimilar materials such as concrete, masonry and steel as specified in Section 09900.

13. Remove coating where exposed in the finished work.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjusting

1. Adjust railings and handrails prior to securing in place to ensure proper matching at butting joints and correct alignment throughout their length. Plumb posts in each direction.

B. Protection

1. Protect aluminum pipe railing system from damage by the work of all contractors.

2. Remove defective aluminum railing system components immediately upon discovery of damage, and replace with material that meets specification requirements, so that all aluminum pipe railing system components will be without damage or surface blemish at the time of Substantial Completion

C. Cleaning

1. Clean exposed surfaces of aluminum pipe railing Work of every substance before leaving the site after completion of installation. Comply with recommendations of both the aluminum pipe railing and finish manufacturer. Do not use abrasives or non-approved solvent cleaners. Test cleaning techniques on an unused section of railing before employing cleaning technique in the Work.

a. Remove protective plastic as recommended by manufacturer.

b. Remove all stains, dirt, grease and other substances by washing railings and handrails thoroughly using clean water and soap. Rinse with clean water.

c. Do not use acid cleaning solutions, steel wool or other harsh abrasives.

d. If stains remain after washing, remove finish and restore in accordance with recommendations of the manufacturer.

2. At the completion of the work, replace adjacent work, marred by the work of this Section.

END OF SECTION

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish and install all aluminum floor gratings as indicated on the Contract Drawings and specified herein.

B. Gratings shall be complete with frames, anchors, fastening devices and miscellaneous appurtenances.

C. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.05 DESCRIPTION

A. Design Requirements

1. General Design Criteria:
   a. The design live load for grating covering floor openings shall be that designated for the adjacent floor area but not less than a uniform load of 150 pounds per square foot or a concentrated load of 300 pounds distributed over a 12-inch square area at the center of span, whichever produces the greater stress.
   b. The design live load for grating on platforms shall be as designated on the Contract Drawings but not less than a uniform load of 100 pounds per square foot.
   c. Grating in areas subject to vehicular traffic shall be designed for the maximum weight vehicle which can access the area. Forklifts or other similar wheeled vehicles shall have maximum wheel loads defined by the manufacturer. When wheel loads are not defined by the manufacturer, the wheel load shall be defined as 40 percent of the gross loaded weight of the maximum size vehicle to be accommodated.
   d. The maximum allowable deflection due to dead load plus live load shall not exceed the span divided by 240, but not more than 1/4 inch.
   e. Gratings shall be designed in accordance with the design criteria specified herein and the Aluminum Association specifications, unless otherwise noted on the Contract Drawings or as required by the NYBC.
2. Design Criteria for Grating: The maximum flexural stress shall be 12,000 pounds per square inch.

1.06 QUALITY ASSURANCE

A. Quality Assurance Inspections

1. Quality Assurance inspections may be made by NYC DEP Bureau of Engineering Design and Construction, Quality Assurance Section or its representative at the manufacturer's facility.
2. Quality Assurance inspections shall be in accordance with the requirements of the Contract Documents.

3. The Contract shall give ample notice to the Engineer prior to the beginning of any fabrication, so that Quality Assurance inspection may be made.

4. Quality Assurance inspections shall include but are not limited to the following activities:

a. Obtain copies of Certified Materials Test Reports (both chemical and physical) and Manufacturer Certificates of Conformance.

b. Perform visual inspection of welding, as per applicable welding code.

c. Perform visual and dimensional inspection of completed work.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings and material specifications of all gratings for the approval of the Engineer.

1. Gratings shall not be manufactured until the Contractor's Shop Drawings have been approved by the Engineer.

2. Samples of grating and fastening devices shall be submitted for approval by the Engineer.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. Type of Gratings

1. Unless otherwise shown on the Contract Drawings or specified, gratings shall be one of the following types and shall be the product of one manufacturer:

a. Swage Locked Grating.

b. Pressure Locked Grating.

2. Other designs of equal strength, rigidity and serviceability may be submitted to the Engineer for approval. Gratings shall be the product of one manufacturer and only one type of grating shall be used exclusively throughout the work.

B. Materials

1. Floor gratings and appurtenances shall conform to the requirements specified herein and to the following aluminum alloys and tempers, provided with a mill finish:

a. Gratings

1) Main Bars - AA 6061-T6

2) Cross Bars - AA 6063-T5

b. Angles

1) Extruded - AA 6063-T5

2) Structural - AA 6061-T6

c. Anchors - AA 6061-T6

2.03 FABRICATION / ASSEMBLING / FINISHES

A. General

1. Gratings shall be accurately fabricated, free from warps, twists or other defects which affect the appearance and serviceability of the grating.

2. Gratings shall have a mill finish unless otherwise noted on the Contract Drawings.

3. All welds shall be ground smooth and conform to the requirements of Section 05 05 23.01 - Welding and NAAMM MBG 533.

4. Openings in and edges of all grating sections shall be banded with bearing bars. Bars shall be welded to all intersecting members.

B. Grating Fabrication

1. All grating sections shall be cut so that no one section will weigh more than 100 pounds.

2. Swage Locked Grating:

a. Swage locked assembly shall consist of main bearing bars, spaced not more than 1 inch apart (clear distance) joined by cross bars that are locked at right angles to, and located in the upper half of bearing bars. Cross bars shall be spaced 2 inches on center, to form rectangular openings.

3. Pressure Locked Grating:

a. Pressure locked assembly shall consist of parallel bearing bars spaced not more than 1 inch apart (clear distance) joined by cross bars spaced not more than 4 inches on centers to form rectangular openings. Cross bars and bearing bars shall be slotted for joining. Slots in the bearing bars shall terminate with dovetail recesses above the neutral axis. Slots in the cross bars shall terminate below the

neutral axis. The cross bars shall be forced down into the slots of the bearing bars and their bottoms spread into the dovetail recesses to make tight rigid joints.

4. Minimum bearing bar size shall be 1-1/2" deep by 3/16" wide.

C. Grating Cut-Outs

1. Cut-outs shall be provided in the grating for the passage of pipe, valve stems, columns and similar work. Where more than two bearing bars are included in the cut-out, banding bars of the same dimensions as the bearing bars shall be provided around the opening and welded or electric-forged to the component parts of the grating.

D. Grating Stair Treads and Landings

1. Grating stair treads shall be 1 inch wider than tread widths shown on the Contract Drawings and shall be securely fastened to angles or carrier bars which in turn shall be fastened to stringers. The outer edge or nosing of stair treads shall be so constructed as to make it distinctly visible and contrasting with the other part of the tread. Non-slip nosings shall be furnished on all the stair treads and landings.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Filed Measurements

1. The Contractor shall check all dimensions in the field after all piping and equipment are set in place and determine the exact dimensions and locations of openings and cut-outs.

2. Templates shall be made where required for location and size of openings and cut-outs.

3. The Contractor shall field verify all pertinent dimensions prior to grating fabrication.

3.02 INSTALLATION IMPLEMENTATION

A. Installation

1. Gratings shall be installed with each section readily removable and replaceable. Adjacent units shall be neatly fitted together.

2. The clearance at the ends or between sections of gratings shall be a maximum of 1/4 inch.

3. Tops of gratings shall be set flush with surrounding construction.

4. Gratings shall be set with a full and uniform end bearing on the supports to preclude rocking movement; wedges or similar shimming devices shall not be used.

B. Fastening Devices

1. Approved aluminum fastening devices, with stainless steel screws, shall be installed to hold the gratings rigidly to the supports with means for easy removal.

2. Fastening devices shall not protrude above the walking surface of the grating.

3. Fasteners shall be installed in accordance with the manufacturer's recommendations.

C. Coating and Contact Surfaces

1. Aluminum surfaces in contact with concrete or dissimilar metals shall be thoroughly protected with two coats of an epoxy paint with a total thickness of 16 mils or other approved isolating material in accordance with the requirements of Section 09 91 00 - Painting.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

END OF SECTION

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified and required, to furnish, install, and test all metal castings complete and operational.

B. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. Metal castings shall include all ferrous and non-ferrous metal castings to be furnished and installed by the Contractor, except as noted below.

1. Included are cast metal components for equipment shown or specified in the Contract Documents (such as valves, pumps, sluice gates, pipes, flanges, etc.).

2. Excluded are items specified in Section 05 56 00.01 - Miscellaneous Metal Castings, or items as noted in the Contract Documents.

B. Metal Castings shall be designed for the tensile strength, hardness, dimension, microstructure, surface finish, etc. designated in the Contract Documents and/or the applicable reference standards as required for their intended use.

1. In cases of conflict between the Contract Specifications and reference standards, the more stringent requirements shall be applicable, as determined by the Engineer.

C. All castings shall conform to the compositional requirements for named elements in the applicable reference standards and/or Contract Documents.

1.06 QUALITY ASSURANCE

A. Shop inspections may be made by the Engineer or by the Engineer's representatives. The Contractor shall give notice as required to the Engineer prior to the beginning of any casting work so that inspection may be scheduled and performed. The Contractor shall furnish all facilities and equipment required for the inspection of materials and workmanship in the shop. The Contractor shall provide all approved Shop Drawings as deemed necessary by the Engineer to conduct the shop inspections. The inspectors shall be allowed free access at all times, to all parts of the manufacturers' plants where relevant manufacturing operations, inspections, and tests are being performed.

B. Inspectors shall have the authority to reject any materials or Work which does not fully meet the requirements of the Contract Documents or approved Shop Drawings.

C. Inspection at the shop is intended as a means of facilitating the work by early identification of non-conformances; it is expressly understood that inspection does not in any way relieve the Contractor from its responsibility to furnish proper materials and workmanship under the Contract Specification.

D. The Contractor shall meet all the specified requirements including, but not limited to: hardness, chemical composition, physical properties, microstructure, pressure tightness, radiographic soundness, magnetic particle inspection, dimensions, and surface finish, as set forth in the Contract Documents and reference standards. In cases of conflict between the Contract Documents and reference standards, the

more stringent and/or costly requirements shall be applicable, as determined by the Engineer.

E. The surface of the metal castings shall be free of adhering refractory, sand, scale, cracks and hot tears. Other surface discontinuities shall meet either Level II Acceptance Criteria of ASTM A802 or the acceptance standards of MSS-SP55.

F. Traceability requirements applicable to both castings and machining shall be as follows:

1. For component items designated by the Engineer at the time inspection instructions are issued as requiring material traceability, material traceability codes shall be permanently applied to the component and annotated on test reports for each individual heat/heat treatment of material supplied.

a. Traceability marking shall be a foundry heat number to maintain complete traceability of each unique material batch to the Certified Material Test Reports provided. Traceability shall be maintained throughout all process operations, including any subcontracted operations, to the finished component.

b. Traceability codes shall be raised cast letters for cast items or, for machined items, shall be indelible markings made by engraving, etching, or stamping.

c. The code shall be readily accessible and shall not be in an area that may be removed or hidden during machining, assembly, or service.

d. The traceability code shall be designated on all component certification documents, thus allowing complete component to material certification traceability.

e. Where marking of individual component parts is not possible due to size, the traceability code shall be clearly marked on all packaging.

f. Material traceability of cast materials to original heat numbers shall be maintained throughout all stages of manufacture.

1) Unless otherwise approved by the Engineer, the size of the heat numbers cast into the surface and shall be 1-in. high × ⅛-in. thick.

2) In castings where the size and/or configuration do not allow for this size to be used, all lettering/numbers shall be of approved height and thickness so that legibility of original markings is maintained after final coatings are applied.

g. Representative samples from each heat shall be provided for the components and identified to ensure traceability back to the heat. Identification of the sample shall include as a minimum the unique material heat number (batch code), relevant component part name

and number, name of supplier/manufacturer, and date of manufacture. Heat numbers shall be cast on the body of the samples.

2. Except as noted herein below and/or except if explicitly shown otherwise on the Contract Drawings, in addition to the traceability code:

   a. All castings shall also have "NYCDEP" cast into the surface.

   b. Unless otherwise approved by the Engineer, the size of the "NYCDEP" logo shall be a minimum of 1-in. high × ⅛-in. thick, and located in a conspicuous location.

   c. Any and all rejected castings shall have the "NYCDEP" designation ground off in the presence of the DEP inspector,

   d. The "NYCDEP" designation shall not be used on any castings not specifically intended for a particular NYCDEP order.

      1) Any manufacturer and/or foundry using the "NYCDEP" designation for work that is not part of an NYCDEP order may be subject to rejection of current work and/or disqualification from future work.

   e. The following shall not have "NYCDEP" cast into the surface, and instead shall be cast as per the latest edition of the NYCDEP Sewer Design Standards and/or the Contract Documents:

      1) Manhole covers.

      2) Curb gratings and curb pieces.

      3) Catch basin hoods.

G. Representative samples and certified material test reports indicating physical properties and chemical composition are required for all major components identified by the Engineer. Three (3) samples of approved size to produce standard specimens per the specified material designation for tensile testing shall be provided for each heat. Samples shall be sent, as soon as possible, from the foundry directly to the NYC DEP or to a location designated by the Engineer.

H. As a minimum, the Engineer or its representatives may elect to perform inspection activities during foundry pour operations, including but not limited to:

   1. Assessing pattern condition prior to mold preparation (visually inspect for defects such as dents, cracks, chips, etc.).

   2. Assessing sand condition.

   3. Assessing mold and core condition prior to assembly procedures.

   4. Reviewing molding and casting processes (e.g. sand mold).

   5. Reviewing resin type, mold coating ("mold wash") type, and core reinforcement.

6. Reviewing melting and casting procedures.

7. Reviewing chemical requirements.

8. Reviewing heat treatment procedures (note: test samples shall be subjected to the same thermal treatment as the castings they represent).

9. Witnessing Chemical Analysis:

   a. Initial ladle analysis to determine correct charge (ladle chemical composition).

   b. Chemical analysis of tensile test bars or chemical coupons.

10. Witnessing Testing for Mechanical Properties:

    a. Testing of tensile test specimens machined from keel or Y-block for mechanical properties including ultimate strength, yield strength, elongation, hardness, impact, transverse bend, and microstructure, as applicable, per Contract Documents, and applicable reference standard requirements. (Note: Tensile test bars shall be poured after filling the mold and shall be from the same ladle and subjected to the same heat treatment, if applicable, as the castings they represent.)

11. Performing visual inspection of castings:

    a. Dimensional verification per Shop Drawings and visual inspection for defects such as metallic projections, shrinkage cavities, incomplete casting, inclusions, porosity, slag, discontinuities, etc.

    b. Verify that stainless steel castings have been cleaned, descaled and passivated.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to the following:

1. Action Submittals:

   a. Weld procedure specifications and supporting procedure qualification records; if permission for welding repair is granted by the Engineer.

   b. Procedures (with acceptance criteria) for the non-destructive evaluation of castings and welds: visual, ultrasonic, liquid penetrant, magnetic particle, and radiographic, as applicable.

   c. Representative samples of cast components as required by the designated material specification for independent chemical and physical verification testing.

2. Information Submittals:

   a. Certified Material Test Reports.

b. Heat Treatment Certification and Heat Treat Charts.

c. Results of Certified Shop Tests.

d. Complete records of all additional tests and inspections shall be submitted for review and acceptance by the Engineer.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. The cleaning, preservation and packing of the cast metal for shipment shall be in accordance with the manufacturer's commercial practice subject to the approval of the Engineer.

2. The packaging and marking shall be adequate to identify the contents and to ensure acceptance and safe delivery to the Site.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. Metal castings shall be handled in such a manner that they may be transported and unloaded without being over-stressed, deformed or otherwise damaged.

2. Metal castings shall be protected from corrosion and deterioration and shall be stored in a dry area.

a. Materials stored outdoors shall be supported above ground surfaces on wood runners and protected with effective and durable waterproof covers approved by the Engineer.

3. Store packaged materials in manufacturer's unopened containers, marked with manufacturer's name and product brand name.

a. Immediately reseal containers after partial use.

4. Metal castings shall not be placed in or on a structure in a manner that might cause distortion or damage to the material.

5. The Contractor shall repair or replace damaged metal castings as directed by the Engineer.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer’s standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Metallic polymer type repair products:

1. Belzona Industrial Protective Coatings and Composites as manufactured by Belzona New York LLC, Glen Cove, NY.

2. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Metal castings shall conform to the requirements of the material specified in the Contract Documents.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Mechanical Properties:

1. Sound casting practices shall be maintained to meet the necessary tensile strength, yield strength, elongation and hardness requirements of the cast metal.

2. Mechanical property requirements of the metal castings shall be as stipulated in Contract Documents and/or referenced standards, where the more stringent requirement shall be applicable.

B. Pour Time:

1. Ductile iron castings shall be poured within 15 min. of the inoculation/nodularization process to avoid fading of the inoculant.

2. Any casting poured more than 15 min. after inoculation/nodularization treatment may be subject to rejection.

3. All representative samples shall be poured from the same ladle immediately after the castings have been poured, and shall not contain bottom sediments.

C. Integrity of Castings:

1. Castings shall be true to pattern in form and dimensions without sharp unfilled angles or corners, free from pouring faults, sponginess, cracks, blow holes and other defects in positions affecting their strength.

2. Castings shall be made accurately to the dimensions shown on the Contract Drawings and shall be machined to secure perfectly true surfaces. Allowance shall be made in patterns so that specified thicknesses will not be reduced as a result of machining.

3. Plugging and filling will not be allowed where the physical strength of the casting will be impaired.

a. Where the Engineer decides that plugging and filling will not impair the strength of the casting, the casting may be plugged and filled only upon written permission from the Engineer.

b. Superficial non-structural cracks and small defects can be repaired subject to the Engineer's approval with approved metallic polymer type repair (filler) products.

4. All castings shall be thoroughly cleaned, inside and outside, free from adhering refractory, sand, scale, non-metallic inclusions (such as ceroxides and slag), cracks and hot tears.

a. Wire brushes, scrapers or other approved mechanical appliances shall be used for this purpose.

b. Acid or other corrosive liquids shall not be used in cleaning castings (except stainless castings).

5. Minimum wall thickness of castings shall be as specified in the designated equipment specification. When wall thickness tolerances are not included in the designated specification, tolerances shall be as follows:

a. For metal castings with a nominal wall thickness less than 0.8-in., the wall thickness shall not be 0.08-in. less than the nominal wall thickness nor 0.12-in. greater than the nominal wall thickness.

b. For metal castings with a nominal wall thickness 0.8-in. or greater, the wall thickness shall not be 10% less than the nominal wall thickness nor 15% greater than the nominal wall thickness.

c. However, acceptable deficiencies in wall thickness shall not exceed one half the area of any casting.

D. Visual Acceptance: The surface of the metal castings shall be free of adhering refractory, sand, scale, cracks and hot tears. Other surface discontinuities shall meet either Level II acceptance criteria of ASTM A802 or the acceptance standards of MSS-SP55.

1. Defects that exceed the acceptance limits may be ground down and blended into the surrounding metal, provided it is meets the minimum wall thickness requirements.

E. Weld repair is not permitted for cast iron or ductile iron. For other materials, no repair of surface defects by welding, plugging, brazing, filling, impregnation, etc., shall be permitted where the physical strength of the casting will be impaired. Additionally, no such repairs shall be permitted without the prior approval of the Engineer, in writing. Castings which have been repaired prior to receiving approval from the Engineer will be subject to rejection. If the manufacturer believes a casting may be repaired by welding, he shall excavate all defects to sound metal by a method approved by the Engineer and verify removal of the defect with PT, MT, or RT (as directed and approved) in the presence of the DEP inspector. He shall then prepare a defect map which identifies all defects by final size (surface dimensions and depth) and location. The defect map, repair procedure, and post repair evaluation procedure shall be submitted to the Engineer for approval.

F. If permission for repair by welding is granted by the Engineer, the amount and type of NDE and acceptance criteria to be performed on the weld repairs of the castings shall be as approved by the Engineer. All weld repairs shall be preheated per approved Welding Procedure Specification (WPS) and repaired castings shall be post weld heat treated. The acceptance criteria for such NDE of weld repairs shall be as follows:

1. Acceptance Criteria for Radiographic Tests: The following weld defects shown by radiography shall be unacceptable:
    a. Any cracks, linear indications, or zone of incomplete fusion or incomplete penetration.
    b. Any elongated indication which has a length greater than:
        1) ¼-in. (6.4mm) for weld thicknesses up to ¾-in. (12.7mm),
        2) ⅓-T for weld thicknesses from ¾-in. to 2¼ in., or
        3) ¾-in. for weld thicknesses over 2¼-in.
        4) Note: Indications not characterized as being a crack or zone of incomplete fusion or penetration shall be evaluated as being elongated indications if the length is three or more times the width.
    c. Any group of aligned indications per 6 in. (152mm) of weld length greater than
        1) ½-in. (12.7mm) for weld thicknesses up to ½-in.
        2) 1-in. (25.4mm) for weld thicknesses ½-in. or greater.
    d. Any rounded indications exceeding ⅛-in. (3.2mm) in diameter.
    e. Any group of rounded indications with diameters $^{1}/_{32}$ in. (0.8mm) or greater, when the sum of their diameters exceeds ¼-in. (6.4 mm) per square in. (645 mm2).
2. Acceptance Criteria for Magnetic Particle and Dye Penetrant Tests: All surfaces to be examined shall be free of:
    a. All linear indications.
    b. Rounded indications greater than $^{3}/_{16}$ in.
    c. Four or more rounded indications greater than $^{1}/_{16}$-inch in a line separated by $^{1}/_{16}$ in. or less (edge to edge).
3. Acceptance Criteria for Visual Tests: All weld surfaces to be examined shall:
    a. Be free of crater cracks or surface cracks.
    b. Have complete fusion and required penetration between the weld metal and the base metal.

c. Have undercut not exceeding $^{1}/_{32}$ in.

d. Have excess reinforcement not exceeding $^{1}/_{64}$ in.

G. Heat Treatment: Castings requiring heat treatment to improve their mechanical properties shall be carried out in accordance with the product material specifications or by written permission from the Engineer. Metal castings shall be heat-treated by full annealing, normalizing, normalizing and tempering, or quenching and tempering. Unless otherwise specified in the Contract Documents, the castings may be heat-treated by any one or combination of these heat treatment processes.

1. Heat treatment shall be performed after castings have been allowed to cool from the pouring temperature to below the transformation range.

2. Furnace temperatures for heat treating shall be regulated by the use of pyrometers.

3. Heat treatment certification report shall be submitted to the Engineer.

4. Heat Treatment Certification shall include:

a. The material traceability code of the heat-treated item

b. The preheat treatment material batch number (heat lot #)

c. Heat treatment batch number

d. Date of heat treatment

e. Process type

f. Process temperature

g. Process duration

h. Quenching details

i. Heat treatment temperature chart

j. Measured surface hardness (and test method)

k. Post heat treatment CMTRs (Certified Material Test Reports)

H. Painting:

1. Where metal castings are required to be painted, such work shall be done in accordance with Section 09 91 00 - Painting. Painting of stainless steel castings is not permitted.

I. Descaling, Cleaning and Passivation of Stainless Steel Castings

1. Stainless steel castings shall be descaled, cleaned and passivated and shall show no rust spots when tested by the Water Wetting and Drying method of ASTM A380 or no free iron indications when tested by the Copper Sulfate Test method of ASTM A380.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. General:

1. All tests required by the Contract Specifications shall be performed by a NYCDEP approved Testing Laboratory whose services have been contracted by the manufacturer.

a. Complete records of all tests and inspections shall be maintained by the manufacturer. The supplier shall monitor and measure the characteristics of the product to verify that the product requirements as specified on component drawings and Contract Documents, including hardness, where applicable, have been met.

b. Records demonstrating compliance with the acceptance criteria shall be maintained, and the records shall indicate the person(s) authorizing the release of the product.

c. A casting log shall also be maintained.

1) The information contained in the casting log shall include, quantity poured, part description, casting serial number, foundry heat number, heat treat number, material designation, material type, material properties, hardness and percent nodularity if applicable.

2. In the event of a disparity between the manufacturer's test results and the NYC DEP's verification test results or should the manufacturer's test results be deemed questionable by the Engineer, the NYCDEP reserves the right to require retesting or additional "referee" testing at an approved testing laboratory.

B. Mechanical Testing: Mechanical testing of the castings shall comply with the sampling methods, dimensional requirements, number of tests and retests, etc. as per the referenced standards, the Contract Drawings and the Contract Specifications.

1. Tensile Tests shall be performed in accordance with the requirements of the individual product specification. If the product specification does not provide requirements for testing, ASTM E8 with definitions provided by ASTM A370 shall be used. Except as otherwise specified in the Contract Documents, one tension test shall be performed on each heat.

2. Hardness measurement at the specified locations on the castings, or as designated by the Engineer, shall be made in accordance with the applicable ASTM or approved standard.

C. Non-Destructive Testing (NDE): Non-Destructive testing shall be performed per the requirements of the referenced standards, the Contract Drawings and the Contract Specifications.

1. Magnetic Particle Testing (MT) shall be performed in accordance with the requirements of ASTM E709. The type and degrees of discontinuities

considered shall be judged by reference photographs in ASTM E125 for ferrous castings; and the basis of acceptance shall be Severity Level 2 or better for any type of discontinuity.

2. Radiographic Examination (RT) for internal defects shall be performed in accordance with ASTM E94. In these cases, radiographic examination of the castings may be performed before or after any heat treatment. The type and degree of discontinuity shall be judged by the applicable reference radiographs. The basis of acceptance shall be Severity Level 2 or better for any type of discontinuity as referenced by ASTM E689 or E802, as applicable.

3. Liquid Penetrant examination (PT) for surface discontinuities shall be performed in accordance with ASTM E165. The type and class of surface discontinuity indications shall be judged by reference standard ASTM E433. Penetrant indications of surface discontinuities shall be accepted or rejected based on the severity level of surface discontinuities in the zones of inspection, and the indicated depth of such discontinuities. Linear defects revealed by liquid penetrant inspection shall be explored by grinding or other suitable means approved by the Engineer. Depth of defects shall not exceed the dimensional tolerance of the material.

4. Ultrasonic Inspection (UT) for internal defects shall be carried out in accordance with ASTM A609. Ultrasonic examination of castings shall be performed after at least one heat treatment above the critical temperature but need not be repeated after subsequent heat treatment. Acceptance standards shall be as designated in the Contract Documents and the relevant reference standards.

5. The technicians carrying out these tests should be American Society for Nondestructive Testing (ASNT) Level I or II certified in the appropriate practice. However, for individuals interpreting test results, a minimum ASNT Level II certification is required.

D. Chemical Testing: The chemical composition of the heat shall be controlled such that the required metallurgical phase(s) and elemental contents shall conform to the compositional requirements for the named elements as specified in the Contract Documents and the relevant reference standards. A product analysis shall be made from material representing each heat. Spectrographic or other methods such as those specified in ASTM E305 and E351 may be used for chemical analysis.

E. Re-certification of material is required when material is subjected to a heat treatment process that alters its properties. All material samples shall be heat treated along with the component parts they represent. When only the mechanical properties are altered, the original certification for chemical composition shall be over-stamped and/or annotated with the unique material traceability code used with the altered material physical properties.

F. Unless otherwise approved, hydrostatic tests on cast components containing pressure boundaries (casting across which a pressure differential can or will occur while in service) shall be performed after shakeout cleaning and/or machining but prior to surface preparation and coating of the surfaces. The cast component shall be under the full test pressure at a minimum of 2-times the rated pressure or 1½-times the maximum service condition (whichever is greater) or as designated in the applicable reference standards for the duration of the hydro test. Any casting that leaks or does not withstand the test pressure shall be rejected. The hydro test report shall be traceable to the item tested and shall accompany all shipment made against the purchase order. The test report shall include supplier's name, test fluid temperature, hold time, pressure, and procedure number.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used.

3.02 ERECTION

A. All castings shall be assembled and erected to accurate grades and alignment and, when placed in concrete or other surrounding materials, shall be carefully supported to prevent movement during placement of concrete or other materials.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

3.05	Adjusting / Protection / Cleanup	5

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 09 91 00 - Painting.

1.04 REFERENCES

A. ASTM A36 - Standard specification for carbon structural steel

B. ASTM A47 - Ferritic Malleable Iron Castings

C. ASTM A48 - Gray Iron Castings

D. ASTM A536 - Ductile Iron Castings.

E. ASTM B584 - Copper Alloy Sand Castings for General Applications

REFERENCES

1.05 DESCRIPTION

A. Miscellaneous metal castings shall include all miscellaneous ferrous and non-ferrous castings to be furnished and installed by the Contractor.

Included in this classification are manhole frames, covers and grades, stop plank grooves, cast iron brackets or other cast iron supports for piping, floor drains, traps, cleanouts, special malleable iron castings and inserts, concrete trench box cover plates, and other special castings of any nature or material, and all necessary bolts, nuts, washers, gaskets and other appurtenances required to join sections of castings.

1.06 QUALITY ASSURANCE

A. Not Used

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

a. Submit Shop Drawings and material specifications for all castings furnished as part of the Work.

1) Shop Drawings shall be submitted under separate cover for each type of casting.

2) If a metal casting is a component or part of Work specified or shown elsewhere:

a) The Contract may elect to include the submittal information for the metal casting required herein under that separate submittal.

b) If the Contractor elects to include the metal casting submittal as part of another submittal, the Contractor shall submit a stand-alone, separate informational submittal for the metal casting indicating as such.

2. Information Submittals:

a. Certificate of conformance to applicable reference standards.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Iron Castings

1. Castings shall be as manufactured by:

a. Neenah Foundry Company, Neenah, WI

b. Campbell Foundry, Harrison, NJ

c. Or approved equal

2.02 MATERIALS / EQUIPMENT

A. Design Requirements

1. Castings exterior to structures shall be designed for an AASHTO H-20 truck loading, unless otherwise noted on the Contract Drawings.

2. Interior castings shall be designed for the loading designated on the Contract Drawings for the adjacent floor area. If no loading is designated, castings shall be designed for a minimum load of 300 pounds per square foot or as required for their intended use.

B. Metal castings shall conform to the requirements specified herein and to the following standards:

1. Gray Iron: ASTM A48

2. Ductile Iron: ASTM A536

3. Malleable Iron: ASTM A47

Manganese Bronze: ASTM B584

4. Carbon Structural Steel: ASTM A36

C. Where these metals are designated by class, grade, type, alloy, temper or coating, they shall conform to the requirements specified herein or as shown on the Contract Drawings.

D. Iron Castings

1. Iron Castings shall include, but not be limited to frames, covers, and grates for trench drains, catch basins, and inlets; and stop log grooves.
   a. Castings shall be of gray iron of uniform quality, free from defects, smooth and well cleaned by shotblasting.
   b. Catalog numbers on the Drawings are provided only to show required types and configuration. All covers shall be cast with raised letters as designated on the Drawings.
2. Covers and Grates
   a. Covers and grates shall be provided with matching frames. Cover shall fit flush with the surrounding finished surface. The cover shall not rock or rattle when loading is applied.
   b. Round covers and frames shall have machined bearing surfaces.
   c. Design loadings:
      1) Where located within a structure, a minimum design loading of 300 psf shall be used, unless noted otherwise.
      2) At all locations not within a structure, the design loading shall be a standard AASHTO H-20 truck loading, unless otherwise noted.
   d. Manhole frames and covers and grates shall be Class 35 unless otherwise specified in the Contract.
3. Pier cleats, bollards, and machinery castings shall be Class 20 or 25.
4. Ductile iron castings shall be grade 80-55-06 unless otherwise specified in the Contract.

E. High Strength Yellow Brass: Commercial designation for this alloy is leaded manganese bronze and castings shall conform to the requirements of ASTM B584, copper alloy UNS No. C86500 or C86700.

F. Watertight gasketing, bolting, locking devices, patterns, lettering, pickholes, vents, or self-sealing features shall be as detailed on the Drawings.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Castings shall be true to pattern in form and dimensions without sharp unfiltered angles or corners, free from pouring faults, sponginess, cracks, blowholes and other defects in positions affecting their strength.

B. All castings shall be made accurately to the dimensions shown on the Contract Drawings and shall be planed or ground where marked or where otherwise necessary to secure perfectly flat and true surfaces. Allowance shall be made in patterns so that specified thicknesses will not be reduced.

C. Manhole covers and floor plates shall conform to the details shown on the Contract Drawings or in their absence to the standards of the Department of Environmental Protection and shall be true and seat evenly at all points.

D. Catalog numbers indicated on the Contract Drawings are given to show required types and configurations. All covers shall be cast with raised letters as designated on the Contract Drawings.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Install products in complete accordance with the manufacturer's printed instructions and the approved shop drawings. In addition:

1. All castings shall be erected to accurate grades and alignment and when placed in concrete or other surrounding materials, shall be carefully supported to prevent movement during placement of concrete or other materials.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Provide field touch up painting of scratched or damaged surfaces, using primer, intermediate and finish paints provided by the manufacturer, in accordance with the requirements of this Section and Section 09 91 00 – Painting. In addition:

1. Non-ferrous castings shall be painted only when specifically required in the Contract.
2. Outdoor manhole frames and covers and grates are not required to be painted.

END OF SECTION

NO TEXT ON THIS PAGE

SECTION 05 59 16 – FABRICATED METAL ACCESS HATCHES
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish, fabricate and install aluminum and stainless steel fabricated metal access hatches as shown on the Contract drawings and specified herein. The hatches shall be provided complete with all accessories and fastenings required for a complete and operational installation.

1. Access hatches shall be installed horizontally and used for access in floors or decks and have a hinge cover with springs, hold-open arms, locking mechanism and a fall protection system.

B. Fabricated metal access hatches specified herein shall include sidewalk, roadway and floor access hatches that are intended to be mounted into cast concrete.

C. The following index of this Section is presented for convenience:

P. New York City Building Code (NYCBC)

1.05 DESCRIPTION

A. The Contractor shall supply Fabricated Metal Access Hatches as follows:

1. Type 1 – ASTM C 1802 Load Level 1 – Light Pedestrian Load

a. Intended for use in areas restricted to pedestrians that are totally inaccessible to all vehicle traffic.

b. A design loading of 150 PSF and a concentrated design load of 300 LBF is required.

c. Deflection shall not exceed the lesser of the span divided by 200 or 3/16 inch.

2. Type 2 – ASTM C 1802 Load Level 2 – Pedestrian Load

a. Intended for use in areas restricted to pedestrian that are totally inaccessible to all vehicle traffic.

b. A design loading of 300 PSF and a concentrated design load of 600 LBF is required.

c. Deflection shall not exceed the lesser of the span divided by 200 or 3/16 inch.

3. Type 3 – ASTM C 1802 Load Level 5 – Off Street Truck Traffic

a. Intended for use in unrestricted parking access lanes and alleyway where the traffic speed is limited to 15 mph.

b. A concentrated design load of 16,000 LBF plus a 30% dynamic (impact) allowance – H20 loading is required.

c. Deflection shall not exceed the lesser of the span divided by 300 or 3/16 inch.

4. Heavy duty access hatches designed to withstand wheel loading in excess of H20 loading and suitable for use in locations subjected to high density traffic or heavier loading applications shall meet the requirements of ASTM C 1802 Load Levels 6, 7, 8, 9 or 10.

5. Access hatch types other than ones listed in this Specification shall be as indicated in the Contract Documents.

B. Access hatch sizes shall be as shown on the Contract Drawings.

C. Covers shall be equipped with hold-open arm(s), springs, hinges and locking mechanism.

D. Lifting Mechanism:

1. Access hatches shall be designed to provide the proper amount of lift assist to assure access hatch cover(s) can be opened by one person with no more than 35 pounds of vertical lifting force.

E. Fall Through Protection

1. All access hatches shall have permanent means of fall protection complying with OSHA 29 CFR 1910.23 and NYCDEP EHS.

a. Furnish and install fall protection grating system on access doors, where specified or indicated on the Contract Drawings, fall protection grating system. The grating system shall be fabricated as part of the access hatch assembly.

b. Fall through protection shall consist of fiberglass or aluminum grating panel(s), lift assist, hold open arm and hardware, and locking mechanism.

2. Removable Safety Barrier Chains

a. Stainless steel safety chains with latches shall be provided and attached to the railing system for additional safety.

3. Safety Railings

a. Safety railings shall be installed in cases where grating panels are not installed or as indicated on the Contract Drawings.

F. Access hatches in sidewalk areas shall comply with the NYCBC.

1.06 QUALITY ASSURANCE

A. Access hatches shall be detailed and fabricated based on calculations prepared by the manufacturer and sealed by a NYS Registered Professional Engineer, indicating that the access hatch is capable of withstanding loads to meet the specified types of access hatches.

B. The Contractor shall require that the manufacturer of the hatches furnish the fall through protection and be responsible for the integration and compatibility of all equipment components provided under this Section.

C. Quality Assurance (QA) Inspections

1. QA inspections may be made by NYC DEP Bureau of Engineering Design and Construction, Quality Assurance Section or its representative at the manufacturer's facility.

2. The Contractor shall give ample notice to the Engineer prior to the beginning of any fabrication, so that the QA inspection may be made.

3. QA inspections may include but not be limited to the following activities:

a. Obtain copies of certified materials test reports, both chemical and physical, Manufacturer Certificates of Conformance and test report for susceptibility to intergranular corrosion of the stainless steel material, as applicable.

b. Perform visual inspection of welding, as per applicable welding code.

c. Perform visual and dimensional inspection of completed work.

1.07 SUBMITTALS

A. The Contractor shall submit shop drawings for approval by the Engineer.

B. Shop Drawings shall be signed and sealed by a NYS Registered Professional Engineer. At minimum each detailed drawing and calculation packet shall be signed and sealed.

C. Shop drawings shall include the following:

1. General layout drawings showing overall frame dimensions, opening at the base of the frame, clear opening size, thickness of the frame and the overall height of the frame, profiles, accessories, location adjacent construction interference and all dimensions and details.

   a. Accessories include drain location, fall through grating details with clearances, and safety barrier chain locations.

2. A list of material manufacturer(s) with the products they manufacture or fabricated, including but not limited to mill test reports.

3. All materials used during the access hatch manufacturing shall be identified by thickness, size, and grade to assure that the appropriate materials are used specific to the hatch design being manufactured.

4. Copies of specifications, installation instruction and general recommendations for each access hatch supplied. Manufacturer's data substantiating that all materials comply with the requirements of this specification.

5. Design calculations and manufacturer's Engineering/product data including prototype test results, design details.

6. Certifications, structural calculations, detailed drawings, plans, elevations, and details of sections and connections

7. Calculations verifying compliance with the performance criteria.

8. Shop drawings shall indicate jointing and anchoring details.

9. Welding procedure specifications and welder and welder operator Certifications shall be as per AWS D1.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Access hatches shall be handled in such a manner that they are transported, unloaded and stored without being over-stressed, deformed or otherwise damages.

B. Shall be transported, handled and stored as per the manufacturer's instruction and recommendations.

1. The access hatches and components shall be stored and covered in a dry, protected and clean location off the ground.

2. All unfinished surfaces are to be protected from exposure and damage.

C. Coatings shall be applied in the shop; the units are to be delivered ready for installation.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor obtain from the manufacturer and provide a manufacturer's warranty, in an acceptable and beneficial form, that access hatches will be free of defects in material and workmanship for a period of 10 years from the date of Substantial Completion. Under the terms of this warranty, should a part fail to function in normal use within this period, the manufacturer shall furnish a new part at no charge.

B. The Contractor shall obtain from the manufacturer and provide a manufacturer's 10-year warranty, in an acceptable and beneficial form, for the fall protection grating system.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Access hatches shall be manufactured by:

1. The Bilco Company, New Haven, CT;

2. Acudor Products, Inc. brand, manufactured by USF Fabrication, Hiaheah, FL;

3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Aluminum

1. Shapes and plates shall be 6061-T6 aluminum alloy with mill finishes and shall be fabricated into finished products with welded or bolted connections as detailed in the Contract Drawings or approved Shop Drawings.

2. Extruded shapes shall meet the requirements of ASTM B221 and B308.

3. ASTM B209 and B632 / B632M, alloys 5052 or 5086.

4. The covers and frame of all hatches shall have a clear anodized shop finish.

B. Stainless Steel

1. Stainless steel shapes and plates shall be Type 316 for bolted construction and Type 316L for welded construction as detailed on the Contract Drawings or approved Shop Drawings.

2. Shapes shall meet the requirements of ASTM A276.

3. Plates shall meet the requirements of ASTM A480 and A666.

4. Type 316L stainless steel shall meet the requirements of ASTM A240, UNS S31603.

C. Access hatch

1. Personnel access hatches shall be a minimum size of 4 feet by 4 feet and be double leaf. Non-personnel access hatches for openings less than 4 feet long shall be single leaf.

2. Hatch leaf shall be manufactured of minimum ¼ inch thick aluminum or stainless steel diamond-pattern plate designed to withstand a live load as indicated on the Contract Drawings for the adjacent floor or deck area.

D. Frame

1. Channel or tee type frame shall be aluminum with an anchor flange around the perimeter and with a 1-1/2 inch drainage coupling where required.

E. Hinges

1. Hinges shall be heavy duty forged Type 316 stainless steel hinges, having a minimum ¼ inch diameter Type 316 stainless steel pin.

2. Hinges shall be specifically designed for horizontal installation and shall be through bolted to the covers with tamperproof Type 316 stainless steel bolts and locknuts.

F. Drain Coupling

1. Provide a 1-1/2 inch drain coupling located in the right front corner of the channel frame or located as indicated on the Contract Drawings.

G. Lifting Mechanism

1. Manufacturer shall provide the required number and size of compression spring operators, enclosed in telescopic tubes, to provide smooth, easy and controlled cover operation throughout the entire arc of opening and to act as s check in retarding downward motion of the cover when closing. The upper tube shall be outer tube to prevent accumulation of moisture, grit and debris inside the lower tube assembly. The lower tube shall interlock

with a flange support shoe fastened to a formed ¼ inch gusset support plate.

2. Springs shall be sufficient to provide the appropriate amount of lift for each door. Spring shall also be designed to counterbalance the specific cover weight throughout arc and to resist downward force when closing.

3. Compression spring tubes shall be an anti-corrosive composite.

H. Hold-open Arms

1. A Type 316 stainless steel hold open arm shall be provided to lock the cover in the fully open 90 degree position. A release handle shall be provided to allow the grating panel to be closed.

I. Hardware

1. Hatches shall be equipped with recessed padlock hasps. All hardware, including but not limited to mounting brackets, heavy forge hinges, torsion rod, hold open arm with release handle, snap lock, padlock hasp and fasteners shall be Type 316 stainless steel.

2. Locks shall be included as part of the hatch.

3. The locations of hinges and hold-open arm with release handle shall be as shown on the Contract Drawings and approved Shop Drawings.

J. Fall Through Protection

1. Grating panels shall be provided as shown on the Contract Drawings.

a. Grating panel(s) shall be manufactured of fiberglass reinforced plastic (FRP) or aluminum.

1) FRP grating panels shall comply with the following:

a) UV and corrosion resistant construction

b) FRP panels shall be molded in one piece or fabricated of 6061-T6 aluminum grating, with load bearing bars in both directions to allow for use without continuous side support.

c) Grating shall be permanently installed and designed to support a 300 PSF live load.

d) Aluminum grating panels shall be powder coated with high visibility safety yellow finish.

b. Grating panels shall have a provision for locking to prevent unauthorized opening.

c. Hardware and hold-open devices shall be Type 316 stainless steel.

d. Lift assistance shall be provided for ease when opening the grating panel.

e. The grate openings shall be 2-inch x 4-inch on center.

f. Grating panels shall lock in the fully open position.

g. Grating panels shall open in the same orientation as the hatch doors.

2. Removable safety barrier chains and latches shall be provided.

a. Chain shall be Type 316 stainless steel.

b. Safety chains shall be capable of withstanding 1,000 pound of working load and 5,000 pounds of breaking load.

c. Safety chains shall be removable at both open ends with a maximum 3-inch sag when the hatch is open.

3. When grating panels are not applicable or feasible, a Safety Railing System shall be built into the access hatch, such as pop-up or fold up or built into the leafs. Any other options shall be in the Contract Documents and specified herein.

a. Safety railing system shall be fabricated of 1.25-inch diameter (1.6-inch O.D.) schedule 40 Type 6061 T-6 aluminum or Type 316 stainless steel. Safety railing system shall be manufactured of the same material as the access hatch.

b. Safety railings shall extend to 42 inches height per OSHA 1910.23;

c. Safety railings shall be retractable and fully contained inside the cover leaf(s) for easy access and storage.

d. Safety railings shall be fitted with ½ inch diameter safety pins to lock the system in either the open or closed position. Safety pins shall be permanently attached to the hatch.

K. Provide materials for all hatch components as specified in table below according to the specified leaf material:

COMPONENTS	HATCH LEAF MATERIAL	
	STAINLESS STEEL	ALUMINUM
Forged Hinges & Hardware	316 Stainless Steel	316 Stainless Steel
Lift Assist Spring Operators	Stainless steel spring enclosed in Type 316 SS housing, ASTM A313.	Spring enclosed in ¾" 316 stainless steel tube
Hold Open Arm	Automatic with release handle Minimum 2 per leaf – one at each end	
Drainage Channel	Minimum cross-sectional area of 7.5 square inches to allow for adequate water drainage	
Diamond plate cover &	Minimum ¼ inch thick	Minimum ¼ inch thick

frame	mill finish	with clear anodized coating
Frame Finish (dissimilar materials)	None	Factory applied bituminous/coating to bond breaker aluminum to concrete
Lock	Recessed padlock hasps. Snap lock with removable handle	
Covers	Min ¼ inch thick mill finish that has been bead blasted to clean the door	Min ¼ inch thick aluminum diamond pattern with anodized coating.
Frame finish	none	Factory applied bituminous/coating

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Finishes

1. Aluminum sidewalk access hatches shall be coated with an anodized finish in accordance with the requirements of AAMA 611 Class 2, with a minimum dry film thickness of 0.7 mils, or as specified or indicated on the Contract Drawings.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. The access hatch manufacturer shall have and perform quality control operations based on a written quality control program that includes the following:

1. Review and rejection of incoming materials based on certified mill test reports and visual inspections.

2. Frequency of inspection and inspection requirements for cut or cut and bent assemblies and part for hatch construction, assembly welding and completed hatch assemblies.

3. All quality control inspection reports shall be dated and maintained by the hatch manufacturer for a minimum period of seven years.

4. All prototype test records for custom hatches and all production test records shall be dated and maintained by the hatch manufacturer for a minimum period of seven years.

5. All prototype test records for the manufacturer’s standard access hatch designs shall be permanently archived.

6. When requested by DEP at the time of request for quotation the written quality control program and the quality control inspection reports during the period of DEP's access hatch, manufacturing shall be provided.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Number, sizes and location of all access hatches shall be provided as shown on the Contract Drawings and approved Shop Drawings.

B. Install the access hatches in accordance with manufacturer's instructions and approved submittals.

1. Test units for proper function and adjust until proper operation is achieved.

2. Repair finishes damaged during installation.

3. Restore finishes, so no evidence remains of corrective Work.

C. Access hatches and their components shall be adjusted for proper alignment and operation.

D. Protective coatings shall be provided for the exterior protection of aluminum frames that are to be cast in fresh concrete to prevent corrosion.

E. Immediately after installation, the Contractor shall clean all the access hatches using products and procedures that are not detrimental to the finishes and as recommended by the manufacturer.

3.03 FIELD TESTING / QUALITY CONTROL

A. All stainless steel materials shall be checked for compliance with tests for susceptibility to intergranular corrosion. Such tests shall be Practices A, B and E of ASTM A262. Detailed procedures for these tests shall be submitted to the Engineer for approval prior to the start of work. If the certified mill report indicates that such tests have been satisfactorily performed, the fabricator may not be required to repeat the test. Material passing Practice E shall be acceptable.

B. Tolerances

1. Maximum tolerance allowances shall be as outlined in ASTM C 1802, unless indicated on the Contract Documents or by the Engineer.

C. Inspection and Field Verification

1. The Contractor shall verify that the area to receive the access hatch is properly prepared and set to the proper elevation.

2. Contract shall meet the requirements of the manufacturer's installation recommendations and approved Shop Drawings.

D. Repairs

1. Repairs are to be performed as per manufacturer's recommendations and meet the requirements of ASTM C 1802.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

1.04 REFERENCES

A. Abbreviations and Acronyms

1. AWPA – American Wood Protection Association
2. GS – Green Seal

B. Reference Standards:

1. ASTM D245 - Standard Practice for Establishing Structural Grades and Related Allowable Properties for Visually Graded Lumber.
2. AWPA M4 - Standard for the Care of Preservative Treated Wood Products.
3. AWPA M6 - Brands Used on Forest Products
4. AWPA T1 - Use Category System: Processing and Treatment Standard
5. AWPA U1 - Use Category System: User Specification for Treated Wood
6. GS-36 - Adhesive for Commercial Use

1.05 DESCRIPTION

A. Preservative treatment processes and wood species, the combination must provide the required protection for the conditions of exposure and life of the structure. Preservative effectiveness shall be influenced not only by the protective value of the preservative chemical, but also by the method of application and extent of penetration and retention of the preservative in the treated wood. For satisfactory treatment and good performance, the timber must be sound and suitably prepared.

1.06 QUALITY ASSURANCE

A. Not Used

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. The following shall be submitted for each type specified:
   a. Certification by treating plant stating chemicals.
   b. Processes used.
   c. Net amount of salts retained.
   d. Conformance with applicable standards.
   e. Certification by treating plant that treatment material complies with governing ordinances
   f. Evidence that treatment will not bleed through finished surfaces.

g. Copies of a certificate, signed by producer, certifying that the softwood lumber producer complies with quality grades and other requirements specified. The certificate shall be submitted in a form recommended by applicable standards, written by the certifying organization.

2. Tests of pressure treated timber and lumber for retention of preservatives shall conform to the requirements of AWPA U1, Paragraph 3, Results of Treatment.

3. Letter of Certification for Pressure Treatment: Submit Certification from treating plant stating chemicals and process used and net amount of preservatives retained are in conformance with specified standards.

B. Sustainability requirements:

1. Product data. Unless otherwise indicated, submit the following for each type of product provided under this Section:

a. Local/Regional Materials:

1) Sourcing location(s): Indicate location of extraction, harvesting, and recovery; indicate distance between extraction, harvesting, and recovery and the project site.

2) Manufacturing location(s): Indicate location of manufacturing facility; indicate distance between manufacturing facility and the project site.

3) Product Value: Indicate dollar value of product containing local/regional materials; include materials cost only.

4) Product Component(s) Value: Where product components are sourced or manufactured in separate locations, provide location information for each component. Indicate the percentage by weight of each component per unit of product.

b. VOC data:

1) Adhesives:

a) Submit manufacturer's product data for adhesives. Indicate VOC limits of the product. Submit MSDS highlighting VOC limits.

b) Submit Green Seal Certification to GS-36 and description of the basis for certification.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Treated timber and lumber shall be stored on raised platforms and shall be stacked and supported to prevent warp.

B. B. Treated timber and lumber having a specified moisture content shall be set on raised platforms and covered with suitable weatherproof protective coverings, such as tarpaulins or heavy polyethylene film. Covers shall be battened down to prevent the covers from blowing off.

C. C. All treated timber and lumber shall be carefully handled to avoid splitting or damage to the surface and edges.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. Preservative Pressure Treatment:

1. Toxicity/IEQ: Products containing chromium will not be permitted. Products containing arsenic will not be permitted.

2. Waterborne Wood Preservatives:

a. Wood products shall be treated with waterborne wood preservatives listed in Section 4 of AWPA Standards U1, excluding those which contain arsenic and/or chromium.

b. Pressure treatment of wood products shall conform to the requirements of AWPA Standards U1 and T1.

c. Retention of preservatives as prescribed in AWPA Standard U1 for the following Use Categories (material conforming to a higher AWPA Use Category may be specified):

1) UC1: Interior construction - above ground, dry conditions.

2) UC2: Interior construction - above ground, damp conditions.

3) UC3A: Exterior construction - above ground, coated and with rapid water runoff.

4) UC3B: Exterior construction - above ground, uncoated or poor water runoff.

5) UC4A: General purpose soil or fresh water contact - heavy duty above ground.

6) UC4B: Heavy duty soil or fresh water contact - critical or difficult to replace components.

7) UC4C: Extreme duty soil or fresh water contact - critical structural components.

3. Boron-based preservatives:

a. Impregnate lumber with preservative treatment conforming to AWPA Standard U1.

B. Fire Retardant Treatment:

1. All wood designated to be fire-retardant treated shall be pressure-impregnated with a flame-proofing complying with the requirements of AWPA Type A, and with U.L., Inc. requirements for flame spread of 25 or less, with no evidence of significant progressive combustion when tested in accordance with ASTM E 84. Each piece of wood shall bear the U.L., Inc. FRS Label or the U.L., Inc. label indicating complete compliance with the fire hazard classification.

2. Toxicity/IEQ: Fire retardant treated wood products shall be free of halogens, sulfates, ammonium phosphate and formaldehyde.

3. Fire Retardant Formulations:

a. Wood products shall be treated with fire retardants listed in AWPA Standard U1.

b. Fire retardant treatment of wood products shall conform to the requirements of AWPA Standard U1, Commodity Specification H and AWPA Standard T1, Section H.

C. Timber and Lumber. Timber and lumber for pressure preservative treatment shall be:

1. Southern yellow pine.

2. Douglas fir.

3. Tree Species as indicated in the Contract Documents.

D. Timber and lumber shall be of the form, structural grade and dressing as shown on the Contract Drawings, specified in Section 06 10 00 - Rough Carpentry or required for the work.

E. All timber and lumber shall be graded in accordance with ASTM D245.

F. Conditioning of Timber and Lumber

1. Timber and lumber shall be conditioned for treatment by either air-seasoning, kiln drying, steaming, heating in the preservative at atmospheric pressure or under vacuum or by a combination of the methods, in such a manner as will not cause damage to the timber for the use intended.

2. Conditioning of timber and lumber for pressure treatment shall conform to the requirements of AWPA U1.

G. Treatment of Timber and Lumber

1. All timber and lumber shall be pressure treated with wood preservative in accordance with these Sections for the service conditions to which the treated timber and lumber will be exposed. Pressure treatments shall conform to the AWPA standards.

2. Timber and lumber used in tidal water structures such as sheet piles, low water braces and other members existing in the tidal zone shall be pressure treated by the full cell process of impregnation.

3. Treatment of timber and lumber shall conform with Table 1, attached to this Section.

4. The minimum net final retention of preservative in pounds per cubic foot of timber and lumber shall comply with the requirements of Table 1 – Pressure Treatment of Timber and Lumber with Water-Borne Preservatives, attached to this Section.

H. Fasteners

1. Timber and lumber shall be fastened with nails, spikes, bolts, rods, plates, washers and all other hardware shall be of the type, size and spacing to meet the conditions encountered.

2. Fasteners in marine installation or exposed to the weather shall be hot dip galvanized in accordance with Section 05 05 13.01 - Galvanizing, unless other materials are indicated on the Contract Drawings or specified in the Contract.

PART 1 GENERAL

1.01 SUMMARY

A. Rough carpentry as specified herein shall include, but not be limited to, wood centers, furring, grounds, blocking, temporary protection of all kinds, and all accessories and appurtenances.

B. Rough carpentry shall be provided where shown on the Contract Drawings, specified herein and as required otherwise for a complete installation.

1.05 DESCRIPTION

A. Sustainability requirements:

1. Certified Sustainably Harvested Lumber: Dimensional lumber derived from a Well Managed Forest as certified by one of the following certification organizations:
   a. Scientific Certification Systems (SCS)
   b. Forest Stewardship Council (FSC)
   c. Institute for Sustainable Forestry (ISF)
   d. Or other verifiable high-quality forestry management program
2. Salvaged Lumber: Lumber from deconstruction or demolition of existing buildings or structures. Unless otherwise noted, salvaged lumber shall be delivered clean, de-nailed, and free of paint and finish materials, and other contamination. Provide documentation certifying products are from salvaged lumber sources.

1.06 QUALITY ASSURANCE

A. Contractor shall provide products from acceptable manufacturers which have been used in satisfactory used is similar service for at least three years.

B. Mark each piece of lumber or each bundle of small pieces of lumber with the grade mark of a recognized association or independent inspection agency. Such association or agency shall be certified by the Board of Review, American Lumber Standards Committee, to grade the species used.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings, catalog cuts and reference materials for approval of the Engineer. Submittals shall include, but not be limited to:

1. Rough Wood Carpentry: The following shall be submitted:
   a. Copies of the chemical treatment manufacturer's instructions for proper use of each type of treated material.

b. For water-borne preservatives, the submittal shall include the statement that moisture content of treated materials was reduced to a maximum of 19 percent prior to shipment to project site.

c. Submittal shall indicate compliance with specified standards and other specified requirements for materials and workmanship.

2. Wood Preservative:

a. Submittals shall be as specified in Section 06 05 73.33 - Preservation Wood Treatment.

3. Sustainability:

a. Recycled Content:

1) Engineered Wood Products:

a) Indicate recycled content; indicate percentage of pre-consumer and post-consumer recycled content per unit of product.

b) Indicate relative dollar value of recycled content product to total dollar value of product included in project.

c) If recycled content product is part of an assembly, indicate the percentage of recycled content product in the assembly by weight.

d) If recycled content product is part of an assembly, indicate relative dollar value of recycled content product to total dollar value of assembly.

2) Salvaged Lumber: Provide documentation certifying products are from salvaged lumber sources.

b. Local/Regional Materials:

1) Sourcing location(s): Indicate location of extraction, harvesting, and recovery; indicate distance between extraction, harvesting, and recovery and the project site.

2) Manufacturing location(s): Indicate location of manufacturing facility; indicate distance between manufacturing facility and the project site.

3) Product Value: Indicate dollar value of product containing local/regional materials; include materials cost only.

4) Product Component(s) Value: Where product components are sourced or manufactured in separate locations, provide location information for each component. Indicate the percentage by weight of each component per unit of product.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery of Materials:

1. Rough carpentry materials shall not be delivered to the project site before the time of installation.

2. Materials shall, however, be delivered in sufficient quantities to allow continuity of the Work.

B. Storage of Materials:

1. Materials shall be stored with manufacturers' labels and seals intact.

2. Lumber shall be stored indoors at the site on raised platforms. If outdoor storage is temporarily incorporated, material shall be set on raised platforms and covered with suitable weatherproof protective coverings, such as tarpaulins or heavy polyethylene film. Covers shall be battened down with sufficient weights, ties or anchors to prevent blow-offs.

3. Damage to materials shall be prevented during storage primarily by minimizing the amount of time they are stored at the site before being incorporated into construction systems.

C. Handling of Materials:

1. Materials shall be handled carefully in order to avoid damage or breakage.

2. Materials shall be handled in a manner which prevents inclusion of foreign materials.

3. Materials shall not be exposed to detrimental conditions or physical damage. Materials which are so exposed shall be removed from the site and shall not be incorporated into the Work.

4. Do not open packages or containers until all preparatory Work is complete and installation will begin immediately. Do not allow materials to become wet or soiled or covered with ice or snow.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. General: All natural wood lumber used in the Work shall be verified as obtained from a certified sustainable natural wood lumber source using sustainable forest management practices.

B. Rough Carpentry: Lumber for rough carpentry such as nailers, grounds, blocking and framing shall be of Sustainably Managed Construction Grade, thoroughly seasoned dry No. 1 white fir, ponderosa pine, spruce or hem-fir.

C. Preservative Treatment: All lumber for rough carpentry which is incorporated into the finished structures shall be pressure-treated lumber complying with the requirements as shown on the Contract Drawings, specified in Section 06 05 73.33 - Preservation Wood Treatment or required for the Work. All lumber shall be seasoned lumber with a maximum moisture content of 19 percent at time of dressing. Water-borne preservative shall be as specified in Section 06 05 73.33 - Preservation Wood Treatment. All lumber shall be branded accordingly.

D. Fire Retardant Treatment: All wood designated on the Contract Drawings or specified to be fire-retardant treated shall be pressure impregnated with flame-proofing as specified in Section 06 05 73.33 - Preservation Wood Treatment.

E. Code Conformance: Materials shall conform to the requirements of the National Design Specification for Wood Construction as recommended by the American Wood Council, unless otherwise indicated.

F. Plywood Standards: Plywood shall conform to the requirements of the American Plywood Association.

G. Grading: Each panel of plywood shall be identified with the appropriate DFPA grade mark of the American Plywood Association.

H. Exterior Plywood Uses: Exterior type plywood shall be installed where plywood is used for roof sheathing or decking, or in areas where it may be exposed to moisture.

I. Temporary Protection: Exterior type southern yellow pine plywood, APA Grade C, plugged fir shall be used for temporary protection.

J. Accessories

1. Anchors, connectors, and fastenings, not indicated or specified otherwise, shall be provided and installed and shall be of the type, size and spacing necessary to suit the conditions encountered and as recommended by National Forest Products Association. Sizes, types, and spacing of nails, screws, or bolts for installation of manufactured building materials shall be as recommended by the product manufacturer, unless indicated or specified otherwise.

    a. Steel rough hardware exposed to the weather shall be zinc-electroplated unless indicated otherwise. Zinc-electroplated steel bolts, nuts, washers, hangers, and straps, and all other rough hardware embedded in, or in contact with exterior walls or slabs, and located in humid areas, shall be provided and installed, except as indicated otherwise.

    b. Rough hardware shall be formed and punched before coating. Common steel wire nails, bright finish, shall be used, unless specified otherwise.

c. Bolt heads and nuts bearing on wood shall be provided with standard steel washers.

d. Galvanized fasteners for treated wood shall be in accordance with the requirements contained in Section 05 05 13.01 - Galvanizing.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. The Contractor shall verify that areas to receive rough carpentry which is to be incorporated into the finished Work are properly prepared and completed to final elevations.

3.02 INSTALLATION

A. General: Rough carpentry shall be installed in accordance with the manufacturer's recommendations and approved shop drawings.

B. Erection: All carpentry shall be correctly laid out. All items of woodwork, hardware, and any other work in connection with carpentry shall be carefully fit and erected, accurately located, and shall be plumb, level, and properly aligned, and rigidly secured in place.

C. Blocking: Blocking shall be furnished and installed where required for the attachment of copings, roof ventilators, ducts and other sheet metal work. Wood grounds for other work shall be provided and installed and as shown and required.

D. Securing Finished Work: Wood blocks, strips, plugs and similar items shall be provided and installed as required to secure finished work to concrete and masonry.

E. Centers: Centers shall be provided, where required, for brick and other masonry at the exterior and interior openings.

F. Protection of other Work: Jambs of finished door frames and finished masonry openings shall be protected to a height of 6 feet above the floor. Protection shall be erected in a manner to facilitate cleaning, painting and similar work without damage to finished work.

G. Preservative Coating: All field-cut edges and surfaces of treated lumber shall be liberally coated with a concentrated solution of preservative.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjusting

1. System components which are dislodged, damaged, expanded, broken, penetrated or crushed by subsequent installation operations or by detrimental weather shall be immediately replaced with undamaged material in compliance with the Sections and properly protected as specified.

B. Protection

1. All components of the work shall be protected from detrimental weather and damage until construction operations are completed.

2. Work which cannot be covered with complete construction systems before the onset of weather detrimental to the work shall be completely covered and protected in such a manner as to deflect water and weather from the installation without damaging adjacent work.

3. Rough carpentry shall be protected from all damage and abuse until Final Acceptance by the City.

SECTION 06 51 05 – PULTRUDED FRP STRUCTURAL SHAPES
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. This Section describes the general requirements for fiber reinforced polymer (FRP) structural shapes, including channels, I-Beams, W-Beams, angles and other shapes produced using the pultrusion process and shall conform to the requirements specified herein and as shown on the Contract Drawings.

B. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. Design Requirements

1. Design criteria, and selection of structural shapes for use under compressive or flexural load shall be in accordance with the manufacturer's load tables.

1.06 QUALITY ASSURANCE

A. Quality Assurance Inspections

1. Quality Assurance inspections may be made by NYC DEP Bureau of Engineering Design and Construction, Quality Assurance Section or its representative at the manufacturer's facility.

2. Quality Assurance inspections shall be in accordance with the requirements of the Contract Documents.

3. The Contract shall give ample notice to the Engineer prior to the beginning of any fabrication, so that Quality Assurance inspection may be made.

4. Quality Assurance inspections shall include (but are not limited to) the following activities:

a. Obtain copies of Certified Materials Test Reports (both chemical and physical) and Manufacturer Certificates of Conformance.

b. Perform visual inspection of welding, as per applicable welding code.

1.07 SUBMITTALS

A. Shop Drawings and material specifications shall be submitted to the Engineer for approval in accordance with the requirements of Section 01 33 00 – Submittal Procedures.

1. Shop Drawings:

a. Shop Drawings shall be submitted for the fabrication and erection of all FRP structural systems, including FRP platform system with removable railings and accessories. Plans, elevations and details of sections and connections shall be included.

b. Shop Drawings for elevated framing platforms or walkways, shall be certified and stamped by a licensed Professional Engineer registered in New York State who has expertise in the field of fiberglass reinforced plastics as well as structural design.

c. The manufacturer's shop drawings shall clearly show material sizes, types, styles, part or catalog numbers, and complete details for the fabrication and erection of components including, but not limited to, location, lengths, types and sizes of fasteners, clip angles, member sizes and connection details.

d. The Contactor shall submit the manufacturer's published literature including structural design data, structural properties data corrosion or resistance tables, certificate of compliance, test report as applicable and design calculations for systems not sized or designed

in the Contract documents. Manufacturer's specifications, load tables, dimension diagrams, anchor details and installation instructions shall be included.

e. Shop drawings shall be certified and stamped by a Professional Engineer licensed in New York State with expertise in the field of FRP as well as structural design, for components that are not sized or designed in the Contract Drawings.

f. Manufacturer’s certifications for all material shall be submitted.

2. The Contractor is to submit sample pieces of structural shapes and other finished products for acceptance by the Engineer as to type, quality, texture, color, workmanship and finish. Sample pieces shall be manufactured by the method to be used in the work. Compliance with all other requirements shall be the exclusive responsibility of the Contractor.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Manufactured materials shall be delivered in original, unbroken pallets, packages, containers or bundle bearing the label of the manufacturer. Adhesives, resins and their catalysts and hardeners shall be crated or boxed separately and noted as such to facilitate their movement to dry indoor storage.

B. All materials shall be carefully handled to prevent them from abrasion, cracking, chipping, twisting, and other types of damage. Store adhesives, resins and their catalysts and hardeners in dry indoor storage between 70 and 85 degrees Fahrenheit until used.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer’s standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Pultruded FRP structural shapes shall be as follows:

1. Extren Series 625 as manufactured by Strongwell, Bristol, VA.

2. Dynaform VEFR as manufactured by Fibergrate Composite Structures, Inc., Dallas, TX.

3. Pultex as manufactured by Creative Pultrusions Inc., Alum Bank, PA.

4. Delta Shapes as manufactured by Detla Composites, Houston, TX.

5. or approved equal.

2.02 MATERIALS / EQUIPMENT

A. All structural shapes are to be manufactured by the pultrusion process. The structural shapes shall be composed of fiberglass reinforcement and resin in qualities, quantities, properties, arrangements and dimensions as necessary to meet the design requirements and dimensions as required for this contract.

B. Premium performance vinyl ester resin system, with fire retardant additives to meet a tested flame spread of 25 or less per ASTM E84 and shall meet the self-extinguishing requirements of ASTM D635. Glass content for structural shapes shall be a minimum of 45% and a maximum of 55% by the weight as determined by ASTM D2584 for a maximum sunlight and chemical/corrosion resistance.

C. A synthetic surface veil shall be the outermost layer covering the exterior surfaces. Glass strand roving shall be used internally for longitudinal strength. Continuous strand glass mats or stitched reinforcements shall be used internally for transverse strength.

D. A UV inhibitor shall be present in the resin to resist ultraviolet degradation. Standard color shall be as per manufacturer's specifications.

E. All finished surfaces of FRP items and fabrications shall be smooth, resin-rich, and free of voids and without dry spots, cracks, crazes or unreinforced areas. All glass fibers shall be well covered with resin to protect against their exposure due to wear or weathering.

F. Pultruded structural shapes are to have the minimum mechanical properties listed below:

Mechanical Properties	ASTM Method	Value
Tensile Strength	D638	30,000 psi
Tensile Modulus	D638	2,600,000 psi
Compressive Stress	D695	30,000 psi
Flexural Stress	D790	30,000 psi
Flexural Modulus	D790	1,600,000 psi
Modulus of Elasticity (Full Section)	N/A	2,800,000 psi
Short Beam Shear (Transverse)	D2344	4,500 psi
Ultimate Bearing Stress	D953	30,000 psi
Barcol Hardness	D2583	45
Density	D792	.062 - .070 pci

G. Fasteners and Accessories:

1. Fasteners shall be in accordance with Section 05 05 23.02 – Miscellaneous Metal Fastenings unless otherwise shown or detailed on the Contract Drawings. All fasteners shall be stainless steel Type 316.

2. End fasteners shall be stainless steel Type 316 for fastening structural shapes together for continuous run and/or installation.

H. Structural systems Structural systems shall include components from Section 06 74 13 - Pultruded FRP Gratings and Plates and Section 06 81 13 - Glass-Fiber Reinforced Plastic Railings.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Fabrication and Handling

1. Structural shapes and appurtenances shall conform to the requirements specified herein and to the following standards:

a. Sealing: All cut edges and holes shall be sealed with a vinyl ester resin to provide maximum corrosion resistance. All field fabricated cuts or drilling shall be coated similarly by the Contractor in accordance with the manufacturer's instructions.

b. Hardware: Type 316 stainless steel bolts shall be provided.

2. The fabricator and Contractor shall exercise precautions necessary to protect the fiberglass pultruded structural shapes from abuse to prevent breakage, nicks, gouges, etc. during fabrication, handling and installation.

3. Structural shapes shall be fabricated and assembled as indicated on the Contract Drawings and in accordance with the manufacturer's fabrication and repair instructions.

4. All structural shapes shall be accurately fabricated, free from warps, twists or other defects, which affect the appearance and serviceability of the gratings and plates.

5. Materials shall be of the minimum size and thickness as specified herein unless otherwise indicated on the Contract Drawings. The dimensions shown on approved shop drawings shall be followed.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Inspection

1. The structural shapes shall be as free, as possible, from visual defects such as foreign inclusions, delamination, blisters, resin burns, air bubble and pits.

2. The inspector will have the authority to reject any Work that does not meet the requirements of this Section.

3. Inspection of personnel, materials and equipment shall not relieve the Contractor of responsibility of providing material and fabrication procedures in compliance with specified requirements.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Field Measurements

1. Field measurements shall be taken prior to preparation of shop drawings and fabrication where required, to ensure proper fitting of the Work.
2. All dimensions shall be checked in the field after all piping and equipment are installed to determine the exact dimensions and locations of openings and cutouts.

3.02 INSTALLATION

A. Structural members shall be installed with each section accurately set plumb, aligned and braced as required to achieve final set condition as shown on the Contract Drawings or Shop Drawings

B. The clearance at the ends or between structural sections shall be a maximum of ¼-inch.

C. Beams, plates and columns shall be set flush with surrounding construction.

D. Beams shall be set with a full uniform bearing on fiberglass columns and beam frames to preclude rocking movement; wedges or similar shimming devices shall not be used.

E. Gratings and plates shall be set with a full uniform bearing on fiberglass angle frames to preclude rocking movement; wedges or similar shimming devices shall not be used.

1. Gratings and plates shall be installed with each section readily removable and replaceable. Adjacent units shall be neatly fitted together.

F. Making cutouts or openings in the field shall be approved by the Engineer.

G. Exposed connections shall be fitted accurately together to form tight joints.

H. Perform cutting, drilling and fitting required for installation of FRP fabrications. Set FRP fabrication accurately in location, alignment and elevation, with edges and surfaces level, plumb and true.

I. Any field cut and drilled edges, holes and abrasions shall be sealed with a catalyzed resin compatible with the original resin as recommended by the manufacturer.

J. Install items specified as indicated and in accordance with manufacturer’s instructions.

K. Fastening Devices

1. Fastening to In-Place Construction: Type 316 stainless steel anchorage devices or approved fasteners shall be provided to secure structural shapes to in-place construction with means for easy removal, as recommended by the manufacturer. Hold down fasteners to supports shall be installed at a maximum spacing of 2 feet on center but not less than four fasteners per each panel. Double nuts or burr threads shall be installed to prevent loosening of the hold down fasteners due to equipment's vibration.

a. Secure structural shapes to in-place construction with means for easy removal, as recommended by the manufacturer.

b. Structural shapes shall be secured to FRP or other structural members with stainless steel Type 316 fasteners, or as specified by the manufacturer.

c. Connections shall be combination joints using mechanical fasteners with adhesive bonding, as per manufacturer's instructions.

d. Mechanical connections utilize mechanical fasteners to join parts of fiberglass assemblies. Stainless steel Type 316 fasteners are to be used to eliminate corrosion.

e. Structural adhesive holds FRP parts together by surface attachment and can sustain a continuously applied load without excessive deformations or failure. Polyesters and epoxies are the two types of adhesives recommended for use with fiber-reinforced materials.

f. Surfaces shall be prepared and joined as per manufacturer's instructions.

SECTION 06 74 13 – PULTRUDED FIBERGLASS REINFORCED GRATINGS AND PLATES
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. This Section describes the general requirements for the fiberglass reinforced plastic (FRP) gratings and plates, stair treads and stair stringers. FRP gratings and plates including frames, embedded angles, grating support legs, stringers, anchors, fastening devices and miscellaneous appurtenances shall conform to the requirements specified in the Contract Documents.

E. ASTM F594 - Stainless Steel Nuts

F. New York City Building Code (NYCBC)

G. American Society of Civil Engineers (ASCE) Manual of Practice MOP #102 - Design Guide for FRP Composite Connections.

1.05 DESCRIPTION

A. Design Requirements

1. Design Criteria:

a. The design live load for grating or plate covering floor openings shall be that designated for the adjacent floor area but not less than a uniform load of 150 pounds per square foot or a concentrated load of 300 pounds distributed over 12-inch square area at the center of span, whichever produces the maximum stress or maximum deflection.

b. The maximum allowable deflection of the span due to live load as indicated on the Contract Drawings or specified herein shall not exceed 1/360, but not more than 1/4 inch.

c. FRP framing supports or FRP grating leg supports shall be provided at the cutout of opening size larger than 3-inch diameter or 3 inches in any direction unless otherwise indicated in the analysis that it meets the requirements of the specified deflection and allowable stress criteria.

d. Connections shall be as per ASCE MOP #102.

B. Type of Grating and Plates

1. Type of Gratings: Unless otherwise shown on the Contract Drawings or specified, gratings shall be one of the following types and shall be the product of one manufacturer. The type specified shall be used exclusively throughout the work.

a. Type "A" Molded Fiberglass Reinforced Grating.

b. Type "C" Pultruded Fiberglass Reinforced Grating.

2. Type "A", and Type "C" gratings shall be used in, over, and adjacent to containment area. Either Type "A", or Type "C" gratings can be used in other areas unless otherwise indicated on the Contract Drawings.

3. Stair Treads: Stair treads shall be pultruded fiberglass structural shapes and shall be used in, over and adjacent to containment areas unless otherwise indicated on the Contract Drawings.

C. Grating Cut-Outs

1. Cutouts shall be provided in the grating for the passage of pipe, valve stems, columns and similar work. Where more than four (4) bearing bars are included in the cut-out, banding bars of the same dimension as the bearing bars shall be provided around the opening and welded or electric-forged to the component parts of gratings.

D. Grating Stair Treads and Landings

1. Grating stair treads shall meet the requirements of pultruded grating and shall be 1 inch wider than tread widths shown on the Contract Drawings but not less than 10-1/2 inches wide and shall be securely fastened to FRP or stainless steel angles or carrier bars which in turn shall be fastened to FRP or steel treads. The outer edge or nosing of stair treads shall be so constructed as to make it distinctly visible and contrasting with other part of the tread. Nosings shall be furnished on all the stair treads and landings.

1.06 QUALITY ASSURANCE

1. Quality Assurance Inspections:

a. Quality Assurance inspections shall include (but are not limited to) the following activities:

1) Obtain copies of Certified Materials Test Reports (both chemical and physical) and Manufacturer Certificates of Conformance.

2) Obtain copies of required test reports that show compliance with subsection 2.02.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings and material specifications for the approval of the Engineer. Submittals shall include, but not be limited to:

1. Plans.

2. Elevations.

3. Details of sections and connections.

4. Shop drawings for elevated framing platforms or walkways, except raised platform systems, shall be certified and stamped by a Professional Engineer

licensed in New York who has expertise in the field of fiberglass reinforced plastics as well as structural design.

5. Setting drawings and templates for location and installation of anchorage devices or grating support legs shall be submitted.

6. Manufacturer's specifications, load tables, dimension diagrams, anchor details and installation instructions shall be included.

7. Gratings and plates shall not be fabricated until field measurements are verified and until the manufacturer's drawings have been approved.

B. The following shall be submitted in accordance with the Contract Documents:

1. Samples: Representative samples of gratings and plates, fasteners and other finished products shall be submitted for approve by the Engineer. The Engineer will review for type, color, texture, workmanship and finish only. Compliance with all other requirements shall be the exclusive responsibility of the Contractor.

2. The grating and plate manufacturer shall be required to furnish copies of ASTM E84 and ASTM D635 test reports showing test results of grating and plate from an independent test laboratory of the grating and plate finished product. Test results on the resin system only will not be allowed.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer’s standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Molded Grating and Plates

1. Duragrate as manufactured by Strongwell, Bristol, VA.

2. Fibergrate Molded Grating as manufactured by Fibergrate, Dallas, TX.

3. DeltaGrate as manufactured by Delta Composite Structures, Houston, TX.

4. Or approved equal.

B. Pultruded Gratings

1. Safe-T-Span as manufactured by Fibergrate, Dallas, TX.

2. Duradek as manufactured by Strongwell, Bristol, VA.
3. DeltaSpan as manufactured by Delta Composite Structures, Houston, TX.
4. Or approved equal.

C. Resin System
1. VEFR as manufactured by Fibergrate, Dallas, TX.
2. Duragrate as manufactured by Strongwell, Bristol, VAC.
3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Molded grating and plate shall be molded from a premium grade thermosetting resin system.
1. Resin system
a. Premium performance vinyl ester resin system shall have a tested flame spread of 25 or less as per ASTM E84.
b. Resin system shall be provided in, over, and adjacent to containment areas unless otherwise indicated on the Contract Drawings.

B. Pultruded Gratings:
1. All pultruded components shall be pultruded using an UV inhibitor in the resin to resist ultraviolet degradation and an UV resistant synthetic veil on all exposed surfaces.
2. Resin system:
a. Vinyl ester with flame spread rating of 25 or less as per ASTM E84.
b. Resin system shall be provided in locations other than containment areas unless otherwise indicated on the Contract Drawings.
3. Glass content shall be a minimum of 60% and a maximum of 70% by the weight as determined by ASTM D2584 for a maximum sunlight and chemical resistance. Grating panels shall have no exposed dry glass or voids containing dry glass.

C. Embedded Angles and Grating Support Legs: FRP embedded angles and FRP grating support legs of the size and shape indicated on the Contract Drawings shall be manufactured by the pultrusion process by combining fiberglass and premium grade resins in a polymer matrix. The angles and grating support legs shall be pultruded using quality thermosetting resins with ultraviolet inhibitors. The FRP embedded angles shall be continuous angle with integral anchors. Grating support legs shall be adjustable type.
1. The resin systems for the angles and grating support legs shall be as follows:
a. Vinyl ester resin with a tested flame spread rating of 25 or less.

b. Resin system shall be provided in, over and adjacent to the containment areas unless otherwise indicated on the Contract Drawings.

c. Resins shall be a vinyl ester with chemical formulation necessary to provide the corrosion resistance, strength and other physical properties as required

2. Glass content shall be a minimum of 45% and a maximum of 55% by the weight as determined by ASTM D2584 for a maximum sunlight and chemical resistance. Angles and grating support legs shall have no exposed dry glass or voids containing dry glass.

D. Fasteners and Accessories:

1. Fasteners shall be in accordance with Section 05 05 23.02 – Miscellaneous Metal Fastening unless otherwise stipulated in the Contract Documents and requirements of ASTM A666.

2. Hold down fasteners shall be stainless steel Type 316, including self-tapping stainless steel screws or machine bolts and nuts as required to hold the gratings and plates on the structure, as per ASTM F593 and F594. Stainless steel Type 316 wire clips shall be provided for attaching grating support leg to grating in panel.

3. Adhesive grouted anchors shall be provided for holding the gratings and plates on the concrete.

4. End fasteners shall be stainless steel Type 316 for fastening gratings or plates together for continuous run and/or installation.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Floor gratings, plates and appurtenances shall conform to the requirements specified herein and to the following standards:

1. Molded fiberglass reinforced gratings shall be a fiberglass reinforced composite molded with smooth mold surfaces. All bearing bars and cross-bars of the grating shall be molded at the same time into a one-piece construction.

2. Molded covered fiberglass reinforced gratings. Grating shall be a molded fiberglass reinforced grating. Cover shall be laminated to the grating and shall be manufactured by building up multiple layers of resin-impregnated fiberglass reinforcement. Fiberglass reinforcement shall be continuous and equally oriented in two (2) directions.

3. Pultruded fiberglass reinforced gratings shall be manufactured from thermally cured pultruded structural load and tie bar components. The load bar shall be formed using continuous strand roving and an outside surface covered with a continuous strand mat and a synthetic surfacing veil.

B. Gratings and plates shall be accurately fabricated, free from warps, twists or other defects which affect the appearance and serviceability of the gratings and plates.

C. Top surface of gratings and plates shall be gritted with annular abrasive particles for skid resistance.

D. Grating and plate cuts shall be sealed with catalyzed resin capable with resin used in the manufacture of the grating and plates and of equal or superior corrosive resistance.

E. Materials shall be of the minimum size and thickness as specified herein unless otherwise indicated on the Contract Drawings. The dimensions shown on approved Shop Drawings shall be followed.

1. The molded FRP grating shall be of a square grid pattern of not less than 1-1/2 inch deep and shall consist of full depth bi-directional bearing bars with a bar spacing of 1-1/2 inches on center in both directions.

2. The molded covered fiberglass grating shall consist of a FRP plate of a nominal thickness of 1/8-inches laminated to the molded FRP gratings.

3. The pultruded FRP grating shall consist of 1-1/2 inch deep minimum bearing bars at a 1-inch maximum clear spacing and with a tie bar spacing of 6 inches maximum on center.

4. The FRP stair treads shall consist of channels with a minimum size of 10 inches deep x 2-3/4 inches wide x 1/2 inch thick.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Field Measurements

1. Field measurements shall be taken prior to preparation of shop drawings and fabrication where required, to ensure proper fitting of the work.

2. All dimensions shall be checked in the field after all piping and equipment are set in place to determine the exact dimensions and locations of openings and cutouts.

3.02 IMPLEMENTATION

A. Installation

1. Gratings and plates shall be installed with each section readily removable and replaceable. Adjacent units shall be neatly fitted together.

2. The clearance at the ends or between sections of gratings and plates shall be a maximum of 1/4-inch.

3. Top of gratings and plates shall be set flush with surrounding construction.

4. Gratings and plates shall be set with a full uniform hearing on fiberglass angle frames to preclude rocking movement; wedges or similar shimming devices shall not be used.

5. Making cutouts or openings in the field shall be approved by the Engineer.

6. Exposed connections shall be fitted accurately together to form tight joints.

B. Fastening Devices

1. Fastening to In-Place Construction: Type 316 stainless steel anchorage devices or approved fasteners shall be provided to secure gratings and plates to supporting members with means for easy removal, as recommended by the manufacturer. Hold down fasteners to supports shall be installed at a maximum spacing of 2 feet on center but not less than four fasteners per each panel. Double nuts or burr threads shall be installed to prevent loosening of the hold down fasteners due to equipment's vibration.

a. Fastening devices shall not protrude above the walking surface of the gratings and plates in a way that will create a tripping hazard.

b. Gratings and plates shall be secured to fiberglass or other structural members with stainless steel Type 316 hold-down fasteners, or as specified by the manufacturer.

c. In the absence of grating and plate support structure, edges of gratings and plates shall be secured to each other with end panel fasteners.

C. Supports for Raised Floor Systems

1. 1-1/2 inch square mesh molded FRP grating panels provided in the containment area shall be supported on FRP adjustable legs with screw-leveling feature, FRP nut base and stainless steel Type 316 wire clip. The height of grating support legs shall be adjusted from atop grating. Raised floor systems to a maximum height of 60-inches shall be cross-braced using FRP angle 2 inches x 2 inches x 1/4 inch minimum fastened with stainless steel Type 316 bolts. The adjacent panels shall be secured with "F" type stainless steel Type 316 clips spaced at maximum 48-inches on center.

SECTION 06 74 20 – FIBERGLASS LADDERS
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. This Section describes the requirements for the fiberglass reinforced plastic (FRP) ladders. FRP ladders, anchors, fastening devices, miscellaneous appurtenances and personal fall arrest system shall conform to the requirements specified herein, and as shown on the Contract Drawings.

B. The Contractor shall furnish all labor, materials, equipment and incidentals necessary to install the FRP ladders.

C. The following index of this Section is presented for convenience:

I. OSHA 1910.28 – Duty to have fall protection and falling object protection

J. OSHA 1910.29 – Fall protection systems and falling object protection – criteria and practices

K. New York City Building Code (NYCBC)

1.05 DESCRIPTION

A. Design requirements

1. The FRP ladder and connections shall be in accordance with NYCBC and OSHA 1910.23and DEP EHS Guidelines.

2. The design live load for ladders shall be that designated for the adjacent floor area but not less than a concentrated load of 300 pounds distributed over the rung span, whichever produces the maximum stress or maximum deflection.

3. The maximum allowable deflection of the span due to live load as indicated on the Contract Drawings or specified herein shall not exceed 1/360, but not more than 1/4 inch.

1.06 QUALITY ASSURANCE

A. All items to be provided under this section shall be furnished only by manufacturers having a minimum of 5 years of experience in the design and manufacture of similar products and systems. Additionally, if requested, a record of at least three previous, separate, similar successful installations in the last 5 years shall be provided.

B. Substitution of any component or modification of the FRP ladder system shall be made only when approved by the Engineer.

C. In addition to the requirements of this Specification, the Contractor must comply with manufacturer's instructions and recommendations for work and installation.

D. Quality Assurance Inspections:

1. Quality Assurance inspections shall include (but are not limited to) the following activities:

a. Obtain copies of Certified Materials Test Reports (both chemical and physical) and Manufacturer Certificates of Conformance.

b. Obtain copies of required test reports that show compliance with subsection 2.02.

1.07 SUBMITTALS

A. Shop drawings and material specifications of all fabricated ladder and accessories shall be submitted to the Engineer for approval in accordance Section 01 33 00 – Submittal Procedures.

1. Shop Drawings shall be submitted for the fabrication and erection of all Work. These drawings shall clearly show material sizes, types, part or catalog numbers, complete details for the fabrication and erection of components including, but not limited to plans, elevation, location, lengths, type and sizes of fasteners, clip angles, member sizes and connection details.

2. Shop drawings for ladders shall be certified and stamped by a licensed Professional Engineer registered in New York State who has expertise in the field of fiberglass reinforced plastics as well as structural design.

3. Setting drawings and templates for location and installation of anchorage devices shall be submitted.

4. Manufacturer's specifications, load tables, structural design data, structural properties data, corrosion resistance tables, dimension diagrams, anchor details, design calculations for systems not sized and installation instructions shall be included.

5. Ladders shall not be fabricated until field measurements are verified and until the manufacturer's drawings have been approved.

6. Shop Drawings shall also show personal fall arrest system for ladders 15 feet or greater.

B. The following shall be submitted upon request of the Engineer:

1. Samples: Representative samples of ladders, fasteners and other finished products shall be submitted for approval by the Engineer. The Engineer will review for type, color, texture, workmanship and finish only. Compliance with all other requirements shall be the exclusive responsibility of the Contractor.

2. The ladder manufacturer shall be required to furnish copies of ASTM E84 and ASTM D635 test reports showing test results from an independent test laboratory of the finished product. Test results on the resin system only will not be allowed.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to the City a manufacturer's limited warranty, in an acceptable and beneficial form, warranting all FRP products against defects in materials and workmanship for a period of 5 years from the date of acceptance by the City.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Ladder and components shall be as manufactured by:

1. Delta Composites, LLC, Spring, TX;
2. Fibergrate, Dalla, TX;
3. Strongwell, Bristol, VA;
4. Structural Fiberglass, Inc., Bedford, PA;
5. Or approved equal.

B. Fall Prevention System

1. Ladder safety system shall be:
   a. PeakWorks 2000 Series Climb-Rite Fixed Rail Ladder Safety System as manufactured by SureWerx;
   b. Miller Saf-T-Climb System as manufactured by Honeywell;
   c. Or approved equal.
2. Full body harness shall be:
   a. PeakPro Harness as manufactured by SureWerx;
   b. Miller Saf-T-Climb Harness as manufactured by Honeywell;
   c. Or approved equal.
3. Shuttle/Trolley shall be:
   a. PeakWorks 2000 Climb-Rite Trolley as manufactured by SureWerx;

b. Miller Saf-T-Grip Shuttle as manufactured by Honeywell;

c. Or approval equal.

2.02 MATERIALS / EQUIPMENT

A. All ladder side rails, rungs and ladder mounting brackets are to be FRP structural shapes manufactured by the pultrusion process. All structural shapes shall be composed for fiberglass reinforcement and resin in qualities, quantities, properties, arrangements and dimensions as necessary to meet the design requirements and dimensions as specified in the Contract Documents.

B. Fiberglass reinforcement shall be a combination of continuous roving, continuous strand mat, bi-directional roving mat and surfacing veil in sufficient quantities as needed by the application and/or physical properties required.

C. Resins shall be a vinyl ester with chemical formulation necessary to provide the corrosion resistance, strength and other physical properties as required.

D. All finished surfaces shall be smooth, resin-rich, free of voids and without dry spots, cracks, crazes or unreinforced areas. All glass fibers shall be well covered with resin to protect against their exposure due to wear or weathering.

E. All products shall have a tested flame spread rating of 25 or less per ASTM E84 Tunnel Test.

F. The ladder side rail shall be 1-3/4 inch square tube with a wall thickness of 1/4 inch or greater. The rungs shall be 1-1/4 inch diameter flutted structural shapes, continuously fluted to provide a non-slip surface. Rungs that are gritted as a secondary operation shall not be permitted. Ladder and wall and floor mount shall be fabricated from pultruded angles, 3/8 inch minimum thickness.

G. Rung to side rail connections shall be bonded and pinned with a dowel rod to prevent rung rotation and pullout. Ladder Dowel Pins shall be ¼ inch diameter solid round rod..

H. The side rails shall be fiberglass reinforced pultruded polyester with OSHA safety yellow pigment.

I. Pultruded ladder and components:

1. All pultruded components shall be pultruded using an ultraviolet resistant synthetic veil on all exposed surfaces.

a. Glass content shall be a minimum of 60% and a maximum of 70% by the weight as determined by ASTM D2584 for a maximum sunlight and chemical resistance. Grating panels shall have no exposed dry glass or voids containing dry glass.

2. Resin shall be a vinyl ester, with flame-spread rating of 25 or less per ASTM E84. A UV inhibitor in the resin shall be present to resist ultraviolet degradation. Standard color shall be dark gray unless otherwise noted.

J. Embedded angles and ladder support: FRP embedded angles and FRP ladder support of the size and shape indicated on the Contract Drawings shall be manufactured by the pultrusion process by combining fiberglass and premium grade resins in a polymer matrix. The angles and support shall be pultruded using quality thermosetting resins with ultraviolet inhibitors. The FRP embedded angles shall be continuous angle with integral anchors. The resin systems for the angles and grating support legs shall be as follows:

1. Vinyl ester resin, with a tested flame spread rating of 25 or less shall be provided in, over and adjacent to the containment areas unless otherwise indicated on the Contract Drawings.

2. Glass content shall be a minimum of 60% and a maximum of 70% by the weight as determined by ASTM D2584 for a maximum sunlight and chemical resistance. Angles and grating support legs shall have no exposed dry glass or voids containing dry glass.

K. All other components of the products shall be pultruded fiberglass structural shapes and shall be as located on the Contract Drawings.

L. Fasteners and Accessories:

1. Fasteners shall be in accordance with Section 05 05 23.02 – Miscellaneous Metal Fastening unless otherwise shown or detailed on the Contract Drawings meet the requirements of ASTM F593, ASTM F594 and ASTM F3125.

M. Vertical Ladders

1. Ladders shall comply with OSHA 1910.23

2. A personal fall arrest system or ladder safety system shall be required on all fixed ladders that extend more than twenty-four feet above a lower level as specific in OSHA 1910.28.

3. The third rail required for the fall prevention system shall be stainless steel.

N. Fall Prevention System

1. All fixed ladders that extend more than twenty-four feet above a level shall be provided with a fall prevention system.

2. Fall prevention systems shall comply with OSHA 1910.28, OSHA 1910.29 and ANSI Z359.16.

3. All necessary components of the fall prevention system shall be furnished including two trolley/shuttle and two full-body harnesses for each fall prevention installation, to provide a complete and fully operational fall prevention system. Full-body harnesses shall be size medium where not universally sized.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Fabrication

1. Pultruded fiberglass reinforced ladder shall be manufactured from thermally cured pultruded structural load and tie bar components. The load bar shall be formed using continuous strand roving and an outside surface covered with a continuous strand mat and a synthetic surfacing veil.
2. Ladders shall be accurately fabricated, free from warps, twists or other defects which affect the appearance and serviceability of the ladders.
3. Top surface of ladder rungs shall be gritted with annular abrasive particles for skid resistance.
4. Ladder cuts shall be sealed with catalyzed resin capable with resin used in the manufacture of the ladder and of equal or superior corrosive resistance.
5. Materials shall be of the minimum size and thickness as specified herein unless otherwise indicated on the Contract Drawings. The dimensions shown on approved Shop Drawings shall be followed.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. All cuts or machined edges and holes shall be performed during ladder fabrication. No cuts shall be performed in the field without prior approval by the Engineer. Abrasions shall be sealed with a resin compatible with the resin matrix used in the fabrication of the ladder.

B. Exposed connections shall be fitted accurately together to form tight joints.

C. Fastening devices

1. Fastening to In-Place Construction: Type 316 stainless steel anchorage devices or approved fasteners shall be provided to secure ladders to supporting members with means for easy removal, as recommended by the manufacturer.
2. Fastening devices shall not protrude into the hand hold area of the ladder in a way that will cause injury.

3.03 FIELD TESTING / QUALITY CONTROL

A. Field measurements

1. Field measurements shall be taken prior to preparation of Shop Drawings and fabrication where required, to ensure proper fitting of the Work.

2. All dimensions shall be checked in the field after all piping and equipment are installed to determine the exact dimensions and locations of openings and cuts.

3.04 STARTUP / DEMONSTRATION

END OF SECTION

SECTION 06 81 13 – GLASS-FIBER-REINFORCED PLASTIC RAILINGS
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. This Section describes the general requirements for the fiberglass reinforced plastic (FRP) railing. FRP railings including all incidentals, such as fasteners toe boards and anchors, shall conform to the requirements specified herein and as shown on the Contract Drawings.

1. FRP railings shall also include, when shown on the Contract Drawings, FRP spring loaded swing gates and all hardware including reinforced mounting posts and hardware and hinges.

B. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

O. The New York City Building Code (NYCBC)

P. American Society of Civil Engineers (ASCE)

1. MOP 66 Structural Plastics Selection Manual

2. MOP 102 Design Guide for FRP Composite Connections

1.05 DESCRIPTION

A. FRP handrail and railing system shall be provided in accordance with the City of New York Building Code and OSHA, Part 1910.23, including the imposed 200-pound loading requirement. In addition, the system shall conform to the following requirements:

1. Completed handrail and railing shall withstand a uniform lateral force of 50 pounds per linear foot and a vertical uniform force of 50 pounds per linear foot, both applied simultaneously at the top of the handrail and railing.

2. Intermediate and bottom rails shall withstand simultaneously applied lateral uniform forces of 50 pounds per linear foot and a vertical load of 50 pounds per linear foot, however, lateral and vertical loads on intermediate and bottom railings need not be considered in the detailing and fabrication of posts and anchorages.

3. Concentrated 200-pound load and uniform force conditions shall not be applied simultaneously.

4. Other pertinent requirements ceded to ANSI A1264.1 by governing codes.

5. Applied loads shall not produce permanent deflection in the completed work when loads are removed.

B. Design of Members and Connections:

1. All details shown on the Contract Drawings are typical; similar details shall apply to similar conditions, unless otherwise shown on the Contract Drawings or specified. Dimensions shall be verified at the site without causing delay in the work.

2. Fabricator shall be responsible for structural analysis FRP railing system within the requirements established by these Specifications.

3. Complete structural analysis and Shop Drawings shall be prepared, signed and stamped with the seal of a Professional Engineer, licensed to practice in the State of New York and recognized as an expert in structural analysis.

C. Fasteners and Supports:

1. When the size, length or load carrying capacity of an anchor bolt or concrete anchor is not shown on the Contract Drawings, the size, length and capacity required to carry the design load times a minimum safety factor of four shall be used.

2. Sizes shown on the Contract Drawings shall be considered minimum. Size shall be increased to comply with design loadings and minimum safety factor specified.

D. Tolerances

1. "Pencil-line" thin butt joints shall be provided.

2. Variations of cast-in-place inserts, sleeves and field-drilled holes shall be limited to the following:

   a. Spacing: ±3/8-inch

   b. Alignment: ±1/4-inch

   c. Plumb: ±1/8-inch

3. Variation of complete railing system alignment shall be limited to 1/4-inch in 12 feet.

4. Rails horizontal or parallel to rake of steps or ramp shall be set to within 1/4-inch in 12 feet.

1.06 QUALITY ASSURANCE

A. Quality Assurance: Materials and fabrication procedures shall be subject to inspection and tests in the mill, shop, and field conducted by a qualified inspection agency. Such inspections and tests shall not relieve the Contractor of responsibility for providing materials and fabrication procedures in compliance with specified requirements.

B. Manufacturer Qualifications:

1. Engage a single fabricator with undivided responsibility for detailing and performance of the fiberglass railing systems.

2. Engage a firm which can show five years previous successful experience in detailing and fabrication of fiberglass railing systems of scope and type similar to the required Work.

C. Installer Qualifications:

1. Engage a single installer skilled, trained and with successful experience in the installation of fiberglass railing systems and with specific skill and successful experience in the erection of the types of materials required; and who agrees to employ only tradesmen with specific skill and successful experience in this type of work. Submit names and qualification to Engineer along with the following information in a minimum of three successful projects:

a. Names and telephone numbers of owner, architects or engineers responsible for projects.

b. Approximate contract cost of the fiberglass railing.

c. Amount of area installed.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings and Material Specifications for the approval of the Engineer. Submittals shall include, but not limited to:

1. Drawings for the fabrication and erection of FRP railing and handrail system with sizes of members, components and anchorage devices shall be submitted based on requirements of these Sections. All plans and elevations identifying the location of all handrail and railings, and details of sections and connections, and all anchorage items shall be included.

2. Calculations for the complete structural analysis of the FRP railing and handrail system, including calculations showing compliance with design criteria specified, shall be submitted.

3. Manufacturer's catalogs showing complete selection of standard and custom components and miscellaneous accessories shall be submitted for selection of the Engineer.

B. Maintenance Manuals: Upon completion of the installation of the FRP railing system the following shall be submitted:

1. Product name and manufacturer.

2. Name, address and telephone number of manufacturer and local distributor.

3. Detailed procedures for routine maintenance and cleaning, including recommended cleaning materials, application methods and precautions as to use of materials that may be detrimental to finish when improperly applied.

C. Test reports from independent testing laboratory evidencing compliance with ASTM E985. The resin shall be fire-retardant vinyl ester with a flame spread rating of 25 or less according to ASTM E84 Tunnel Test. A synthetic surface veil as the outermost layer and UV inhibitor in the resin shall be present to resist ultraviolet degradation.

D. Samples of FRP railing and handrail shall be submitted.

1. Each type of railing finish, including bolted connections, not less than 6-inches long.

2. Samples will be reviewed for color, texture, workmanship and finish only. Compliance with all other requirements is the exclusive responsibility of the Contractor.

E. Certification: Copies of certificate of compliance, where required, attesting to the material's compliance with the requirements shall be submitted:

1. Certification shall be furnished by the manufacturer stating that loading tests have been performed on the railing and handrail system, and that they conform to all applicable New York City Building Code, OSHA and ANSI requirements for load and deflection.

F. Manufacturer's and installer's qualifications.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery of Materials:

1. Materials shall be delivered to the Project Site in undamaged condition and protected against damage to finished surfaces.

2. All railings shall be properly wrapped with paper and protected against scratching, splashing of mortar, paint or other defacements during transportation and erection until adjacent work is completed by other trades.

B. Storage of Materials:

1. All materials shall be stored in clean, dry location, away from uncured concrete and masonry.

2. All materials shall be covered with waterproof paper, tarpaulins or polyethylene sheeting.

C. Handling of Materials:

1. On-site handling shall be kept to a minimum.

2. Protective covering on railings and handrails shall be maintained.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Modular Handrail System as manufactured by Fibergrate, Dallas, TX.

B. Safrail Handrail System as manufactured by Strongwell, Bristol, VA.

C. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Railings: FRP railings shall be furnished and installed with the following materials and properties:

1. All rails, posts and toe boards shall be FRP pultruded structural shapes with synthetic veil for ultraviolet resistance.

2. Glass content shall be a minimum of 25% and a maximum of 35% by weight as determined by ASTM D2584 for a maximum sunlight and chemical resistance.

3. The resin system shall be fire retardant vinyl ester with a flame spread rating of 25 or less, type square or round:

4. Laminates shall have no exposed glass, voids or dry glass.

5. The FRP railing manufacturer shall be required to furnish copies of ASTM E84 and ASTM D635 test reports showing test results of all materials from independent test laboratory of the finished railing product. Test results on only the resin system will not be accepted.

B. Mechanical Properties (minimum) of FRP structural shapes and plates:

Ultimate Tensile Strength	30,000 psi
Ultimate Compressive Strength	30,000 psi

Ultimate Bearing Strength	30,000 psi
Ultimate Shear Strength	4,500 psi
Modulus of Elasticity	2.5 x 10^6 psi
Barcol Hardness	50 psi

C. Toe boards:

1. Toe boards shall be furnished and installed of the same material and finish as railings for railings around openings, platforms, balconies and other areas shown on the Contract Drawings. The dimensions and details shall be fabricated as shown on the Contract Drawings.
2. Toe boards shall be securely fastened in place with not more than 1/4-inch clearance above floor level. Expansion in toe boards shall be provided for without warping or buckling of toe boards.
3. Toe boards shall meet requirements of OSHA Part 1910.23, Section (e).
4. Toe boards shall follow curvature of FRP railing. Where FRP railing system is shown to have curved contours at corners, or other locations, the toe board shall likewise be curved to follow line of FRP railing system.

D. Brackets, Flanges and Anchors: ASTM A666, Type 316L stainless steel brackets, flanges, and anchors shall be provided for railing posts and handrail supports. Components shall be in accordance with manufacturer's recommendations and as acceptable to the Engineer as shown on approved Shop Drawings.

E. Removable Railing Post Sleeves: FRP post sleeves shall be provided for removable railing sections. Post sleeves shall be sized for snug fit to avoid lateral movement of the removable railing.

F. Concrete and Masonry Anchors: Concrete and masonry anchors shall be stainless steel Type 316 as specified in Section 05 05 23.02 - Miscellaneous Metal Fastenings.

G. Bolting Materials: Stainless steel Type 316 bolts as specified in Section 05 05 23.02 - Miscellaneous Metal Fastenings.

H. FRP shape and plate cuts shall be sealed with catalyzed resin of equal or superior corrosive resistance to the FRP shapes and plates.

I. Spring Loaded Swing Gate shall be fully assembled and capable of swinging in either direction by inverting installation position. Gate size shall be laterally adjusted for minus 1-1/4 inch to plus 2-1/2 inch.

1. Standard system shall have top and mid rail in accordance with OSHA Standard 29 CFR 1910.23(a) (2)
2. Height
   a. Top rail 42 inches
   b. Bottom rail 21 inches

3. Widths shall be as indicated on the Structural or Architectural Drawings and field verified.

4. Posts shall be reinforced FRP.

5. FRP Railings:

   a. Round tubular pultruded FRP with 1.90 inch outer diameter, 1.51 inch inner diameter

   b. Pultruded square tube FRP handrail or as shown on the Contract Drawings.

   c. Color shall be Safety Yellow or as shown on the Contract Drawings.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Field Measurements: Field measurements where required shall be taken prior to preparation of Shop Drawings and fabrication to ensure proper fitting of the work.

B. An FRP railing system shall be provided as shown on the Contract Drawings with posts, top, bottom, intermediates and picket type rails and with flush joints. Details shall be as shown on the Contract Drawings.

C. Items shall be preassembled in the shop to the greatest extent possible, so as to minimize field splicing and assembly of units at the site. Units shall be disassembled only to the extent necessary for shipping and handling. Units shall be clearly marked for reassembly and coordinated installation.

D. Railing shall be assembled in sections as long as practicable. Posts shall be connected to flanges by stainless steel bolts.

E. Exposed work shall be formed true to line and level with accurate angles and surfaces and straight sharp edges. All corners shall be fabricated without the use of fittings. Corners shall be formed to the smallest radius as possible without causing grain separation or otherwise impairing the work. The 4-inch outside radius shall be provided.

F. Intersections of rails and posts shall be coped. Lower rails shall be coped and connected to the posts.

G. Expansion and contraction shall be provided for in the railing system. Adequate number of expansion joints shall be located so that each joint does not have to move more than 1/16-inch plus or minus from each side of joint.

H. Completely factory fabricated railing system shall be provided.

I. Unless otherwise indicated on the Contract Drawings the following minimum sizes of railing shall be provided:

1. Top and mid-rails shall not be less than 1-3/4 inches x 1-3/4 inches x 1/8 inch square tube.

2. Posts shall not be less than 2 inches x 2 inches x 3/16 inch square tube.

3. Toe boards shall not be less than 9/16 inch x 4 inches.

J. Color: Railing color shall be yellow unless otherwise indicated on the Contract Drawings.

K. Weep Holes: Provide 15/64-inch diameter weep holes at the lowest point on all railing system posts and along the bottom side of railing system rails. Provide pressure relief holes at closed ends of handrails and railings.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Fastening to In-Place Construction

1. Stainless steel anchoring devices and fasteners shall be used unless otherwise indicated on the Contract drawings.

2. Anchorage devices and fasteners shall be provided where necessary for securing handrails and railing items to in-place construction, including threaded fasteners for concrete and masonry inserts, through-bolts and other connectors as required. Devices and fasteners shall be compatible with installed material.

3. Flanged fittings shall be secured to steel, ironwork and FRP work with nuts, bolts and washers; hollow tile and other masonry shall be secured with injection adhesive anchors as specified in Section 05 05 23.02 - Miscellaneous Metal Fastenings. Flanges shall be set in neat Portland cement grout.

4. Expansion joints shall be located at the post nearest the expansion joint in the structure upon which the railing is placed. End posts and railing returns shall be provided at 16-inches on each side of the structure expansion joints. Separation between returns shall match the width of the structure expansion joint.

5. Field dowel connections shall be located at posts.

B. Cutting, Fitting and Placement

1. Cutting, drilling and fitting shall be performed as required for installation. Measured from established lines and levels, the work shall be accurately set in location, alignment and elevation, plumb, level, true and free of rack.

2. Exposed connections shall be fitted accurately together to form tight hairline joints. The surfaces of units which have been finished after

fabrication and are intended for field connections shall not be cut or abraded.

3. Wall handrails shall be supported at ends with handrail returns and with intermediate brackets spaced not more than 6 feet on center. The wall plate portion of the bracket shall be drilled to receive one bolt, unless otherwise shown on the Contract Drawings for concealed anchorage. Flush-type wall return fittings shall be provided with the same projection as shown on the Contract Drawings for wall brackets. Wall brackets and wall return fittings shall be secured to building construction as follows:

   a. For concrete and solid masonry anchorage, anchor expansion shields and adhesive anchors shall be used.

   b. For hollow masonry anchorage, adhesive anchors bolts having square heads shall be used.

4. Permanent splice connections shall be made in accordance with manufacturer's instructions.

5. Expansion Joints: Slip joints shall be provided with internal sleeve extending two inches minimum beyond the joint on each side. Expansion joints shall be provided for field splices and their internal sleeves shall be secured on one side to the rail assembly. Joints shall be located within six inches of posts. Proposed locations of expansion joints shall be submitted to the Engineer for review.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Alignment and Adjustment

1. Railings shall be adjusted in place prior to securing, to ensure proper matching at butting joints and correct alignment throughout their length. Posts shall be plumbed in each direction.

2. At walkways where railing is provided on each side, railing posts shall be located directly opposite each other.

3. Posts shall be top mounted by providing base plates or fixtures securely attached to concrete surfaces with concrete anchors.

4. Posts shall be side mounted by fastening them securely in brackets attached to steel, FRP members or concrete fascia as shown on the Contract Drawings, and shall be completed in accordance with the manufacturer's instructions.

5. Posts shall be anchored to steel or FRP stringers, support flanges, angle type or floor type as required by conditions and shall be completed in accordance with the manufacturer's instructions.

6. Hinged railing sections shall be provided where shown on the Contract Drawings. Hinges and latches shall be provided for connection to adjacent railing.

B. Cleaning and Repair

1. Cleaning:

a. Protective plastic shall be removed as recommended by the manufacturer.

b. All stains, dirt, grease or other substances shall be removed by washing railings thoroughly, using clean water and soap and then rinsing with clean water. If stain remains after washing, remove, finish and restore in accordance with manufacturer's recommendations.

c. Acid solution, steel wool or other harsh abrasive shall not be used.

2. FRP railing and handrails shall be left free from dents, burrs, scratches, holes and other blemishes. Minor scratches shall be refinished indistinguishable from adjacent un-scarred areas. If, after refinishing, damage remains visible when viewed from five feet away, or if finish of the work has been altered to the point where it appears different from adjacent work, the damaged work shall be replaced with new undamaged material at no additional expense to the City.

A. New York City Building Code

B. ASTM D41 - Standard Specification for Asphalt Primer Used in Roofing, Damp-proofing, and Waterproofing

C. ASTM D4479 - Standard Specification for Asphalt Roof Coatings – Asbestos free; Type 1

1.05 DESCRIPTION

A. Job Conditions

1. Environmental Conditions:

a. Proceed with Work only when temperature and moisture conditions comply with the manufacturer's written recommendations and when no rain or other damaging environmental condition is forecast for the time when the materials will be exposed to potential damage.

b. Protect Work from precipitation, frost and direct sun. Erect temporary shelters to protect Work in progress.

c. Proceed with bituminous damp-proofing only when weather conditions will permit unrestricted use of materials and quality control of the Work being installed, complying with the Sections and with the recommendations of the bituminous damp-proofing manufacturer, and only when manufacturer and installer are willing to guarantee the Work as required without additional reservations and restrictions.

d. Record decisions, conditions and agreements to proceed with the Work when weather conditions might be unfavorable. State the reasons for proceeding, with the names of the persons involved along with the changes, if any, or revisions, requirements or terms of the Contract.

B. Protection:

1. Provide continuous protection of materials against damage, wetting and moisture absorption primarily by storing materials under cover and above ground and away from other construction traffic.

2. Protect installed materials and completed systems against damage by construction activities. Exclude all persons not involved with the Work from the work area until such time as the Work has been isolated from all potential damage.

C. Substitutions:

1. Do not change products, system components, installation techniques or manufacturers after Working Drawing approval by Engineer.

D. Clearly identify, in a manner which is highlighted to Engineer, all proposed substitutions, modifications, variations, unspecified features and "or equal" products. Provide complete comparative data with specified products at time of Working Drawing submission.

1.06 QUALITY ASSURANCE

A. Source Quality Control:

1. Engage a single manufacturer who shall provide the services of a Technical Representative who shall assist Contractor and Engineer by providing technical opinions on the adequacy of materials, methods of installation and field testing methodology and significance of test results based on Shop Drawings approved by Engineer.

2. Provide such services during the time of delivery, storage, handling, job mock-up construction, installation and testing of all components.

B. Installer Qualifications:

1. Engage a single installer skilled, trained and with successful experience in the application of each product who is a licensee of the manufacturer, or who can submit evidence in writing of being acceptable to the manufacturer and who agrees to employ only tradesmen with specific skill and successful experience in this type of Work. Submit name and qualifications to Engineer along with the following information on a minimum of three successful projects:

a. Names and telephone numbers of owners, architects or engineers responsible for projects

b. Approximate contract cost of the work

c. Size of area installed

2. Submit proof of acceptability of installer by manufacturer to Engineer.

C. Allowable Installation Tolerances:

1. Do not install Work until substrate preparation and tolerances have been approved by Engineer, bituminous damp-proofing manufacturer's Technical Representative and the bituminous damp-proofing installer, and Contractor has verified to Engineer that substrates are within tolerances specified and acceptable to produce approved Work. Work advanced for any reason without such verification shall be stopped, removed and replaced with new material after substrate is approved at no additional expense to DEP.

2. Substrate Tolerances:

a. Out-of-Plane: 1/8 inch maximum in 10 foot - 0 inches and 1/16 inch maximum in any 12 inches measured along the plane.

b. Maximum Offset in Plane Alignment: 1/16 inch.

c. Variation From Slope: 1/8 inch maximum in 10 foot - 0 inches.

D. Requirements of Regulatory Agencies:

1. Material and Equipment Acceptance Division of the Board of Standards and Appeals of New York City Department of Buildings: Where, in order to be

incorporated into the Work, a particular item or product system specified by Engineer requires acceptance by the New York City Commissioner of Buildings, the Contractor shall assist the product manufacturer in obtaining such approval, without additional expense to DEP, and in providing DEP with an approved certified copy of the boards resolution giving the MEA number for the item or product system which shall be submitted to Engineer as part of the Working Drawing approval process. Contractor may submit, in place of products specified by Engineer, products which are "equal" in all ways to the product specified but which have already achieved an MEA number. Such "or approved equal" product submissions shall not change the requirements of these Sections as to performance, required features or properties, as determined by Engineer, and shall not require additional compensation to Contractor or additional expense to DEP. Final acceptance of "equal" is at the sole determination of Engineer.

2. Comply with all applicable requirements of governing authorities and codes for all Work.

3. In those instances where the Commissioner of Buildings requires a certificate of compliance of the manufacturer or producer certifying that the item or product system was tested and is equivalent to material of the same kind and quality regularly being manufactured by such manufacturer or producer Contractor shall provide all such certificates to the Commissioner of Buildings without additional expense to DEP.

E. Job Mock-Ups:

1. Prior to the installation of bituminous damp-proofing, but after Engineer's approval of Working Drawing submittals, erect stepped-back job mock-ups using substrate preparation, materials and application techniques specified and approved for final Work. Provide all components of the bituminous damp-proofing showing the correct installation, substrate preparation and the workmanship quality which shall be achieved in the Work. Build mock-ups at the Site, in a location approved by Engineer, of full thickness and approximately 4 feet long and 4 feet square. Indicate the proposed workmanship to be expected in the finished Work. Obtain Engineer's acceptance of mock-ups before start of Work. Retain and protect mock-ups before start of Work. Retain and protect mock-ups during construction as a standard of judging completed Work. Do not alter or destroy mock-ups until given written permission by the Engineer.

2. Build as many job mock-ups as necessary in order to achieve Engineer's acceptance of the Work.

F. Work which proceeds without approved job mock-ups shall be stopped, removed and re-installed, after job mock-up approval, at no additional expense to DEP.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings and Design materials for approval of the Engineer. Submittals shall include, but not be limited to:

1. Samples: Submit for approval the following:
   a. Bituminous damp-proofing system applied to a 12-inch by 12-inch by 2-inch thick concrete sample demonstrating specified surface preparation to be used on job mock-up and specified thickness of fluid-applied waterproofing. Apply waterproofing to only one-half of the sample board, leaving the other half visible and showing specified substrate preparation.
   b. Samples will be reviewed by Engineer for general appearance and as examples of the types of components to be installed on the job mock-ups. Compliance with other requirements is the responsibility of Contractor.
2. Shop Drawings: Submit for approval the following:
   a. Copies of specifications, installation instructions and general recommendations from the manufacturer, for each type of bituminous damp-proofing product.
3. Test Reports: Submit for approval the following:
   a. Copies of test reports verifying compliance with physical properties specified herein.
   b. Copies of testing agencies background and experience in preforming similar tests to those specified.
4. Certificates: Submit for approval the following:
   a. Copies of certificates stating that the installer has been approved, or is a licensee of the manufacturer.
   b. Evidence of installer's experience.
   c. Evidence prior to delivery that materials and components furnished conform to the requirements of the Sections.
5. Statement of Application:

B. Upon completion of the work, submit a notarized statement to Engineer signed by Contractor stating that the work complies with the requirements of these Specifications and the installation methods were proper and adequate for the conditions of installation and use.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery of Materials:
1. Deliver materials in manufacturer's original, unopened and undamaged containers, with information accurately representing container contents as approved by Engineer at time of Working Drawing submission.
2. Include the following information on the label:
   a. Name of material and supplier.

b. Installation, handling and protection requirements.

3. Deliver materials in sufficient quantities to allow uninterrupted continuity of the Work.

B. Storage of Materials:

1. Store materials in original, undamaged containers with manufacturer's labels and seals intact.

2. Store all materials in a dry, enclosed area, off the ground and away from all possible contact with water and in a location where temperature can be constantly maintained between 60 F and 75 F and out of direct sunlight.

3. Prevent damage to materials during storage primarily by minimizing the amount of time they are stored at the site before being incorporated into construction systems.

C. Handling of Materials:

1. Do not open containers, or expose materials to detrimental conditions or physical damage. Materials which are so exposed shall be removed from the site and shall not be incorporated into the Work.

2. Handle materials in a manner which prevents contamination and inclusion of foreign materials.

3. Do not open packages or containers until all necessary preparatory Work is complete, approved and installation will begin immediately. Do not allow materials to become wet or soiled or covered with ice or snow.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer’s standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Fibered damp-proofing

1. Type “83AF” as manufactured by Karnak Corp., Clark, NJ

2. Or approved equal complying with the following:

1) Solids by Weight: 72%

2) Solids by Volume: 65%

3) Permeability: 0.003

4) ASTM D4479 - Type 1

5) Cure Time: 24 to 48 hours @ 70ºF, 50% RH

B. Asphalt Primer

1. Type “108" as manufactured by Karnak Corp., Clark, NJ
2. Or approved equal conforming to ASTM D41.

2.02 MATERIALS / EQUIPMENT

A. Not Used

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. The Contractor shall examine the surfaces to receive the damp-proofing, and the conditions under which the Work is to be performed, and notify Engineer in writing of all conditions detrimental to the proper and timely completion of the Work and the performance of the damp-proofing systems. Do not proceed with the damp-proofing Work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

3.02 SUBSTRATE PREPARATION

A. Provide cast-in-place concrete free from voids and sharp projections before placing any fluid-applied waterproofing system. Comply with the manufacturer's instructions for the preparation of the substrates to receive the damp-proofing system unless more stringent conditions are specified.

B. Remove surface irregularities on cast-in-place concrete and fill all holes, honeycombs, spalls and cracks using manufacturer's recommended joint seal parging. Repair areas of unacceptable consolidation. Where necessary to remove sharp projections, grind concrete surfaces.

C. Clean the substrate of dust, debris and other substances detrimental to the Work. Remove grease, oil and other contaminants from surfaces of cast-in-place concrete.

D. Parge all construction joints to a minimum depth of 1/8 inch and 3 inch minimum width using manufacturer's recommended joint seal parging.

E. Seal all through-wall projections using elastic sheet flashing and manufacturer’s recommended sealants.

F. Prime the substrate with a seal coat as recommended by the manufacturer.

3.03 INSTALLATION

A. Comply with manufacturer's instructions for the installation of bituminous damp-proofing.

1. Concrete substrate walls shall be cured for a minimum of 30 days prior to installation of damp-proofing system.

2. All cracks and non-working joints over 1/8 inch shall be filled using trowel grade material of the specified system.

3. Asphalt primer shall be installed with a wide fiber brush at the rate of 1 gallon per 100 square feet.

4. Fibered damp-proofing shall be installed with a wide fiber brush at the rate of 4 gallons per 100 square feet.

5. Damp-proofing shall be cured for a minimum of 48 hours before backfilling.

B. Install 1/8-inch thick protection board, approved by the manufacturer, before backfilling.

3.04 FIELD TESTING / QUALITY CONTROL

A. Certify that the completed bituminous damp-proofing Work is in accordance with the Sections and is waterproof, of uniform thickness and without gaps, holidays or pinholes at the time of Final Acceptance.

3.05 STARTUP / DEMONSTRATION

A. Not Used

3.06 ADJUSTING / PROTECTION / CLEANUP

A. Protect the area from access by other installers and Contractors until the Work of this Section has been incorporated into finished construction systems.

B. Protect other Work from spillage of damp-proofing materials, and prevent materials from entering and clogging drains and conductors. Replace or restore other Work which is soiled or otherwise damaged by the performance of the damp-proofing and associated work.

C. System components which are dislodged, damaged, or penetrated by subsequent installation operations or damaged by detrimental conditions shall be immediately replaced with undamaged material in compliance with the Sections and properly protected as specified.

END OF SECTION

SECTION 07 14 00 – FLUID-APPLIED WATERPROOFING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. This Section describes a system of 100 percent solids, solvent-free, environmentally friendly, notched or mason's trowel-applied, thixotropic liquid urethane rubber waterproofing with NSF 61 approval recommended by the manufacturer for vertical below-grade cast-in-place concrete walls and horizontal cast-in-place concrete roof slabs all provided with surface preparation in compliance with ASTM D 4258 and ASTM D 4259 - Abrasive Blast Cleaning Procedure, elastic flashings and other components and system accessories necessary to provide water- and vapor tight performance for conditions and details encountered in the Work. Provide complete technical services as available from the specified manufacturer and on-site technical representation by manufacturer's technical representative. Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish, install, test and place into satisfactory service all fluid-applied waterproofing Work.

B. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. Environmental Conditions:

1. Proceed with fluid-applied waterproofing Work only when temperature and moisture conditions comply with the fluid-applied waterproofing manufacturer's written recommendations and when no rain or other damaging environmental condition is forecast for the time when the materials will be exposed to potential damage.

2. Apply fluid-applied waterproofing only when material temperature is above 60° F, surface temperature is minimum of 40° F and air temperature is minimum of 40° F and rising.

3. Protect Work from precipitation, frost and direct sun. Erect temporary shelters to protect Work in progress.

4. Proceed with fluid-applied waterproofing only when weather conditions will permit unrestricted use of materials and quality control of the Work being installed, complying with the Section requirements and with the recommendations of the fluid-applied waterproofing manufacturer and only when manufacturer and installer are willing to guarantee the Work as required without additional reservations and restrictions.

5. Record decisions, conditions and agreements to proceed with the Work when weather conditions might be unfavorable. State the reasons for proceeding, with the names of the persons involved along with the changes, if any, or revisions, requirements or terms of the Contract.

B. Pre-installation Conference:

1. Before erecting job mock-up, Contractor, his installers for the fluid-applied waterproofing and bentonite waterproofing, mason responsible for installation of glazed face brick and technical representative of the fluid-applied waterproofing system manufacturer shall meet on-site with Engineer to discuss approved products and workmanship to ensure proper application of fluid-applied waterproofing system components and substrate preparation requirements for the Work. Two series of meetings shall be provided; one series for below-grade vertical walls, the other for above-grade cast-in-place concrete roof deck Work.

2. Record the discussions of the conferences and the decisions and agreements or disagreements reached, and furnish a copy of the records to each party attending. Review foreseeable methods and procedures related to the fluid-applied waterproofing Work, including, but not necessarily limited to, the following:

a. Review project requirements (Drawings, Specifications and other Contract Documents).

b. Review required submittals, both completed and yet to be completed.

c. Review status of substrate Work, including approval of abrasive blast surface finish, preparation, drying, structural loading limitations and similar considerations.

d. Review availability of materials, tradesmen, equipment and facilities needed to make progress and avoid delays.

e. Review required inspection, testing and certifying.

f. Review weather and forecasted weather conditions, and procedures for coping with unfavorable conditions, including the possibility of temporary waterproofing.

g. Review regulations concerning code compliance, environmental protection, health, safety, fire and similar considerations.

h. Review procedures needed for protection of waterproofing during the remainder of the construction period.

3. Reconvene the meetings at the earliest opportunity if additional information must be developed in order to conclude the subjects under consideration.

4. Record any revisions or changes agreed upon, reasons therefor, and parties agreeing or disagreeing with them.

C. Protection:

1. Provide continuous protection of materials against damage, wetting and moisture absorption primarily by storing materials under cover and above ground and away from other construction traffic.

2. Protect installed materials and completed systems against damage by construction activities. Exclude all persons not involved with the fluid-applied waterproofing Work from the work area until such time as the Work has been isolated from all potential damage.

D. Scheduling:

1. Proceed with the fluid-applied waterproofing and associated Work after projections and penetrations through the substrates have been installed, and when the substrate construction and framing of openings is complete.

E. Substitutions:

1. Do not change products, system components, installation techniques or manufacturers after Shop Drawing approval by Engineer.

2. Clearly identify, in a manner which is highlighted to Engineer, all proposed substitutions, modifications, variations, unspecified features and "or equal" products. Provide complete comparative data with specified products at time of Shop Drawing submission.

1.06 QUALITY ASSURANCE

A. Source Quality Control:

1. Engage a single manufacturer who shall provide the services of a Technical Representative who shall assist Contractor and Engineer by providing technical opinions on the adequacy of materials, methods of installation and field testing methodology and significance of test results based on Shop Drawings approved by Engineer.

2. Provide such services during the time of delivery, storage, handling, job mock-up construction, installation and testing of all fluid-applied waterproofing components.

3. Provide a manufacturer who will provide complete technical services including preparation and review of Shop Drawings, installation methods

and proposed detailing for the Work. Where the manufacturer requires additions, or changes to the Contract Drawings and Contract Specifications these shall be made at no additional expense to DEP and only as acceptable to Engineer.

4. Fluid-applied waterproofing system shall incorporate only the highest quality materials, environmental features, and methods of construction and installation as recommended by the manufacturer and as acceptable to Engineer.

B. Installer Qualifications:

1. Engage a single installer skilled, trained and with successful experience in the application of each product who is a licensee of the manufacturer, or who can submit evidence in writing of being acceptable to the manufacturer and who agrees to employ only tradesmen with specific skill and successful experience in this type of Work. Submit name and qualifications to Engineer along with the following information on a minimum of three successful projects:

   a. Names and telephone numbers of owners, architects or engineers responsible for projects.

   b. Approximate contract cost of the fluid-applied waterproofing.

   c. Amount of area installed.

2. Submit proof of acceptability of installer by manufacturer to Engineer.

C. Performance Criteria:

1. Contractor's Review: Accompanying approval request, submit to Engineer a written statement signed by Contractor, stating that the Contract Drawings and Specifications have been reviewed with an agent of the fluid-applied waterproofing material manufacturer and that he is in agreement that the selected systems are proper and compatible and that the details used for the Work are not in conflict with the manufacturer's details.

2. Statement of Application: Upon completion of the Work, submit a notarized statement to Engineer signed by Contractor stating that the Work complies with the requirements of the manufacturer's printed instructions and were proper and adequate for the condition of installation and use.

3. Do not thin fluid-applied waterproofing. Do not request the use of spray application. Requests by Contractor for spray application will not be approved by Engineer. Resulting consequences of additional time spent by Contractor in attempting to have such requests approved shall be at no additional expense to DEP regardless of final determination on product use. All expenses caused by such attempts shall be at the expense of Contractor. Apply all fluid-applied waterproofing with a notched or mason’s trowel.

D. Testing Agency: Engage a testing laboratory regularly engaged in the testing of construction materials, and who complies with ASTM E 329.

E. Allowable Installation Tolerances:

1. Do not install Work until substrate preparation and tolerances have been approved by Engineer, fluid-applied waterproofing manufacturer's Technical Representative and the fluid-applied waterproofing installer and Contractor has verified to Engineer that substrates are within tolerances specified and acceptable to produce approved Work. Work advanced for any reason without such verification shall be stopped, removed and replaced with new material after substrate is approved at no additional expense to DEP.

2. Substrate Tolerances:

a. Out-of-Plane: 1/8 inch maximum in 10 foot - 0 inches and 1/16 inch maximum in any 12 inches measured along the plane.

b. Maximum Offset in Plane Alignment: 1/16 inch.

c. Variation From Slope: 1/8 inch maximum in 10 foot - 0 inches.

F. Requirements of Regulatory Agencies:

1. Material and Equipment Acceptance Division of the Board of Standards and Appeals of New York City Department of Buildings: Where, in order to be incorporated into the Work, a particular item or product system specified by Engineer requires acceptance by the New York City Commissioner of Buildings, the Contractor shall assist the product manufacturer in obtaining such approval, without additional expense to DEP, and in providing DEP with an approved certified copy of the boards resolution giving the MEA number for the item or product system which shall be submitted to Engineer as part of the Shop Drawing approval process. Contractor may submit, in place of products specified by Engineer, products which are "equal" in all ways to the product specified but which have already achieved an MEA number. Such "or approved equal" product submissions shall not change the requirements of these Specifications as to performance, required features or properties, as determined by Engineer, and shall not require additional compensation to Contractor or additional expense to DEP. Final acceptance of "equal" is at the sole determination of Engineer.

2. In those instances where the Commissioner of Buildings requires a certificate of compliance of the manufacturer or producer certifying that the item or product system was tested and is equivalent to material of the same kind and quality regularly being manufactured by such manufacturer or producer Contractor shall provide all such certificates to the Commissioner of Buildings without additional expense to DEP.

G. Job Mock-Ups:

1. Prior to the installation of fluid-applied waterproofing systems, but after Engineer's approval of Shop Drawing submittals, erect stepped-back job mock-ups using substrate preparation, materials and application techniques specified and approved for final Work. Provide all components of the fluid-

applied waterproofing systems showing the correct installation, substrate preparation and the workmanship quality which shall be achieved in the Work. Build mock-ups at the site, in location approved by Engineer, of full thickness and approximately 12 foot - 0 inches long and 12 foot - 0 inches square for horizontal surfaces. Indicate the proposed workmanship to be expected in the finished Work. Include methods of installation typical to the Work including wall and roof penetration details, system termination details and installation of the glazed face brick to follow the Work of this Section. Also include an area of honeycombing and fin removal and the Work of this Section for Engineer's approval. Obtain Engineer's acceptance of mock-ups before start of Work. Retain and protect mock-ups before start of Work. Retain and protect mock-ups during construction as a standard of judging completed Work. Do not alter or destroy mock-ups until given written permission by Engineer.

2. Build as many job mock-ups as necessary in order to achieve Engineer's acceptance of the Work.

3. Fluid-applied waterproofing Work which proceeds without approved job mock-ups shall be stopped, removed and re-installed, after job mock-up approval, at no additional expense to DEP.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings for approval of the Engineer. Submittals shall include, but not be limited to:

1. Samples: Submit for approval the following:

a. Fluid-applied waterproofing system applied to a 12-inch by 12-inch by 2-inch thick concrete sample demonstrating specified surface preparation to be used on job mock-up and specified thickness of fluid-applied waterproofing. Apply waterproofing to only one-half of the sample board, leaving the other half visible and showing specified substrate preparation.

b. Samples will be reviewed by Engineer for general appearance and as examples of the types of components to be installed on the job mock-ups. Compliance with other requirements is the responsibility of Contractor.

2. Shop Drawings: Submit for approval the following:

a. Copies of specifications, installation instructions and general recommendations from the fluid-applied waterproofing manufacturer, for each type of fluid-applied waterproofing product.

b. Drawings showing extent of each component of each system used in the Work and all details for the Work referencing system components provided as samples to Engineer. Provide Shop Drawings coordinated with cast-in-place concrete, bentonite waterproofing system and glazed face brick masonry showing all

construction, system terminations and other conditions encountered in the Work and manufacturer's approved and recommended details appropriate to waterproof these joints and transitions as required for full fluid-applied waterproofing system waterproof performance whether or not specific indication is made on the Contract Drawings to the details of the specified manufacturer.

3. Test Reports: Submit for approval the following:

   a. Copies of test reports verifying compliance with physical properties specified herein.

   b. Copies of testing agencies background and experience in preforming similar tests to those specified.

B. Certificates: Submit for approval the following:

1. Copies of certificates stating that the fluid-applied waterproofing systems installer has been approved, or is a licensee of the fluid-applied waterproofing manufacturer.

2. Evidence of installer's experience.

3. Evidence prior to delivery that materials and components furnished conform to the requirements of the Sections.

4. Evidence of acceptance of the substrate by the fluid-applied waterproofing manufacturer.

5. Evidence that the material used in the Work has been manufactured within one year of installation and has, for that entire time, been constantly stored between 50°F and 80°F, and in accordance with the manufacturer’s written recommendations.

C. Contractor's Review: Contractor shall submit to Engineer a written statement as specified. Show by copy of transmittal form that a copy of the statement has been transmitted to the manufacturer.

D. Statement of Application: Contractor shall submit to Engineer a written statement as specified.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery of Materials:

1. Deliver materials in fluid-applied waterproofing manufacturer's original, unopened and undamaged containers, with information accurately representing container contents as approved by Engineer at time of Shop Drawing submission.

2. Include the following information on the label:

   a. Name of material and supplier.

   b. Installation, handling and protection requirements.

3. Deliver materials in sufficient quantities to allow uninterrupted continuity of the Work.

B. Storage of Materials:

1. Store materials in original, undamaged containers with manufacturer's labels and seals intact.

2. Store all materials in a dry, enclosed area, off the ground and away from all possible contact with water and in a location where temperature can be constantly maintained between 60 F and 75 F and out of direct sunlight.

3. Prevent damage to materials during storage primarily by minimizing the amount of time they are stored at the job-site before being incorporated into construction systems.

C. Handling of Materials:

1. Do not handle, open or mix component materials unless fluid-applied waterproofing can be properly handled as recommended by the manufacturer of the fluid-applied waterproofing.

2. Do not open containers, or expose materials to detrimental conditions or physical damage. Materials which are so exposed shall be removed from the site and shall not be incorporated into the Work.

3. Handle materials carefully and in a manner which prevents contamination and inclusion of foreign materials.

4. Do not open packages or containers until all necessary preparatory Work is complete, approved and installation will begin immediately. Do not allow materials to become wet or soiled or covered with ice or snow.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer’s standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Product and Manufacturer: Provide one of the following:

1. LM-60V and LM-60H Fluid-Applied Waterproofing System as manufactured by:

a. Gaco Western, Incorporated, Waukesha, WI.

b. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Fluid-Applied Waterproofing:

1. Liquid Urethane Rubber: Provide materials that comply with the following physical properties and have received NSF 61 approval:

a. Tensile Strength, ASTM D412: 175 psi.

b. Elongation at Break, ASTM D412: 300% at 75°F

c. Hardness, Shore Type A, Durometer 30 ASTM D2240.

d. Low Temperature Brittleness, ASTM D746: Passed @ minus 50°F.

e. Water Vapor Transmission, ASTM E96: 0.012 per inch.

f. Tear Resistance, ASTM D624: 30 pounds per lineal inch.

B. Elastic Membrane Flashing:

1. Synthetic rubber sheet, not less than 60 mils thick, textured as required for bonding to the substrate, in widths of not less than 10 feet, complying with the following:

a. Tensile Strength, ASTM D412.: 1400 psi.

b. Elongation at Break, ASTM D412: 300% at 75°F.

c. Hardness, Shore Type A, ASTM D2240: Durometer 50 to 70.

d. Low Temperature Brittleness, ASTM D746: Minus 75°F.

e. Tear Resistance, Die C, ASTM D624: 125 pounds per lineal inch.

f. Water Absorption, ASTM D1149: 0.5% maximum by weight, 72 hours at 104 F.

g. Resistance to Heat Aging, ASTM D573: 15 points maximum increase in hardness, 30% maximum loss of elongation and 15% maximum loss of tensile strength for 168 hours at 240 F.

C. Miscellaneous Waterproofing Materials:

1. Bonding Adhesive: Types recommended by manufacturer.

2. Expansion Joints and Flashing Accessories: Types recommended by the manufacturer for the specific installation, provided at locations shown or specified and at locations recommended by manufacturer, and including adhesive tapes, flashing cements and sealants.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Certify that the completed fluid-applied waterproofing Work is in accordance with the Sections and is waterproof, of uniform thickness and without gaps, holidays or pinholes at the time of Final Acceptance.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examination

1. The Contractor shall examine the surfaces to receive the trowel-applied waterproofing, and the conditions under which the trowel-applied waterproofing Work is to be performed, and notify Engineer in writing of all conditions detrimental to the proper and timely completion of the Work and the performance of the fluid-applied waterproofing systems. Do not proceed with the fluid-applied waterproofing Work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

B. Preparation

1. Provide cast-in-place concrete free from voids and sharp projections before placing any fluid-applied waterproofing system. Comply with the manufacturer's instructions for the preparation of the substrates to receive the waterproofing system unless more stringent conditions are specified.

2. Test substrate for moisture in accordance with ASTM D4263. Where substrate indicates moisture content above manufacturer’s recommended limit, use appropriate drying methods, and retest. If, after retesting, substrate continues to contain moisture above manufacturer’s recommended maximum, provide continuous barrier coat material, at no additional expense to DEP.

3. Remove surface irregularities on cast-in-place concrete and fill all holes, honeycombs, spalls and cracks using manufacturer's recommended joint seal parging. Repair areas of unacceptable consolidation. Where necessary to remove sharp projections, grind concrete surfaces.

4. Clean the substrate of dust, debris and other substances detrimental to the Work. Remove grease, oil and other contaminants from surfaces of cast-in-place concrete and provide abrasive blast in compliance with ASTM D4258 and ASTM D4259 - Abrasive Blast Cleaning Procedure for all surfaces to receive the Work of this Section to provide a surface profile acceptable to the fluid-applied waterproofing manufacturer for maximum adhesion. Follow abrasive blast by broom cleaning all surfaces followed by vacuum cleaning using vacuum cleaners equipped with high-efficiency particulate air filters. Remove all dust, loose stones and debris.

5. Parge all construction joints to a minimum depth of 1/8 inch and 3 inch minimum width using manufacturer's recommended joint seal parging.

6. Seal all through wall projections using elastic sheet flashing and manufacturer’s recommended sealants.

7. Install cant strips, expansion joints flashing accessories and other items as shown and as recommended by the manufacturer.

8. Prime the substrate with a seal coat if recommended by the manufacturer.

3.02 INSTALLATION

A. Comply with manufacturer's instructions for the application of fluid-applied waterproofing, including priming, membrane flashing, and curing. Provide trowel application, do not spray.

1. Start the application only in the presence of the manufacturer's technical representative.

2. Mark walls and slabs in 100 square foot areas to indicate extent of one application kit coverage. Do not exceed recommended coverage rate of 100 square feet per four gallon kit. Provide Engineer with calculations indicating compliance with maximum coverage rate. Coverage rate is based on uniformly prepared substrate as acceptable to installer. Provide additional material at no additional expense to DEP as may be required by substrate accepted by installer.

B. Apply fluid-applied waterproofing using notched or mason’s trowel and in accordance with manufacturer's written instructions. Apply in one coat to obtain total uniform, continuous thickness of 1/16-inch. Engineer should be aware this is about four gallons (one application kit) per one hundred square feet of surface area. Calculations indicating spreading rates exceeding this coverage rate are not achieving the specified application thickness of 1/16-inch. Consult manufacturer’s Technical Representative for recommendations on applying a second coat of material as may be required to achieve minimum thickness of 1/16-inch on all areas requiring fluid-applied waterproofing.

1. Apply waterproofing from first floor elevation down to base of footing, grade beams or sides of mat slabs.

C. Elastic Membrane Flashing: Install with membrane flashing as shown on approved Shop Drawings.

3.03 FIELD TESTING / QUALITY CONTROL

A. All components of the fluid-applied waterproofing system shall be fully tested and accepted before placing any other materials.

B. Area to be tested shall be sandbagged and made watertight around entire area of test and flooded to a minimum depth of two (2) inches at high end and maximum depth at end of slope. Water in flooded area shall be left in-place for 48 hours. Monitor and record air temperature and humidity and water temperatures during the time of the test. Provide calculations of surface area water evaporation expected to be encountered over the temperature and humidity ranges experienced during the test. Monitor water level.

C. Water levels which, for any reason, fall below expected levels based on evaporation calculations, shall be interpreted as indication that the system is not performing in a watertight manner.

D. Inspect and determine location of leaks. Where location of leak cannot be determined Contractor may, at its option, retest the area in question or remove and replace the waterproofing system with new material. Waterproofing system which fails a second test shall be removed and replaced with new at no additional expense to City. Replace only after substrate is dry, clean and acceptable to perform the Work.

E. Include all test information and calculations in Field Report to be submitted to Engineer.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Do not allow construction traffic which is not associated with the installation of the fluid-applied waterproofing and related materials in the area of Work. Protect the area from access by other installers and Contractors until the Work of this Section has been incorporated into finished construction systems.

B. Protect other Work from spillage of waterproofing materials, and prevent materials from entering and clogging drains and conductors. Replace or restore other Work which is soiled or otherwise damaged by the performance of the waterproofing and associated Work.

C. System components which are dislodged, damaged, or penetrated by subsequent installation operations or damaged by detrimental conditions shall be immediately replaced with undamaged material in compliance with the Sections and properly protected as specified.

D. Upon completion of the Work the installer shall advise Contractor of recommended procedures for his surveillance and protection of the waterproofing Work during the remainder of the construction period. At the end of the construction period, or at a time when the remaining construction work will in no way affect or endanger the waterproofing Work, the installer and Technical Representative shall make a final inspection of fluid-applied waterproofing and prepare a written report to Contractor with copy to DEP and Engineer of deterioration or damage found in the Work.

E. Only the installer shall repair or replace deteriorated or defective Work found at the time of final inspection. Only the installer shall be engaged by Contractor to repair damage to the waterproofing Work which occurred subsequent to fluid-applied waterproofing installation and prior to final inspection. Repair or replace the Work so that there will be no question as to the waterproof condition of fluid-applied waterproofing and associated Work at the time of Final Acceptance.

END OF SECTION

NO TEXT ON THIS PAGE

PART 1 GENERAL

1.01 SUMMARY

A. This Section describes the requirements for perimeter foundation insulation, cavity wall insulation, formaldehyde-free recycled glass fiber thermal batt insulation, preformed concrete masonry unit core insulation, fire safing insulation with gas and smoke tight fire resistant sealants and other fire stop system components for each kind and condition of penetration through fire-rated construction and miscellaneous materials and accessories as specified herein and as required to complete the Work.

B. The Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install all building insulation Work.

C. The Contractor shall implement practices and procedures to meet the project's sustainability goals as identified in the Contract Documents. The Contractor shall ensure that the sustainability requirements of this Section are implemented to the fullest extent.

D. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. Substitutions:

1. Do not change products, system components, manufacturers after Shop Drawing approval by Engineer.

2. Clearly identify, in a manner which is highlighted to Engineer, all proposed substitutions, modifications, variations, unspecified features and "or equal" products. Provide complete comparative data with specified products at time of Shop Drawing submission.

B. Scheduling:

1. Proceed with the building insulation and associated Work only after curbs, blocking, OSB substrate board, nailer strips, vents, drains and other projections through the substrates have been installed, and when the substrate construction and framing of openings is complete.

2. Proceed with and complete the Work only when materials, equipment and tradesmen required for the installation of the building insulation and backfilling operations are at the site and are ready to follow with the Work in a manner which will not leave the Work vulnerable to damage or deterioration.

3. Do not advance the installation of building insulation materials beyond that which is necessary for proper sequencing of the Work and for which there is proper and secure protection from damaging weather and construction activities.

4. Do not begin stainless steel sheet metal cladding until testing confirms that all cavity spaces between the structure and OSB sheet metal substrate sheathing have been completely and uniformly filled with foamed-in-place cementitious insulation. Do not delay job progress or permit OSB substrate to degrade with exposure to detrimental weather conditions. Schedule installation of sheet metal cladding immediately after testing indicates that all cavities have been filled or after remedial foamed-in-place cementitious insulation Work has been completed. No final payment shall be made until testing confirms acceptability of the foamed-in-place cementitious insulation installation and acceptability of the OSB substrate by the sheet metal cladding manufacturer.

1.06 QUALITY ASSURANCE

A. Manufacturer/Installer Qualifications:

1. Obtain all foamed-in-place cementitious insulation from a manufacturer who is a licensed manufacturer of the product developer and who will also be responsible for the installation of foamed-in-place cementitious insulation.

2. Engage single installers for each type of building insulation who are skilled, trained and have a record of successful experience in the application of each product and who have a record of performing Work in accordance with the recommendations and requirements of the manufacturer or who can submit evidence in writing of being acceptable to the manufacturer for production of guaranteed construction and who agrees to employ only tradesmen with specific skill and successful experience in each type of Work. Submit names and qualifications to Engineer along with the following information on a minimum of three successful projects:

a. Names and telephone numbers of owners, architects or engineers responsible for projects.

b. Approximate contract cost of the building insulation system installed.

c. Amount of area installed.

B. Product/Manufacturer Selection:

1. Obtain building insulations, requiring a hydro-chlorofluorocarbon blowing agent, from manufacturers who manufacture specified insulation using a blowing agent acceptable for use until the year 2020 complying with the requirements of the Copenhagen Amendments to the Montreal Protocol in all ways.

2. Provide a manufacturer who will provide complete technical services including preparation and review of Shop Drawings, installation methods and proposed detailing for the Work.

C. Performance Criteria:

1. Thermal Conductivity: The thicknesses shown are for the thermal conductivity, k-value at 75 degrees F, specified for each material.

2. Provide adjusted thicknesses as directed by Engineer for the use of material having a different thermal conductivity.

D. Materials and Equipment Compliance:

1. Materials and equipment submitted for DEP's approval by the Contractor shall have met, at the time of their submittal, the certification and material acceptance requirements of the NYC Department of Buildings.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings for approval of the Engineer. Submittals shall include, but not be limited, to:

1. Samples: Submit for approval the following:

a. 12-inch by 12-inch sample of each insulation product and each accessory and miscellaneous material to be used in the Work.

b. Samples will be reviewed by Engineer for general appearance and as examples of the types of components to be installed on the job mock-ups specified in other Sections. Compliance with other requirements is the responsibility of Contractor.

2. Shop Drawings: Submit for approval the following:

a. Copies of specifications, installation instructions and general recommendations from the building insulation manufacturers, for each type of building insulation product. Include manufacturer's data substantiating that the materials comply with the requirements.

b. Complete selection of fire stop manufacturer's recommended systems for each condition and kind of penetration encountered in the Work. Coordinate with equipment manufacturers for required number and kind of penetrations through fire rated construction. Provide a schedule of penetrations and the fire stop system to be included in the Work for each condition and kind of penetration encountered.

c. Drawings showing extent of the Work and all details required for the Work referencing system components provided as samples to Engineer.

3. Test Reports: Submit for approval the following:

a. Copies of test reports verifying compliance with physical properties and environmental features specified herein.

b. Copies of testing agencies background and experience in preforming similar tests to those specified.

4. Certificates: Submit for approval copies of certificates stating that the manufacturer of the foam-type rigid board insulation has used an environmentally safe blowing agent complying with the requirements of the Sections.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery of Materials:

1. Deliver building insulation products in manufacturer's original, unopened, factory-sealed containers, bearing manufacturer's name and labels, accurately representing container contents as approved by Engineer at time of Shop Drawing submission.

2. Damaged materials unsuitable for use shall be rejected by Engineer and permanently removed from site by Contractor.

3. Do not deliver insulation materials to the project site before the time of installation.

4. Deliver materials in sufficient quantities to allow uninterrupted continuity of the Work.

B. Storage of Materials:

1. Store materials in original, undamaged containers with manufacturer's labels and seals intact.

2. Store all materials in a dry, enclosed area, off the ground and away from all possible contact with water, ice or snow.

3. Prevent damage to materials during storage primarily by minimizing the amount of time they are stored at the job-site before being incorporated into construction systems.

C. Handling of Materials:

1. Handle materials carefully in order to avoid damage and breakage or compressing of boards to less than their specified thickness or other damage.

2. Do not open containers, or expose materials to detrimental conditions or physical damage. Materials which are so exposed shall be removed from the Site and shall not be incorporated into the Work.

3. Handle materials in a manner which prevents inclusion of foreign materials.

4. Do not open packages or containers until all necessary preparatory Work is complete and installation will begin immediately. Do not allow materials to become wet or soiled or covered with ice or snow.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Provide one of the following for each of the following product types:

1. Perimeter Foundation, Parapet and Coping Insulations:
   a. STYROFOAM 100 HIGH LOAD as manufactured by The Dow Chemical Company, Midland, MI.
   b. Or approved equal.
2. Cavity Wall Rigid Insulation Board:
   a. CAVITYMATE ULTRA and Square Edge STYROFOAM, as manufactured by The Dow Chemical Company, Midland, MI.
   b. Or approved equal.
3. Semi-rigid Insulation:
   a. Rainbarrier Black as manufactured by Thermafiber, Inc., Toledo, OH.
   b. Or approved equal.
4. Recycled Glass Fiber Insulation Batts:
   a. Grid-SHIELD Thermal Batt Insulation as manufactured by Schuller International, Incorporated (Johns-Manville), Littleton, CO.
   b. Or approved equal.
5. Preformed Concrete Masonry Unit Core Insulation:
   a. Korfil Standard U-Shaped Block Insulation as manufactured by Concrete Block Insulating Systems Incorporated, a Division of W.R. Grace Construction Products, Incorporated, West Brookfield, MA.
   b. Or approved equal.
6. Fire Safing Insulation:

a. Thermafiber Safing Insulation as manufactured by USG Interiors, Incorporated, Stockton, CA.

b. Or approved equal.

7. Fire-Stop Sealants and Other Fire-Stop System Components:

a. 3M Fire Stop Systems as manufactured by 3M Incorporated, St. Paul, MN.

b. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Perimeter Foundation, Parapet and Coping Insulations: Provide the following:

1. Rigid, closed-cell, thermally stabilized, very high-load-resisting, extruded, hydrogenated chlorofluorocarbon blown, foam board insulation consisting of 100 percent virgin extruded polystyrene modified resin complying with ASTM C578, Type V.

2. Provide a blowing agent with lowest available ozone depletion potential, such as HCFC-142b, or better. HCFC-141b shall not be approved by Engineer.

3. Physical Properties: Provide the following:

a. Thermal Conductivity (k), ASTM C177 and ASTM C518: 0.20 Btu/in./hr./sf/^{0}F.

b. Compressive Strength (psi at 5% deformation) ASTM D1621: 100 psi minimum.

c. Flexural Strength, ASTM C203: 100 psi minimum.

d. Coefficient of Thermal Expansion, ASTM D696: 3.5 x 10^{-5} inches/in./F.

e. Water Vapor Absorption, ASTM C272: Less than 0.1% by volume maximum.

f. Water Vapor Permeance, ASTM E96: 0.3-0.8 perms/inch maximum.

g. Flame Spread, ASTM E84: 5.

h. Smoke Developed, ASTM E84: 165 maximum.

4. Thickness: Two layers each 2-inches thick, unless otherwise noted on drawings.

5. Width: 24-inches

6. Length: 96-inches

B. Cavity Wall Rigid Insulation Board: Provide the following:

1. Rigid, rectangular boards of extruded polystyrene complying with ASTM C578, Type X and IV.
2. Provide a blowing agent with lowest available ozone depletion potential, such as HCFC-142b, or better. HCFC-141b shall not be approved by Engineer.
3. Physical Properties: Provide the following:
   a. Minimum Compressive Strength, (at 10 percent deformation), ASTM D1621: 25 psi.
   b. Flame Spread, ASTM E84: 10 maximum
   c. Smoke Development, ASTM E84: 165 maximum
   d. Vapor Transmission, ASTM E96: 0.4 - 1.1 perms/inch
   e. Thermal Resistance, ASTM C177: 5/inch and 5.6/inch
   f. Maximum Water Absorption, ASTM C272: 0.10% by volume
4. Sizes: 24-inches by 48 inches by 3-inches thick and 16-inches by 48-inches by 3-inches thick (Minimum).

C. Recycled Glass Fiber Insulation Batts: Provide the following:

1. General: Provide un-faced, polyethylene encapsulated insulation formed from glass fibers certified by SCS as containing a minimum of 25 percent total recycle glass content with a minimum of 18 percent obtained from post-consumer recycled bottle glass and thermosetting acrylic resin binders fabricated into flexible blankets, complying with ASTM C665, Type 1.
   a. Physical Properties: Provide the following:
      1) Thermal Conductivity (k), ASTM C518: 0.32.
      2) Btu/in./hr./sf/EF.
      3) Density, ASTM C303: 1.5 pcf.
      4) Water Vapor Transmission, ASTM E96: 0.10 perm/inch.
      5) Flame Spread, ASTM E84: 25.
      6) Smoke Developed, ASTM E84: 50.
      7) Thickness: 6-3/4-inches
      8) Nominal Width: 24-inches by 48-inches

D. Preformed Concrete Masonry Unit Core Insulation: Provide the following:

1. Individually molded expanded polystyrene core insulation complying with ASTM C236, and ASTM C578 Standard Type I.
2. Physical Properties: Provide the following:
3. Density, ASTM C303: 0.90-1.14 pounds per cubic foot minimum.

4. Water Vapor Transmission, ASTM E96: 1.4 per inch
5. Thermal Conductivity (k), ASTM C177: 0.26 BTU/in/hr/sf/^{0}F.
6. Compressive Strength, ASTM D1621: 1013 pounds per square inch.
7. Flame Spread, ASTM E84: 5 maximum.
8. Smoke Developed, ASTM E84: 130 maximum.

E. Fire Safing Insulation: Provide the following:

1. Mineral Fiber Insulation: Un-faced, semirigid, nonasbestos, non-combustible blankets composed of compounds of spun mineral fiber felt, complying with ASTM C665, Type I, and FS HHI558B, Type 1 and 2.
2. Physical Properties: Provide the following:
3. Thermal Conductivity (k), ASTM C518: 0.25 Btu/in./hr./sf/°F.
4. Density, Manufacturer's Certified Test: 4 pcf.
5. Flame Spread, ASTM E84: 15 maximum.
6. Smoke Developed, ASTM E84: 0.
7. Fire Resistance Rating, ASTM E119: 3 hours.
8. Thickness: 4-inches
9. Width: 24-inches

F. Fire-Stop Sealants and Other Fire-Stop System Components: Provide the following:

1. Complete selection of fire stop manufacturer's recommended silicone rubber fire stop systems. Provide complete systems complying with UL 1479 with a two or three hour fire rating. Provide equal fire protection as provided by fire-rating of construction penetrated.
2. Provide multiple component systems coordinated to meet actual conditions encountered in the Work and as recommended by the fire stop manufacturer. In addition to providing fire-resistance the fire stop systems shall also be gas and watertight.

G. Miscellaneous Materials and Accessories: Provide the following:

1. Adhesive for Bonding Insulation: Provide the type recommended by the insulation manufacturer, and complying with fire resistance requirements.
2. Mechanical Anchors: Provide type and size shown or, if not shown, as recommended by the insulation manufacturer for the type of application shown and condition of substrate.
3. Protection Board: Provide fiberboard sheathing or heavy duty asphaltic panels as recommended by the insulation manufacturer.

4. Adhesive Tapes: Provide complete selection of insulation manufacturer's recommended taping materials.

5. Bitumen: Asphalt, ASTM D449

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Contractor shall verify that foamed-in-place cementitious insulation shall be mixed using the quantities, proportions and the pressures required in the manufacturer's written specifications and comply with the intended use.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examination

1. The Contractor shall examine the substrate and the conditions under which the Work is to be performed, and notify Engineer in writing of unsatisfactory conditions. Do not proceed with the Work until unsatisfactory conditions have been corrected in a manner acceptable to the Engineer.

B. Preparation

1. Verify that surfaces to receive building insulation are clean of all debris, dirt and other contamination before installation begins in any area.

2. Correct unacceptable Work to meet the requirements of the Section

3.02 INSTALLATION

A. General:

1. Comply with manufacturer's instructions for the particular conditions of installation in each case. If printed instructions are not available or do not apply to the project conditions, submit to Engineer specific recommendations from manufacturer for approval before proceeding with the Work.

2. Extend all insulations full thickness over entire surface to be insulated. Cut and fit tightly around obstructions, and fill voids with insulation.

3. Apply the number of layers of insulation specified herein, each of the required thickness to provide the thermal value indicated, unless otherwise shown or required, to make up the total thickness.

B. Pre-installation Conference:

1. Prior to the installation of the foamed-in-place cementitious insulation and associated Work, Contractor shall schedule and meet at the site with the installer of the foamed-in-place cementitious insulation, sheet metal cladding installer, the installer of each component of associated work, Engineer and other representatives directly concerned with performance of the Work. Review foreseeable methods and procedures related to the foamed-in-place cementitious insulation Work, including but not necessarily limited to, the following:
    a. Review project requirements, including Drawings, Sections and other Contract Documents.
    b. Review required submittals, both completed and yet to be completed.
    c. Review status of substrates including curing of foamed-in-place insulation, structural loading limitations and similar considerations.
    d. Review availability of materials, tradesmen, equipment and facilities needed to make progress and avoid delays.
    e. Review required inspection, testing, certifying and accounting procedures.
    f. Review weather and forecasted weather conditions, and procedures for coping with unfavorable conditions.
    g. Review regulations concerning environmental protection, health, safety, fire and similar considerations.
    h. Review procedures needed for protection of substrates during the remainder of the stainless steel cladding construction period.
2. Reconvene the meeting at the earliest opportunity if additional information must be developed in order to conclude the subjects under consideration.
3. Record any revisions or changes agreed upon, reasons therefor, and parties agreeing or disagreeing with them.

C. Environmental Conditions:

1. Do not install building insulation when weather conditions are such that conditions do not comply with the building insulations manufacturer's written recommendations. Install building insulations only when damaging environmental condition are not forecasted for the time when the system material components will be exposed to potential damage.
2. Install foamed-in-place cementitious insulation only when the combination of interior and exterior temperatures are such that the temperature at the point of application is 40°F and rising during the application process and 48 hour initial curing period.

3. If Contractor wishes to advance the foamed-in-place cementitious insulation Work when weather conditions are not within manufacturer's recommended temperature ranges provide enclosures with heat to maintain manufacturer's recommended temperatures during the initial curing period. Erecting and maintaining all such enclosures and the provision of heat and heating equipment shall be at no additional expense to the City.

4. Record decisions, conditions and agreements to proceed with the Work when weather conditions might be unfavorable. State the reasons for proceeding, with the names of the persons involved along with the changes, if any, or revisions, requirements or terms of the Contract.

5. Proceed with the Work only when temperature and moisture conditions comply with the manufacturer's written recommendations.

D. Preformed Concrete Masonry Unit Core Insulation:

1. Provide factory-installed preformed concrete masonry unit core insulation installed in all cores of all exterior perimeter wall concrete unit masonry construction.

2. Install inserts in accordance with manufacturer's written specification.

3. Concrete unit masonry Work containing damaged or mutilated preformed insulation shall not be used in the Work.

E. Board Type Perimeter Insulation:

1. Install perimeter insulation after concrete foundation Work has been poured and after sodium bentonite panels and prefabricated drainage mats are in-place and acceptable to Engineer.

2. Apply double 2 foot-0-inch-wide continuous layers of insulation of the required thickness. Stagger joints in insulation and butt insulation tightly together.

3. Protect top surface of horizontal insulation (from damage during backfilling Work) by application of one of the types of protection course materials recommended by the insulation manufacturer.

4. On vertical surfaces, set units in adhesive applied in accordance with manufacturer's instructions. Use type of adhesive recommended by manufacturer of board-type perimeter insulation.

5. Tape bottom edge of insulation before temporarily attaching insulation to wall with mastic.

6. Tape all joints in vertical wall insulation.

7. Protect insulation on vertical surfaces (from damage during backfilling) by application of one of the types of protection course materials recommended by the insulation manufacturer. Set in adhesive in accordance with the

recommendations of the manufacturers of the insulation and the protection course material.

F. Cavity Wall Rigid Insulation Board:

1. Install exterior wall rigid insulation board after all concrete unit masonry Work is complete.

2. Apply a single layer of insulation cut to fit snugly and uniformly and in continuous contact with edges of continuous masonry horizontal joint reinforcement over the entire plane of the wall.

3. Apply exterior wall rigid insulation to exterior concrete unit masonry walls in all area shown to receive masonry outer cavity wall wythes.

4. Set units in adhesive applied in accordance with manufacturer's instructions. Use type of adhesive recommended by manufacturer of board-type cavity wall insulation.

G. Batt-Type Insulation:

1. Install batt insulation above ceilings and between studs and rafters as shown. Extend insulation full width, length and height in all areas shown.

2. Fit tightly around obstructions to form a uniform insulated barrier.

H. Safing Insulations and Fire Stop Systems:

1. Install safing insulation and fire stop systems to present a continuous fire-rated fire barrier in areas shown and at the perimeter of all fire-rated partitions and poke through floor and wall penetrations to maintain the continuity of fire-rated construction whether or not shown.

2. Install fire stop sealants and other fire stop system components in thicknesses recommended by the manufacturer at all locations where poke through penetrations occur, all locations where other penetrations such as ducts, pipe cables, cable trays and conduit occur and at the perimeter of all fire rated walls.

3. Include all components of manufacturer's fire/smoke stop systems for complete system responsibility installed in accordance with manufacturer's written recommendations and specifications.

3.03 FIELD TESTING / QUALITY CONTROL

A. Foamed-In-Place Cementitious Insulation: Contractor shall conduct a timed, field density check at the beginning, middle and end of each day’s application. Check shall be done in accordance with manufacturer’s instructions and a log of results maintained and submitted to Engineer on a daily basis.

B. In order to assure that foamed-in-place insulation has been installed in a continuous layer completely insulating all areas of the structure, infrared thermographic testing shall be performed at the completion of the insulation Work for each structure

before beginning the insulation Work on the next structure, at no additional expense to the City.

C. Submit results of all testing to Engineer along with recommendations for remedial Work. Do not delay job progress. Coordinate the submission of tests and remedial Work in a manner which does not impact the acceptability of OSB substrate and which permits expeditious completion of the sheet metal cladding Work.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. All components of the Work shall be protected from detrimental weather and until construction operations including, but not limited to, backfilling, framing and sheathing, aluminum siding and concrete unit masonry Work, is completed and acceptable to Engineer. Protect Work from precipitation, frost and direct sun.

B. Protection:

1. Do not overload the building structure or damage in-place construction system with the weight of stored materials or use of equipment.

2. Provide continuous protection of materials against damage, wetting and moisture absorption primarily by storing materials under cover and above ground and away from all other construction traffic.

3. Protect materials against damage by construction activities.

C. Work which cannot for reasons acceptable to Engineer be covered with complete construction system before onset of weather detrimental to the Work shall be completely covered and protected in such a manner as to deflect water and weather from the installation without damaging adjacent Work.

D. To not allow construction traffic which is not associated with the installation in the area of Work. Protect the area from access by other installers and Contractors until the Work of this Section has been incorporated into finished construction systems.

E. System components which are dislodged, damaged, broken, penetrated or crushed by subsequent installation operations or damaged by detrimental weather shall be immediately replaced with undamaged material in compliance with the Sections and properly protected as specified.

F. Only the original installer shall repair or replace deteriorated or defective Work.

G. Building insulations which have become wet, damaged, or deteriorated shall be promptly removed from the Site, even if discovered in the completed Work.

END OF SECTION

PART 1 GENERAL

1.01 SUMMARY

A. This Section describes the requirements for roofing insulation systems including extruded polystyrene rigid foam board-type insulation beneath all sheet metal flashing, very high load bearing extruded polystyrene rigid foam board-type insulation beneath all cast-in-place concrete rooftop wearing decks and a composite system of lightweight insulating concrete and pre-generated foam with integral expanded polystyrene rigid foam insulation board for use over non-vented substrates beneath all single-ply roofing.

B. The Work also includes all miscellaneous materials and accessories and a Job Conditions Report from the installer of the composite roofing insulation containing information specified. Contractor shall also include the presence of full time on-site composite roofing manufacturer's Technical Representative and provide a ten-year composite roofing insulation performance warranty. Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish, install and field test roofing insulation Work.

C. The Contractor shall implement practices and procedures to meet the project's sustainability goals as identified in the Contract Documents. The Contractor shall ensure that the sustainability requirements of this Section are implemented to the fullest extent.

D. The roofing insulation system described herein must come from the same manufacturer as the Elastomeric Membrane Roofing specified in Section 07 53 00 – Elastomeric Membrane Roofing.

E. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. System Design Requirements

1. Roofing insulation Work shall withstand the uplift forces of wind, as defined by the roofing guarantee. Refer to Section 07 53 00 - Elastomeric Membrane Roofing, and Section 07 62 00 - Sheet Metal Flashing and Trim.

2. Failures of the roofing insulation Work in bond or anchorage to the substrate, or within the insulation, will be considered failures of materials or workmanship under the insulation performance warranty.

B. Sustainable Design Requirements

1. Low Emitting: Insulation tested according to ASTM D 5116 and shown to emit less than 0.05-ppm formaldehyde.

2. Insulation shall be produced using a blowing agent with zero ozone-depleting potential. HCFC-142b or HCFC-141b shall not be used.

3. Recycled Content of Roof Insulation Products: Postconsumer recycled content plus one-half of pre-consumer recycled content not less than 15 percent.

C. Substitutions

1. Manufacturer of the primary roofing systems shall be manufacturers who find the generic types of insulation specified herein as acceptable and bondable if installed according to the roofing manufacturer's standards for complete product and performance responsibility.

2. The thickness of the composite insulation system, the maximum step between layers of expanded polystyrene rigid board insulation, and the minimum slope-to-drain shall not vary from what is shown, specified and approved.

1.06 QUALITY ASSURANCE

A. Composite Roofing Insulation Installer Qualifications:

1. Subcontract roofing insulation Work to an installer approved in writing, who has qualified for appointment and has been trained by the manufacturer of the composite roofing insulation system.

2. Engage a single installer skilled, trained and with successful experience in the installation of the type of composite roofing insulation specified, and equipped to perform workmanship in accordance with both the requirements of the manufacturer of the composite roofing insulation and of the single-ply roofing manufacturer so that there will be unequivocal responsibility for the performance of the roofing insulation Work.

3. Submit proof of acceptability of installer by manufacturer to Engineer.

B. Performance Criteria:

1. The thicknesses shown are for the thermal conductivity, k-value at 75 F specified for each material.

2. Comply with Factory Mutual Technical Advisory Bulletin 1-29 for recommendations concerning requirements for 1-90 securement.

3. Provide composite roofing insulation system recommended by the manufacturer for use on non-vented substrates.

C. Erection Tolerances: Provide the following for composite roofing insulation:

1. Provide minimum of 1/8-inch leveling slurry coat of insulating concrete over the top of cast-in-place concrete roofing decks.

2. Finished system shall not pond water and shall provide a uniformly sloped surface to low point of roof drains. If at any time up to the time of Final Acceptance the roofing shows signs of ponding water, the composite roofing insulation system shall be repaired to provide uniform slope to drain.

D. Requirements of Regulatory Agencies: Comply with fire-resistance ratings as shown, and as required by governing authorities and the New York City Building Code and comply with the following roofing insulation requirements:

1. Materials and equipment submitted for DEP's approval by the Contractor shall have met, at the time of their submittal, the certification and material acceptance requirements of the NYC Department of Buildings, unless otherwise required by the Authority Having Jurisdiction over the Work.
2. All material provided under this Section shall comply with the Detailed Specifications.
3. Comply with all applicable requirements of governing authorities and codes for all Work.
4. U.L. requirements for Roofing Deck Constructions which are rated "UL Construction No. 1".
5. Factory Mutual requirements for "Class 1" construction, for fire hazard and 1-90 wind resistance.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings for approval of the Engineer. Submittals shall include, but not be limited to:

1. Samples: Submit for approval the following:
   a. Each fastener to be used in the Work.
   b. 12-inch by 12-inch sample of specified rigid board-type insulation and composite insulation system.
2. Shop Drawings: Submit for approval the following:
   a. Manufacturer's specifications and installation instructions for type of insulation required. Include data substantiating that the materials comply with specified requirements.
   b. Weights of all equipment to be used on roofing.
   c. Field verified locations of all roof penetrations, drain locations, and deck deflections.
   d. Complete layout of all roofing insulation showing sizes, placement and number of courses and methods of fastening.
   e. All required roofing insulation details approved by the roofing insulation manufacturer and the manufacturer of the respective roofing systems.
   f. Laboratory test results for Thermal Resistance Values based on ASTM C177 or ASTM C518 for actual composite roofing insulation system shown and specified.
3. Certifications: Submit Job Conditions Report as specified and, in addition, include a notarized statement from the full-time on-site Technical Representative and installer that the composite roofing insulation system was installed according to manufacturer's written recommendations.

4. Sustainable Design Submittals:

   a. Environmental Materials Reporting Form (EMRF) Recycled Content. Provide the following information:

      1) Name of Product and Manufacturer.

      2) Cost of product: Material cost only (excluding labor and equipment).

      3) The percentage (by weight) of post-consumer and pre-consumer recycled content for the submitted product.

   b. VOC Reporting Form:

      1) For adhesives used onsite and within the building's weatherproofing system provide the VOC content in grams/Liter (g/L) less water and exempt compounds.

5. Sustainable Design:

   a. Recycled Content: Submit percentage of recycled content for each material or product. No product shall contain CFC, HCFC (hydro-chlorofluorocarbon) or any Resin base chemical.

   b. Regional Materials: Submit location of product manufacturer and distance from manufacturing location to the project site.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery of Materials:

1. Do not deliver roofing insulation materials to the project site before time of installation.

2. Deliver materials in manufacturer's original, undamaged packages or acceptable bulk containers.

3. Materials shall be manufactured and delivered from manufacturing locations that are closest to the project site to reduce transportation costs and emissions.

B. Storage of Materials:

1. Do not allow roofing insulation materials to become wet or soiled, or covered with ice or snow.

2. Store packaged materials to protect them from the element and physical damage.

C. Handling of Materials:

1. Comply with manufacturer's recommendations for handling, storage and protection.

2. Do not use cement which shows indication of moisture damage, caking or other signs of deterioration.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Roofing insulation systems shall be as manufactured by:

1. Firestone; Polyiso Insulation
2. Sika sarnafil; Styrofoam Deckmate Plus insulation
3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Extruded Polystyrene Rigid Board Roofing Insulation: Provide the following between sheet metal structural roof decks and board sheet metal flashing substrate:

1. Rigid, rectangular boards of extruded polystyrene complying with ASTM C578, Type VI.
2. Physical Properties: Provide the following:
   a. Minimum Compressive Strength, (at 5 percent deformation), ASTM D 1621: 40 psi.
   b. Flame Spread, ASTM E84: 5 maximum.
   c. Smoke Development, ASTM E84: 165 maximum.
   d. Vapor Transmission, ASTM E96: 1.0 perms/inch.
   e. Thermal Resistance per inch, ASTM C177: 5.0 deg F x h x sq. ft. /Btu x in. at 75 deg F
   f. Maximum Water Absorption, ASTM C272: 0.10% by volume.
   g. Flexural Strength, ASTM C203: 60 lbs. /in^2.
3. Size: 24-inches by 96 inches by 2-inch thick; cut as required to fit within profile of sheet metal flashing adjustable radiused hat section.
4. Number of Layers: As indicated by thickness of roofing insulation shown.
   a. Minimum insulation assembly R-value of 34 continuous insulation.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examination

1. The Contractor shall examine the substrate and the conditions under which the roofing insulation Work is to be performed, and notify Engineer in writing of any unsatisfactory conditions. Do not proceed with the Work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

2. Environmental Requirements:

a. Do not install insulation when weather conditions are such that the deck is not completely dry, or where there is no assurance that the insulation can be completely protected from the weather by the end of the day.

b. For applications of composite roofing insulation system when the temperature is expected to fall below 40ºF submit written installation recommendations of the composite insulation system manufacturer confirming acceptability of the conditions encountered. Contractor shall verify that composite roofing insulation system installed under such adverse weather conditions meet all material and performance requirements specified. Record actual conditions of installation, including intervals between system component placement, weather and temperature conditions, temporary uses of roofing (if any) and other pertinent installation factors and submit notarized information signed by manufacturer's full-time on-site technical representative to Engineer.

c. Hot water is not available at the project site and shall be supplied by composite roofing insulation installer as required by installation conditions.

d. Potable water is not available at the project site and shall be provided by composite roofing insulation installer.

B. Preparation

1. Pre-Roofing Conference: Provide both a representative of the composite roofing insulation system manufacturer and the foreman of the installer who will actually work on this job at the pre-roofing conference specified in Section 07 53 00 – Elastomeric Membrane Roofing.

2. Verify that fire-resistant cement board insulation underlayment is in place on sloping metal decks and that channel-shaped attachment angles and

adjustable radiused hat sections are properly installed over all areas to receive sheet metal flashing Work.

3. Do not overload the building structure with the weight of stored materials or use of equipment.

4. Sequencing:

a. Proceed with and complete the Work only when materials, equipment and tradesmen required for the installation of the roofing membrane and sheet metal flashing over the insulation are at the site and are ready to follow with this Work immediately (same day) behind the insulation Work.

b. Do not install any more board-type insulation each day than can be covered with the complete sheet metal flashing system by the end of that working day.

c. Follow composite roofing insulation manufacturer written requirements for installation timing sequence for Work. Do not place more leveling slurry coat than can be completely covered with insulation within 30 minutes nor more expanded polystyrene insulation than can be covered with insulating concrete within 4 hours of placing insulation.

3.02 INSTALLATION

A. General:

1. Comply with manufacturer's instructions for the particular conditions of installation in each case. If printed instructions are not available or do not apply to the project conditions, consult the manufacturer's full-time on-site Technical Representative for specific recommendations before proceeding with the Work. All such discussions shall be recorded in writing in Job Conditions Report and shall be incorporated into the Work only when acceptable to Engineer.

2. Coordinate heights of wood blocking to provide flush transition between roofing insulation Work and perimeter wood blocking.

3. Extend insulations full thickness as shown over entire surface of the roofs.

4. Cut and fit board-type insulation tightly around obstructions, and fill voids with insulation. Keep back 1/4 inch for all vertical flashings.

B. Laying Board-Type Insulation Units for Sheet metal flashing System:

1. Apply four courses of rigid board insulation over entire surface of roofs receiving sheet metal flashing between continuous adjustable radiused hat sections.

2. Mechanically fasten in accordance with the requirements of the applicable fire and insurance ratings and primary roofing manufacturer's recommendations, and apply in accordance with the recommendations of

the manufacturer of the insulation, mechanical fastener and completed roofing system manufacturer.

3. Install insulation board with the long joints between boards perpendicular with incline of deck. Cut roofing insulation and taper edges of boards where curvature of deck requires, to fit snugly beneath oriented strand board sheet metal flashing substrate Work. Remove ridges between insulation boards and provide a smooth transition between boards following curvature of adjustable radiused hat sections.

C. Laying Composite Roofing Insulation System for Single-Ply Roofing System:

1. Place insulating concrete using approved equipment after sufficient mixing time to provide a consistent, thoroughly uniform consistency that will screed to a smooth surface and achieve the compressive strength specified.

2. Provide insulating concrete leveling slurry to a depth of 1/8-inch above the top of deck.

3. Place expanded polystyrene rigid board insulation into the slurry within 30 minutes of insulating concrete placement with joints staggered in a running bond pattern.

4. Tightly butt all rigid boards together and install in a manner that provides full contact of slurry to board, and with adequate pressure to cause insulating concrete to enter the locking/keying openings of the rigid board.

5. Install rigid boards in a stair-stepped configuration with maximum step down of 1 inch between boards, over entire plane of roof surface beneath all single-ply roofing. Cut boards as required in order to maintain 2 inches of insulating concrete cover at insulation step in compliance with slope-to-drain and high point and low point elevations shown.

6. Within four hours of rigid board placement place 2 inches of insulating concrete over rigid boards and screed to a smooth, consistently dense, uniformly sloped plane leading to roof drains at low points. Insure that all locking/keying openings in rigid board are completely filled with insulating concrete. Provide finish and other system features acceptable to single-ply roofing installer.

7. Include reinforcing mesh as part of the composite roofing insulation system to help control crack formation and distribute forces within the roofing insulation system.

8. Provide high and low point elevations shown.

D. Laying Board-Type Insulation Units for Liquid-Applied Membrane Waterproofing Inverted Roofing:

1. Apply two courses of very high load bearing rigid board insulation over entire surface of roofs.

2. Adhesively adhere boards, staggering joints between courses.

3. Be prepared to follow immediately with cast-in-place concrete sloped-to-drain wearing slab.

3.03 FIELD TESTING / QUALITY CONTROL

A. Retain a minimum of four 3-inch by 6-inch cylinder material specimens for each day's pour. Protect specimens from damage and temperature extremes and test in accordance with ASTM C495. Submit results of test as part of notarized Job Conditions Report and submit to Engineer.

B. Check cast density hourly at the point of placement. Include reports as part of notarized Job Conditions Report information and submit to Engineer.

1. Final Acceptance will be contingent upon the receipt by the Engineer of a Job Conditions Report certifying conformance of the Work with the requirements of the Section and which includes all information required.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjusting

1. Insulation which has become wet, damaged, or deteriorated shall be promptly removed from the job, even if already installed.

2. Correct all improperly sloped, chipped, cracked, improperly set, ridged or rough areas in the insulation to provide substrate acceptable to roofing manufacturer and Engineer.

B. Protection

1. Do not permit construction period traffic over completed roofing insulation Work, except as required for roofing.

2. Protect insulation Work from exposure to moisture, damage and deterioration, primarily by prompt installation of roofing Work to be placed over the insulation.

3. Do not expose completed Work to prolonged exposure to elements in excess of seven days.

4. Do not use completed roofing insulation as a temporary working surface without protection approved by insulation installer.

END OF SECTION

1.05 DESCRIPTION

A. Regular vapor barrier, such as that used under slabs on grade, shall be a three-ply laminate combining two layers of rubber modified high density polyethylene and a high strength cord grid reinforcing mesh, manufactured in one piece in sizes up to 120 feet by 200 feet, with as few seams as possible, in accordance with the requirements of the Contract Documents.

B. Fire retardant vapor barrier or air barrier, such as that used on roof slabs, or as part of a wall system, shall be a three-ply polyethylene vapor barrier, reinforced with a heavy duty cord grid, manufactured in one piece in sizes up to 100 feet by 200 feet, with as few seams as possible, in accordance with the requirements of the Contract Documents. Fire retardant material shall have a Class I, Class A flame spread rating when tested in accordance with ASTM E84.

1.06 QUALITY ASSURANCE

A. Requirements of Regulatory Agencies: All fire retardant vapor barriers and/or air barriers work shall comply with fire-resistance ratings as shown, and as required by governing authorities and the New York City Building Code and shall be in accordance with the following requirements:

1. The Office of Technical Certification and Research (OTCR) of the New York City Department of Buildings: Where, in order to be incorporated into the Work, a particular item or product system specified by the Engineer requires acceptance by the New York City Commissioner of Buildings, Contractor shall ensure that the product manufacturer has obtained such approval, without additional expense to DEP, and in providing DEP with an approved certified copy from the Approved Independent Agency, for the

item or product system which shall be submitted to the Engineer as part of the Working Drawing approval process. Contractor may submit, in place of products specified by the Engineer, products which are "equal" in all ways to the product specified that is NYC code prescribed or alternate the code. Such "or approved equal" product submissions shall not change the requirements of these Specifications as to performance, required features or properties, as determined by the Engineer, and shall not require additional compensation to Contractor or additional expense to DEP. Approval of the proposed "equal" is at the sole determination of the Engineer.

2. In those instances where the Commissioner of Buildings requires a certificate of compliance of the manufacturer or producer certifying that the item or product system was tested and is equivalent to material of the same kind and quality regularly being manufactured by such manufacturer or producer Contractor shall provide all such certificates to the Commissioner of Buildings without additional expense to DEP.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings for approval of the Engineer. Submittals shall include, but not be limited to:

1. Product Data: The Contractor shall submit copies of specifications, installation instructions and general recommendations from the vapor barrier and/or air barrier manufacturer. Manufacturer's data substantiating that the materials comply with the requirements shall be included.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery of Materials:

1. Materials shall not be delivered to the project site before the time of installation.

2. Materials shall be delivered in sufficient quantities to allow continuity of the Work.

B. Storage of Materials:

1. Materials shall be stored in original, undamaged containers with manufacturer's labels and seals intact.

2. All materials shall be stored in a dry, enclosed area, out of direct sunlight, off the ground and away from all possible contact with water, ice, or snow.

3. Damage to materials during storage shall be prevented primarily by minimizing the amount of time they are stored at the project site before being incorporated into construction systems.

C. Handling of Materials:

1. Materials shall be handled carefully in order to avoid damage or breakage.

2. Materials shall not be exposed to detrimental conditions or physical damage. Materials which are so exposed shall be permanently removed from the project site and shall not be incorporated into the Work.

3. Materials shall be handled in such a manner so as to prevent inclusion of foreign materials.

4. Packages or containers shall not be opened until all necessary, preparatory Work is complete and installation is to begin immediately. Materials shall not be allowed to become wet or soiled or covered with ice or snow.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Membrane-Type Vapor and Air Barriers

1. Blueskin SA System by Henry, A Carlisle Company, El Segundo, CA

2. Air shield System by W.R. Meadows, Hampshire, IL.

3. Or approved equal.

B. Fluid type Vapor and air barriers:

1. Air-Bloc 16MR System by Henry, A Carlisle Company, El Segundo, CA

2. Air shield LM System by W.R. Meadows, Hampshire, IL.

3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Vapor barrier systems and air barrier systems shall be provided by the same manufacturer.

B. Regular Vapor Barrier Membrane: Regular vapor barrier membrane shall be a three-ply reinforced polyethylene fabric, and shall meet or exceed the following performance standards when tested in accordance with the following methods:

Property	ASTM Test	Result
Weight	ASTM D3776	28 lbs./MSF
Puncture Propagation Tear	ASTM D2582	17 lbs.
Permeance	ASTM E96	0.037 grains/hr/sf

Property	ASTM Test	Result
Drop Dart	ASTM D1709	490 g
3" Tensile Strength	ASTM D882	96 lbs./5800 psi
Puncture Strength	ASTM D4833	26.6 lbs.

C. Fire Retardant Vapor or Air Barrier Membrane: Fire retardant membrane shall be a three-ply laminate fabric combining two layers of fire retardant, linear, low density polyethylene reinforced with a high strength cord grid, and shall meet or exceed the following performance standards when tested in accordance with the following methods:

Property	ASTM Test	Result
Weight	ASTM D3776	43 lbs./MSF
Puncture Propagation Tear	ASTM D2582	26 lbs.
Permeance	ASTM E96	0.035 grains/hr/sf
Cold Crack	ASTM D1709	-15 degrees F
Drop Dart	ASTM D1709	700 g
3" Tensile Strength	ASTM D882	100 lbs./3268 psi
Puncture Strength	ASTM D4833	36.0 lbs.
Flame Spread	ASTM E84	0
Smoke Developed	ASTM E84	50
NFPA 701 Large Scale Fire Resistance Test		Pass

D. Seam Tape: Seam tape shall be the manufacturer's standard double-sided asphaltic pressure sensitive mastic type seaming tape.

E. Fabric Repair Tape: Fabric repair tape shall be the manufacturer's standard self-adhesive tape used to repair any holes in vapor barrier which may be caused by excessive abuse.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examination

1. The Contractor shall verify that areas to receive vapor barriers and/or air barriers are properly prepared and completed to final elevations.

B. Preparation

1. Surfaces to receive vapor barriers shall be clean and free of all foreign matter. Slab subgrade shall be properly compacted in accordance with Division 2 requirements, and shall be smooth with no rutted or lumpy areas.

2. Surfaces to receive air barriers shall be clean and free of all foreign matter.

3.02 INSTALLATION

A. General: Vapor barriers and air barriers shall be installed in strict accordance with the manufacturer's instructions. Barriers shall be smooth and wrinkle free.

B. Seams: Seams in barrier fabric shall be accomplished using the manufacturer's standard seam tape. Fabric overlap and seam tape placement shall be in accordance with the manufacturer's instructions. In ambient temperatures of 60 degrees F and less, additional heat sources shall be applied to the seams to achieve an effective bond.

C. Door, Window and Louver Penetrations: Penetrations edges through the barriers shall be taped using manufacturer's membrane adhere to substrate and return into penetration opening 3-inches. Install in accordance with the manufacturer's directions. Membrane shall not be exposed on interior and exterior finishes and shall cover membrane.

D. Pipe Penetrations: Pipes and other penetrations through the barriers shall be sealed using manufacturer's standard pipe boots, which shall be installed in accordance with the manufacturer's directions.

E. Repairs: Holes in vapor barriers and/or air barriers shall be brought to the attention of the Engineer, and if, in the opinion of the Engineer, the holes are reparable, the holes shall be repaired using the manufacturer's standard fabric repair tape, applied in strict accordance with the manufacturer's instructions.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjusting

1. System components which are dislodged, damaged, expanded, or penetrated by subsequent installation operations or damaged by detrimental

weather shall be immediately replaced with undamaged material in compliance with the Sections and properly protected as specified.

B. Protection

1. All components of the Work shall be protected from detrimental weather and damage until construction operations are completed and acceptable to Engineer.

2. Work which cannot, for reasons acceptable to Engineer, be covered with complete construction system before the onset of weather detrimental to the Work shall be completely covered and protected in such a manner as to deflect water and weather from the installation without damaging adjacent Work.

3. Vapor and air barrier systems shall be protected from all damage and abuse from all other Contractors and installers involved in the Work until Final Acceptance by DEP.

END OF SECTION

PART 1 GENERAL

1.01 SUMMARY

A. The Work of this section includes, but not limited to, fiber cement panels, components of fiber cement panel attachments consisting of the following:

1. Fiber cements panels (fabricated to sizes indicated).
2. Concealed embedded anchoring fasteners.
3. Aluminum horizontal adjustable tracks and clips.
4. Anchors, fasteners, flashing, insect screens and joint trim and other accessories required for a complete installation.

B. The Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish, install and place into satisfactory service all fiber cement panel Work.

C. The Contractor shall implement practices and procedures to meet the project's sustainability goals as identified in the Contract Documents. The Contractor shall ensure that the sustainability requirements of this Section are implemented to the fullest extent.

1.05 DESCRIPTION

A. System Design Requirements

1. Through color high density fiber cement panels.
2. The system shall consist of panels supported by extruded aluminum clips attached to aluminum horizontal tracks. Vertical adjustable aluminum track clips.
3. Fixed concealed, embedded panel anchors.
4. Silicone gaskets inserted into vertical track and silicone isolators wrapped around clips provide color consistent or shadow line at vertical joint (custom color or standard black) and compression bubbles in each maintain panel position across the façade and prevent wind induced rattle.
5. Perimeter Framing Deflection: L/300.
6. Thermal Movement: Design system to accommodate vertical and horizontal thermal movement of components without causing distortion, excessive stress on fasteners, or 'oil canning' when subjected to recurring temperature variations.
7. Drainage: Design for positive drainage of water leakage and condensation to exterior of wall panel system.
8. Seismic Design: Conform to New York Building Code for the Seismic Category appropriate for location of system installation.

B. Structural Performance: Cementitious wall panel assemblies must be designed to withstand project-specific design loads and their effects within constraints specified in this Section and ASCE/SEI 7, as modified by lol codes, without defects, damage, or failure, including but not limited to the following:

1. Dead Loads: As indicated on Drawings.
2. Wind Loads: As indicated on Drawings.
3. Seismic Loads: As indicated on Drawings.
4. Snow Loads: As indicated on Drawings.
5. Live Loads: As indicated on Drawings including those arising from use and occupancy.
6. Loads from Temperature and Moisture Loads: Including expansion, contraction, deflection, deformation, creep, shrinkage, settlement, and differential movement.
7. Cladding Deflection Limits: L/300
8. Restrictions: cementitious wall panels must not have a limitation on installation height.

C. Moisture/Air Control and Weathertightness:

1. Building Enclosure Design Principle: Exterior enclosure construction for this Project is based on. “Rainscreen Principle” as defined by RAiNA. Face sealed assemblies are not permitted.
2. Continuity: Maintain integrity and continuity of building enclosure’s thermal, air, and vapor control layers always by using appropriate insulation, water-resistive barriers to tie work of this section with adjacent construction in sections.
3. System must be a drained, back ventilated system. Incorporate means of draining moisture to exterior. Drainage system must provide clear, paths of drainage of trapped moisture within cementitious panel assemblies to exterior of wall assemblies.

D. Ventilation and Drying:

1. Air Space Inlets and Outlets: Provide air inlets and outlets at the top and bottom of building and at wall terminations. Size air outlets above based on vertical distance between lower inlets. For air outlets at top of building or at wall terminations, do not exceed twice the size of air inlets. Air outlets are permitted to be up to 1/8 in (3mm) less than inlets. Maintain unobstructed vertical airflow near windows, doors, eaves, and building bases.
    a. Minimum sizes for air inlets and outlets (based on building height):
        1) 0 to 16 ft: Minimum air inlets and outlets 3/8 inch.
        2) >16 ft to 33 ft: Minimum air inlets and outlets 1/2 inch.
        3) >33 ft to 66 ft: Minimum air inlets 3/4 inch.
2. Minimum Air Space: Maintain vertical continuity of airflow behind the cementitious panels from the air inlets to the outlets. Provide a minimum vertical air gap based on the building height to ensure the performance of the rainscreen system.
    a. Minimum size for air space for an open jointed system (based on building height):
        1) 0 to 44 ft: Minimum 3/4 inch vertical air space.
        2) >44 ft to 99 ft: Minimum 1 inch vertical air space.

E. Thermal Movements: Fabricate and install cementitious wall panel assemblies to prevent buckling, opening of joints and overstressing of fasteners under the following temperature conditions:

1. Temperature Change: Ambient temperature cycling of -4 deg F to 176 deg F.

F. Color Evaluation: No visible change, 2000 hours of accelerated weathering with color evaluation when calculated to ASTM D 2244.

1.06 QUALITY ASSURANCE

A. Manufacturer Qualifications:

1. Minimum of 10 years' experience in fabricating and supplying fiber cement panel systems.

2. Responsible for technical design support as required for system conforming to panel manufacturer's warranty provisions.

3. Provide review and approval of shop drawings showing conditions differing from panel manufacturer's standard details prior to installation.

4. Conduct interim inspections during construction.

B. Installer Qualifications:

1. Engage a single installer skilled, trained and with successful experience in the installation of preformed metal siding and with specific skill and successful experience in the erection of the types of materials required; and who agrees to employ only tradesmen with specific skill and successful experience in this type of Work. Submit names and qualification to Engineer along with the following information on a minimum of three successful projects:

a. Names and telephone numbers of owner, architects or engineers responsible for projects.

b. Approximate contract cost of the preformed metal siding.

c. Amount of area installed

C. Single Source Responsibility:

1. Provide system and components for this Section under responsibility of single metal wall panel manufacturer.

2. Perform metal panel and related flashing and sheet metal work by or under supervision of single installer.

D. Mock-Up: Provide a full size mock-up minimum 12 feet by 10 feet, with 6 feet corner return, for evaluation of surface preparation techniques and application workmanship. Mock-up shall include a corner, window sill, jamb and head condition, wall base and wall-roof intersection.

1. Finish areas designated by Architect.

2. Do not proceed with remaining work until workmanship, color, and sheen are approved by Architect.

1.07 SUBMITTALS

A. Product Test Reports:

1. Indicate compliance of products with requirements of this Section.

2. Provide report documentation certified by a qualified, independent testing agency.

B. Shop Drawings: Submit for approval the following:

1. Profiles of metal wall panel, and the details of forming, jointing, internal supports, anchorages, trim, flashing, and accessories. Show details of rain screen and condensate drainage at edges, terminations and penetrations of the metal wall panel Work drawn at 1-1/2 inch scale. Accurately represent the conditions where the Work of this Section interfaces with other materials and construction systems such as door, louver and roof construction. Show completely dimensioned small-scale layouts and elevations of entire Work drawn at 1/4 inch scale with details referenced from these elevations.

2. Show location, extent and accurate configuration and profile of all items required to be built into the Work, which penetrate the Work or which are mounted on the Work.

3. Completely dimensioned isometric drawings of details of all custom transition flashings, required for the Work drawn at 1-1/2 inch scale.

4. Completely dimensioned plans, elevations and details showing all support system components and required adjustable anchorage for the entire metal wall panel Work and other inter-related component systems such as windows, louvers and doors specified in other Sections. Support system structural performance calculations and anchorage drawings shall be prepared, signed and stamped with the seal of a Licensed Professional Engineer licensed to practice in the State of New York and recognized as an expert in the specialty involved.

5. Provide drawings coordinating the Work of this Section with adjacent Work.

6. Provide mock-up drawings coordinating the Work of this Section with adjacent Work.

C. Product Data:

1. Provide manufacturer's technical data, installation instructions, standard detail drawings specific to this project, and accessory data showing conformance with specified requirements.

2. Indicate installation requirements, rough-in dimensions, special procedures, and conditions requiring special attention.

3. Provide data for fasteners including: Clips, fastener types, and locations.

4. Provide data related to treatment at edges, terminations, and flashings.

5. Indicate provisions for thermal expansion and contraction.

D. Operation and Maintenance Data: Submit operation, maintenance, and cleaning information for products covered under this section..

E. Samples: Submit for approval the following:

1. Samples two complete sets of 5 1/4" x 2 1/2" color chips. Final selection of finish shall be made by Engineer from complete range of standard finishes from the manufacturer.

2. One of each type fastener employed, with statement of intended use.

3. Samples will be reviewed by Engineer for color, finish and workmanship only. Compliance with all other requirements is the responsibility of Contractor

F. Sustainable Design Submittals:

1. Environmental Materials Reporting Form (EMRF) Recycled Content and Regional Materials. Provide the following information:

a. Name of Product and Manufacturer.

b. Material cost breakdowns. Cost breakdowns must include total material-only cost (excluding installation, labor and equipment).

c. The percentage (by weight) of post-consumer and pre-consumer recycled content for the submitted product.

d. Indicate the location and distance from Project of material manufacturer and point of extraction, harvest, or recovery for each raw material.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Deliver components, wall panels, and other manufactured items to prevent damage or deformity.

B. Package wall panels for protection during transportation and handling.

C. Unload, store, and erect wall panels in a manner to prevent bending, warping, twisting, and surface damage.

D. Store wall panels flat and cover with suitable weather tight and ventilated covering. Store wall panels to ensure dryness, with positive slope for drainage of water. Do not store wall panels in contact with other materials that may cause staining, denting, or other surface damage. Do not allow storage space to exceed 120 degrees Fahrenheit.

E. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

1. High-density, through-color cementitious panels: Standard limited 20-year material and 10-year finish warranty in accordance with manufacturer's terms and conditions.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Fiber Cement Wall Panel:

1. Etex N.V. EQUITONE, 1731 Fred Lawson Drive, Maryville, TN.
2. American Fiber Cement, 6901 S. Pierce St., Littleton, CO.
3. SwissPearl Group AG, 8867 Niederurnen, Switzerland.
4. Or Equal.

2.02 MATERIALS / EQUIPMENT

A. Air-cured High Density Cementitious panels (Grade III) – Premium Semi-Transparent / Graffiti Resistant Finish:

1. Basis-of-Design Product: natura PRO by EQUITONE.
2. Material Location: This item is installed from grade to first floor.
3. Nominal Thickness: 1/2 in.
4. Panel Sizes (fabricated): As noted on Drawings.
5. Panel Fastening Method: concealed using Fischer Tergo+ or approved alternatives per manufacturer.
6. Exposed Finish: Manufacturer's standard semi-transparent, double-layer acrylic finish with a matte UV-hardened polyurethane (PU) topcoat that allows for panel fibers to remain visible.
7. Panel Color: To be selected by Architect from manufacturer's standard offering.
8. Concealed Finish: back side to be sealed with transparent coating.

B. Air-cured High Density Cementitious panels (Grade III) – Opaque / Graffiti Resistant Finish:

1. Basis-of-Design Product: pictura PRO by EQUITONE.
2. Material Location: This item is installed from first floor to roof.
3. Nominal Thickness: 1/2 in.
4. Panel Sizes (fabricated): As noted on Drawings.
5. Panel Fastening Method: concealed using Fischer Tergo+ or approved alternatives per manufacturer.
6. Exposed Finish: Manufacturer's standard opaque, double-layer acrylic finish, with a matte UV hardened polyurethane (PU) topcoat

7. Panel Color: To be selected by Architect from manufacturer's standard offering.

8. Concealed Finish: back side to be sealed with transparent coating.

C. Rainscreen Cladding Support System:

1. Primary rail system (in contact with backup wall)

   a. Basis-of-Design Product: Therma Z by Knightwall or equal.

   b. Rail Finish: Coating per manufacturer.

   c. Rail Color: Black.

   d. Direction: vertical.

2. Secondary rail system (in contact with cementitious wall panel)

   a. Minimum 1.8mm 6063-T5 aluminum.

   b. Rail Finish: Anodized.

   c. Rail Color: Black.

   d. Direction: horizontal.

3. Thermally Broken Systems:

   a. Manufacturer's standard thermally broken support system for rainscreen cladding consisting of horizontal or vertical framing elements, designed to minimize thermal bridging and securely support cladding assembly.

   b. Components: proprietary profiles and brackets suitable for exterior cladding applications. Components must allow for thermal isolation between cladding and building structure.

   c. Thermal Isolation: Incorporate thermal break elements into system to reduce heat transfer. Thermal isolators must be compatible with structural components and sized appropriately to meet system performance requirements.

4. Adjustability: Ensure system allows for adjustable cavity depth to accommodate insulation, align cladding, and maintain required ventilation cavity.

5. Fasteners: Provide mechanical fasteners suitable for substrate encountered. Ensure fasteners are corrosion-resistant and capable of long-term performance in exterior conditions.

6. Bracing and Reinforcement: Include necessary bracing, furring, and support elements to ensure system stability and accommodate special conditions, such as complex geometries or variations in cladding plane.

D. Auxiliary Materials

1. Perforated Insect/Vermin Screen: Provide aluminum or stainless steel perforated screen with perforation pattern that permits airflow equivalent to the continuous inlet/outlet gap as specified in this Section.
    a. Minimum open area: minimum 4.75 in² / ft (1025 mm² open area per linear meter) of open area.
    b. Screen thickness: not to exceed 1/32 in. (0.79 mm/ 21ga) when installed between the cementitious panel and sub-framing elements.
2. Aluminum joint closures: Provide products as detailed on Drawings. Maximum thickness of nonstructural finishing profile to be 1/32 in. (0.79 mm/ 21ga) gage between cementitious panel and sub-framing elements.
3. Galvanic Protection: Provide tapes and other methods as necessary to separate and prevent contact between dissimilar metals.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Fabrication

1. Tolerances: Panel bow not to exceed L/300 panel dimension in width and length.
2. Allow for field adjustments as recommended by the manufacturer where final dimensions cannot be established by field measurement prior to panel fabrication.
3. Do not ship or provide to field any panels with scratches and marks caused by the fabrication of panels.
4. Strippable Protective Film: Factory applied for protection of weather face finish and removed upon completion of the panel installation. Failure to remove the film may lead to over-exposure and damage to the panel.

B. Fasteners

1. Supply Fasteners and clips tested to meet provisions of this section, as approved by fastener manufacturer and engineer of record.
2. Concealed Sheet Metal Fasteners: Non-corrosive fasteners, as instructed by panel manufacturer.
3. Fastener Lengths: Penetrate metal framing and sub girts, and other metal framing systems in accordance with the manufacturer’s recommendations.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examination

1. Verify installation conditions are satisfactory to receive work of this Section before beginning.
2. Verify substrate installation is complete, flat, and true to plane.

B. Preparation

1. Field Measurements: Verify dimensions prior to fabrication of wall panels and flashings.
   a. Field measure location penetrations and other elements and fabricate panels with cut outs to the greatest extend possible.
2. Install sub framing, furring, and other miscellaneous panel support members and anchorages according to ASTM C754 and cementitious panel manufacturer's written recommendations.
3. Ensure step flashings and kick-out flashings are installed before beginning installation of air and water-resistive barrier membrane.
4. Protect surrounding areas and surfaces to preclude damage during work of this Section.
5. Lay out work before beginning installation as necessary for true, plumb, and aligned panel installations.
6. Verify locations of joints and panel lengths.

3.02 INSTALLATION

A. General

1. Conform to manufacturer’s instructions and provisions of Contract Documents.

B. Girts and Fasteners

1. Space, locate, align, and fasten sub girt framing over CMU after application of air barrier as specified by Section 07 27 00 – Vapor and Air Barrier.
2. Install fasteners in lengths and locations in accordance with fastener manufacturers’ instructions.
3. Torque screws as necessary to provide a snug fit. Do not over-torque; prevent damage to panels.

C. Wall Panels

1. Align panels and secure in place without warp or deflection.
2. Saw-cut wall panels where penetrations and wall mounted elements are required is , de-burr edges, and clean as instructed by manufacturer round penetrations and wall mounted elements.
3. Maintain consist of 3/8” gap at penetration and elements abutments.

D. Flashings

1. Install flashings as part of complete, watertight system as necessary to seal and close ends and to restrict water penetration behind wall panels.
2. Thermal Movement: Install flashing systems to allow unrestricted thermal movement of metal panels over attachment clips.
3. Penetrations: Detail and install flashings per weather resistive barrier and metal panel manufacturers' written instructions.

E. Metal Flashing:

1. Detail and install per weather-resistive barrier and metal panel manufacturers' written instructions.
2. Overlap adjacent flashings a minimum of 4 inches in conformance with Section – 07 62 00 Sheet Metal Flashing and Trim.
3. Cutting and Fitting: Make neat, square, and true.

3.03 FIELD TESTING / QUALITY CONTROL

A. Manufacturer's Service:

1. Manufacturer shall review work involved in handling, installation, protection, and cleaning of cementitious wall panel assemblies and components, and submit written reports in acceptable format to verify compliance of Work with Contract conditions.
2. Manufacturer's Field Services: Provide manufacturer's field services consisting of product use recommendations and periodic site visits for product installation review in accordance with manufacturer's instructions.
    a. Report any inconsistencies from manufacturer's recommendations immediately to ENGINEER.
    b. Schedule site visits to review work at stages listed:
        1) Start of installation of secondary vertical framing.
        2) Start of installation of horizontal track system.
        3) Start of installation of fiber cement wall panels.
        4) Midway point of installation of fiber cement wall panels.
        5) Completion of fiber cement wall panels.
3. Clean and inspect fiber cement wall panels prior to substantial completion. Provide photographic and video documents of all elevation of the building.
    a. Replace damaged panels.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjusting

1. Correct identified defects and irregularities.
2. Replace damaged, soiled, or discolored panels.

B. Protection

1. Take measures to protect wall panel installations from construction activities for duration of Project.
    a. Protect cementitious wall panel assemblies from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades. Protect panels from damage during the removal of spacers and shims. Do not apply adhesives or tapes to finished surfaces of panels.
2. Do not permit activities that may result in gouging, scratching, or denting metal panels and flashing.
3. Promptly replace cementitious wall panel assemblies work damaged during construction that cannot be satisfactorily repaired to the satisfaction of the City, at no cost to the City.

C. Cleaning

1. Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
2. Leave installation clean and free from residue and debris from Work of this Section.

END OF SECTION

NO TEXT ON THIS PAGE

PART 1 GENERAL

1.01 SUMMARY

A. This Section describes the general requirements for a fully adhered, single-ply elastomeric roofing system and for a complete water- and weather-tight installation of the system complying with all governing codes and standards.

B. The Contractor shall provide all labor, materials, equipment and incidentals necessary to perform the work of this Section as shown on the Contract Drawings, specified herein or in the Contract, or required otherwise for a complete installation.

C. The Contractor shall implement practices and procedures to meet the project's sustainability goals as identified in the Contract Documents. The Contractor shall ensure that the sustainability requirements of this Section are implemented to the fullest extent.

D. The following index of this Section is presented for convenience:

Article	Title	Section Page

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the

applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1. Rule 1113 - Architectural Coatings

2. Rule 1168 - Adhesives and Sealants

1.05 DESCRIPTION

A. The single ply roofing system to be provided under this Section shall include a complete system of loose-laid elastomeric roofing laminated to a non-woven polyester fleece backing which is capable of direct installation on composite roof insulation without the use of an intermediate protection board and is provided with elastomeric base flashing. The system shall also include all materials and system components required for puncture protection, heavy duty roof walkway, one-way breather vents, and other features necessary to complete the Work.

B. Installation of the System shall meet the requirements of FM Approval Rating Class 1-90 construction for composite cementitious wet fill insulation substrates. The work of this Section shall also be coordinated with the results of Sections 07 22 16-Roof Board Insulation and 07 62 00 – Sheet Metal Flashing and Trim, and the FM publications referenced above.

C. Sustainable Design Requirements: Products applied on site and within the building's weatherproofing system shall comply with VOC limits of authorities having jurisdiction and the following VOC limits of when calculated according to SCAQMD Rule 1113 and Rule 1168:

1. Multipurpose Construction Adhesive: VOC not more than 70 g/L.

2. Plastic Foam Adhesives: VOC not more than 50 g/L.

3. Single-Ply Roof Membrane Sealants: VOC not more than 450 g/L.

4. Nonmembrane Roof Sealants: VOC not more than 300 g/L.

5. Sealant Primers for Nonporous Substrates: VOC not more than 250 g/L.

6. Sealant Primers for Porous Substrates: VOC not more than 775 g/L.

7. Other Adhesives and Sealants: VOC not more than 250 g/L.

D. Project-specific system/design requirements will be provided in the Contract (if necessary) to update the requirements given herein or to supplement other requirements given in the Contract Drawings.

E. Scheduling:

1. Proceed with the roofing and associated work only after curbs, blocking, continuous wood sleepers, vents, drains and projections through the substrate have been installed, and when the substrate construction and framing of openings is completed.

2. Proceed with and complete the Work only when materials, equipment and skilled tradesmen required for the installation of other roofing membrane system components are at the Site and are ready to follow with the Work immediately after composite roof insulation is acceptable for installation of the complete single-ply roofing system.

1.06 QUALITY ASSURANCE

A. Installer Qualifications:

1. Engage a single installer skilled, trained and with successful experience in the installation of single-ply roofing systems, who is a recognized roofing contractor, with specific skill and successful experience in the type of roofing specified, and equipped to perform workmanship in accordance with the Drawings and Specifications, manufacturer's written instructions for guaranteed construction and the approved Shop Drawings and who agrees to employ only tradesmen with specific skill and successful - experience in this type of Work. Submit names and qualifications to Engineer along with the following information on a minimum of three successful projects:

a. Names and telephone numbers of owners, architects or engineers responsible for projects.

b. Approximate contract cost of the single-ply roofing system.

c. Amount of area installed.

2. The roofing installer shall be an approved roofing applicator who has qualified for appointment and has been trained by the manufacturer.

3. Proof of acceptability of installer by manufacturer to Engineer.

B. Performance Criteria: Provide the following:

1. Except as otherwise shown, comply with the written specifications and recommendations of the roofing manufacturer. In addition, comply with FM Publication 1-28 Technical Advisory Bulletin for Class 1-90 wind up-lift resistance. Select appropriate entries in Table 3 of 1-28 for submission to Engineer for approval.

2. Single-ply roofing system, base and other flashings shall be permanently weather- and watertight, and not deteriorated in excess of manufacturer's published limitations.

3. Provide stone ballast weight distributions over entire roof surfaces in all areas not shown to receive heavy-duty roof walkway pavers and pedestal system. Comply with FM wind uplift criteria, ballast and paver locations, weights of materials required in fields, perimeters and corners of roof areas, and approval recommendations contained in 1-29 paragraph 2.7 'Single-Ply Membrane Covers: General.'

4. Provide heavy-duty walkway protection pavers at all traffic concentration points regardless of traffic frequency and whether or not shown.

5. Specified manufacturer's installation and product specifications and details unless more stringent criteria shown or specified is acceptable to the single-ply roofing system manufacturer specified.

C. Requirements of Regulatory Agencies:

1. Comply with applicable insurance rating bureau requirements as required by the New York City Building Code, unless more restrictive requirements are specified.

2. Provide materials and roofing systems which have been tested, listed and labeled by Underwriters Laboratories' Incorporated for Class "A" rating, and bear the UL label on each package or are shipped to the Site with a UL Certificate of Compliance.

3. Provide roofing materials which have been tested, listed and FM labeled for Class "A" maximum flame spread rating.

4. The Office of Technical Certification and Research (OTCR) of the New York City Department of Buildings: Where, in order to be incorporated into the work, a particular item or product system specified by Engineer requires acceptance by the New York City Commissioner of Buildings, Contractor shall ensure that the product manufacturer has obtained such approval, without additional expense to DEP, and in providing DEP with an approved certified copy from the Approved Independent Agency, for the item or product system which shall be submitted to Engineer as part of the Shop Drawing approval process. Contractor may submit, in place of products specified by Engineer, products which are "equal" in all ways to the product specified that is NYC code prescribed or an alternate to the code. Such "or approved equal" product submissions shall not change the requirements of these Sections as to performance, required features or properties, as determined by Engineer, and shall not require additional compensation to Contractor or additional expense to DEP. Final acceptance of "equal" is at the sole determination of Engineer

5. Comply with all applicable requirements of governing authorities and codes for all Work.

6. In those instances where the Commissioner of Buildings requires a certificate of compliance of the manufacturer or producer certifying that the item or product system was tested and is equivalent to material of the same kind and quality regularly being manufactured by such manufacturer or producer Contractor shall provide all such certificates to the Commissioner of Buildings without additional expense to DEP.

D. Source Quality Control:

1. Obtain elastic sheets from only one manufacturer, who publishes complete information on the specified roofing system, and offers to guarantee the completed roofing installation as required.

2. Take field dimensions prior to preparation of Shop Drawings.

E. Allowable Installation Tolerances:

1. Do not install Work until substrate preparation and tolerances have been approved by Engineer, single-ply roofing system manufacturer's Technical Representative and the single-ply roofing system installer and Contractor have verified to Engineer that substrates are within tolerances specified and acceptable to produce approved Work. Work advanced for any reason without such verification shall be stopped, removed and replaced with new material after substrate is approved at no additional expense to DEP.

2. Substrate Tolerances:

a. Out-of-Plane: 1/8 inch maximum in 10 foot - 0 inches and 1/16 inch maximum in any 12 inches measured along the plane.

b. Maximum Offset in Plane Alignment: 1/16 inch.

c. Variation From Slope: 1/8 inch maximum in 10 foot - 0 inches.

1.07 SUBMITTALS

A. The Contractor shall submit the following for review and approval by the Engineer:

1. Samples: Submit for approval the following:

a. 12-inch by 12-inch sheet of each item specified and 6-inch long pieces of each required system component to be used in the Work.

b. Each fastener type required marked as to type of material and with their intended purpose in the Work.

c. All components of the single-ply roofing system, flashing and ballast systems labeled with their intended use in the Work.

2. Shop Drawings: Submit for approval the following:

a. Shop Drawings completely dimensioned using field-verified dimensions on plans of each roof area. Also accurate location of all roof penetrations, roof mounted equipment, curbs, skylights and other features on the roof as specified by Engineer. Contractor shall submit all details requiring consideration and the performance of the details shall be approved by the single-ply roofing system manufacturer for guaranteed construction as specified.

b. Manufacturer's specifications and product manuals indicating product information correlated to specified requirements, manufacturer's installation instructions, maintenance instructions and other data as may be required by Engineer.

c. Copies of the FM Global Property Loss Prevention Data publications and appropriate Technical Advisory Bulletins published by Factory Mutual indicating compliance with wind uplift pressure-resistant performance criteria, ballast and paver requirements and the requirements for FM Approved 1-90 system construction and perimeter securement conditions.

3. Contractor's Review: Accompanying approval request, submit to Engineer a written statement signed by Contractor, stating that the Drawings and Sections for roofing and flashing have been reviewed with an agent of the roofing material manufacturer and that he is in agreement that the selected systems are proper, compatible and that the details shown are not in conflict with the roofing manufacturer's roofing and flashing details. Show by copy of transmittal form that a copy of the statement has been transmitted to the manufacturer.

4. Statement of Application: Upon completion of the Work, submit a statement to Engineer signed by Contractor stating that the Work complies with the requirements of these Sections and the installation methods comply with the manufacturer's printed instructions and were proper and adequate for the condition of installation and use.

B. Sustainable Design Submittals:

1. VOC Reporting Form. Provide the following information:

a. For all adhesives and sealants, applied on site and within the building's weatherproofing system, provide the VOC content in grams/Liter (g/L) less water and other exempt compounds.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery of Materials:

1. Deliver materials to the site in sufficient quantities to ensure uninterrupted progress of the Work.

2. Deliver materials in manufacturer's original, unopened containers and rolls with labels intact and legible.

3. Materials requiring fire resistance classification shall be delivered to the job with labels attached and packaged as required by labeling service.

B. Storage of Materials:

1. Store materials in a dry, well ventilated, weather tight place, and in a manner which will ensure that there is no possibility of significant moisture pick-up.

2. Store in a manner which complies with fire and safety regulations.

3. Store emulsions at temperatures above 40°F.

C. Store materials on clean raised platforms with weather protective covering when stored outdoors. Handling of Materials:

1. Handle rolled goods so as to prevent damage to edge or ends.
2. Select and operate material handling equipment so as not to damage existing construction or applied roofing.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

1. Firestone: RubberGard EcoWhite EPDM Roofing System;
2. Carlisle:
3. Sitka Sarnafil: EcoSmart Roofing System;
4. Or an approved equal.

2.02 MATERIALS / EQUIPMENT

A. Adhered Roofing Systems: Provide the following:

1. Ethylene Propylene Diene Monomer Synthetic Rubber Sheeting: Provide white synthetic rubber sheeting laminated to a 0.075-inch thick non-woven polyester fleece backing. Comply with the following:
   a. Rubber Membrane Thickness (not including polyester backing):
      1) 0.060-inches.
   b. Hardness Durometer A, ASTM D2240: 60 ±10 points
   c. Tensile Strength, ASTM D412: 1305 pounds per square inch minimum
   d. Elongation at Break, ASTM D412: 500% minimum at 75 F
   e. Brittleness Temperature, ASTM D2137: -75 F
   f. Tear Resistance, ASTM D624: 175 pounds per linear inch minimum
   g. Flame Resistance, ASTM D542: No flame
   h. Resistance to Heat Aging, Change in Original Properties after 70 hours at 212 F, ASTM D573: Hardness +10 points maximum, Elongation -40 percent maximum, Tensile Strength -15 percent maximum

i. Resistance to Oil Aging, Change in Volume after 70 hours Immersion in ASTM No. 33 oil at 212 F, ASTM D471: +80 percent

j. Resistance to Ozone, Condition after Exposure to 100 pphm Ozone in Air for 168 hours at 104 F, ASTM D1149: No cracks

k. Resistance to Permanent Set, Compression Set after 22 hours at 158 F, ASTM D395: +10 percent maximum

l. Resistance to Water, Change in Weight after 7 days Immersion at 158 F, ASTM D471: 2.0% maximum change in mass

B. Cover Board:

1. ASTM C 1177/C 1177M, glass-mat, water-resistant gypsum substrate, 5/8 inch thick, factory primed

2. Protection Mat: Woven or nonwoven polypropylene, polyolefin, or polyester fabric, water permeable and resistant to UV degradation, type and weight as recommended by roofing system manufacturer for application

3. Attachment: Polyurethane adhesive.

C. Insulation:

1. Total Insulation Assembly R-Value: R-33.

2. Insulation board Maximum Thickness: 3”.

3. Insulation Assembly Minimum Thickness (low point): 5”

4. Attachment: Adhered.

5. Refer to Specification Section 07 22 16 Roof Board Insulation for roof insulation product.:

D. Substrate Board:

1. ASTM C 1177/C 1177M, glass-mat, water-resistant gypsum substrate, 5/8 inch thick, factory primed

2. Protection Mat: Woven or nonwoven polypropylene, polyolefin, or polyester fabric, water permeable and resistant to UV degradation, type and weight as recommended by roofing system manufacturer for application.

3. Attachment: Mechanically attached.

E. Vaper Barrier:

1. Polyethylene Film: ASTM D4397, 6 mils, minimum, with maximum permeance rating of 0.13 perm.:

Walkway Pads: White EPDM, 0.30” thick by 30” x 30” with EPDM tape adhesive strips laminated to the bottom.

F. Miscellaneous Materials: Provide the following:

1. Flashing Membrane: Non-reinforced, bi-laminate, white-on-black, cured single ply roofing membrane composed of ethylene propylene diene monomer, same thickness as roofing membrane.
2. Splice Cleaner: Cleaning solution for EPDM containing toluene, heptane, carbon black and isopropanol.
3. Bonding Adhesive: Two-part spray-applied polyurethane foam catalyzed as required by installation temperature range encountered.
4. In-Seam Sealant: Silicone.
5. Splicing Cement: Butyl adhesive.
6. Lap Sealant: EPDM elastomeric sealant.
7. Deck Primer: As recommended by sheet manufacturer.
8. Asphalt: ASTM D312, Type III. Softening Point: 185F-205F
9. Rubber Fastening Strips: As required by roofing manufacturer for fully guaranteed construction.
10. Termination Bars: Continuous 2-inch by 1/4-inch Type 316 stainless steel.
11. Rubber Fastening Strips: As required by roofing manufacturer for fully guaranteed construction.
12. Yellow Safety Strip: A 5.5″ strip and nominal 30 mil (0.76 mm) thick yellow TPO or EPDM membrane laminated to a white, cured, seam tape, compatible with EPDM.
13. Other miscellaneous and accessory materials required for guaranteed construction.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Shop fabricate all special flashings shown using sheeting specified.

B. Use manufacturer's standard sheet seaming system for "plastic welding" or lapped joints to create seams of strength equal to sheet strength.

C. Include edge sealer to cover exposed sheet edges.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. The Contractor shall examine the substrate and the conditions under which the single-ply roofing system and base flashing Work is to be performed, and notify Engineer in writing of unsatisfactory conditions. Do not proceed with the Work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

B. Verify adequacy of slope-to-drain, compressive strength, moisture content and other composite roof insulation features important to the successful installation of the single-ply roofing system, flashing and ballast systems before start of work.

3.02 INSTALLATION

A. General:

1. Follow all applicable installation instructions and recommendations contained in the single-ply roofing system manufacturer's written installation and product manuals and the information contained on approved Shop Drawing submittals. Where Contractor wishes to deviate from written installation and product manuals and approved Shop Drawing submittals all such deviations shall be submitted to Engineer for approval along with single-ply roofing system manufacturer's written agreement and a statement of acceptability for compliance with guaranteed construction.

2. Begin installation only in the presence of the single-ply roofing system manufacturer's technical representative.

3. Cut sheets to the maximum size possible, in order to minimize seams and to accommodate contours of the deck. Do not seam within four feet of roof drains.

4. Clean all splices and lap areas using manufacturer's recommended splice cleaner.

5. Lap sheets and bond joints using the seaming system recommended by the manufacturer.

6. Cover top edges of each sheet at seams with uniform fillet of special sealant.

7. Install one-way breather vents as recommended by the single-ply roofing system manufacturer as shown but not less than one per 1000 square feet.

8. Install all roofing and associated work in a manner that will insure a complete roofing system at the end of each day’s work. Do not advance the installation of any one material beyond that which is necessary for proper sequencing of the single-ply roofing system Work.

B. Pre-installation Conference:

1. Prior to the installation of the single-ply roofing system and associated Work, Contractor shall schedule and meet at the site with the roofing installer, the installer of each component of associated work, the installers of deck and composite insulating substrate construction to receive roofing Work, the installers of other work in and around roofing which must follow the roofing Work, including mechanical work, Engineer and other representatives directly concerned with performance of the Work. Review foreseeable methods and procedures related to the single-ply roofing system Work, including but not necessarily limited to, the following:

a. Review project requirements, including Drawings, Sections and other Contract Documents.

b. Review required submittals, both completed and yet to be completed.

c. Review status of substrate including drying, structural loading limitations and similar considerations.

d. Review availability of materials, tradesmen, equipment and facilities needed to make progress and avoid delays.

e. Review required inspection, testing, certifying and accounting procedures.

f. Review weather and forecasted weather conditions, and procedures for coping with unfavorable conditions.

g. Review regulations concerning code compliance, FM compliance, environmental protection, health, safety, fire and similar considerations.

h. Review procedures needed for protection of roofing during the remainder of the construction period.

2. Reconvene the meeting at the earliest opportunity if additional information must be developed in order to conclude the subjects under consideration.

3. Record any revisions or changes agreed upon, reasons therefor, and parties agreeing or disagreeing with them.

C. Environmental Conditions:

1. Proceed with roofing and associated work only when weather conditions will permit unrestricted use of materials and quality control, complying with the Section requirements and with the recommendations of the roofing materials manufacturers.

2. Proceed only when Contractor and his installer are willing to guarantee the Work as required and without additional reservations and restrictions.

3. Record decisions, conditions and agreements to proceed with the Work when weather conditions might be unfavorable. State the reasons for proceeding, with the names of the persons involved along with the changes, if any, or revisions, requirements or terms of the Contract.

D. Substrate Board

1. Install substrate board with long joints in continuous straight lines, perpendicular to roof slopes with end joints staggered between rows. Tightly butt substrate boards together.

2. Fasten substrate board to top flanges of steel deck to resist uplift pressure at corners, perimeter, and field of roof according to membrane roofing system manufacturers' written instructions.

E. Vapor Retarder Installation

1. Polyethylene Film: Adhere polyethylene-film vapor retarder in a single layer over area to receive vapor retarder, side and end lapping each sheet a minimum of 2 inches and 6 inches, respectively.

2. Completely seal vapor retarder at terminations, obstructions, and penetrations to prevent air movement into membrane roofing system.

F. Insulation and Cover Board Installation

1. Refer to Section 07 22 16, Roof Board Insulation.

2. Coordinate installing membrane roofing system components so insulation is not exposed to precipitation or left exposed at the end of the workday.

3. Comply with membrane roofing system, cover board and insulation manufacturer's written instructions for installing roof insulation.

4. Comply with membrane roofing system manufacturer's written instructions for installing roof cover board.

G. Adhered Membrane Roofing Installation

1. Adhere membrane roofing over area to receive roofing according to membrane roofing system manufacturer’s written instructions. Unroll membrane roofing and allow to relax before installing.

2. Start installation of membrane roofing in presence of membrane roofing system manufacturer’s technical personnel.

3. Accurately align membrane roofing and maintain uniform side and end laps of minimum dimensions required by manufacturer. Stagger end laps.

4. Bonding Adhesive: Apply to substrate and underside of membrane roofing at rate required by manufacturer and allow to partially dry before installing membrane roofing. Do not apply to splice area of membrane roofing.

5. Fabric-Backed Membrane Adhesive: Apply to substrate at rate required by manufacturer and install fabric-backed membrane roofing.

6. In addition to adhering, mechanically fasten membrane roofing securely at terminations, penetrations, and perimeters.

7. Apply membrane roofing with side laps shingled with slope of roof deck where possible.

8. Tape Seam Installation: Clean and prime both faces of splice areas, apply splice tape, and firmly roll side and end laps of overlapping membrane roofing according to manufacturer’s written instructions to ensure a watertight seam installation. Apply lap sealant and seal exposed edges of membrane roofing terminations.

9. Repair tears, voids, and lapped seams in roofing that does not comply with requirements.

10. Spread sealant or mastic bed over deck drain flange at roof drains and securely seal membrane roofing in place with clamping ring.

11. Install membrane roofing and auxiliary materials to tie in to existing membrane roofing to maintain weather-tightness of transition and to not void warranty for existing membrane roofing system.

H. Base Flashing Installation

1. Install sheet flashings and preformed flashing accessories and adhere to substrates according to membrane roofing system manufacturer's written instructions.

2. Apply bonding adhesive to substrate and underside of sheet flashing at required rate and allow to partially dry. Do not apply to seam area of flashing.

3. Flash penetrations and field-formed inside and outside corners with cured or uncured sheet flashing.

4. Clean splice areas, apply splicing cement, and firmly roll side and end laps of overlapping sheets to ensure a watertight seam installation. Apply lap sealant and seal exposed edges of sheet flashing terminations.

5. Terminate and seal top of sheet flashings and mechanically anchor to substrate through termination bars.

I. Roof Walkway:

1. Flexible Walkway Pads: Install walkway products in locations indicated. Adhere walkway products to substrate with compatible adhesive according to roofing system manufacturer's written instructions.

3.03 FIELD TESTING / QUALITY CONTROL

A. Field Testing

1. Before placing any ballast or pads on single-ply roofing system membrane, and after all elastic sheet and flashing seams have been sealed, conduct in-place water retention tests.

2. Plug drains and flood roof with 2 inches of water above roof high points. Let water remain in-place for 24 hours. Do not add additional water during the time of the test and schedule testing during a period when precipitation is not predicted. If precipitation occurs during the time of the test, redo test when precipitation is not predicted during the time of the test. Calculate expected evaporation at temperatures, humidity and wind conditions occurring during the time of the tests.

3. Measure water remaining in place at the high point of roofs. Roof areas which demonstrate loss of water, that cannot be explained by loss due to evaporation, shall be inspected by a Technical Representative of the single-ply roofing system manufacturer and the source of leaks determined and presented to DEP and the Engineer as part of a field report which shall also

make recommendations for remedial Work. Where the source of leaks cannot be determined, the single-ply roofing system shall be removed and replaced with new single-ply roofing system at no additional expense to DEP. All material and construction systems damaged by the results of this test shall be replaced with new at no additional expense to DEP.

4. After remedial repairs have been made and inspected by a representative of the single-ply roofing system manufacturer and judged to be watertight, repeat the water retention test. If, this test shows that the single-ply roofing system is still not retaining water according to expected results, remove the entire single-ply roofing system and replace with new at no additional expense to DEP.

B. Inspection and Acceptance

A. At the end of the construction period, or at a time when the remaining construction Work will in no way affect or endanger the single-ply roofing system and associated Work, a technical representative of the single-ply roofing system manufacturer shall make a final inspection of the Work and prepare a written report to DEP and Engineer of deterioration, damage or deficiencies found in the Work.

B. Only the installer shall repair or replace deteriorated or defective Work.

C. Certify that the completed Work is in accordance with the Sections, and without damage or deterioration (except for normal weathering) at time of Final Acceptance.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Protect single-ply roofing system from damage during the construction period so that it will be undamaged in any way at the time of Final Acceptance by DEP.

1. Provide continuous protection of materials against wetting and moisture absorption.

2. Protect materials against damage by construction traffic.

B. Protect other Work, and surfaces of membrane, from spillage of single-ply roofing system sealing and bonding materials, and prevent materials from entering and clogging drains and conductors.

C. Replace Work which is soiled or otherwise damaged by the performance of the single-ply roofing system and associated Work and from improper installation techniques.

D. Remove broken, cracked and chipped pedestrian plaza pavers and replace with undamaged material.

END OF SECTION

SECTION 07 62 00 – SHEET METAL FLASHING AND TRIM
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. This Section describes the general requirements for sheet metal flashing and trim for a complete water- and weather-tight installation complying with all governing codes and standards.

B. The Contractor shall provide all labor, materials, equipment and incidentals necessary to perform the work of this Section as shown on the Contract Drawings, specified herein or required otherwise for a complete installation.

C. The Contractor shall implement practices and procedures to meet the project's sustainability goals as identified in the Contract Documents. The Contractor shall ensure that the sustainability requirements of this Section are implemented to the fullest extent.

D. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the

applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

E.	SMACNA	–	Sheet Metal and Air Conditioning Contractors National Association, Incorporated, Architectural Sheet Metal Manual

1.05 DESCRIPTION

A. Sheet metal flashing and trim to be provided under this Section shall include complete systems of flashing and counterflashing at penetrations in roofing; interlocking, mechanically-keyed, 3-way ribbed stainless steel metal masonry cavity wall flashing and miscellaneous system components such as cast-in-place and built-in-place reglets and other accessory components; miscellaneous flashings not supplied under the work of other Sections; miscellaneous accessories, fasteners and incidental system components.

B. Installation of the systems shall meet the requirements of FM Approval Rating Class 1-90 construction, without relying upon sealants or other non-metallic detailing and fabricating techniques to achieve weather- and water tightness.

C. Performance Criteria:

1. Sheet metal flashing and trim shall be permanently watertight, and not deteriorate in excess of manufacturers' published limitations.

2. Comply with fabrication details recommended by SMACNA and the sheet metal flashing and trim manufacturers, as approved by Engineer at time of Shop Drawing submission.

3. Provide completely weather- and watertight wall and single-ply roofing metal flashing systems. Contractor shall provide only the highest quality materials and methods of construction and installation as recommended by sheet metal flashing and trim manufacturers in compliance with governing

authorities and as approved by Engineer at time of Shop Drawing submission.

D. Sustainable Design Requirements

1. Recycled Content of Steel-Sheet Flashing and Trim: Postconsumer recycled content plus one-half of preconsumer recycled content shall not be less than 25 percent.

2. Low Emitting Materials: All adhesives and sealants used onsite and within the building's weatherproofing system shall meet the VOC content limits for the work as specified in the Contract Documents.

E. Project-specific system/design requirements will be provided (if necessary) in the Contract in order to update the requirements given herein or to supplement other requirements given in the Contract Drawings.

F. Scheduling:

1. Coordinate ribbed metal cavity wall flashings with other Work to ensure secure anchorage and watertight seals, and to minimize exposure to puncture or other damage from the work of other trades. Refer to Sections 04 22 00 - Concrete Unit Masonry and 07 53 00 - Elastomeric Membrane Roofing.

2. Deliver materials to the site in sufficient quantities to ensure uninterrupted progress of the Work.

3. Do not proceed with the sheet metal flashing and trim Work until curb and substrate construction, blocking, and other construction to receive the Work is completed.

4. Schedule the installation of sheet metal flashing and trim Work to coincide with the installation of roofing, waterproofing, drains, piping, blocking, nailers, framing at openings, curbs, Concrete Unit Masonry and other adjoining and substrate work.

5. Proceed with and complete the work only when materials, equipment and knowledgeable tradesmen required for the installation of sheet metal flashing and trim systems are at the site and are ready to follow and integrate the work of this Section with work requiring the installation of sheet metal flashing and trim.

1.06 QUALITY ASSURANCE

A. Engage installers skilled, trained and with successful experience in the detailing, fabrication and installation of each type of sheet metal flashing and trim work required who are recognized sheet metal contractors, equipped to perform workmanship in accordance with the Contract Documents and approved Shop Drawings so that there will be undivided responsibility for the performance of each flashing and trim component of the work.

1.07 SUBMITTALS

A. The Contractor shall submit the following to the Engineer for review and approval:

1. Installer Qualifications: Submit names and qualifications to Engineer along with the following information on a minimum of three successful projects:

a. Names and telephone numbers of owners, architects or engineers, responsible for the projects.

b. Approximate contract prices for sheet metal flashing and trim.

c. Size of area installed

2. Samples:

a. Typical examples of sheet metal flashing and trim profiles, 12-inches long with all fasteners, clips, and supports required for the Work. 12-inch by 12-inch sheet of each item specified and 6-inch long pieces of each required system component to be used in the work.

b. Each fastener type required marked as to type of material and with their intended purpose in the work.

3. Shop Drawings:

a. Copies of manufacturers' specifications, installation instructions and recommendations for sheet metal flashing and trim requirements.

b. Manufacturer's data substantiating that the materials comply with the requirements.

c. Shop Drawings showing the coordination of the Work with Sections 04 22 00 – Concrete Unit Masonry and 07 53 00 – Elastomeric Membrane Roofing.

d. Detailed Shop Drawings showing all profiles of sheet metal flashing and trim systems to be used in the work, fully dimensioned, located, quantified and presented such that sequence of installation is acceptable to each interfacing material supplier.

e. Large scale isometric drawings of all sheet metal and trim intersections and transitions, include all fastener locations and materials, cleats and other miscellaneous accessories necessary to complete the Work as specified.

B. Sustainable Design Submittals:

1. Environmental Materials Reporting Form (EMRF) Recycled Content. Provide the following information:

a. Name of Product and Manufacturer.

b. Material cost breakdowns. Cost breakdowns must include total material-only cost (excluding installation, labor and equipment).

C. Percentage (by weight) of post-consumer and pre-consumer recycled content in the submitted product(s), if applicable.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery of Materials:

1. Deliver materials in manufacturers' original, unopened and undamaged containers and rolls, with labels intact and legible and with information accurately representing container contents as approved by Engineer at time of Shop Drawing submission.

2. Items delivered in broken, damaged, rusted, or unlabeled condition shall immediately be removed from project site and not offered again for approval by Engineer.

B. Storage of Materials:

1. Store materials in an area protected from all construction traffic not associated with the work of this Section.

2. Store materials off the ground and in same package in which they were shipped, and on platforms protected from dirt and other contamination.

3. Store under cover and in a manner which does not permit water to remain on units.

C. Handling of Materials:

1. Protect all sheet metal flashing and trim work from dents, scratches, warps and bends.

2. Immediately after installation of each system component, remove all strippable protective films.

3. Comply with manufacturer's instructions for handling and installation of the ribbed metal cavity wall flashing materials, except where more stringent requirements are shown or specified.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Through-Wall Ribbed Sheet Metal Flashing (Stainless Steel):

1. Cheney Flashing Company, Inc.; Cheney Flashing – Trenton, NJ.
2. Or approved equal.

B. Reglets:

1. Cheney Flashing Company, Inc., Trenton, NJ.
2. Or approved equal

2.02 MATERIALS / EQUIPMENT

A. Stainless Steel Flashings Associated with Single-Ply Roofing:

1. Provide through-wall sheet metal flashing for embedment in masonry with ribs at 3-inch intervals along length of flashing to provide an integral mortar bond.
2. Provide sheet stainless steel, Type 316 complying with ASTM A666, with No. 2D dead soft, fully annealed finish, unless required to be harder temper for proper forming and performance for application indicated.
3. Provide thickness of 0.0156 inch.
4. Provide stainless steel flashing and counterflashing at penetrations in single- ply roofing.

B. Interlocking Mechanically-Keyed, Ribbed Stainless Steel Flashing & Counterflashing System Associated with Concrete Unit Masonry:

1. Provide deformed sheet, stainless steel, Type 316 complying with ASTM A666 for all Work with No. 2D finish.
2. For flashing within concrete unit masonry wall system, through-wall flashing at spandrels and horizontal steel and concrete members in walls provide flashing with a mechanically-keyed, 3-way saw tooth design, which bonds in all directions and which has weep holes drainage at 3-inch intervals.
3. Provide a complete system of interlocking, mechanically-keyed components all by the same manufacturer including, but not limited to, cast-in-place mechanically-keyed and built-in-place mechanically-keyed masonry-reglets, through-wall metal masonry counterflashing and metal through-wall base flashing, and in other locations shown.
4. Thickness: Provide thickness of 26 gauge (0.018-inches).

C. Reglets: Units of type, material, and profile indicated, formed to provide secure interlocking of separate reglet and counterflashing pieces, and compatible with flashing indicated with factory- mitered and -welded corners and junctions.

1. Material: Stainless steel, 0.0187 inch thick.

2. Select reglet types required from subparagraphs below.

3. Surface-Mounted Type: Provide with slotted holes for fastening to substrate, with neoprene or other suitable weatherproofing washers, and with channel for sealant at top edge.

4. Stucco Type: Provide with upturned fastening flange and extension leg of length to match thickness of applied finish materials.

5. Concrete Type: Provide temporary closure tape to keep reglet free of concrete materials, special fasteners for attaching reglet to concrete forms, and guides to ensure alignment of reglet section ends.

6. Masonry Type: Provide with offset top flange for embedment in masonry mortar joint.

7. Flexible Flashing Retainer: Provide resilient plastic or rubber accessory to secure flexible flashing in reglet where clearance does not permit use of standard metal counterflashing or where Drawings show reglet without metal counterflashing.

8. Counterflashing Wind-Restraint Clips: Provide clips to be installed before counterflashing to prevent wind uplift of counterflashing lower edge.

D. Miscellaneous Materials:

1. Solder for Stainless Steel: ASTM B32, Lead-free; 96.5% Sn, 3.45% Cu, 1% Sb, 0.05% Ag used with an acid flux of the type recommended by the stainless steel manufacturer. Use a non-corrosive rosin flux over tinned surfaces.

2. Stainless Welding Rods: Type recommended by stainless steel sheet manufacturer for the type of metal sheets furnished.

3. Nails, Screws and Rivets: Same material as flashing sheet, or as recommended by manufacturer of flashing sheet.

4. Cleats: Same metal and gage as sheet being anchored, 2-inches wide, punched for two anchors.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Fabricated Metal Flashing and Trim: Shop fabricate sheet metal flashing and trim to comply with profiles and sizes shown, and to comply with manufacturer's recommended details. Except as otherwise shown or specified, provide soldered flat-lock seams, and fold back metal to form a hem on the concealed side of exposed

edges. Comply with metal producers' recommendations for tinning, soldering and cleaning flux from metal.

B. On all metal base and counterflashing, and trim provide completely shop-fabricated corners and special flashings; arc welded to insure watertight joints. Grind welds smooth so as to be indistinguishable from adjacent surfaces

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examination

1. The Contractor shall examine the substrate and the conditions under which the sheet metal flashing and trim Work is to be performed, and notify the Engineer in writing of unsatisfactory conditions. Do not proceed with the work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

B. Preparation

1. Clean the substrate of dust, debris, substances and interferences detrimental to the Work and prepare substrates as recommended by the sheet metal manufacturer.

3.02 INSTALLATION

A. General:

1. Separate dissimilar metals from substrates and from each other by painting each metal surface in the area of contact with a 15-mil thick application of bituminous coating, as recommended by the manufacturers of the dissimilar metals. Comply with manufacturer's recommendations for other forms of protection of the stainless steel and aluminum against corrosion.

2. Provide thermal expansion for running trim, flashing and other items exposed for more than 15 feet - 0 inch continuous length. Maintain a watertight installation at expansion seams. Locate expansion seams at 15 feet - 0 inch intervals, and 2 feet - 0 inch each side of corners and intersections.

3. Fabricate and install the work with lines and corners of exposed units true and accurate. Form exposed faces flat and free of buckles, excessive waves and avoidable tool marks, considering the temper and reflectivity of the metal. Provide uniform, neat double-locked seams with cleats rolled into the seam and with minimum exposure of solder, welds and sealant. Except as otherwise shown, fold back the sheet metal to form a hem on the

concealed side of exposed edges. All exposed edges of all sheet metal flashing shall be hemmed not less than 1/2-inch wide.

4. Conceal fasteners and expansion provisions wherever possible in exposed work, and locate so as to minimize the possibility of leakage. Cover and seal work as required for a watertight installation.

5. Provide cleat-type anchorages for metal flashings and trim wherever practical, arranged to relieve stresses from building movement, and thermal expansion and contraction.

6. On vertical surfaces lap 2-piece flashings a minimum of 4 inches.

7. On sloping surfaces, for slopes of not less than 6 inches in 12 inches, lap unsealed flashings a minimum of 6 inches. For slopes less than 6 inches in 12 inches, use soldered flat-locked seams.

8. For embedment of metal flashing flanges in single ply roofing or flashing or stripping, extend flanges for a minimum of 6 inches embedment.

9. Flashing to be inserted into reglets shall be installed to the full depth of the reglet with the top flange of the flashing edge turned forward to form a hook. Caulk flashing into reglets using stainless steel wedges. Fill reglet with sealant specified in Section 07 90 00 - Joint Protection.

B. Installation of Stainless Steel Flashing and Trim:

1. Tin the edges of plain stainless steel to be soldered, for a width of 1-1/2 inches, using solder for stainless steel and acid flux. Remove every trace of acid flux residue from the metal promptly after tinning or soldering.

2. Provide welded joints. Provide upturned, 1/2-inch wide hooked flanges, and weld between adjoining sheets; lay seam flat.

C. Installation of Ribbed Metal Cavity Wall Flashing:

1. Build ribbed metal through-wall masonry flashing work into Concrete Unit Masonry construction as construction work progresses. Work performed without built-in flashings shall be stopped, removed and rebuilt at no additional expense to DEP, even if discovered only after walls and other materials are in-place and completed.

2. Install all flashings in a split bed of mortar, increasing the thickness of the bed if required to achieve full mortar coverage on top and bottom of flashings.

3. Coordinate the installation of flashing materials and associated work so as to provide a complete system complying with the combined recommendations of manufacturers and installers involved in the work.

4. Use only installation techniques approved by the ribbed metal cavity wall flashing manufacturer

3.03 FIELD TESTING / QUALITY CONTROL

A. Field Quality Control for Cavity Wall Flashing

1. Field test ribbed metal cavity wall flashing after installation. After building three courses of concrete unit masonry above area of ribbed cavity wall flashing, tape weep vents closed and fill cavity with water.

2. Water leaking from the wall below the area of the ribbed metal cavity wall flashing shall be evidence that the ribbed metal cavity wall flashing was improperly installed.

3. Remove concrete unit masonry and improperly installed ribbed cavity wall flashing and install new ribbed cavity wall flashing. Repeat this process until the wall does not shown evidence of leakage beneath ribbed cavity wall flashing. All such remedial work shall be at no additional expense to DEP.

4. Remove tape from weep vents and all mortar and other debris from cavity and demonstrate free flow of water from the cavity at conclusion of test

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Provide continuous protection of metal flashing and trim materials against wetting, contamination and other damage primarily by storing materials under cover and above ground and away from all construction traffic.

B. Do not permit workmen, or others, to step directly on flashing sheets in place, or to place or move equipment over flashing and trim surfaces. Protect surfaces during installation of permanent covering work and adjoining work.

C. Neutralize excess flux as work progresses with five percent to ten percent washing soda solution and rinse thoroughly.

D. Clean exposed surfaces of every substance which is visible or might cause corrosion or prevent uniform oxidation of the metal surfaces. Exercise extreme care to remove fluxes and ferrous metal particles, including welding splatter and grinding dust.

E. Do not leave metal debris and discarded materials at the Site of the Work. Clean each site of the work as the work progresses on a daily basis.

END OF SECTION

PART 1 GENERAL

1.01 SUMMARY

A. Principal items of work under this Section include:

1. Preformed copings
2. Closures, trim, fasteners, sealants and accessories for fabricating and installing work under this Section.
3. Roof curbs.
4. Metal Fascia.
5. Conductors and Downspouts.
6. Thru-wall Scuppers, Conductors, and flashing.

B. Furnish all labor, materials, equipment and incidentals necessary to perform the work of this Section as specified, shown on the Contract Drawings or required for a complete job.

C. The Contractor shall implement practices and procedures to meet the project's sustainability goals as identified in the Contract Documents. The Contractor shall ensure that the sustainability requirements of this Section are implemented to the fullest extent.

D. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 06 10 00 - Rough Carpentry

B. Section 07 53 00 - Elastomeric Membrane Roofing

1.04 REFERENCES

A. ASTM Standards:

1. ASTM A480 - General Requirements for Flat-Rolled Stainless and Heat-Resisting Steel Plate, Sheet, and Strip, Standard Specification for

2. ASTM A240 - Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications, Standard Specification for

3. ASTM A666 - Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate and Flat Bar, Standard Specification for

4. ASTM D1187 - Test Method for Asphalt-Base Emulsions for use as Protective Coatings for Metal, Standard Specification for

5. ASTM D 4586 - Standard Specification for Asphalt Roof Cement, Asbestos-Free, Standard Specification for

B. Trade Standards:

1. Sheet Metal and Air Conditioning Contractors National Association "Architectural Sheet Metal Manual" (SMACNA)

2. The American National Standard Institute / Single Ply Roofing Industry “ES-1” (ANSI/SPRI)

1.05 DESCRIPTION

A. System Design Requirements: Roof Specialties system shall comply with performance requirements without failure due to defective manufacture, fabrication, installation, or other defects in construction.

1. Thermal Expansion and Contraction:

a. Completed Roof Specialties and flashing system shall be capable of withstanding expansion and contraction of components caused by changes in temperature without buckling, or reducing performance ability.

b. The design temperature differential shall be not less than 220 degrees Fahrenheit.

2. Uniform Wind Load Capacity:

a. Installed Roof Specialties system shall withstand negative wind pressures complying with the following criteria.

1) Design Code: ANSI/SPRI "ES-1"

2) Safety Factor: 2.0

3) The wind load criteria found on the Contract Drawings.

b. The nominal capacity of the system shall be determined based on physical testing in accordance with ANSI/SPRI ES-1. The allowable load carrying capacity shall be calculated by reducing the calculated nominal capacity by the safety factor listed herein.

3. Metal thicknesses of exposed sheet metal components shall meet the requirements of ANSI/SPRI ES-1 Table 5.

B. Accessories and items essential for the completeness of the installation shall be the same kind of material as the item to which applied.

C. Sustainable Design Requirements:

1. Recycled Content of Steel-Sheet Roof Specialties: Postconsumer recycled content plus one-half of pre-consumer recycled content shall not be less than 25 percent.

1.06 QUALITY ASSURANCE

A. The workmanship of sheet metal work, method for forming joints, anchoring, cleating, and provisions for expansion shall conform to the standard details and recommendations of the Copper Development Association and the Architectural Sheet Metal Manual published by SMACNA. Workmanship shall be in accordance with the best trade practice and recommendations and specifications of the Sheet Metal and Air Conditioning Contractors National Association, Incorporated.

1. Uplift requirements shall match the requirements for adjacent membrane roofing as specified in Section 07 53 00 - Elastomeric Membrane Roofing.

2. Wind resistance calculation shall be designed specifically for this project. The Contractor shall calculate and certify that the perimeter roof specialties systems furnished meet the anticipated design pressure as specified in the Detailed Specifications when tested in accordance with SPRI Test Methods RE-2 and RE-3.

B. The forming and assembling of sheet metal components shall be performed using methods that will not void any manufacturer's warranty.

C. Contractor must obtain all components of the roof specialties system from a single manufacturer. Any secondary products that are required which cannot be

supplied by the specified manufacturer must be recommended by the manufacturer and approved by the Engineer.

D. Installer Qualifications:

1. Engage an experienced metal edge system contractor to install edge system who has a minimum of three (3) years of experience specializing in the installation of metal edge systems.

2. Contractor must be certified by manufacturer specified as a supplier of the metal edge system and obtain written certification from manufacturer that installer is approved for installation of the specified system.

E. Coordination:

1. The Contractor will be obligated to coordinate the Work under other Sections to ensure perfect match of colors. The Contractor shall submit samples of each approved manufacturer's finishes for approval.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings for approval of the Engineer. Submittals shall include, but not be limited to:

1. Samples of each material listed

2. Manufacturers Literature

B. Each submittal shall be identified by the Specification Section Number.

C. Each submittal shall be complete in all respects, incorporating all information and data listed herein and all additional information required for evaluation of the proposed materials compliance with the Contract Documents.

D. Partial, incomplete or illegible submissions will be returned to the Contractor without review for resubmission.

E. Samples shall include finish and color samples for all items.

F. Shop Drawings shall include, but not be limited to:

1. Complete layout and installation drawings with clearly marked dimensions and schedules including sizes, weights, gages of metal and spacing.

2. Details of all attachments.

G. Design Test Reports:

1. Submit copies of design test reports for each of the performance testing standards listed in Article 1.05 herein.

2. Test reports shall be performed by independent, International Accreditation Service, Inc. (IAS) accredited testing laboratory, and shall bear the seal of a registered Professional Engineer licensed in the State of New York.

H. Engineering Calculations:

1. Submit engineering wind pressure calculations specific to this Project.
2. Calculations shall be prepared and sealed by a registered Professional Engineer licensed in the State of New York, who is a full-time employee of the system manufacturer.
3. Calculations shall clearly demonstrate that the system is capable of resisting the calculated design wind pressure(s) after the application of the safety factor specified herein in accordance with the requirements of ANSI/SPRI ES-1 and the building code.

I. Installer Qualifications:

1. Engage a single installer skilled, trained and with successful experience in the installation of roof specialties systems and with successful experience in the erection of the types of materials required; and who agrees to employ only tradesmen with specific skill and experience in this type of work. Submit names and qualifications to the Engineer for approval along with the following information on a minimum of three successful projects:
   a. Names and telephone numbers of owners, architects or engineers responsible for projects.
   b. Approximate contract cost of the system.
   c. Amount of area installed.

J. Sustainable Design Submittals:

1. Environmental Materials Reporting Form (EMRF) Recycled Content. Provide the following information:
   a. Name of Product and Manufacturer.
   b. Material cost breakdowns. Cost breakdowns must include total material-only cost (excluding installation, labor and equipment).

K. The percentage (by weight) of post-consumer and pre-consumer recycled content in the submitted product(s), if applicable.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Deliver all materials in factory packed unopened cartons and crating bearing the manufacturer's labels.

B. Store materials in clean, dry and protected areas in such manner to preclude damage of any nature.

C. Handle all materials with proper care to avoid denting, marring, warping or other distortions during delivery, storage and handling.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

1. Copings:
   a. Perma-Tite Gold Coping as manufactured by Metal Era, An MTL Company, Waukesha, WI.
   b. Or approved equal
2. Roof curbs:
   a. Custom Solutions Roofs and Metal Products, Cedar Rapids, IA:
      1) Roof curb with Pipe Portal System: Model #P100-B-UU-N-05-L
      2) Roof Stack Flashing with Insulation: Model #P300-B-UU-N-05-CL
      3) Equipment Rail: Model #P500-B-UU-N-05-G.
   b. Or approved equal
3. Fascia :
   a. Anchor-Tite HG Fascia as manufactured by Metal Era, An MTL Company, Waukesha, WI.
   b. Or approved equal.
4. Downspouts:
   a. Industrial Closed Faced Downspouts as manufactured by Metal-Era, An MTL Company, Waukesha, WI
   b. Or approved equal.
5. Scuppers and Conductors:
   a. Thru-Wall Scupper, Welded, Raised Conductor Box as manufactured by Metal- Era, An MTL Company, Waukesha, WI
   b. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Copings:
1. Coping units over parapet walls to be 22 ga., or as noted on the Contract Drawings.
2. Units to be of size and profiles shown on the Contract Drawings.

3. Provide coping units with mitered welded corners, splice plates and joint trim, retainer clips, compression pads, fasteners and other accessories required to make a complete installation, in accordance with the manufacturer's recommendations.
4. Finish on all exposed surfaces of stainless steel copings and accessories to be 304-2B.
5. Sealants for installation of copings shall be of an approved type acceptable to the manufacturers of materials herein specified.
6. Fastenings shall be concealed type, stainless steel or cadmium plated. Self-tapping screws to be stainless steel of sizes recommended by the manufacturers.
7. Seed clips to be stainless steel.

B. Roof curbs shall be fabricated of Stainless Steel: 0.028 inch thick with continuous mitered and welded corner seams, integral base plates, factory installed pressure treated wood nailed, and insulated with 1½ inch thick rigid fiberglass insulation. Profile shall be as shown on the Contract Drawings.

C. Downspouts shall be manufactured of 22 ga. type 304-2B stainless steel. Provide telescoping joint design for expansion. Elbows shall be welded construction, and shall match the finish and color of the downspout.

1. Size: 3-inches by 4-inches.
2. Formed Lengths: 12 foot.
3. Seams: Double Seam Lock.
4. Attachment Straps: Concealed “U” straps.
    a. Width: 2-inches.
    b. Straps per 12-foot length: 3.
5. Elbows: Manufacturers custom elbows.
6. Downspout Transition: Standard Manufacturer’s shape adaptor.

D. Thru-Wall Scuppers, Conductors and Flashing: Thru wall scupper flashing in walls and parapets shall be constructed of 1/8-inch thick stainless steel. All joints shall be welded.

1. Picture Frames: Front, 2-inches wide; Back, 3-inches wide.
2. Scupper opening: 4-inches high; 8-inches wide.
3. Conductor projection: 8-inches.
4. Conductor screen: Custom removable stainless steel mesh.
    a. Size: 1/2-inch by 1/2-inch.
5. Provide overflow scupper same as welded scupper without conductor.

a. Provide 1/2-inch projected drip edge.

E. Fascia shall consist of complete assemblies, composed of hold down clips, joint covers, preformed mitered welded covers and other accessories required for a complete installation in accordance with the manufacturer's recommendation. Fascia shall be fabricated of 22 ga. type 304-2B stainless steel 5005-H34 alloy.

F. Manufacturer's Standards: In addition to the standards listed above, the flashing products and their installation shall be in accordance with the manufacturer's published recommendations and specifications.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examination:

1. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, system supports, and other conditions affecting performance of the Work.
2. For the record, prepare written report, approved by Installer, listing conditions detrimental to performance of the Work. Any Work needed to correct unsatisfactory conditions need to be submitted to the Engineer for approval prior to the Work being done.
3. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Preparation:

1. Dissimilar metals shall be separated from each other by painting each metal surface in contact with a coating as specified in Specification 09 91 00 – Painting.
2. Clean substrates of substances harmful to insulation, including removing projections capable of interfering with insulation attachment.
3. Establish straight, side and crosswise benchmarks.
4. Use proper size and length fastener for strength requirements.
5. All surfaces shall be checked for square and straightness.
6. Measure the wall lengthwise and crosswise to confirm lengths, widths, and clearances of roof specialties system components and verify clearances for thermal movement.

3.02 INSTALLATION

A. General:

1. Unless otherwise specified, all roof specialties shall be installed in accordance with the manufacturer's instructions to provide a complete watertight and weatherproof construction, free from bends and buckles and as shown on the Contract Drawings. Ample provision shall be made for expansion and contraction. Repair or replace all materials that have been damaged during installation.

B. Sheet Underlayment:

1. Apply primer if required by manufacturer. Comply with temperature restrictions of underlayment manufacturer for installation. Apply over entire parapet or roof-wall edge, wrinkle free, in shingle fashion to shed water, and with end laps of not less than 6 inches (150 mm) staggered 24 inches (610 mm) between courses. Overlap side edges not less than 3-1/2 inches (90 mm). Roll laps with roller. Cover underlayment within 90 days.

C. Scuppers, Conductors and Downspouts:

1. Install products in accordance with manufacturer’s instructions..
   a. Installation shall be in accordance with roofing manufacturer’s installation instructions, details and warranty requirements.
   b. Provide sealants, fasteners and accessories as recommended by SMACNA.
2. Install products to allow water to drain from edge of roof.
3. Install products to allow for thermal movement.
4. Joint Sealants: Apply joint sealants in accordance with manufacturer’s instructions.
5. Review lengths of straight pieces before cutting to avoid creating relatively short sections adjacent to full-length sections.
6. Isolate products from ACQ treated wood blocking or other galvanically incompatible material with appropriate membrane material.
7. Confirm subdrainage size and provide appropriately size adaptor. Where downspout daylight, provide precast concrete splash block and 45-degree elbow directed away from building.~~:~~

D. Copings:

1. Install copings true and straight. Fasten as recommended by manufacturer. Seal and flash in accordance to primary roofing manufacturer's recommendations.

2. Install in manufacturers standard lengths with anchor plates and concealed joint cover at each joint. All screws shall be of stainless steel. Mitered and welded corners shall be used for all changes in direction.

E. Roof Curbs:

1. Center curbs over openings.

2. Anchor to wood blocking installed under Section 06 10 00 - Rough Carpentry.

F. Leave units ready to receive flashing provided herein and to be installed as the membrane roofing is installed.

3.03 FIELD TESTING / QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect roof specialties system installation, including accessories. Report results in writing.

B. Remove and replace applications of roof specialties system where inspections indicate that they do not comply with specified requirements.

C. Additional inspections, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Check levels and adjust as necessary after roofing and flashing is complete.

B. Protect materials from damage by other trades. Remove protective coatings at completion of project as directed by the Engineer.

END OF SECTION

PART 1 GENERAL

1.01 SUMMARY

A. This Section describes the general requirements for roof hatches, custom stainless steel hardware and accessories for complete watertight systems. The Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish, install and place into satisfactory operation all roof hatch work and equipment access covers and curb.

B. The following index of this Section is presented for convenience:

G. OSHA 29 CFR 1910.27 - Occupational Safety and Health Act of 1970, Fixed Ladders

1.05 DESCRIPTION

A. Performance Criteria:

1. Roof hatch and equipment access cover Work shall be permanently watertight, and not deteriorate in excess of manufacturers' published limitations.

2. Detail and fabricate roof hatches to withstand a live load of 40 per square foot over the entire horizontal plane of the hatch and a concurrently acting point load of 200 pounds located at the center of the roof hatch. Specified loadings shall not cause any permanent deflections in the roof hatch or support curbs or damage to operating hardware.

3. Equipment Access Cover and Curb Design Criteria:

a. Detail and fabricate equipment access cover and curb to withstand additional dead load of 20 pounds per square foot, a live load of 40 pounds per square foot over the entire horizontal plane of the cover and a concurrently acting point load of 200 pounds located at the center of the equipment access cover. Specified loadings shall not cause any permanent deflections in the equipment access cover or support curbs.

b. Equipment access cover and curb design shall meet applicable loads specific to installed location.

B. Requirements of Regulatory Agencies:

1. Comply with applicable requirements of the New York City Building Code, SMACNA Sheet Metal Manual details and the requirements of OSHA 1910.27 for roof hatch minimum sizes, clearances and coordination with fixed ladders.

C. Do not proceed with the roof hatch work until curb and substrate construction, blocking, and other construction to receive the work is completed.

D. Coordinate the installation of roof hatch work with roofing and flashing work in order to provide continuity in the installation of roofing Work in a manner which maintains roofing manufacturer's guaranteed construction.

E. Schedule the installation of roof hatch work to coincide with the installation of roofing, drains, piping, blocking, nailers, framing at openings, curbs, and other adjoining and substrate work so that the roof hatches may be built into the Elastomeric Membrane Roofing as the work progresses as shown on approved Shop Drawings and without the need for field changes to approved installation details or methods of flashing in order to maintain permanently water- and weathertight conditions on the roof.

F. Proceed with and complete the work only when materials, equipment and knowledgeable tradesmen required for the installation of roof hatches, flashing and trim systems are at the site and are ready to follow and integrate the work of this Section with work requiring the installation of sheet metal flashing and trim and Elastomeric Membrane Roofing.

1.06 QUALITY ASSURANCE

A. Source Quality Control:

1. Obtain materials only from manufacturers who will, if requested, send a qualified technical representative to the Site for the purpose of advising installer of proper procedures and precautions during the installation of the roof hatches.

B. Engage manufacturers who have been successfully providing roof hatches of the type specified and who will submit a list of successful installations along with telephone numbers of owners, architects or engineers responsible for the work.

C. Engage manufacturers who have been successfully providing roof equipment access covers of the type specified and who will submit a list of successful installations along with telephone numbers of owners, architects or engineers responsible for the work.

D. Professional Engineer:

1. Engage a registered professional engineer legally qualified to practice in the State of New York and experienced in providing engineering services of the kind indicated.

2. Responsibilities include, but are not necessarily limited to, the following:

a. Carefully reviewing system performance and design criteria stated in the Contract Documents.

b. Preparing written requests for clarification or interpretation of performance or design criteria for submittal to Engineer by Contractor.

c. Preparing, or supervising the preparation of design calculations, and reviewing and approving related Shop Drawings prepared by the equipment access cover and curb manufacturer prior to submission to Engineer, and providing comprehensive engineering analyses verifying compliance of the system with the requirements of the Contract Documents.

d. Signing and sealing all calculations and engineering analyses.

e. Certifying that:

1) It has performed the design of the equipment access cover and curb system in accordance with the performance and design criteria stated in the Contract Documents, and

2) The said design conforms to all applicable local, state and federal codes, rules and regulations and to the prevailing standards of practice.

1.07 SUBMITTALS

A. The Contractor shall submit Shop Drawings for approval by the Engineer. Submittals shall include, but not be limited to:

1. Copies of manufacturer's proposed fabrication details and material specifications for roof hatches and equipment access covers and curbs.

2. Include flashing and roughing-in drawings showing this work coordinated with Sections 07 53 00 - Elastomeric Membrane Roofing, 07 21 00 - Thermal Insulation, 06 10 00 - Rough Carpentry and 07 62 00 - Sheet Metal Flashing and Trim as appropriate to the location of the item.

B. Manufacturer’s specifications, installation and coordination instructions and other data as may be requested by Engineer substantiating that products comply with the requirements.

C. Equipment Access Cover and Curb: Complete design calculation and Shop Drawings shall be prepared, signed and stamped with the seal of a Licensed Professional Engineer, licensed and registered to practice in the State of New York and recognized as an expert in the required work unless the design and details have been shown on the Contract Drawings.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Deliver all materials without damage and in manufacturer’s original, unopened and undamaged protective wrappings bearing name and model number of approved items.

B. Storage of Materials:

1. Minimize the amount of time roof hatches are stored on-site. If roof hatches do arrive on-site before they can be incorporated into the orderly assembly of the roofing work, store in a completely protected and secure enclosure, under cover and away from all other construction traffic.

2. Do not store in contact with earth, wood or concrete or in contact with other surfaces that could cause staining or other types of surface marks or blemishes of any kind.

C. Handling of Materials:

1. Do not subject roof hatches to bending or stress of any kind.

2. Handle and protect units during installation in a manner recommended by the roof hatch manufacturer.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to the City the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

1. Equipment Access Cover and Curb: Provide one of the following:

a. RPRC-1 and RPC-3LW2X4 as custom manufactured by Roof Products, Inc. (RPI), Chattanooga, TN.;

b. Or approved equal.

2. Ladder Access Roof Hatch: Provide one of the following:

a. Type S50TB with Ladder up Safety Post as manufactured by Bilco Company, Hillside, NJ;

b. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Equipment Access Cover and Curb:

1. Provide manufacturer's custom units, modified as necessary to comply with the requirements. Custom fabricate units wherever necessary for size, type and profile, using manufacturer's standard detailing to the extent applicable.

2. Frame:

a. Material: ASTM A 653 G90 hot-dipped galvanized steel. Minimum 18 gauge or heavier gauge as engineered by manufacturer.

b. Corners: Mitered and welded. Bolted connections are not accepted.

c. Base Plates: Integral to frame and welded.

d. Internal Reinforcement: As required by Access Curb and Cover design by manufacturer.

e. Wood Nailers: Factory installed, pressure treated. Size and width as required by manufacturer.

3. Cover:

a. Material: ASTM A 653 G90 hot-dipped 14 gauge galvanized steel.

b. Interior liner: 18 gauge Galvanized steel.

c. Internal Reinforcement: As required by Equipment Access Cover and Curb design.

d. Integral lifting lugs.

e. Internally insulated with minimum 5-inch thick three-pound density fiberglass insulation, Minimum R-Value of 20 insulation.

4. Curb:

a. Fabricate structural curb to support cover and additional load of ballasted solar panel assembly.

b. Material: ASTM A 653 G90 hot-dipped galvanized steel.

1) Minimum 18 gauge, minimum or as engineered by manufacturer.

c. Corners: Mitered and welded. Bolted connections not accepted.

d. Base Plates: Integral to frame and welded.

e. Internally reinforced with galvanized 1 inch by 1 inch by 12 gauge angles for curbs exceeding 3 foot length. Reinforce internal bulkhead at wider curbs to support lateral loads.

f. Wood Nailers: Factory installed, pressure treated. Size and width as suitable for support of items installed on curbs.

g. 3/4-inch plywood top with support channels as required.

h. Insulation: Factory installed 1-1/2 inch thick three-pound density fiberglass insulation.

i. Curb Height: Minimum 12 inch above finished roof.

j. Construct curbs to match roof slope with plumb and level top surface for mounting mechanical equipment.

k. Counter Flashing: 18 gauge galvanized steel.

5. Clear Opening Size:

a. Sodium Bisulfite Tank clear opening size: 10 feet by 10 feet, unless otherwise noted on Contract Drawings.

b. Sodium Hypochlorite Tank clear opening size: 12 feet by 12 feet, unless otherwise noted on Contract Drawings.

6. Finishes:

a. Exterior and interior galvanized steel shall be painted per Section 09 91 00, Painting.

B. Ladder Access Roof Hatch:

1. Provide manufacturer's standard thermally broken units, modified as necessary to comply with the requirements. Custom fabricate units wherever necessary for size, type and profile, using manufacturer's standard detailing to the extent applicable. Hatch shall be thermally broken type.

2. Materials:

a. Aluminum: Sheet and extrusions of the alloys and tempers specified by the manufacturer for strength, durability and proper application of finish.

b. Cover and Curb: 11 gage; ASTM B221 and ASTM B209, 6063T5 alloy

c. Cover and Curb Liner: 14 gage; ASTM B221 and ASTM B209, 3003H14 alloy

d. Finish: Class I high density clear anodized coating, AMP 500 Aluminum Association Designation A41

e. Insulation (Curb and Cover): 3" concealed polyisocyanurate insulation, between aluminum panels with R-Value of 20.

f. Gaskets: Fingered design; polyvinylchloride

3. Equip units with custom self-lifting mechanism. Provide custom ASTM A666 stainless steel hardware including hold-open devices, hinges, compression spring operators enclosed in telescopic tubes, latch, and operating handles for inside operation. Equip units with hardware for manual release operation from outside.

4. Provide manufacturer’s recommended operable steel safety posts mounted at center of roof ladder rungs.

5. Provide manufacturer’s railing and gate around hatch in compliance with OSHA. Railing and gate shall be supported by manufacturer’s reinforced roof hatch curb.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Shop-fabricate each unit complete with framing, gaskets, structure, curbs, flashing, well-liners, hardware, accessories, anchorage provisions and other components. Disassemble only to the extent necessary for delivery and installation.

B. Construct units for live loading specified using manufacturer's custom fabrication details. Reinforce as required with aluminum structural sections to order to provide resistance to the loading specified.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Inspection

1. The Contractor shall examine the substrate and the conditions under which the roof hatch work is to be performed, and notify Engineer in writing of unsatisfactory conditions. Do not proceed with the work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

B. Preparation

1 Clean the substrate of dust, debris, substances and interferences detrimental to the Work and prepare substrates as recommended by the roof hatch manufacturer.

3.02 INSTALLATION

A. Separate dissimilar metals from substrates and from each other by painting each metal surface in the area of contact with a 15-mil thick application of bituminous coating, as recommended by the manufacturers of the dissimilar metals.

B. Bed flanges of set-on accessories in a compound which is compatible with roofing and flashing and which is acceptable to, and consistent with material and detailing requirements of, the manufacturer of roofing for guaranteed construction. On sloping decks, flash flanges with other work for proper water shed.

C. Anchor roof hatch permanently to the substrate, by approved methods which are adequate for the sizes and locations of units and which shall provide permanent resistance to loading specified.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Protect roof hatch Work until Final Acceptance.

B. Do not permit workmen, or others, to step directly on roof hatches in place, or to place or move equipment over roof hatch surfaces. Protect surfaces during installation of Elastomeric Membrane Roofing, sheet metal flashing work and other adjoining work.

C. Neutralize excess flux as work progresses with five percent to ten percent washing soda solution and rinse thoroughly.

D. Clean exposed surfaces of every substance which is visible or might cause corrosion or prevent uniform oxidation of the metal surfaces. Exercise extreme care to remove fluxes and ferrous metal particles, including welding splatter and grinding dust.

E. Do not leave metal debris and discarded materials at the site of the work. Clean each site of the work as the work progresses on a daily basis.

END OF SECTION

NO TEXT ON THIS PAGE

PART 1 GENERAL

1.01 SUMMARY

A. This Section describes the general requirements for firestopping systems for penetrations and joints in building floors and walls at and through fire rated walls and floors and in order to maintain fire resistance rating of enclosure.

B. Complete technical services from the approved firestopping manufacturers and on-site technical representation by their Technical Representatives during the time of delivery, storage and installation of the work of this Section and during other work which may affect the work of this Section as specified herein is also included.

C. The Contractor shall provide all labor, materials, equipment and incidentals necessary to perform the work of this Section as shown on the Contract Drawings, specified herein or required otherwise for a complete job.

D. The Contractor shall implement practices and procedures to meet the project's sustainability goals as identified in the Contract Documents. The Contractor shall ensure that the sustainability requirements of this Section are implemented to the fullest extent.

E. The following index of this Section is presented for convenience:

O. UL Fire Resistance Directory.

P. UL Qualified Firestop Contractor Program Requirements, 2006

1.05 DESCRIPTION

A. The Work shall include but is not limited to:

1. Penetrations in fire-resistance-rated walls.

2. Penetrations in horizontal assemblies.

3. Penetrations in smoke barriers.

4. Joints in or between fire-resistance-rated constructions.

5. Joints at exterior curtainwall/floor intersections.

6. Joints in smoke barriers.

B. Coordinate the schedule of firestopping, which denotes the quantity and type of all firestopping required, with the schedule of firestopping required by Subcontractors and other contractors.

1. Provide a schedule of required firestops. Schedule is to include:

a. Quantity of penetrations.

b. Material being penetrated (i.e., concrete slab, masonry wall, include thickness of material).

c. Quantity, size and material of penetrant (i.e., single ¾" EMT conduit, five 2" metal conduit, insulated ¼" copper refrigerant pipes, 1" PVC condensate pipe, 2" gas fire suppression pipe).

d. Height above finished floor (AFF).

C. Fire Rating: Where caulking and sealant systems are applied within a fire rated room, corridor, egress path, and as indicated in the Contract Drawings, those caulking and sealant systems shall maintain the fire rating of the location in which application is being done.

D. Substitutions

1. Do not change products, system components, colors or manufacturers after Shop Drawing and Samples approvals by Engineer.

2. Clearly identify, in a manner which is highlighted to Engineer, all proposed substitutions, modifications, variations, unspecified features and "or equal" products. Provide complete comparative data with specified products at time of Shop Drawing submission.

E. Sustainable Design Requirements

1. Low Emitting Materials: Sealants and sealant primers used on site and within the building's weatherproofing system shall comply with the following limits for VOC content:

a. Architectural Sealants: 250 g/L.

b. Sealant Primers for Nonporous Substrates: 250 g/L.

c. Sealant Primers for Porous Substrates: 775 g/L.

1.06 QUALITY ASSURANCE

A. Installer Qualifications: A firm that has been approved by FM Global according to FM Global 4991, "Approval of Firestop Contractors," or been evaluated by UL

and found to comply with its "Qualified Firestop Contractor Program Requirements."

B. Fire-Test-Response Characteristics: Penetration firestopping and fire-resistive joint systems and shall comply with the following requirements:

1. Penetration firestopping and fire-resistive joint systems tests are performed by a qualified testing agency acceptable to authorities having jurisdiction.

2. Penetration firestopping and fire-resistive joint systems are identical to those tested per testing standard description. Provide rated systems complying with the following requirements:

a. Penetration firestopping and fire-resistive joint systems products bear classification marking of qualified testing and inspecting agency.

b. Classification markings on penetration firestopping and fire-resistive joint systems correspond to designations listed by the following:

1) UL in its "Fire Resistance Directory."

2) Intertek ETL SEMKO in its "Directory of Listed Building Products."

3) FM Global in its "Building Materials Approval Guide.":

C. Special Inspections: Provide Special Inspections in accordance with NYCBC Chapter 17 and Section 01 45 33, Code required Special Inspections and Procedures.

D. Pre-Installation Meeting: Conduct conference at Site to review the following:

1. Status of all submittals, including samples.

2. Status of substrate preparation.

3. Status of environmental conditions.

4. Review testing requirements of the Special Inspections and governing codes.

1.07 SUBMITTALS

A. The Contractor shall submit the following to the Engineer for review and approval.

1. Product Data:

a. Copies of manufacturer’s technical data and installation instructions for each component of the firestopping Work, including certification that firestopping Work meets the specified requirements.

b. UL Design or equal assembly for each type of firestopping, penetration type and location.

2. Certificates:

a. From Installer indicating penetration firestopping and fire-resistive joint systems have been installed in compliance with requirements and manufacturer's written recommendations.

3. Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for firestopping.

B. Shop Drawings:

1. Plans indicating proposed layout and locations of all firestopping Work.

2. Product Schedule: For each penetration firestopping fire-resistive joint system. Include location and design designation of qualified testing and inspecting agency. Refer to Part 3 for format of schedules to be followed.

a. Where Project conditions require modification to a qualified testing and inspecting agency's illustration for a particular penetration firestopping and fire-resistive joint systems condition, submit illustration, with modifications marked, approved by penetration firestopping and fire resistive joint systems manufacturer's fire-protection engineer as an engineering judgment or equivalent fire- resistance-rated assembly.

b. Guarantee: Copies of written guarantee agreeing to repair or replace sealants which fail to perform as specified.

3. Sustainable Design Submittals:

a. Environmental Materials Reporting Form (EMRF) Recycled Content. Provide the following information:

1) Name of Product and Manufacturer.

2) Material cost breakdowns. Cost breakdowns must include total material-only cost (excluding installation, labor and equipment).

3) The percentage (by weight) of post-consumer and pre-consumer recycled content in the submitted product(s), if applicable.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery of Materials:

1. Deliver materials in caulking and sealant manufacturer's original unopened and undamaged containers, with information accurately representing container contents as approved by Engineer at time of Shop Drawing and Samples submissions.

2. Include the following information on the label:

a. Name of material and supplier.

b. Formula or specification number, lot number, color and date of manufactures.

c. Mixing instructions, shelf life and curing time when applicable.

3. Failure to comply with these requirements shall be sufficient cause for rejection of the material in question, by Engineer, and his requiring its removal from the site. Supply new material conforming to the specified requirements at no additional expense to the City.

B. Storage of Materials:

1. Store materials so as to preclude foreign materials.

2. Do not store or expose materials to temperature above 90 F or store in direct sunshine.

3. Do not use materials which are outdated as indicated by shelf life.

4. Store sealant tape in a manner which will not deform the tape.

5. In cool or cold weather store containers where temperature approximates 75ºF for 16 hours before using.

6. When high temperatures prevail store mixed sealants in a cool place.

C. Handling:

1. Handle materials carefully to prevent inclusion of foreign materials.

2. Do not open containers or mix components until necessary preparatory work and priming has been completed.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Firestopping Systems: Provide one of the following:

1. 3M Fire Protection Products.

2. Tremco Fire System Group, an RPM Company, Beachwood, OH.

3. Hilti Incorporated.

4. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Penetration Firestopping Performance:

1. Provide penetration firestopping that is produced and installed to resist spread of fire according to requirements indicated, resist passage of smoke and other gases, and maintain original fire- resistance rating of construction penetrated. Penetration firestopping systems shall be compatible with one another, with the substrates forming openings, and with penetrating items if any.

2. Penetrations in Fire-Resistance-Rated Walls: Provide penetration firestopping with ratings determined per ASTM E 814 or UL 1479, based on testing at a positive pressure differential of 0.01-inch wg.

   a. Fire-resistance-rated walls include fire walls, fire-barrier walls, smoke-barrier walls, and fire partitions.

   b. F-Rating: Not less than the fire-resistance rating of constructions penetrated.

3. Penetrations in Horizontal Assemblies: Provide penetration firestopping with ratings determined per ASTM E 814 or UL 1479, based on testing at a positive pressure differential of 0.01-inch wg.

   a. Horizontal assemblies include floors, floor/ceiling assemblies, and ceiling membranes of roof/ceiling assemblies.

   b. F-Rating: At least 1 hour, but not less than the fire-resistance rating of constructions penetrated.

   c. T-Rating: At least 1 hour, but not less than the fire-resistance rating of constructions penetrated except for floor penetrations within the cavity of a wall.

4. Penetrations in Smoke Barriers: Provide penetration firestopping with ratings determined per UL 1479.

   a. L-Rating: Not exceeding 5.0 cfm/sq. ft. of penetration opening at 0.30-inch wg at both ambient and elevated temperatures.

5. W-Rating: Provide penetration firestopping showing no evidence of water leakage when tested according to UL 1479.

6. Exposed Penetration Firestopping: Provide products with flame-spread and smoke-developed indexes of less than 25 and 450, respectively, as determined per ASTM E 84.

7. VOC Content: Penetration firestopping sealants and sealant primers shall comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D (EPA Method 24):

   a. Sealants: 250 g/L.

   b. Sealant Primers for Nonporous Substrates: 250 g/L.

c. Sealant Primers for Porous Substrates: 775 g/L.

8. Accessories: Provide components for each penetration firestopping system that are needed to install fill materials and to maintain ratings required. Use only those components specified by penetration firestopping manufacturer and approved by qualified testing and inspecting agency for firestopping indicated.

   a. Permanent forming/damming/backing materials, including the following:

      1) Slag-wool-fiber or rock-wool-fiber insulation.

      2) Sealants used in combination with other forming/damming/backing materials to prevent leakage of fill materials in liquid state.

      3) Fire-rated form board.

      4) Fillers for sealants.

   b. Temporary forming materials.

   c. Substrate primers.

   d. Collars.

   e. Steel sleeves

B. Fill Materials

1. Cast-in-Place Firestop Devices: Factory-assembled devices for use in cast-in-place concrete floors and consisting of an outer metallic sleeve lined with an intumescent strip, a radial extended flange attached to one end of the sleeve for fastening to concrete formwork, and a neoprene gasket.

2. Latex Sealants: Single-component latex formulations that do not re-emulsify after cure during exposure to moisture.

3. Firestop Devices: Factory-assembled collars formed from galvanized steel and lined with intumescent material sized to fit specific diameter of penetrant.

4. Intumescent Composite Sheets: Rigid panels consisting of aluminum-foil-faced elastomeric sheet bonded to galvanized-steel sheet.

5. Intumescent Putties: Nonhardening dielectric, water-resistant putties containing no solvents, inorganic fibers, or silicone compounds.

6. Intumescent Wrap Strips: Single-component intumescent elastomeric sheets with aluminum foil on one side.

7. Mortars: Prepackaged dry mixes consisting of a blend of inorganic binders, hydraulic cement, fillers, and lightweight aggregate formulated

for mixing with water at Project site to form a non-shrinking, homogeneous mortar.

8. Pillows/Bags: Reusable heat-expanding pillows/bags consisting of glass-fiber cloth cases filled with a combination of mineral-fiber, water-insoluble expansion agents, and fire-retardant additives. Where exposed, cover openings with steel-reinforcing wire mesh to protect pillows/bags from being easily removed.

9. Silicone Foams: Multicomponent, silicone-based liquid elastomers that, when mixed, expand and cure in place to produce a flexible, non-shrinking foam.

10. Silicone Sealants: Single-component, silicone-based, neutral-curing elastomeric sealants of grade indicated below:

    a. Grade: Pourable (self-leveling) formulation for openings in floors and other horizontal surfaces, and non-sag formulation for openings in vertical and sloped surfaces, unless indicated firestopping limits use of non-sag grade for both opening conditions.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Mixing

1. For those products requiring mixing before application, comply with penetration firestopping manufacturer's written instructions for accurate proportioning of materials, water (if required), type of mixing equipment, selection of mixer speeds, mixing containers, mixing time, and other items or procedures needed to produce products of uniform quality with optimum performance characteristics for application indicated.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examination

1. Examine substrates and conditions, with Installer present, for compliance with requirements for opening configurations, penetrating items, substrates, and other conditions affecting performance of the Work.

2. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Preparation

1. Surface Cleaning: Clean out openings immediately before installing firestopping to comply with manufacturer's written instructions and with the following requirements:

a. Remove from surfaces of opening substrates and from penetrating items foreign materials that could interfere with adhesion of firestopping.

b. Clean opening substrates and penetrating items to produce clean, sound surfaces capable of developing optimum bond with firestopping. Remove loose particles remaining from cleaning operation.

c. Remove laitance and form-release agents from concrete.

2. Priming: Prime substrates where recommended in writing by manufacturer using that manufacturer's recommended products and methods. Confine primers to areas of bond; do not allow spillage and migration onto exposed surfaces.

3. Masking Tape: Use masking tape to prevent firestopping from contacting adjoining surfaces that will remain exposed on completion of the Work and that would otherwise be permanently stained or damaged by such contact or by cleaning methods used to remove stains. Remove tape as soon as possible without disturbing firestopping's seal with substrates.

3.02 INSTALLATION

A. General: Install firestopping to comply with manufacturer's written installation instructions and published drawings for products and applications indicated.

B. Install forming materials and other accessories of types required to support fill materials during their application and in the position needed to produce cross-sectional shapes and depths required to achieve fire ratings indicated.

1. After installing fill materials and allowing them to fully cure, remove combustible forming materials and other accessories not indicated as permanent components of firestopping.

C. Install fill materials for firestopping by proven techniques to produce the following results:

1. Fill voids and cavities formed by openings, forming materials, accessories, and penetrating items as required to achieve fire-resistance ratings indicated.

2. Apply materials so they contact and adhere to substrates formed by openings and penetrating items.

3. For fill materials that will remain exposed after completing the Work, finish to produce smooth, uniform surfaces that are flush with adjoining finishes.

D. The heights of the fire penetrations shall be at these approximate heights:

1. Above 10 feet above finished floor (AFF): 100% of the penetrations.

E. Identification:

1. Identify penetration firestopping with preprinted metal or plastic labels. Attach labels permanently to surfaces adjacent to and within 6 inches of firestopping edge so labels will be visible to anyone seeking to remove penetrating items or firestopping. Use mechanical fasteners or self-adhering-type labels with adhesives capable of permanently bonding labels to surfaces on which labels are placed. Include the following information on labels:

   a. The words "Warning - Penetration Firestopping - Do Not Disturb. Notify Building Management of Any Damage."

   b. Contractor's name, address, and phone number.

   c. Designation of applicable testing and inspecting agency.

   d. Date of installation.

   e. Manufacturer's name.

   f. Installer's name.

3.03 FIELD TESTING / QUALITY CONTROL

A. Contractor shall provide the services of a field technical representative authorized by the manufacturer of the firestopping to perform on-Site, in-progress inspections at no additional cost to the DEP.

B. Certify that the completed Work is in accordance with these Specifications and without damage or deterioration at the time of Final Acceptance.

C. Inspection – Independent inspection agency employed and paid by DEP, will examine penetration firestopping in accordance with ASTM E – 2174, “Standard Practice for On-Site Inspection of Installed Fire Stops and ASTM E-2393, “Standard Practice for On-Site Inspection of Installed Fire Stop Joint Systems. Inspection agency to examine firestopping and will determine, in general, that firestopping has been installed in compliance with requirements of tested and listed firestop system, and installation process conforms to FM 4991 – Standard for Approval of Firestop Contractors or UL Qualified Firestop Contractor Program.

D. The inspector shall advise the Contractor of any deficiencies noted within one (1) working day.

E. Do not proceed to enclose firestopping with other construction until inspection agency has verified that the firestop installation complies with the requirements.

F. Where deficiencies are found, repair or replace the firestopping so that it complies with requirements of tested and listed system design.

3.04 STARTUP / DEMONSTRATION

A. Sample Penetration Firestopping Schedule (Contractor shall provide completed schedule based on construction and penetrations encountered.)

1. Submit a schedule in the format indicated below. List each type of penetration firestopping product required. Include all information listed for each product. Indicate location of product on the plans submitted under Article 1.4. Insert the number of the firestopping type in (--1--) below as means of identifying location of each penetration firestopping application on Drawings; insert number to complete drawing designations. Submit multiple system numbers for each location if required. Insert the UL-Classified Systems number in (--2--) below. Insert the product and manufacturer for each firestopping type in (--3--) below.
2. Where UL-classified systems are indicated, they refer to system numbers in UL's "Fire Resistance Directory" under product Category XHEZ.
    a. Firestopping with No Penetrating Items; FS-(--1--):
        1) UL-Classified Systems: (--2--).
        2) Product and Manufacturer: (--3--)
    b. Firestopping for Metallic Pipes, Conduit, or Tubing FS-(--1--):
        1) UL-Classified Systems: (--2--).
        2) Product and Manufacturer: (--3--).
    c. Firestopping for Nonmetallic Pipe, Conduit, or Tubing FS-(--1--):
        1) UL-Classified Systems: (--2--).
        2) Product and Manufacturer: (--3--).
    d. Firestopping for Electrical Cables; FS-(--1--):
        1) UL-Classified Systems: (--2--).
        2) Product and Manufacturer: (--3--).
    e. Firestopping for Cable Trays with Electric Cables; FS-(--1--):
        1) UL-Classified Systems: (--2--).
        2) Product and Manufacturer: (--3--).
    f. Firestopping for Insulated Pipes; FS-(--1--):
        1) UL-Classified Systems: (--2--).
        2) Product and Manufacturer: (--3--).
    g. Firestopping for Miscellaneous Electrical Penetrants FS-(--1--):
        1) UL-Classified Systems: (--2--).
        2) Product and Manufacturer: (--3--).
    h. Firestopping for Miscellaneous Mechanical Penetrants; FS-(--1--):
        1) UL-Classified Systems: (--2--).
        2) Product and Manufacturer: (--3--).

i. Firestopping for Groupings of Penetrants; FS-(--1--):

1) UL-Classified Systems: (--2--).

2) Product and Manufacturer: (--3--).

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Clean off excess fill materials adjacent to openings as the Work progresses by methods and with cleaning materials that are approved in writing by firestopping manufacturers and that do not damage materials in which openings occur.

B. Provide final protection and maintain conditions during and after installation that ensure that firestopping is without damage or deterioration at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, immediately cut out and remove damaged or deteriorated firestopping and install new materials to produce systems complying with specified requirements.

C. Protect the sealants during the construction period so that they will be without deterioration, soiling, or damage at the time of Substantial Completion.

END OF SECTION

NO TEXT ON THIS PAGE

PART 1 GENERAL

1.01 SUMMARY

A. This Section describes the general requirements for caulking and sealant systems for openings and joints in building roofs and walls between concrete-in-place, masonry units, metal roof flashing, and other equipment and structures in order to provide a positive barrier against the passage of air and moisture.

B. Complete technical services from the approved caulking and sealant manufacturers and on-site technical representation by their Technical Representatives during the time of delivery, storage and installation of the work of this Section and during other work which may affect the work of this Section as specified herein is also included.

C. The Contractor shall provide all labor, materials, equipment and incidentals necessary to perform the work of this Section as shown on the Contract Drawings, specified herein or required otherwise for a complete job.

D. The Contractor shall implement practices and procedures to meet the project's sustainability goals as identified in the Contract Documents. The Contractor shall ensure that the sustainability requirements of this Section are implemented to the fullest extent.

E. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. System Design Requirements

1. The caulking and sealant systems to be furnished under the work of this Section shall include two-part elastomeric sealants, components, accessories and miscellaneous materials used for sealing joints in horizontal and vertical planes.

2. The Work shall include but is not limited to:

a. All joints between cast-in-place concrete and masonry;

b. All cast-in-place concrete to cast-in-place concrete expansion joints;

c. All joints between masonry and metal;

d. All control joints in masonry and concrete;

e. All isolation joints between equipment and other items; and

f. Joints were construction systems are discontinuous or inherently non-watertight.

3. The Work shall be performed at all locations whether or not indicated required to render the building watertight except where a construction system is specifically specified or shown as not relying upon the use of sealants in order to achieve weather- and water tightness.

4. Fire Rating:

a. Where caulking and sealant systems are applied within a fire rated room, corridor, egress path, and as indicated in the Contract Drawings, those caulking and sealant systems shall maintain the fire rating of the location in which application is being done.

B. Substitutions

1. Do not change products, system components, colors or manufacturers after Shop Drawing and Samples approvals by Engineer.

2. Clearly identify, in a manner which is highlighted to Engineer, all proposed substitutions, modifications, variations, unspecified features and "or equal" products. Provide complete comparative data with specified products at time of Shop Drawing submission.

C. Sustainable Design Requirements

1. Low Emitting Materials: Sealants and sealant primers used on site and within the building's weatherproofing system shall comply with the following limits for VOC content:

a. Architectural Sealants: 250 g/L.

b. Sealant Primers for Nonporous Substrates: 250 g/L.

c. Sealant Primers for Porous Substrates: 775 g/L.

1.06 QUALITY ASSURANCE

1. Engage a single manufacturer who shall provide the services of a Technical Representative who shall assist Contractor and Engineer by providing technical opinions on the adequacy of materials and methods of installation based on Shop Drawings approved by Engineer.

a. Provide such services during the time of delivery, storage, handling and installation of all caulking and sealant system components.

2. Test caulking and sealants for compatibility with the substrates specified for conformance to current industry standards, and recommend remedial procedures as required.

B. Installer Qualifications: Engage a single installer skilled, trained and with successful experience in the application of the types of material required and who agrees to employ only tradesmen with specific skill and successful experience in this type of work.

C. Performance Criteria: Do not provide exposed caulking and sealant work for metal batten roofing, sheet metal flashing and trim or custom preformed metal

siding work in order to render the work watertight. These construction systems shall be detailed, fabricated and provided such that they are inherently watertight without the use of additional caulking, sealant, elastomeric compounds, asphaltic compounds or other similar materials.

D. Compatibility: Before purchase of each specified sealant, investigate its compatibility with the joint surfaces, joint fillers and other materials in the joint system. Provide only materials (manufacturer's recommended variation of the specified materials) which are known to be fully compatible with the actual installation condition, as shown by manufacturer's published data or certification.

1.07 SUBMITTALS

A. The Contractor shall submit the following to the Engineer for review and approval.

1. Samples:

a. Actual cured material samples of each type of caulking and sealant specified, 4-inches long, in each of the manufacturer's standard colors.

b. Samples will be reviewed by Engineer for color and texture only.

c. Compliance with other requirements is the responsibility of Contractor.

B. Shop Drawings:

1. Copies of manufacturer's specifications, recommendations and installation instructions for each type of sealant, caulking compound and associated miscellaneous material required. Include manufacturer's published data, indicating that each material complies with the requirements and is intended for the applications shown.

2. Test Reports:

a. Compatibility tests for substrates, based on adhesion-in-peel standard test procedures and ASTM C920.

b. Copies of certified laboratory test reports indicating conformance with the requirements specified.

3. Guarantee:

a. Copies of written guarantee agreeing to repair or replace sealants which fail to perform as specified.

4. Sustainable Design Submittals:

a. Environmental Materials Reporting Form (EMRF) Recycled Content. Provide the following information:

1) Name of Product and Manufacturer.

2) Material cost breakdowns. Cost breakdowns must include total material-only cost (excluding installation, labor and equipment).

3) The percentage (by weight) of post-consumer and pre-consumer recycled content in the submitted product(s), if applicable.

5. VOC Reporting Form.

a. For all sealants and sealant primers used on site and within the building's weatherproofing system, provide the VOC content in grams/Liter (g/L) less water and other exempt compounds.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery of Materials:

1. Deliver materials in caulking and sealant manufacturer's original unopened and undamaged containers, with information accurately representing container contents as approved by Engineer at time of Shop Drawing and Samples submissions.

2. Include the following information on the label:

a. Name of material and supplier.

b. Formula or specification number, lot number, color and date of manufactures.

c. Mixing instructions, shelf life and curing time when applicable.

3. Failure to comply with these requirements shall be sufficient cause for rejection of the material in question, by Engineer, and his requiring its removal from the site. Supply new material conforming to the specified requirements at no additional expense to the City.

B. Storage of Materials:

1. Store materials so as to preclude foreign materials.

2. Do not store or expose materials to temperature above 90 F or store in direct sunshine.

3. Do not use materials which are outdated as indicated by shelf life.

4. Store sealant tape in a manner which will not deform the tape.

5. In cool or cold weather store containers where temperature approximates 75°F for 16 hours before using.

6. When high temperatures prevail store mixed sealants in a cool place.

C. Handling:

1. Handle materials carefully to prevent inclusion of foreign materials.

2. Do not open containers or mix components until necessary preparatory work and priming has been completed.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Exterior and Interior Joints in Vertical Planes: Provide one of the following:

1. Dymeric 240FC as manufactured by Tremco Incorporated, an RPM Company, Beachwood, OH.
2. Sikaflex-2C NS as manufactured by Sika Corporation, Lindhurst, NJ.
3. Or approved equal.

B. Exterior and Interior Joints in Horizontal Planes: Provide one of the following:

1. THC 900/ 901 as manufactured by Tremco Incorporated, an RPM Company, Beachwood, OH.
2. Sikaflex-2C SL as manufactured by Sika Corporation, Lindhurst, NJ.
3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Exterior and Interior Joints in Vertical Planes:

1. Urethane-based, two-component elastomeric sealant complying with the following:
   a. ASTM C 920 Adhesion-in-Peel, ASTM C 920and ASTM C794: Minimum 10 lbs/linear inch with no adhesion failure.
   b. Hardness (Standard Conditions), ASTM C661: 20-25 (Shore A).
   c. Stain and color change, ASTM C 920 and ASTM C510: No discoloration or stain.
   d. Accelerated Aging, ASTM C793: No change in sealant characteristics after 250 hours in weather meter.
   e. Rheological Vertical Displacement at 120 F, ASTM C 920: No sag.

B. Exterior and Interior Joints in Horizontal Planes:

1. Polyurethane-based, two-component elastomeric sealant complying with the following:

a. ASTM C 920Water Immersion Bond, ASTM C1247: Elongation of 25% with no adhesive failure.

b. Hardness (Standard Conditions), ASTM C661: 30-40.

c. Stain and Color Change, ASTM C1247 and ASTM C510: No discoloration or stain.

d. Accelerated Aging, ASTM C793: No change in sealant characteristics after 250 hours in weather meter.

C. Provide colors selected by Engineer from caulking and sealant manufacturer's standard color charts. Engineer will select a maximum of ten colors for the Work. Manufacturers supplying sealants other than those specified above must provide the same colors available from those specified.

D. Miscellaneous Materials:

1. Joint Cleaner: Provide the type of joint cleaning compound recommended by the sealant and caulking manufacturer, for the joint surfaces to be cleaned.

2. Joint Primer and Sealer: Provide the type of joint primer and sealer recommended by the caulking and sealant manufacturer, for the joint surfaces to be primed or sealed.

3. Bond Breaker Type: Polyethylene tape or other plastic tape as recommended by the caulking and sealant manufacturer, to be applied to sealant-contact surfaces where bond to the substrate or joint filler must be avoided for proper performance of caulking and sealant. Provide self-adhesive tape wherever applicable.

4. Sealant Backer Rod: Compressible rod stock polyethylene foam, polyethylene jacketed polyurethane foam, butyl rubber foam, neoprene foam or other flexible, permanent, durable non absorptive material as recommended for compatibility with caulking and sealant by the caulking and sealant manufacturer. Provide size and shape of rod which will control the joint depth for sealant placement, break bond of sealant at bottom of joint, form optimum shape of sealant bead on back side, and provide a highly compressible backer to minimize the possibility of sealant extrusion when joint is compressed.

5. Low Temperature Catalyst: Provide the type recommended by the caulking and sealant manufacturer.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Mixing

1. Comply with sealant manufacturer's written instructions for mixing 2-component sealants.

2. Thoroughly mix components before use.

3. Add entire contents of activator can to base containers. Do not mix partial units.

4. Mix contents for a minimum of 5 minutes or as recommended by the sealant manufacturer, until color and consistency are uniform.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examination

1. The Contractor shall examine the joint surfaces, substrates, backing, and anchorage of units forming sealant rabbet, and the conditions under which the caulking and sealant work is to be performed, and notify Engineer in writing of any condition detrimental to the proper and timely completion of the Work and the performance of the sealant systems. Do not proceed with the caulking and sealant work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

B. Joint Surface Preparation

1. Clean joint surfaces immediately before installation of sealant compound. Remove dirt, insecure coatings, moisture and other substances which would interfere with bonds of sealant compound as recommended by sealant manufacturer's written instructions.

2. Etch concrete and masonry joint surfaces to remove excess alkalinity, unless sealant manufacturer's written instructions indicate that alkalinity does not interfere with sealant bond and performance.

a. Etch with 5 percent solution of muriatic acid.

b. Neutralize with dilute ammonia solution.

c. Rinse thoroughly with water and allow to dry before sealant installation.

3. If necessary, clean porous materials such as concrete and masonry by grinding, abrasive blasting or mechanical abrading. Blow out joints with oil-free compressed air, or by vacuuming joints prior to application of primer or sealant.

4. Roughen joint surfaces on vitreous coated and similar non-porous materials, wherever sealant manufacturer's data indicates lower bond strength than for porous surfaces. Rub with fine abrasive cloth or wool to produce a dull sheen.

3.02 INSTALLATION

A. Comply with sealant manufacturer's written instructions except where more stringent requirements are shown or specified and except where manufacturer's technical representative directs otherwise.

B. Prime or seal the joint surfaces wherever recommended by the sealant manufacturer. Do not allow prime or sealer to spill or migrate onto adjoining surfaces. Allow primer to dry prior to application of sealants.

C. Apply masking tape before installation of primer, in continuous strips in alignment with the joint edge to produce sharp, clean interface with adjoining materials. Remove tape immediately after joints have been sealed and tooled as directed.

D. Do not install sealants without backer rods or bond breaker tape.

E. Roll the back-up rod stock into the joint to avoid lengthwise stretching. Do not twist, braid, puncture or prime backer-rods.

F. Employ only proven installation techniques, which will ensure that sealants will be deposited in uniform, continuous ribbons without gaps or air pockets, with complete "wetting" of the joint bond surfaces equally on opposite sides. Except as otherwise indicated, fill sealant rabbet to a slightly concave surface, slightly below adjoining surfaces. Where horizontal joints are between a horizontal surface and a vertical surface, fill joint to form a slight cove, so that joint will not trap moisture and dirt.

G. Install sealants to depths as recommended by the sealant manufacturer but within the following general limitations, measured at the center (thin) section of the bead.

1. For horizontal joints in sidewalks, pavements and similar locations sealed with elastomeric sealants and subject to traffic and other abrasion and indentation exposures, fill joints to a depth equal to 75 percent of joint width, but not more than 5/8-inch deep or less than 3/8-inch deep.

2. For vertical joints subjected to normal movement and sealed with elastomeric sealants, but not subject to traffic, fill joints to a depth equal to 50 percent of joint width, but not more than 1/2-inch deep or less than 1/4-inch deep.

A. Project Conditions / Environmental Conditions:

1. Do not proceed with installation of caulking and sealants under adverse weather conditions, or when temperatures are below or above manufacturer's recommended limitations for installation.

2. Proceed with the work only when forecasted weather conditions are favorable for proper cure and development of high early bond strength.

3. Wherever joint width is affected by ambient temperature variations, install elastomeric sealants only when temperatures are in the lower third of manufacturer's recommended installation temperature range, so that

sealant will not be subjected to excessive elongation and bond stress at subsequent low temperatures.

4. When high temperatures prevail avoid mixing sealants in direct sunlight.

B. Remove excess and spillage of compounds promptly as the Work progresses.

C. Cure sealants and caulking compounds in compliance with manufacturer's instructions and recommendations, to obtain high early bond strength, internal cohesive strength and surface durability.

3.03 FIELD TESTING / QUALITY CONTROL

A. Where questions of compatibility of sealants and substrate arise the sealant manufacturer shall test the substrate in question for compatibility with the specified sealant and report his findings, with recommendations, to Engineer. Any required sealant change shall be at no additional expense to the City.

B. Do not proceed with installation of elastomeric sealants over joint surfaces which have been painted, lacquered, waterproofed or treated with water repellent or other treatment or coating unless a laboratory test for durability (adhesion), in compliance with Paragraph 4.3.9 of ASTM C 920 has successfully demonstrated that sealant bond is not impaired by the coating or treatment. If laboratory test has not been performed, or shows bond interference, remove coating or treatment from joint surfaces before installing sealant.

C. After nominal cure of exterior joint sealants which are exposed to the weather, test for water leaks. Flood the joint exposure with water directed from a 3/4-inch garden hose, without nozzle, held perpendicular to wall face, 2 feet-0 inch from joint and connected to a water system with 30 pounds per square inch minimum normal water pressure. Move stream of water along joint at an approximate rate of 20 feet per minute.

D. Test approximately 5 percent of total joint system, in locations which are typical of every joint condition, and which can be inspected easily for leakage on opposite face. Conduct test in the presence of Engineer, who will determine the actual percentage of joints to be tested and the actual period of exposure to water from the hose, based upon the extent of observed leakage, or lack thereof.

E. Where nature of observed leakage indicates the possibility of inadequate joint bond strength, Engineer may direct that additional testing be performed at a time when joints have been fully cured, followed by natural exposure through both extreme temperatures and returned to the lowest range of temperature in which it is feasible to conduct testing. Perform testing as directed at any time within 24 months of installation date.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Protection: Do not allow caulking and sealants to overflow or spill onto adjoining surfaces, or to migrate into the voids of adjoining surfaces including rough

textured materials. Use masking tape or other precautionary devices to prevent staining of adjoining surfaces, by either the primer/sealer or the caulking and sealant materials.

B. Repair sealant installation at leaks or, if leakage is excessive, replace sealant installation as directed.

C. Clean adjacent surfaces of sealant or soiling resulting from the Work. Use solvent or cleaning agent recommended by the sealant manufacturer. Leave all finish work in a neat clean condition.

D. Protect the sealants during the construction period so that they will be without deterioration, soiling, or damage at the time of the City's Final Acceptance.

END OF SECTION

NO TEXT ON THIS PAGE

SECTION 08 11 19 – STAINLESS-STEEL DOORS AND FRAMES
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish and install all doors, frames, transoms, sidelights, and associated equipment shown on the Contract Drawings and specified herein.

B. The Contractor shall implement practices and procedures to meet the project's sustainability goals as identified in the Contract Documents. The Contractor shall ensure that the sustainability requirements of this Section are implemented to the fullest extent.

C. The following index of this Section is presented for convenience:

Article	Title	Section Page

8.	UL 10C	-	Underwriters Laboratories, Positive Pressure Fire Tests of Door Assemblies

1.05 DESCRIPTION

A. The Contractor shall be responsible for coordinating all work in this Section with work covered under Section 08 71 01 - Finish Door Hardware.

B. Sustainable Design Requirements

1. Recycled Content of Stainless Steel Doors and Frames: Postconsumer recycled content plus one-half of pre-consumer recycled content shall not be less than 30 percent.

2. Low Emitting Materials: Paints, coatings, sealants, and adhesives used on site and within the building's weatherproofing system shall meet the VOC content limits of OTC Phase II.

1.06 QUALITY ASSURANCE

A. Provide stainless steel doors and frames and accessories manufactured by a single firm specializing in the production of this type of Work and complying with specified standards of ANSI, NFPA, SDI and UL.

B. Materials and Equipment Compliance:

1. Materials and equipment submitted for DEP's approval by the Contractor shall have met, at the time of their submittal, the certification and material acceptance requirements of the NYC Department of Buildings, unless otherwise required by the Authority Having Jurisdiction over the Work.

2. All materials provided under this Section shall comply with the Contract Documents.

3. Comply with all applicable requirements of governing authorities and codes for all work.

C. Fire rated Assemblies: Wherever fire-resistance classification is shown or scheduled for stainless steel doors and frames (3-hour, 1-1/2-hour, and similar designations), provide fire-rated assemblies investigated and tested as complete assemblies including type of fire door hardware to be used. Identify each fire door, frame and stick system assembly with recognized testing laboratory labels, indicating applicable fire rating of both door, frame and stick assembly.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings for approval by the Engineer. Submittals shall include, but not be limited to the following:

1. Samples.

2. Shop Drawings.

B. Each submittal shall be complete in all respects, incorporating all information and data listed herein and all additional information required for evaluation of the proposed materials compliance with the Contract Documents.

C. Samples shall include:

1. Corner sections of frames and trim.

2. Cut-away corner sections of hollow metal doors showing internal reinforcement specified.

3. Insulating material.

D. Shop Drawings shall include, but not be limited to:

1. Complete layout and installation drawings and schedules with clearly marked dimensions. Drawings shall indicate details of construction, profiles, gauges, reinforcing and location of all doors and frames.

E. Sustainability Submittals:

1. Environmental Product Declarations

a. The Contractor shall provide product-specific type III Environmental Product Declaration (EPD) conforming to ISO 14025, 14044.

2. Envision Submittals

a. The Contractor shall report information pertaining to the sustainable procurement, regional sourcing, and/or recycled content of new materials to be procured during the Work, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall coordinate with its vendor on sustainable product requirements as stipulated by the Contractor's approved New Materials Sustainable Implementation Plan, in accordance with Section 01 35 63 – Sustainability Certification Project Requirements. The Contractor shall submit vendor shop drawings for review by the Engineer that clearly illustrate the vendor is meeting the requirements as approved in the Contractor's New Materials Sustainable Implementation Plan.

3. VOC Reporting Form. Provide the following information:

a. For all paints, coatings, sealants and adhesives used on site and within the building's weatherproofing system provide the VOC content in grams/Liter (g/L) less water and other exempt compounds.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery of Materials:

1. Materials shall not be delivered to the project site before the time of installation.

2. Materials shall be delivered in sufficient quantities to allow continuity of the work.

B. Storage of Materials:

1. Materials shall be stored in original, undamaged packaging with manufacturer's labels and seals intact.

2. All materials shall be stored in a dry, enclosed area, off the ground and away from all possible contact with water, ice or snow.

3. Damage to materials during storage shall be prevented primarily by minimizing the amount of time they are stored at the site before being incorporated into construction systems.

4. Protection shall be arranged to protect all hardware which may be attached.

C. Handling of Materials:

1. Materials shall be handled carefully in order to avoid damage or breakage.

2. Materials shall not be exposed to detrimental conditions or physical damage. Materials which are so exposed shall be removed from the site and shall not be incorporated into the work.

3. Packages shall not be opened until all necessary preparatory work is complete and installation is to begin immediately. Materials shall not be allowed to become wet or soiled or covered with ice or snow.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Door Component Inc., North Plainfield, NJ;

B. Medallion Entry Systems, Inc., Indianapolis, IN;

C. Or an approved equal.

2.02 MATERIALS / EQUIPMENT

A. Stainless Steel Doors

1. Doors shall be of the finest commercial quality No. 16 gauge Type 316 stainless steel, 1-3/4-inch thick, of sizes shown. Doors shall be series "CH" Seamless Honeycomb Core doors.

2. Door louvers in fireproof doors shall be Model L as manufactured by:

3. Finish of all doors and frames shall be #4 finish.

4. All doors shall be provided with stainless steel tags, 1/2-inch diameter x 1/16-inch thick, stamped with the door number and black Japan-filled; numbers shall conform to those in the Door Schedule.

5. Doors shall have a one-piece Kraft honeycomb core securely bonded under heat and pressure to both face sheets. Honeycomb core shall have a 1" hexagonal cell impregnated with phenolic resin. There shall be no seams

on the faces or edges of the doors. Vertical edges shall be continuously heliarc welded, full height of the door. Exterior doors shall be capped to prevent moisture penetrating the door.

a. Exterior door leafs shall be insulated with U-Factor of 0.36.

6. Double doors shall have applied stainless steel astragals, 1/8-inch x 1- 1/2-inch.

7. Heads and jambs of frames shall be matched, mitered, welded and finished to present a smooth surface for finishing. Provide a minimum of 3 anchors per jamb, as well as clip angle for floor anchorage. Prepare frames for all hardware at factory from templates furnished. All hardware cutouts shall be reinforced with 1/8-inch plate welded to frame; 3/16-inch plate shall be used for hinge reinforcements.

8. Jambs shall be constructed to be set on the finished floor. Rubber mutes shall be shipped attached to lock jambs on single doors and on head members for double doors.

9. Glass for all doors shall be secured with moldings of No. 20 gauge stainless steel fastened with stainless steel counter-sunk oval head machine screws. The moldings shall be assembled as frames with corners welded.

10. All exterior doors shall be fully weather-stripped, as called for under Section 08 71 01 - Finish Door Hardware.

11. Louvers in fireproof doors shall be constructed of No. 18 gauge stainless steel and shall be equipped with a fusible link and automatic mechanism as approved by the New York City Building Department Office of Technical Certification and Research (OTCR) and finished to match face of door.

12. Proper concealed reinforcements of sheet or bar steel shall be provided for hardware and for all attached work. Reinforcement for butt side of doors shall be a continuous 3/16-inch stainless steel plate. Lock reinforcement shall be No. 12 gauge stainless steel sheet. Reinforcement for door closures, holders, checks and brackets shall be No. 12 gauge plate of length as required for finish hardware.

13. Reinforce tops and bottoms of door with minimum No. 16 gauge horizontal stainless steel closing channels, as integral part of door construction, welded continuously to the outer sheets. Close top and bottom edges to provide weather seal, using 16 gauge flush-mounted inverted closure channels continuously adhered to face sheets with structural silicone adhesive.

14. Edge profiles shall be provided on both stiles of doors beveled 1/8 inch in 2 inches.

B. Stainless Steel Frames

1. Materials shall be free from defects impairing strength, durability, and/or pressed as required for their respective function. Molded work shall have sharply defined profiles and arises, be clean and sharp. Work shall be of

proper dimensions to receive work of others. The indicated and specified thicknesses of the metal are minimum.

2. Gauges for steel used in the work shall be as follows:

	Steel Work	U.S. Gauge
1	Combination Metal Frames and Trim:	
	a. Exterior Combination Frames & Trim	No. 12
	b. Interior Combination Frames & Trim	No. 16
	c. Interior Combination Frames & Trim for Fire Rated Frames	No. 14
	d. Exterior Scribe Molding	No. 14
	e. Interior Scribe Molding	No. 18
	f. Exterior and Interior Angle Floor Knees, Adjustable Anchors, Slides and Adjustable Anchors	No. 16
	g. Fillers	As Required
2	Hardware Reinforcement:	
	a. Butts, Checks, Overhead Door Holders, Bracking Pulls	3/16" thick
	b. Locking Latches	No. 12
3	Trim	No. 16

C. Stainless Steel Combination Frames and Trim

1. Stainless steel combination frames and trim shall be placed at door openings, as shown on the Contract Drawings.

2. Stainless steel combination frames and trim shall be of size and approximate design shown on the Contract Drawings, have integrally molded trim and loose molds according to contours of details, reinforced, and drilled tapped for hardware. The type, as detailed, covers the general run of frames for the work but the forming shall be varied from that shown where indicted by special details or necessitated by other conditions.

3. Miter corners accurately, heliarc weld, and dress exposed joints to render same inconspicuous. Spreaders shall be of an approved type.

4. Frames shall extend to rough concrete slab, bottoms provided with suitable angle clips for securing to jambs. Heads of frames for openings wider than 3 feet shall be reinforced with angles or channels formed of No. 10 gauge stainless steel spot welded. Where waterproofing occurs, frames shall extend 1 inch below finished floor. Where required to receive labeled

ratings, frames shall be fabricated of gauges required and shall be provided with the necessary labels.

a. Provide stainless steel labels permanently attached to section of frame concealed by closed door.

5. Slots shall be provided at upper sections of vertical members for securing temporary wood blocking to which shall be nailed the braces for holding jambs in place while building walls. All doors frames shall be provided with rubber door silencers, not less than two (2) per jamb.

6. Rubber door silencers shall be shipped attached to lock jamb on single doors and on head members for double doors.

7. Provide holes as approved for fastening wood blocking and trim where such are required by the Drawings.

8. Finish for stainless steel frames shall be No. 4 Finish.

D. Anchors for Stainless Steel Frames

1. Door frames in concrete openings shall be anchored with 4 hex head stainless steel expansion bolts for each jamb and two hex head stainless steel expansion bolts for each head; where steel lintels occur, machine bolts shall be used. Removable stops shall be installed to cover the bolt heads, the stops to be fastened with counter sunk oval head screws.

2. Door frames in brick or hollow tile openings shall have adjustable anchors spaced 12 inches from the top and bottom of rough bucks and intermediate anchors shall be spaced not more than 30 inches apart on each side. Anchors shall slide on a No. 14 ga. 6-inch long steel strap securely welded to rough bucks. The leg extending into the wall shall be crimped No. 14 ga. steel at least 8 inches long where possible and 3 inches wide, except that the width shall not exceed the thickness of the masonry, nor shall the edge of the anchor come closer than 1/2 inch to the finished face of a wall.

3. Door frames in gypsum wall board partition walls shall be provided with welded-in steel anchors, which shall be screw-adjusted after the frame is installed, positioning the jambs solidly against wall structure.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Fabrication and Workmanship

1. All metal work shall be accurately fabricated and neatly assembled so as to be free from dents, tool marks, warpage, buckle or open joints. All lines shall be straight and true to curvatures as required, arises and angles as sharp as practical, moldings true to profile, mitres formed in true alignment and abutting profiles shall intersect accurately.

2. Molded members and moldings shall be as shown on the Contract Drawings, unless otherwise approved. Stock molding shall be as shown on the Contract Drawings unless otherwise approved. Stock moldings which

closely approximate the contours shown on the Contract Drawings will be accepted.

3. All items of template hardware, drilling and tapping shall be located by templates so that accurate alignment will be secured. Templates should be located before manufacturing is commenced.

4. All members shall be accurately fastened together so as to provide rigid construction in the assembled work. Removable members shall be secured with countersunk head tamperproof machine screws not more than 12 inches apart. All connections, except those of removable members shall be welded or interlocked.

5. All exposed face joints between members shall be continuously welded and dressed smooth and flush to be practically invisible.

6. Sinkages, cutouts and concealed reinforcement shall be provided as required for the proper installation and attachment of all hardware.

7. Sinkages shall be provided for butts lock fronts and strikes so that the exposed surfaces of hardware will finish flush with adjacent surfaces.

B. Labeled Work

1. Door openings to receive fire ratings as indicated on the Contract Drawings shall have frames and doors and equipment of gauges meeting the requirements for the rating noted by the OTCR. Frames and doors shall bear the necessary label and shall be labeled separately.

2. Each labeled door and frame shall be cut and reinforced to receive the type hardware required.

C. Hardware

1. Furnish and apply, in connection with this work, all hardware not requiring special finish such as screws, anchors, braces, bolts, etc., as required to erect this work properly.

2. Finishing hardware will be furnished under Section 08 71 01 Finish Door Hardware. This Contractor shall, however, receive, check, store and apply the finishing hardware insofar as it occurs in connection with work under this Section. Protect door knobs by covering with cloth pads securely wired in place and do not apply escutcheons and other trim until directed to do so, by the Engineer.

3. Specified manufacturer's supplemental and special reinforcement for hinges, surface applied closers, holders, coordinators, stops and strikes shall be manufacturer's standard but not less than specified and recommended for maximum heavy-duty construction.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. All doors and frames specified herein shall be neatly installed in designated locations indicated on Drawings.

B. Install in strict accordance with manufacturer's printed instructions and SDI standards and recommendations.

C. Fixed units shall be securely fastened in place and operative units adjusted to work properly.

D. Combination frames and trim shall be securely anchored in place with jambs filled solidly with mortar.

E. Do all necessary cutting, drilling and fitting for securing work in position including all necessary cutting, drilling and tapping of the work to accommodate the work of other trades. Drilling and tapping for non-template hardware shall be performed at the site.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. The Contractor shall provide protection against stains, dirt or damage to the finished installation. The doors shall be adjusted at installation for proper operation. At conclusion of construction, doors shall have any final adjustments made in order to place the doors in perfect operating condition.

B. Check and re-adjust all operating hardware items immediately before final inspection. Leave work in complete and proper operating condition. Remove and replace defective work, including all steel that is warped, bowed, scratched or otherwise damaged.

C. Upon completion of the project all finished work of this Section shall be carefully cleaned. Defective finish shall be removed and refinished, and all work left clean and perfect.

END OF SECTION

SECTION 08 16 13 – FIBERGLASS REINFORCED PLASTIC DOORS AND FRAMES
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish and install all fiberglass reinforced plastic (FRP) doors, frames, and transoms and associated equipment shown on the Contract Drawings and specified herein.

B. The Contractor shall implement practices and procedures to meet the project's sustainability goals as identified in the Contract Documents. The Contractor shall ensure that the sustainability requirements of this Section are implemented to the fullest extent.

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

1.05 DESCRIPTION

A. Provide FRP door and frame components including, but not limited to, astragals, cores, faces, stiles, rails, heads, jambs, and internal reinforcement. Ensure all shapes are composed of fiberglass reinforcement and resin in qualities, quantities, properties, arrangements and dimensions as necessary to meet the design requirements in accordance with code requirements, and dimensions specified.

B. Ensure fiberglass reinforcements are a combination of continuous roving, continuous strand mat, and surfacing veil in sufficient quantities as needed by the application and/or physical properties required.

C. Verify resins are of isophthalic polyester with chemical formulation necessary for corrosion resistance, strength and other physical properties as required.

1. Chemical resistance to:

a. Sodium Bisulfite, 50% concentration.

b. Sodium Hypochlorite, 15% concentration.

D. Ensure all finished surfaces of FRP items and fabrications are smooth, resin-rich, free of voids and without dry spots, cracks, and un-reinforced areas. Completely cover all glass fibers with resin to protect against their exposure due to wear or weathering.

E. The Contractor shall be responsible for coordinating all Work in this Section with Work covered under Section 08 71 01 - Finish Door Hardware.

F. Sustainable Design Requirements

1. Low Emitting Materials: Paints, coatings, sealants, and adhesives used on site and within the building's weatherproofing system shall meet the VOC content limits listed below.

1.06 QUALITY ASSURANCE

A. Provide FRP doors and frames and accessories manufactured by a single firm specializing in the production of this type of Work and complying with specified standards of ASTM, ANSI, NFPA, and UL.

B. Materials and Equipment Compliance:

1. Materials and equipment submitted for DEP's approval by the Contractor shall have met, at the time of their submittal, the certification and material acceptance requirements of the NYC Department of Buildings, unless otherwise required by the Authority Having Jurisdiction over the Work.
2. All materials provided under this Section shall comply with the Contract Documents.
3. Comply with all applicable requirements of governing authorities and codes for all work.

C. Door and Frame Performance:

1. Design exterior and interior doors, frames and hardware to resist equivalent static design loads in accordance with ASTM F1642, with frame deflections not to exceed L/160 of the unsupported member lengths. Use equivalent static design loads for connections of the door frame to the surrounding walls or hardware and associated connections, in accordance with ASTM F2248 and ASTM E1300. Design supporting elements and their connections based on their ultimate capacities. Provide calculations prepared by a Professional Engineer that substantiates compliance with these requirements, including insulation materials. Use frames that provide an equivalent level of performance. Provide framing members with shape and thickness sufficient to withstand a design wind load of not less than 30 pounds per square foot of supported area with a deflection of not more than 1/175 times the length of the member and a safety factor of not less than 1.65.
2. Design doors and frames to provide for expansion and contraction of the component parts caused by an ambient temperature range of minus 0 to 100 degrees F causing buckling, opening of joints, overstressing of fasteners, or other harmful effects.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings for approval by the Engineer. Submittals shall include, but not be limited to the following:

1. Samples.
2. Shop Drawings.

B. Each submittal shall be complete in all respects, incorporating all information and data listed herein and all additional information required for evaluation of the proposed materials compliance with the Contract Documents.

C. Samples shall include:

1. Corner sections of frames and trim.
2. Cut-away corner sections of doors showing internal reinforcement specified.

D. Shop Drawings shall include, but not be limited to:

1. Complete layout and installation drawings and schedules with clearly marked dimensions. Drawings shall indicate details of construction, profiles, gauges, reinforcing and location of all doors and frames.

E. Sustainable Design Submittals:

1. Environmental Materials Reporting Form (EMRF) Recycled Content. Provide the following information:

a. Name of Product and Manufacturer.

b. Material cost breakdowns. Cost breakdowns must include total material-only cost (excluding installation, labor and equipment).

c. The percentage (by weight) of post-consumer and pre-consumer recycled content in the submitted product(s), if applicable.

F. VOC Reporting Form. Provide the following information:

1. For all paints, coatings, sealants and adhesives used on site and within the building's weatherproofing system provide the VOC content in grams/Liter (g/L) less water and other exempt compounds.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery of Materials:

1. Materials shall not be delivered to the project site before the time of installation.

2. Materials shall be delivered in sufficient quantities to allow continuity of the work.

B. Storage of Materials:

1. Materials shall be stored in original, undamaged packaging with manufacturer's labels and seals intact.

2. All materials shall be stored in a dry, enclosed area, off the ground and away from all possible contact with water, ice or snow.

3. Damage to materials during storage shall be prevented primarily by minimizing the amount of time they are stored at the site before being incorporated into construction systems.

4. Protection shall be arranged to protect all hardware which may be attached.

C. Handling of Materials:

1. Materials shall be handled carefully in order to avoid damage or breakage.

2. Materials shall not be exposed to detrimental conditions or physical damage. Materials which are so exposed shall be removed from the site and shall not be incorporated into the work.

3. Packages shall not be opened until all necessary preparatory work is complete and installation is to begin immediately. Materials shall not be allowed to become wet or soiled or covered with ice or snow. Not Used

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. FRP Doors and Frames:

1. CORRIM Company, Oshkosh, WI.
2. Chem-Pruf Door Co Ltd, Brownsville, TX.
3. Tiger Door, Brownsville, TX.
4. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Provide and install a seamless press-molded constructed FRP door. Laminate FRP face sheets to be applied while wet and uncured to an internal door stile and rail subframe/core assembly which is pressure molded under heat. Integrally fuse the composite door panel over the entire surface area, do not adhesive-bond at the perimeter stile and rail.

B. Provide door stiles and rails which are high-modulus pultruded FRP square or rectangular tube subframe. Miter and join tubes internally at the corners with solid polymer blocks to yield a one piece unit. Provide a mid-rail tube across the width of the door at lockset height and additional horizontal rails where specified. Chemically weld all connections. No mechanical fastening at the tube joints is permitted.

C. Provide a triangular shaped 3/8 inch phenolic resin impregnated kraft paper honeycomb cell core for maximum rigidity and compressive strength. Use of polyurethane foam or balsa wood cores are not permitted.

D. Provide internal reinforcement composed of high-modulus pultruded solid FRP or high-density polymer compression blocks at all hardware and corner locations. No aluminum, steel, or wood blocking for reinforcement is permitted. A minimum pull-out force strength of 900 pounds per screw is required for all hinge locations.

E. Door faces are to utilize a chemical resistant thermosetting polyester resin with fiberglass reinforcing layers. Provide structural reinforcement which is knitted

multi-layer material with layers of unidirectional fiberglass orientated in both vertical and horizontal directions for high stiffness, impact and warp resistance. Furnish door faces as indicated by the door elevation drawings.

F. Ensure the exposed finish of the FRP door faces are to be an ultra-violet light stabilized marine grade Neopentyl Glychol (NPG)-isophthalic polyester gelcoat integrally molded to a 25/30 mil wet thickness.

G. Provide an integral heavy pultruded FRP astragal on the stile edge of the inactive leaf for double doors of the same materials as specified for door stiles and rails. Cutouts for door lights and louvers are to be manufactured and not field fabricated. Cutouts are to be totally enclosed by internal pultruded FRP stiles and rails as specified and incorporated into the door subframe with the opening completely fused to both door faces.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. FRP Door

1. Total door thickness to be nominal 1-3/4 inches thick.

2. Provide doors with completely seamless construction on all six surfaces.

3. Face: FRP face sheets shall be manufactured using a corrosion resistant resin system with light stabilizing additives. The resin shall be reinforced with fiberglass, 50% average by weight for enhanced strength. Face sheets shall be a minimum of 0.125 inch thick fiberglass. Face sheets shall be smooth.

4. Stiles and Rails: Stiles and rails shall be pultruded fiberglass solid sections or tubes. Pultrusion is a fiberglass fabrication process that results in a much stronger, more durable product. Non-rated and 20 minute doors will have a full width horizontal pultruded fiberglass tube every 24 inches in height for internal reinforcement. A solid fiberglass block shall be used at all hardware reinforcements and corner intersections. A minimum of 1,000 pounds screw withdrawal force shall be required per screw. Absolutely no metal or wood reinforcements, including #2 SPF (Spruce Pine Fir), will be allowed in any part of the stile and rail configuration.

5. Cores:

a. Core material shall be Polypropylene plastic honeycomb core with a non-woven polyester veil for unparalleled plate bonding, 180 PSI typical compression range or

b. Polyurethane Foam Core: A 1-1/2 inch thick rigid block of polyurethane shall be laminated to the interior of the panels. The polyurethane insulation shall be Class A and CFC free. Foam properties comply with ASTM E-84 and NYC Construction Codes.

c. Exterior door: The “R” factor shall be 12.

6. Hardware Preparation: Doors shall be reinforced and mortised for hardware with 1-1/2 inches x 1-1/2 inches of solid fiberglass to allow application of hinges and locks, in accordance with the hardware schedule, hardware manufacturer's instructions and templates.

    a. Reinforcement Blocking: Non-swelling polymer or firestop blocking will be used for all lockset, surface mounted hardware and through bolted hardware blocking.

    b. Pilot holes for full mortise butt hinges will be pre-drilled by factory.

    c. All hardware shall be attached / installed by using pilot hole and stainless steel wood screws.

B. FRP frames shall be rigid, neat in appearance, free from defects and the finish shall match the doors. Fabricate FRP doors and frames as shown on the drawings and in accordance with best shop practices. Field measurements shall be taken as required for coordinating with adjoining work.

1. Provide frames for doors, as indicated in door schedule. Non-rated: Standard one-piece FRP profile with integral stop:

    a. Stop: 5/8 inches.

    b. Jamb: 5-3/4 inch x 2 inch equal rabbet.

    c. Head: 4 inch header, modified depth with equal rabbet.

    d. Thickness: 3/16 inches thick.

2. All frames shall be 100% pultruded fiberglass with an average 50% glass content by weight which results in an industrial fiberglass frame as strong as a 14-gauge hollow metal frame.

3. Head and jamb members shall be one piece frame, resin bonded and assembled at factory.

C. Reinforcements and Braces / Supports: Provide structural and hardware reinforcement and braces at the following locations and as recommended by manufacturer:

1. Frames shall be reinforced and mortised for hardware in accordance with the hardware schedule, manufacturer's instructions and templates. Absolutely no metal reinforcements will be allowed in any part of the FRP frame configuration.

2. Corner Reinforcement: 4 inches x 4 inches x 5-3/8 inches x 1/4 inch thick pultruded fiberglass angle. Attached to head bar at factory using stainless steel screws.

3. Mortise Hinge Reinforcement: 3 inches x 7 inches x 9/16 inch (or 3/8 inch) thick FRP material attached to frame by means of bonding and stainless steel countersunk screws.

4. Closer Reinforcement: 1-1/2 inches x 19 inches x 3/16 inch thick FRP material attached to frame by means of bonding.

5. Strike Reinforcement: 1-1/2 inches x 9 inches x 3/4 inch thick FRP material attached to frame by means of bonding and stainless steel countersunk screws.

D. Anchors:

1. Provide anchorage devices and fasteners where necessary for fastening fabricated FRP door frame to the adjacent construction-in-place as recommended by the FRP frame manufacturer and as required of chemical resistance.

a. Provide Expansion Type Anchor for concrete of corrosive-resistant steel a minimum 3/8-inch diameter bolt with expansion shield or insert. Provide chemical resistant coating at all exposed anchor surfaces.

2. Anchoring Systems: Furnish at least three anchors in each jamb of frames up to 90 inches high and one additional anchor for each 30 inches in height above 90 inches, in shapes, sizes and spacing shown or required for anchorage into adjoining wall construction.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. All doors and frames specified herein shall be neatly installed in designated locations indicated on the Contract Drawings.

B. Install in strict accordance with manufacturer's printed instructions.

1. Frames shall be anchored and grouted in place.

C. Fixed units shall be securely fastened in place and operative units adjusted to work properly.

D. Combination frames and trim shall be securely anchored in place with jambs filled solidly with mortar.

E. Do all necessary cutting, drilling and fitting for securing work in position including all necessary cutting, drilling and tapping of the work to accommodate the work of other trades. Drilling and tapping for non-template hardware shall be performed at the site.

3.03 FIELD TESTING / QUALITY CONTROL

A. Frame Installation Tolerances

1. Squareness: Plus or minus 1.6 mm 1/16 inch, measure at the door rabbet on a line 90 degrees from the jamb perpendicular to the frame head.
2. Alignment: Plus or minus 1.6 mm 1/16 inch, measure at the jamb on a horizontal line parallel to the wall plane.
3. Twist: Plus or minus 1.6 mm 1/16 inch, measure at the opposite face corners of the jambs on parallel lines, and perpendicular to the wall plane.
4. Plumb and True: Plus or minus 1.6 mm 1/16 inch, measure at the jambs to the floor.

B. Door Clearance Tolerances

1. Jambs and Head: Plus 1/8 inch or minus 1/16 inch.
2. Pairs of Doors: Plus 1/8 inch or minus 1/16 inch.
3. Bottom of Door and Top of Threshold: Maximum 3/8 inch.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. The Contractor shall provide protection against stains, dirt or damage to the finished installation. The doors shall be adjusted at installation for proper operation. At conclusion of construction, doors shall have any final adjustments made in order to place the doors in perfect operating condition.

B. Check and re-adjust all operating hardware items immediately before final inspection. Leave work in complete and proper operating condition. Remove and replace defective work, including all FRP that is warped, bowed, scratched or otherwise damaged.

C. Upon completion of the project all finished work of this Section shall be carefully cleaned. Defective finish shall be removed and refinished, and all work left clean and perfect.

END OF SECTION

SECTION 08 51 13 – ALUMINUM WINDOWS
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish, install and place into satisfactory service all high-performance, thermal-barrier, custom architectural grade aluminum windows and frames, and auxiliary system components, of the performance grade specified.

B. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. This Section describes exterior, high-performance, minimum 3-1/4-inch frame depth, factory-fabricated and factory-glazed, aluminum windows with integral structural polyurethane thermal-breaks and true divided muntins complying with the requirements of AAMA/NWWDA 101/I.S. 2 - Architectural Performance Class and Section 4 - Optional Performance Grades, all with Architectural Class I anodized finish or with a complete selection of factory-applied, four coat, custom and premium exotic color, custom blended full strength polyvinylidene fluoride finishes and colors with extended life topcoat, as selected in the Contract; all designed, detailed and fabricated as required to resist specified loadings, and resistance to air and water penetration specified and in accordance with the requirements of governing authorities having jurisdiction; associated high-performance operating hardware, auxiliary system items, accessories, fasteners and similar items for completely functioning systems.

B. Design Requirements

1. Comply with applicable standards and recommendations by AA, AAMA, and ASCE, except to the extent more stringent requirements are specified or required by governing authorities having jurisdiction at the Site.

2. Comply with AAMA/NWWDA 101/I.S.2 including "non-mandatory" Appendix B, C, and D except where more stringent Wind Velocity Maps are included in ASCE 7 or other governing authorities having jurisdiction.

C. Modifications: Aluminum window and frame requirements shown are intended to establish basic dimensions of units, modules, profiles, mullion depths, sight lines, support locations of members and the visual design intention. Within these limitations Contractor shall be responsible for the structural adequacy, weather resistance, thermal and condensation resistance, and the detailing and fabrication of all aluminum window and frame system, including anchorage, and to make whatever modifications of, and additions to, the details as may be required to fulfill the minimum performance requirements of AAMA Optional Performance Grade and the requirements of non-mandatory Appendixes specified, at no additional expense to the City. Maintain the visual design concept as shown, including member sizes, profiles, support locations and alignment of components.

D. Performance Criteria:

1. General:

a. The design wind load pressures for aluminum windows and frames shall be determined in accordance with analytical procedures established by ASCE 7 and shall take into consideration the load magnification effect caused by gusts in resonance with along-wind vibrations of flexible building and other structures. Professional engineer who prepares, signs, stamps its seal on Shop Drawings submitted to Engineer shall take into consideration the need for wind-tunnel tests in order to include the effects of across-wind loading, vortex shedding or instability due to galloping or flutter of Project locations where channeling effects or buffeting in the wake of upwind obstructions warrant special consideration, or for those buildings or structures having unusual geometric shapes or response characteristics.

b. On Projects where the professional engineer believes such conditions may exist, provide Engineer and the City with recommendations for further testing required to establish the design criteria for aluminum windows and frames. Identify all costs associated with such testing. Do not proceed with testing until given written approval by the City.

c. After carefully reading system performance criteria and other requirements of the Section, professional engineer to whom design of the aluminum window and frame system is delegated shall make all requests for clarification of requirements that may be necessary in writing, to Engineer.

2. Loading Analysis Criteria:

   a. Wind Loads: Provide structural analysis, calculations and details indicating compliance with the NYCBC, ASCE 7-93 and ASCE 7-88, based on project location, heights and wind speed of 115 miles per hour (MRI 100 years), Ground Roughness (Exposure) Category D; Importance Factor based on ASCE 7 - Category IV - Essential Facility, and corresponding formula coefficients, to determine velocity pressures.

   b. Seismic Loads: Provide aluminum window and frame system, including anchorage, capable of withstanding the effects of earthquake motions calculated according to requirements of the NYCBC or ASCE 7, Section 9, whichever are more stringent.

   c. Dead Loads: Provide aluminum window and frame system components that do not deflect an amount that will reduce glazing bite below 75 percent of required glazing bite dimension when carrying full dead load. Provide minimum of 1/8 inch clearance between members and top of fixed panels, glazing, or other fixed part immediately below. Provide a minimum of 1/16 inch clearance between members and operable windows and doors.

   d. Live Loads: Provide aluminum window and frame system, including anchorage that accommodates supporting structure's deflection from uniformly distributed and concentrated live loads indicated without failure of materials or permanent deformation.

   e. Deflection of Framing Members, ASTM E330: Maximum deflection of L/175 at center of single span when subjected to both positive and negative applicable design pressures, with no permanent deformation or damage of any main frame, sash, panel or sash member in excess of 0.2 percent of the span when the load is removed.

   f. Provide complete loading analysis performance calculations and Shop Drawings for all aluminum window and frame system components prepared, signed and stamped with the seal of a licensed professional engineer licensed to practice in the State of New York and recognized as an expert in the specialty involved.

3. Water and Air Infiltration Tests: A 5 foot-10 inch by 3 foot-1 inch window with a 4 foot-10 inch by 2 foot-10 inch minimum vent size shall comply with the following:

   a. Static Test Pressure Water Penetration Testing, ASTM E331 and AAMA 910: After the AAMA 910 life cylce test, no evidence of uncontrolled water penetration to the interior of the building through the aluminum windows and frames when subjected to a static air pressure difference of 12 pounds per square foot.

b. Air Infiltration Testing, ASTM E283: After the AAMA 910 life cycle test, maximum air infiltration of 0.08 cubic feet per minute per square foot, when subjected to a static air pressure difference of 6.24 pounds per square foot.

4. Aluminum Window Classification (Grade): Based on AAMA/NWWDA 101/I.S.2, provide the following:

   a. Performance Class: In addition to General Requirements of Section 1, Gateway Performance Requirements established in Table 2.1, the Specific Performance Requirements of Section 2.2 and the Material and Component Requirements of Section 3, provide Optional Performance Class - Architectural AW, for all aluminum windows and frames.

   b. Performance Grade: As a minimum, provide Optional Performance Grade 65 aluminum windows and frames tested for structural test pressure of 1.5 times design pressure, unless structural calculations based on performance criteria specified identifies the need for more stringent optional performance grade for any area of the Project.

   c. Product Type: Provide F - Fixed Window, as noted below unless shown on the Contract Drawings.

      1) Fixed: AW-PG100-FW.

5. Provide design, detailing and fabrication based on the most stringent combination of standards, testing and engineering analysis specified.

6. Thermal Movements: Aluminum window and frame system, including anchorage, shall withstand thermal expansion and contraction movements of system and supporting elements resulting from not less than an ambient temperature change of 120 degrees F, which may cause a surface curtain wall material temperature change of 180 degrees F. Limit the deflection as for wind pressure loading. Thermal movements shall not cause permanent deformation, cracking, opening of joints, undue stress on fasteners, or other effects detrimental to weathering performance.

7. The design of the aluminum window and frame system, including anchorage, as shown and specified is intended to prevent excessive condensation on the indoor faces of the work, with the heating and ventilating system in operation, and under the following conditions. Provide aluminum window and frame system design, detailing and fabrication in compliance with AAMA 1503.1 that achieves and maintains this design intention:

   a. Outdoor: Ambient temperature 0 degrees F; 15 mph wind.

   b. Indoor: Ambient temperature of 75 degrees F; relative humidity of 25 percent.

   c. Excessive condensation is defined as visible water.

d. Condensation Resistance Factor: 58 minimum for frame.

8. Provide internal drainage to lead all infiltrated water to the exterior through weep slots.

9. Testing: Wherever manufacturer's standard window units comply with the requirements and have been tested in accordance with the specified tests, provide certification by the manufacturer of compliance with such tests; otherwise, perform the required tests through a AAMA accredited and recognized testing laboratory or agency and provide certified test results.

E. Scheduling and Coordination:

1. Review installation procedures under other Sections and coordinate them with the work specified herein.

2. Notify other Contractors in advance of installation to provide them with sufficient time for the installation and coordination of interrelated items that are included in their Contracts and that must be installed in conjunction with the work included in this Section.

3. Schedule the arrival of aluminum window and frame components and accessories to minimize the time they are stored at the Site before installation.

4. Do not proceed with the installation of aluminum window and frame system until Contractor can provide finished work complying with all requirements of the Sections.

5. Where aluminum window and frame systems require the building in of plates, inserts and other items, furnish required inserts to avoid delay in the work of other trades. Provide setting drawings, templates, and directions for installation of plates, inserts and anchors, required by the Work of this Section but installed under other Sections.

6. Coordinate with other work by furnishing Shop Drawings, inserts and similar items at the appropriate times for proper sequencing of construction without delays.

F. Field Measurements:

1. Verify dimensions in areas of installation before fabrication and indicate dimensions on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delay.

2. Coordinate supports, adjacent construction, and equipment locations to ensure actual dimensions correspond to dimensions established for aluminum window and frame system work.

1.06 QUALITY ASSURANCE

A. Installer Qualifications:

1. Engage a single installer skilled, trained and with successful experience in the installation of aluminum window and frame systems and with specific skill and successful experience in the erection of the types of units and components required; and who agrees to employ only tradesmen with specific skill and successful experience in this type of work. Submit names and qualification to Engineer along with the following information on a minimum of three successful projects:
    a. Names and telephone numbers of owner, architects or engineers responsible for projects.
    b. Approximate contract cost of the aluminum window and frame system.
    c. Size of area installed.
2. Provide aluminum finish applicators experienced in the handling and application of the finish coatings specified, acceptable to the coating or aluminum manufacturer.

B. Professional Engineer:
1. Engage a registered professional engineer licensed in the State of New York and experienced in providing engineering services of the kind indicated.
2. Responsibilities include, but are not necessarily limited to, the following:
    a. Carefully reviewing system performance and design criteria stated in the Contract Documents.
    b. Preparing written requests for clarification or interpretation of performance or design criteria for submittal to Engineer by Contractor.
    c. Preparing, or supervising the preparation of design calculations, and reviewing and approving related Shop Drawings prepared by the aluminum window and frame system manufacturer prior to submission to Engineer; testing plan development, and test-result interpretations; and providing comprehensive engineering analyses verifying compliance of the system with the requirements of the Contract Documents.
    d. Signing and sealing all calculations and engineering analyses.
    e. Certifying that:
        1) It has performed the design of the system in accordance with the performance and design criteria stated in the Contract Documents, and
        2) The said design conforms to all applicable local, state and federal codes, rules and regulations and to the prevailing standards of practice.

C. Erection Tolerances:

1. Limit variations from plumb, level or dimensioned angle to the following:

   a. 1/8-inch maximum deviation in 10 foot vertical or angular run, and in 20 foot horizontal runs.

   b. 1/4-inch maximum deviation in 40 foot runs, all directions.

2. Limit variations from theoretical member locations shown, based on established floor lines and column lines, including variations from plumb and level, to the following:

   a. 3/8-inch total maximum deviation for members at all locations.

   b. 1/8-inch maximum change in deviation for members for 10 foot runs, all directions.

3. Limit offsets in end to end and edge to edge alignments of adjoining and consecutive members, which form planes, continuous runs and profiles, to the following:

   a. 1/16-inch maximum offset in flush alignment, including members which are to be 1/2-inch or less out of flush, and including members which are separated 2-inches or less by a reveal or protrusion in the plane of the aluminum windows and frames.

   b. 1/8-inch maximum offset in alignments which are to be out of flush by more than 1/2-inch or separated by a reveal or protrusion of more than 2- inch width.

D. Testing Agency Qualifications: To qualify for approval, an independent testing agency shall demonstrate to Engineer's satisfaction, based on evaluation of criteria submitted by testing agency, that it has the experience and capability to satisfactorily conduct the testing indicated without delaying the work in accordance with ASTM E329 and AAMA qualifications.

E. Mock-Up:

1. Before proceeding with final purchase of materials and fabrication of aluminum window and frame components, prepare a mock-up at the Project Site, including all components shown on Shop Drawings approved by Engineer, indicating the final relationship and configurations of the various parts and components and the quality of workmanship that shall be achieved in the work.

2. Build mock-up full height and width of opening, in a location selected by Engineer, and part of an area to receive the work of this Section.

3. Include all items that are part of the aluminum window and frame system including anchorages, insulating glass and dry-seal joint system.

4. Incorporate materials and methods of fabrication and installation that are identical with Project requirements. Accepted mock-up may be incorporated into the finished work.

5. Build as many mock-ups as required to obtain Engineer's acceptance. Disassemble rejected mock-ups and remove all components from Site. Do not incorporate rejected mock-up components into the work.

6. Aluminum window and frame installation that proceeds without an approved mock-up shall be stopped, and a mock-up prepared for Engineer's approval.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings for approval by the Engineer. Submittals shall include, but not be limited to:

1. Samples: Submit for approval the following:

a. Each required aluminum finish, on 12-inch long extrusions and 6-inch square sheets, of the alloys to be used for the work.

b. Establish samples of the required finish, for Engineer's acceptance, prior to fabrication. Where normal color and texture variations are to be expected, include three or more units in each sample, to show the range of such variations. Provide minimum possible color range variation. Engineer reserves the right to reject material finishes with objectionable variations from the established samples.

c. Polyvinylidene fluoride coating manufacturer's complete color charts showing all colors and finishes, including custom, special and premium colors.

d. Each component and cut-away corner of each window complete with finish and operating hardware, 2 foot-0 inches long by 2 foot - 0 inches wide, minimum, before Engineer's visit to manufacturer's facility for approval of actual aluminum window and frame systems to be incorporated into this Project.

e. Engineer reserves the right to require samples demonstrating design, detailing and fabrication techniques and workmanship for each system auxiliary component and accessory, before fabrication proceeds.

f. One of each type fastener employed, with statement of intended use.

g. Samples will be reviewed by Engineer for color, finish and workmanship only. Compliance with all other requirements is the responsibility of Contractor.

2. Shop Drawings: Submit for approval the following:

a. Window location chart and schedules of typical aluminum window and frame elevations showing all configurations of operators, sash

and muntins, custom panning and other cladding and flashing, fully dimensioned and coordinated with actual measurements obtained at the Project Site and required operating hardware and other auxiliary system components and accessories. Indicate clearly, and in a manner that is highlighted to Engineer, all deviations from the Contract Documents.

b. Details of each aluminum window and frame system detailing conditions at openings, details of construction, location and installation requirements of operating hardware and reinforcements, and details of joints, connections and every typical composite member. Show all window and frame reinforcements including welds, plate lengths, locations and gauges for each component of operating hardware and internal reinforcement. Indicate metal thicknesses; types of fasteners and support locations; and erection tolerances.

c. Copies of manufacturer's specifications, roughing-in diagrams, technical data and installation instructions for each aluminum window and frame system. Transmit copy of each instruction to the installer. Provide setting drawings, templates, instructions and directions for installation, operating instructions and maintenance data.

3. Operation and Maintenance Manual (O&M Manual): Upon completion of the work, furnish copies of detailed maintenance manual including the following information:

a. Product name and number.

b. Name, address and telephone number of manufacturer and local distributor.

c. Detailed procedures for routine maintenance and cleaning.

d. Detailed procedures for light repairs such as dents, scratches and staining.

e. Design calculations verifying compliance with performance criteria specified, acceptable to governing authorities having jurisdiction, prepared, signed and stamped with the seal of a registered professional engineer, as specified.

4. Certificates: Submit for approval the following:

a. Copies of material purchase receipts indicating types of materials purchased and incorporated into this Project, signed by a certified and licensed Notary Public, verifying that material purchased for the work complies with material designations specified as confirmed by approved Shop Drawings.

b. Proof of testing laboratory AAMA certification and copies of testing agencies background and experience in preforming similar tests to those specified.

c. Registered professional engineer who prepares, signs and stamps its seal shall provide a written statement confirming responsibility for the design and attest that the work prepared meets the Sections and the requirements of governing authorities having jurisdiction, and conforms to the prevailing standards of practice for the type of work specified.

d. Design calculations, signed and sealed by a Professional Engineer registered in the state of New York.

5. Test Reports: Submit for approval the following:

a. Valid AAMA "Notice of Product Certification" indicating that the aluminum windows and frames to be provided for this Project conform to AAMA/NWWDA 101 I.S.2.

6. Warranties: Submit for review:

a. Copies of written warranties agreeing to replace aluminum window and frame system components that fail to perform as specified.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery of Materials:

1. Deliver aluminum window and frame system materials, components and accessories dry and undamaged, with manufacturer's protective wrapping intact.

2. Deliver aluminum window and frame system components in clearly and legibly labeled with AAMA designations and in undamaged cartons to provide protection during transit and storage.

3. Inspect aluminum window and frame system components upon delivery for damage. Remove and replace all damaged items.

B. Storage of Materials:

1. Do not store aluminum window and frame system components in contact with concrete or other materials that might cause corrosion or staining.

2. Store aluminum window and frame component under cover and in an area protected from the weather and with good air circulation around each piece. Avoid the use of non-vented plastic or canvas shelters which could create a humidity chamber. Immediately remove wrapping if it becomes wet.

3. Provide a 1/4 inch space between aluminum window and frame system components in order to promote air circulation.

C. Handling of Materials:

1. Do not subject aluminum window and frame components to bending or stress.
2. Do not damage edges or handle material in a manner that will cause scratches, warps or dents.
3. Handle material using appropriate hand wear and tools that do not damage finish of items to remain exposed.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to the City a manufacturer's warranty, in an acceptable and beneficial form, warranting to deliver without charge, replacement aluminum window and frame system components that develop leakage or air infiltration, deflections, or deterioration of metal in excess of normal weathering, and in excess of performance criteria specified, within three years of the date of Substantial Completion.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Window Model and Manufacturers:
1. 8400TL by Kawneer, Norcross, GA.
2. YOW 350 XT by YYK AP, Austell, GA.
3. Series 3250i by EFCO Corporation, Monett, MO.
4. Or approved equal.

B. Exposed Aluminum Polyvinylidene Fluoride Based Coating:
1. Duranar Metallic XL Specialty Color 4-Coat System as manufactured by PPG Industries Coatings and Resins Division, Incorporated, Pittsburgh, PA.
2. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Extrusions:
1. Provide extruded, double tubular aluminum mullions, muntins, pressure plates, snap covers, two-piece snap trim, sills and glazing stops and trim, equal to ASTM B221, 6063-T5 alloy and temper as recommended by the aluminum window and frame manufacturer to comply with the requirements of performance, fabrication, application of finish and control of color for finishes.
2. Provide extrusions within commercial tolerances, formed true to details shown and free of defects impairing strength, durability, color or finish.

B. Sheets:

1. Provide aluminum sheet closures, auxiliary components and accessories, equal to ASTM B209, 5005 alloy for exposed sheet and 3003 alloy for non-exposed sheet or as recommended by the aluminum window and frame manufacturer to comply with the requirements of performance, fabrication, application of finish and control of color for finishes.

2. Provide thicknesses as follows:

a. Principal Formed Sheet Members: 0.125-inches minimum thickness.

3. Provide sheet free of defects impairing strength, durability, color or finish.

C. Fasteners: Epoxy adhesives or non-magnetic stainless steel, guaranteed by the manufacturer to be non-corrosive and compatible with the aluminum window members, trim, hardware, anchors and other components of the window units.

1. Do not use exposed fasteners, except where unavoidable for the application of operating hardware. Match the finish of the metal surrounding fastener, unless otherwise specified.

2. Provide Philips flat-head machine screws for exposed fasteners, unless otherwise specified.

D. Thermal Separators: Integral, structural polyurethane.

E. Glass and Glazing Accessories: As specified in Section 08 81 03 – Glass, Plastic and Glazing.

F. Weather-stripping: Provide double rows of manufacturer's replaceable EPDM stripping complying with ASTM D2000, secured in extruded aluminum ports at all vent perimeters.

G. Brackets, Gussets, Reinforcements and Splice Clips:

1. Provide aluminum brackets and reinforcements wherever possible. Where steel units are required for higher strength or other unavoidable necessity, hot-dip galvanize the pieces after fabrication, with 2.0 ounces zinc coating, complying with Section 05 05 13.01 - Galvanizing.

2. Where fasteners screw anchor into aluminum less than 0.125-inches thick, reinforce interior with aluminum or nonmagnetic stainless steel to receive screw threads or provide standard, noncorrosive, pressed-in, spline grommet nuts.

H. Auxiliary Components and Accessories:

1. Provide extruded aluminum, nominal 0.062-inch thick wall, with exposed surfaces finished to match aluminum windows and frames in color and performance; concealed fasteners; all required weather seals; designed for unrestricted expansion and contraction.

2. Provide complete selection of exterior wrap-around custom panning accessories; two-piece head and jamb receptors; sills and sub sills with thermal-breaks, anchors and end dams; two-piece interior snap trim and clips; interior glazing adapters, expanders, receptors, stools and other trim necessary for a complete installation, as determined by Engineer.

3. Provide intermediate, thermally broken, expansion-type, vertical and horizontal integral mullions (stack; offset stack; and three-piece) and mullion covers in configurations and types as required for combinations of windows and sizes of window areas shown.

I. Bituminous Paint: Cold applied asphalt mastic complying with SSPC-Paint 12, compounded for 30-mil thickness per coat.

J. Expansion Anchor Devices: Where inserts are not provided to support the concrete structure, provide drilled-in expansion bolt anchors of either toothed-stainless steel or lead shield design.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. General: Provide specified manufacturer's standard fabrication and accessories, except to the extent more stringent requirements are specified. Include complete system for assembly of components and anchorage of window units. Include all components of glass and factory-applied glazing system.

B. Sizes and Profiles: The required sizes for window units and the profile requirements are shown on the Contract Drawings. The details shown are based upon standard details by one manufacturer. It is intended that similar details by other manufacturers will be acceptable, provided they comply with the size requirements, performance requirements and with minimum/maximum profile requirements shown and specified.

C. Frame and Vent: All members shall be double tubular; corners mitered, double-gusset reinforced, factory-sealed with sealant complying with AAMA 800 and crimped.

D. Water Control: Provide pressure equalization gasket on vent interior; vent and frame weeps, foam baffles, and exterior hoods to allow water to drain by gravity and resist wind-blown rain.

E. Provide field-mounted drip caps on vent exteriors above frame sill.

F. Aluminum Window And Frame Coatings

1. General:

a. After fabrication of the aluminum windows and frames, prepare surfaces for finishing in accordance with recommendations of the aluminum producer and the finisher or processor.

b. Finish all components of each assembly simultaneously so as to attain complete uniformity of color.

c. Sequence the finishing and processing of materials in a predetermined bay-by-bay, floor-by-floor, wall-by-wall plan, which will minimize color and texture differences between adjacent components.

d. All internal and external members of aluminum windows shall be anodized, as specified.

2. Exposed Aluminum Polyvinylidene Fluoride Based Coating: Apply full strength polyvinylidene fluoride based coatings at the factory by coil coating for sheet material and spray coating for extruded or factory-fabricated material. Provide a four coat finish system complying with the following:

a. Alkali clean and hot water rinse all surfaces to receive poly-vinylidene fluoride based finish.

b. Prepare a chemical conversion coating on the surface, using phosphates or chromates followed by a cold water rinse. Seal with a chromic acid rinse and dry, except where manufacturer recommends another method to achieve greater coating reliability.

c. Apply a base prime coat of epoxy paint to the prepared surface in its coil form, by reverse roller coating. Fully cure in a gas-fired oven to a dry film thickness of 0.2 - 0.4-mils. Follow with a barrier coat, 0.75 - 1.0-mil thick.

d. Apply color coat containing mica pearlescent or metallic flakes over the barrier coat by roller coating for coil material and airless or Ransburg electrostatic hand spray for extrusions and fuse at a peak metal temperature of 440 degrees F. Apply to a dry film thickness of 0.7-mil for coil coating and 1.2-mil for spray coating so that the total dry film is approximately 1.0-mil thick for coil material and 1.5-mil thick for extruded material.

e. Apply clear fluoropolymer top coat to provide a dry film thickness of 0.4-0.8- mils. The entire four coat system shall have a dry film thickness of 2.6-mil minimum.

f. Provide the following physical properties, as proven by the following laboratory test methods acceptable to Engineer:

1) Weathering, ASTM D4214: Chalking, not more than No. 8, after exposure for 5000 hours in Sunshine Arc Weather meter XWR using 60/60 cycle.

2) Color Change, ASTM D2244: No greater than 5 N.B.S units after removal of external deposits and after exposure for 5000 hours in Sunshine Arc Weather meter XWR using 60/60 cycle.

3) Humidity Resistance, ASTM D2247; no blisters after 3000 hours.

4) Salt Spray, ASTM B117: Few scattered blisters no larger than ASTM No. 4, and no more than 1/16 inch creep from areas scribed to bare metal after 3000 hours.

5) Dry Adhesion: No pick-off when tape tested over 1/16-inch cross hatch.

6) Wet Adhesion: No pick-off when tape tested over 1/16-inch cross hatch; extruded material only.

7) Boiling Water Adhesion: No pick-off when tape tested over cross hatch area after 1 hour immersion in distilled boiling water.

8) Water Immersion: No pick-off when tape tested over cross hatch area after immersion in aerated distilled water 80 ±10 degrees F after 500 hours.

9) Abrasion Resistance, ASTM D968: Coefficient of abrasion of 67 minimum.

10) Gloss, ASTM D523: 30±5 reflectivity at 60 degrees F.

11) Pencil Hardness, ASTM D3363: HB-H minimum.

12) Dry Film Thickness, ASTM D3363: Primer, 0.2-0.4 mils; barrier coat, 1.0 mils; color coating, 0.7-1.5 mils; clear topcoat, 0.4-0.8 mils.

13) Solvent Resistance: 100 Double MEK rubs minimum.

14) Flexibility, ASTM D522: No cracking prior to metal fracture.

15) Acid Resistance, ASTM D1308: 16 hour spot test with 5 percent hydrochloric acid - no effect.

16) Alkali Resistance, ASTM D1308: 16 hour spot test with 5 percent sodium hydroxide - no effect.

g. Provide specified polyvinylidene coating for all components of the aluminum window and frame system.

1) Complete selection of manufacturer's standard, custom and premium colors and coating system components for final selection by Engineer.

2) Engineer will select custom special extended life premium colors at time of Shop Drawing and Sample submission review, as specified in the Contract.

h. Protective Coating: Immediately upon completion of the aluminum mullions and frames finish, apply a transparent, color-coded, strippable-film coating, not less than 1.0 mil dry film thickness.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Provide engineering design calculations and details prepared, signed and stamped with the seal of a registered professional engineer licensed to practice in the State of New York and recognized as an expert in the required work.

B. Engineer reserves the right, in consultation with the City, to visit the aluminum window and frame manufacturer's facilities and determine if the proposed manufacturer's facilities are acceptable. Contractor shall include as part of the work arranging, and all costs for, three visits by four representatives of the City and Engineer to visit the manufacturer's facilities for the purpose of approving manufacturer's fabricating techniques and completed aluminum window and frame systems components proposed for installation as part of the work of this Project, unless additional visits are required to determine compliance with Contract requirements.

C. Where required by Engineer in order to verify types of metal used in the Work, provide metallurgy laboratory analysis of system component materials.

D. Obtain all aluminum window and frame system components, operating hardware, custom panning, flashing and accessories from the same manufacturer.

E. Engage a manufacturer who requires that a technical representative be present at the time of mock-up preparation, and start of installation and who requires that the completed work be inspected by a technical representative of the aluminum window and frame manufacturer.

F. Provide aluminum windows and frames labeled with AAMA or WDMA Hallmark labels.

G. Factory and Site Quality Control Procedures: Provide schedules, details, isometrics or explanatory sketches cross-referenced to Shop Drawings as required to insure that both fabrication and installation are in accordance with the Contract Documents. Factory quality control procedures shall include, but not necessarily be limited to, the following:

1. Finishing Fabrication: Procedures and controls for tolerances, joinery, sleeves, reinforcement gussets and finishes.

2. Finish and Match: Procedures required for the match of exposed surfaces.

3. Assembly and Pre-assembled Units: Welds, fasteners, glass, sealants, gaskets and separators.

4. Sealing and Pre-assembled Units: As required by the sealant manufacturer. Include sealant documentation as part of Shop Drawing submissions.

5. Material Handling: Procedures, care, protection, shipping, storage and other requirements to insure safe arrival and handling of materials.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Contractor shall examine the alignment of substrates and the sequence of work before erection of the custom aluminum window and frame systems work begins and notify Engineer in writing of unsatisfactory conditions. Do not proceed with the custom aluminum window and frame systems work until unsatisfactory conditions have been corrected in a manner acceptable to Engineer.

B. Custom aluminum window and frame systems work shall not be installed when there is no assurance of adequate, long term protection by Contractor.

3.02 INSTALLATION

A. All windows shall be installed by factory-trained erectors in strict accordance with installation data provided by approved Shop Drawing submittal, and the specified requirements.

B. Do not install component parts that are observed to be defective in any way, including warped, bowed, dented, abraded and broken members, and including damaged glass.

C. Do not cut, or trim, component parts during erection, in a manner that would damage the finish, decrease the strength, or result in a visual imperfection or a failure in performance of the custom aluminum window and frame systems. Return component parts which require alteration to the shop for refabrication, if possible, or for replacement with new parts.

D. Install component parts level, plumb, true to line and with uniform joints and reveals. Provide required support secured to structure with non-staining and non-corrosive shims, anchors, fasteners, spacers and fillers. Use erection equipment that will not mar or stain finished surfaces, and will not damage the component parts.

E. Apply a bituminous coating of approximately 30-mil dry film thickness, or other permanent dielectric separator, on concealed contact surfaces of dissimilar materials before installation, wherever there is the possibility of corrosive or electrolytic action.

F. Apply sealant in accordance with manufacturer’s written recommendations at joints, wipe off excess and leave exposed sealant surface clean and smooth.

G. Anchor components parts securely in place as shown, by bolting, or other permanent mechanical attachment system, which will comply with performance requirements and permit movements which are intended or necessary.

3.03 FIELD TESTING / QUALITY CONTROL

A. Test installed units in conformance with AAMA 502 for air and water infiltration with the window manufacturer and the City present.

B. Select test units as directed by the Engineer and use an AAMA-accredited laboratory provided by Contractor.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Protection

1. Notify Contractor of protective treatment and other precautions required through the remainder of the construction period, to ensure that window units will be without damage or deterioration, other than normal weathering at time of Final Acceptance.

2. Contractor shall advise Engineer, in writing, of protection and surveillance requirements that Contractor shall provide at no additional expense to the City, to insure that aluminum windows and frame system will be without damage or deterioration at the time of Final Acceptance by the City.

3. Where protective coating has been supplied, remove coating completely immediately before installation and when construction activities no longer requires its retention.

4. Provide continuous protection of materials against damage primarily by storing materials under cover and above ground and away from other construction traffic.

5. Do not install aluminum windows and frames until all work that could damage aluminum window and frame systems has been completed.

6. Provide temporary closures until construction sequencing allows installation of aluminum window and frame systems at a time when the systems will not be subject to construction damages of any kind.

B. Adjustment

1. All windows shall be adjusted for smooth operation and weathertight closure providing a tight fit at contact points and at weatherstripping after installation is complete and readjusted when necessary prior to Substantial Completion.

2. At the completion of the work, restore adjacent work, marred by the work of this Section, to an undamaged and clean condition.

3. Adjacent work that has been physically damaged, or that does not respond adequately to cleaning, shall be replaced with new materials at no additional expense to the City.

C. Cleaning

1. Clean aluminum surfaces immediately after installation, exercising care to avoid damage of finish. Lubricate hardware and other moving parts.

2. Maintain the aluminum window and frame systems in a clean condition throughout the construction period, so that they will be without any evidence of deterioration or damage, other than the effects of normal weathering, at the time of Final Acceptance.

3. Select methods of cleaning that will promote the achievement of uniform appearance and stabilized colors and textures for materials that weather or age with exposure.

END OF SECTION

SECTION 08 71 01 – FINISH DOOR HARDWARE
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment and incidentals necessary to perform the work of this Section as shown, specified or required otherwise for a complete job.

B. Finish hardware is defined to include all items known commercially as finish hardware, as required for swing doors, except special types of unique and non-matching hardware specified in the same Section as the door and door frame.

C. Types of finish hardware work required include, but are not necessarily limited to, the following:

1. Heavy-duty pivot hinges
2. Heavy-duty mortise hinges
3. Electric Power Transfer
4. Electrified Mortise Lock Sets
5. Mortise Locksets
6. Vertical Rod Panic Exit Devices
7. Panic exit devices
8. Overhead surface-mounted door closers
9. Extra-heavy-duty overhead holders and stops
10. Magnetic Monitor Switch
11. Acoustic Stripping and Seals
12. Thresholds
13. Silencers
14. Floor stops
15. Miscellaneous items

D. The Contractor shall implement practices and procedures to meet the project's sustainability goals as identified in the Contract Documents. The Contractor shall ensure that the sustainability requirements of this Section are implemented to the fullest extent.

E. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Not Used

1.04 REFERENCES

A. Doors and Hardware Institute

1. Recommended Locations for Architectural Hardware for Standard Steel Doors & Frames;

2. Recommended Locations for Builders' for Custom Steel Doors & Frames

B. South Coast Air Quality Management District (SCAQMD)

1. Rule 1113 -- Architectural Coatings

2. Rule 1168 -- Adhesives and Sealants

C. Green Seal (GS)

1. GS–11 -- Green Seal Standard for Paints and Coatings.

2. GC–03 -- Green Seal Environmental Criteria for Anti-Corrosive Paints.

D. ASTM C920 -- Standard Specification for Elastomeric Joint Sealants

1.05 DESCRIPTION

A. Where the finish, shape, size or function of a member receiving finish hardware is such as to prevent the use of or make unsuitable the types specified, furnish similar types having as nearly as practicable the same operation.

B. If finish hardware for any location is not specified, provide finish hardware equal in design and quality to adjacent finish hardware for comparable openings.

C. Furnish finish hardware items of proper design for use on doors and frames of the thickness, profile, swing, security and similar requirements, as necessary for proper installation and function.

D. Unless otherwise specified, comply with the technical guidance of Door and Hardware Institute (DHI), for locating hardware on standard or customized steel doors and frames, as applicable.

E. Provide stainless steel finish hardware or matching finish hardware as specified for all doors and frames.

F. Sustainable Design Requirements

1. VOC Content: Products applied on site and within the building's weatherproofing system shall comply with VOC limits of authorities having jurisdiction and the following VOC limits of when calculated according to SCAQMD Rule 1113 and Rule 1168, Green Seal Standard GS–11, Green Seal Criteria GC–03:

   a. Architectural Sealants: 250 g/L

   b. Sealant Primers for Nonporous Substrates: 250 g/L

   c. Sealant Primers for Porous Substrates: 775 g/L

   d. Multipurpose Construction Adhesives: 70 g/L

   e. Flat Paints and Coatings: VOC not more than 50 g/L

   f. Non flat Paints and Coatings: VOC not more than 150 g/L

   g. Primers, Sealers, and Under coaters: VOC not more than 200 g/L

   h. Anticorrosive and Antirust Paints Applied to Ferrous Metals: VOC not more than 250 g/L.

G. Coordination:

1. Review installation procedures under other Sections and coordinate the installation of items that must be installed with the finish hardware.

2. Coordinate the work of other Sections in order to provide clearances and accurate positioning of recessed or cast-in-place items required by this Section.

1.06 QUALITY ASSURANCE

A. Supplier Qualifications: The finish hardware supplier shall have in his employ a member of the DHI as a certified Architectural Hardware Consultant who shall be responsible for checking, supervising and preparing written Field Report for complete finish hardware installation and with on-site presence during the time of installation and adjustment of the Work.

B. Requirements of Regulatory Agencies: Comply with the applicable requirements of governing authorities and codes for the types of finish hardware specified.

C. Source Quality Control: Obtain all similar products and accessories from the same manufacturer.

D. Substitutions

1. Clearly identify, in a manner which is highlighted to the Engineer, all proposed substitutions, modifications, variations, unspecified features and "or approved equal" products. Provide complete comparative data, comparing "or approved equal" with specified products, at time of Shop Drawings submission.

E. Do not make substitutions after the Engineer's approval of final finish hardware schedule and sample at time of Shop Drawing submission.

1.07 SUBMITTALS

A. Contractor shall submit the following to the Engineer for review and approval:

1. Actual unit of each finish hardware item specified incorporating all standard and special features and finishes specified, demonstrated and identified by supplier's representative to the Engineer. Samples shall be presented at time of Shop Drawing submittal as the Engineer will not review or approve Shop Drawings without concurrent sample submissions.

2. The Engineer's review will be for general quality and features of units, compliance with all other requirements is the exclusive responsibility of the Contractor.

3. Approved samples may be incorporated into the finish hardware work.

B. Shop Drawings:

1. Copies of manufacturer's data for each item of finish hardware. Include whatever information may be necessary to show compliance with requirements, and include instructions for installations and for maintenance of operating parts and exposed finishes. Wherever needed, furnish templates to fabricators of other work which is to receive finish hardware.

2. Copies of the finish hardware schedule. Include a separate key schedule, showing clearly how City's final instructions on keying of locks have been fulfilled. Finish hardware schedules are intended for coordination of the Work. Review and acceptance by the Engineer does not relieve the

Contractor of his exclusive responsibility to fulfill the requirements as shown and specified.

3. Based on the finish hardware requirements specified, organize the final finish hardware schedule into "hardware sets," indicating complete designation of every item required for each door or opening. Furnish initial draft of schedule at the earliest possible date, in order to facilitate the fabrication of other work (such as stainless steel frames) which may be critical in the Project construction schedule. Furnish final draft of schedule after samples, manufacturer's data sheets, coordination with Shop Drawings for other work, delivery schedules and similar information have been complete and accepted.

4. Copies of manufacturers' specifications and installation instructions for required materials and components which are not included in other submittal specified in other Sections of this Specifications. Coordinate the requirements of this Section with other submittal and coordinate the submittal of other data in other Sections with the Sections' submittal.

5. Maintenance Manual: Upon completion of the Work, furnish copies of detailed maintenance manuals, including the following information:

   a. Product name and manufacturer.

   b. Name, address and telephone number of manufacturer and local distributor.

   c. Detailed procedure for routine maintenance and cleaning.

   d. Detailed procedures for repairs such as dents, scratches and staining.

   e. Parts identification manual and maintenance manuals for each piece of finish hardware.

C. Cylinders and Keying System:

1. Provide a great grandmaster keying system.

2. Equip all locks with manufacturer's special 6-pin tumbler cylinder, with construction master key feature, which permits voiding of construction keys without cylinder removal.

3. Comply with Engineer's instructions for master keying and, except as otherwise specified, provide individual change key for each lock which is not designated to be keyed alike with a group of related locks.

4. Key Material: Provide keys of nickel silver only.

5. Key Quantity: Furnish 3 keys for each lock and 5 keys for each master and grandmaster system. Provide one extra key blank for each lock.

D. Test Reports: Submit for approval certified laboratory test reports for required performance tests.

E. Sustainable Design Submittals:

1. VOC Reporting Form. Provide the following information:

F. Finish hardware schedule

G. For all paints, coatings, sealants and adhesives used on site and within the building's weatherproofing system provide the VOC content in grams/liter (g/L) less water and other exempt compounds, if applicable.

H. Written field report on condition of each item of finish hardware actually present on each door at the project site with each item referenced to the approved Shop Drawings. Final approval or final payment shall not be provided to Contractor until field report has been submitted to and approved by the Engineer.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery of Materials:

1. Deliver finish hardware sufficiently in advance of its setting for proper inspection.

2. Pack each piece of finish hardware separately, complete with screws, keying, instructions and templates, tagged to correspond with the approved finish hardware schedule.

3. Deliver individually packaged finish hardware items at the proper time to the proper locations for installation.

B. Storage of Materials:

1. Provide secure lock-up for finish hardware stored at the project site, but not yet installed.

2. Store finish hardware in manufacturers' original packages.

C. Handling of Materials: Control the handling and installation of finish hardware items which are not immediately replaceable, so that the completion of the Work will not be delayed by finish hardware losses, both before and after installation.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Heavy Duty Pivot Hinges:

1. H147 Bottom Pivot, H180 Top Pivot and M190 Heavy-Duty Intermediate Pivots as manufactured by:

a. Rixson, a subsidiary of Yale Security, Incorporated, Monroe, NC.

b. Or approved equal.

B. Heavy Duty Mortise Hinges:

1. SP3386 StormPro Tornado Resistant, NRP, Heavy-Duty Mortise as manufactured by:

a. McKinney, an ASSA ABLOY Group Company.

b. Or approved equal.

C. Electric Power Transfer:

1. EPT-10 Electric Power Transfer as manufactured by Von Duprin or EPT-2 for magnetic monitor switches, Indianapolis, IN.

2. Or approved equal.

D. Electric Mortise Lock Sets

1. Heavy-Duty Mortise Lockset L9080 PEL RX with RX (request to exit) function, Lever Handle 03N (plug only to show) with MS750 24 VAC, 3 amp transformer as manufactured by Schlage, Carmel, IN. Provide EL (electric locking) series at all doors except at exterior doors and as noted otherwise.

2. Or approved equal.

E. Mortise Lock Sets

1. Heavy-Duty Mortise Lock Set, Newport N9M (ANSI No. 14), by Corbin Russwin, an ASSA ABLOY Group Company.

2. Or an approved equal.

F. Panic Exit Devices

1. ED5200A 3-Hour Fire Listed Surface Rim Exist Device, Finish BHMA 630 (ANSI A156.3, Type 1, Grade 1) by Corbin Russwin, an ASSA ABLOY Group Company.

2. Or an approved equal.

G. Heavy Duty Floor Mounted Door Closer

1. SC H27CWF by Rixson, a Subsidiary of Yale Security, Inc., an ASSA ABLOY Group Company, Monroe, NC.

2. Or approved equal.

H. Overhead Surface-Mounted Door Closer

1. DC8000 Parallel Arm Mounting Heavy-Duty Non-Hold Open Arm with Stop (DC8210 Series), by Corbin Russwin, an ASSA ABLOY Group Company.

2. Or approved equal.

I. Extra Heavy-Duty Overhead Holders and Stops

1. 904H – US32D Extra Heavy-Duty Surface-Mounted Overhead Door Holder/Stop as manufactured by Glynn-Johnson Part of Worldwide Ingersoll-Rand, Dublin, Ireland

2. Or approved equal.

J. Flash Bolts and Automatic Flush Bolts (forged/wrought brass parts)

1. FB458 Manual Flush Bolts, US26D finish, as manufactured by Ives, Part of Worldwide Ingersoll-Rand, Dublin, Ireland.

2. Or approved equal.

K. Astragals

1. 357C by Pemko Manufacturing Company, Memphis, TN.

2. Or approved equal.

L. Magnetic Monitor Switch

1. RX (exit device) or LX (latch-bolt) magnetic monitor switch with PT 750 24 VAC transformer by Von Duprin, Indianapolis, IN.

2. Or approved equal.

M. Weather-stripping (bumper type)

1. No. 170AA by Zero International, Inc., Bronx, NY.

2. Or approved equal.

N. Acoustic Seals

1. 3708AA (Head and Jambs), 368AA (Semi-Mortised Automatic Door Bottom), and 564A (Threshold) by Zero International, Inc, Bronx, NY.

2. Or approved equal.

O. Thresholds

1. 655A (interior saddles) by Zero International, Inc.

2. Or approved equal.

P. Offset Thresholds

1. 566A (exterior doors) by Zero International, Inc. Provide Offset Threshold of similar design as required.

2. Or approved equal.

Q. Silencers

1. SR 64 by Ives, Part of Worldwide Ingersoll-Rand, Dublin, Ireland.

2. Or approved equal.

R. Stops

1. FS13, US26D finish, by Ives, Part of Worldwide Ingersoll-Rand.
2. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Requirements for All Products

1. Hand of Door: Contract Drawings show the swing or hand of each door leaf (left, right, reverse bevel, etc.). Furnish each item of finish hardware for proper installation and operation of the door swing as shown.
2. Manufacturer's Nameplate: Do not use manufacturer's products which have manufacturer's name or trade name displayed in a visible location (omit removable nameplates).
3. Base Metals: Produce finish hardware units of the basic metal and forming method specified, using the manufacturer's standard metal alloy, composition, temper and hardness. Do not substitute materials or forming methods for those specified.
4. Fasteners: Manufacture finish hardware to conform to published templates, generally prepared for machine screw installation. Do not provide finish hardware which has been prepared for self-tapping sheet metal screws, except as specifically indicated.
5. Furnish screws for installation, with each finish hardware item. Provide Phillips flat-head screws except as otherwise specified. Finish exposed (exposed under any condition) screws to match the hardware finish or, if exposed in surfaces on other work, to match the finish of such other work as closely as possible, including "prepared for paint" in surfaces to receive painted finish.
6. Provide fasteners which are compatible with both the unit fastened and the substrate, and which will not cause corrosion or deterioration of finish hardware, base material or fastener.
7. Provide concealed fasteners for finish hardware units which are not exposed when the door is closed, except to the extent no standard manufacturer units of the type specified are available with concealed fasteners. Do not use through bolts for installation when the bolt head or the nut on the opposite face is exposed in other work under any condition, except where it is not possible to adequately reinforce the Work and use machine screws or concealed fasteners of another standard type of satisfactorily avoid the use of through bolts.
8. Tools for Maintenance: Furnish a complete set of specialized tools as needed for City's continued adjustment, maintenance, removal and replacement of finish hardware.

B. Heavy-Duty Pivot Hinges

1. Templates and Screws: Provide only template-produced units.

2. Base Metal: Fabricate hinges from forged bronze with US 26D Satin Chrome finish.

3. Number of Hinges: Provide three hinges on each door leaf of less than 60-inches height; provide one additional hinge for next 30-inches of door height; provide two additional hinges for each 30-inches or fraction thereof for doors above 90-inches tall.

4. Hinge Size: Except as otherwise specified or as required to comply with UL and NFPA, provide hinges of the following sizes:

   a. Exterior and Interior Doors, maximum 48-inches wide: Top and bottom pivots; intermediate pivots based on number of hinges as specified; minimum of one intermediate pivot required on all doors.

5. Types of Hinges: Provide all doors with offset hung, bottom, top and intermediate units with hardened steel pivot pins treated to prevent rusting or binding, permanently seated in an oil impregnated sintered bronze bearing lubricated for the life of the door and capable of supporting a minimum door weight of 800 pounds and recommended by the manufacturer for use on heavy-duty high traffic doors subject to extreme abuse. Provide single acting, mortised mounted units sized for a maximum door width of 4 foot-0 inches. Top pivot shall have a sloped top surface.

C. Heavy-Duty Mortise Hinges

1. Templates and Screws: Provide only template-produced units.

2. Base Metal: Fabricate hinges from stainless steel with US 32D Satin Stainless Steel finish.

3. Number of Hinges: Provide four hinges on each door leaf of less than 86-inches height; provide one additional hinge for next 30-inches of door height.

4. Hinge Size: Except as otherwise specified or as required to comply with UL and NFPA, provide hinges of the following sizes:

D. Electric Power Transfer

1. Provide this accessory at all locations where electrified hardware is provided through door leafs.

E. Electrified Mortise Locks Sets

1. Strikes: Provide manufacturer's standard wrought box strike, for each location and use shown. Provide stainless steel curved lip strikes, unless otherwise recommended by manufacturer, finish to match lock or latch set trim. Device to be UL certified to respond by solenoid operation to lock or unlock and contain a request to exit function microswitch interconnected with interior knob.

2. Lock Throw: Provide minimum of 1-inch anti-friction latch bolt and 1-inch dead bolt throw wherever available on manufacturer's functions specified.

3. Materials: Provide the following materials:
   a. Latch Bolt: Stainless steel.
   b. Dead Bolt: Stainless steel.
   c. Case: Stainless steel.
   d. Hub: Nickel steel.
   e. Scalp: Stainless steel.
   f. Escutcheon: 8-1/2-inches by 1-3/4-inches stainless steel; US 32D; Satin Stainless Steel.
4. Backset: Provide minimum backset of 2-3/4-inches.
5. Finish: US32D Satin Stainless Steel.

F. Mortise Locks Sets
1. Strikes: Provide manufacturer's standard wrought box strike, for each location and use shown. Provide stainless steel curved lip strikes, unless otherwise recommended by manufacturer, finish to match lock or latch set trim.
2. Lock Throw: Provide minimum of 1-inch anti-friction latch bolt and 1-inch dead bolt throw wherever available on manufacturer's functions specified.
3. Materials: Provide the following materials:
   a. Latch Bolt: Stainless steel.
   b. Dead Bolt: Stainless steel.
   c. Case: Stainless steel.
   d. Hub: Nickel steel.
   e. Scalp: Stainless steel.
   f. Escutcheon: 8-1/2-inches by 1-3/4-inches stainless steel; US 32D; Satin Stainless Steel.
4. Backset: Provide minimum backset of 2-3/4-inches.
5. Finish: Us32d Satin Stainless Steel.

G. Panic Exit Devices
1. Strikes: Provide manufacturer's standard wrought stainless steel jamb-mounted top latch bolt and bottom latch bolt for each location and use shown.
2. Exit Doors: Where required by governing regulations or where shown or scheduled, provide panic exit devices of the type required. Provide units for 1-3/4-inch thick doors.
3. Lock Throws: Provide minimum of 3/4-inch latch bolt throws.

4. Provide surface-applied two-point latching exit devices as specified.
5. Provide the following materials:
    a. Latch Bolt: Stainless steel.
    b. Case: Stainless steel.
    c. Cylinders: Brass.
    d. Front: Stainless steel.
    e. Chassis: Brass.
    f. Crossbar: Oval, seamless, knurled crossbar with interlocking expansion collets and roll pins; satin stainless steel; 0.062-inches minimum thickness with steel reinforcing tube.
6. Backset: Provide minimum backset of 2-3/4-inches.
7. Finish: US 32D Stainless Steel.
8. Function: ANSI No. 4: entrance by trim when latch bolt is retracted by key or set in a retracted position by key; no thumbpiece.

H. Overhead Surface-Mounted Door Closers

1. Provide all doors, unless specially scheduled or specified as being provided with floor mounted or concealed overhead closers, with surface-mounted overhead door closers. Provide both active and inactive door leafs with closers.
2. Size of Units: Except as otherwise specified, comply with the manufacturer's recommendations for size of door control unit, depending upon size of door, exposure to weather, and anticipated frequency of use.
3. Where parallel arms are specified, and for closers on exterior doors, provide closer unit one size larger than recommended for use with standard arms.
4. Use parallel arm arrangement for doors that would otherwise have the door closer appearing in finished corridors or entries.
5. Comply with UL, Building Materials Directory, and List of Inspected Fire Protection Equipment and Materials, and NFPA No. 80 for doors requiring door closers. Modify closers specified as required.
6. Provide hold open feature for all non-fire rated doors unless otherwise specified.
7. Provide corner bracket mounting on exterior doors. Select all arms to clear weatherstripping, and overhead door holders.
8. Provide long arm to allow door to swing 180 degrees where long arm will eliminate floor mounted stops.
9. Provide closers with spring power adjustment feature capable of increasing spring power 15 percent minimum in all closer sizes.

10. Provide individual regulating valves for closing and latching speeds, and separate adjustable backcheck valve.
11. Provide delayed closing action feature on all door closers. Position valve at top of closure.
12. Provide the following materials and features in addition to others specified herein:
    a. Full Metal Cover: Aluminum.
    b. Case: Cast iron.
    c. Arms: Plated to match full metal covers.
    d. Other Parts: Steel.
    e. Extreme temperature fluid.
    f. Security torx machine screws.
    g. Ten year warranty.
    h. Provide manufacturer's optional corrosion protection.
13. Finishes: S26D Satin Chrome. Color coordinate all arms and other accessories.
14. Highly Corrosive Atmospheres: Provide all closers with specified manufacturers.

I. Extra Heavy-Duty Overhead Holders and Stops

1. Provide surface-mounted extra heavy-duty overhead holders and stops on all leafs of all doors with hold open feature.
2. Material: Provide the following materials:
    a. Arm: Stainless steel; 1/4-inch thick.
    b. All Other Parts: Stainless steel.
3. Coordinate placement of extra heavy-duty overhead holder and stop with weatherstripping for non-interference.
4. Design and reinforce connections of extra heavy-duty holder and tops where they are fasteners to other materials, to resist a superimposed load of 30 pounds per square foot acting on the plane of the doors. Mount to door using a minimum of four countersunk mounting holes with four 3/8-inch diameter stainless steel sex bolts.
5. Provide all manufacturer recommended door reinforcements and coordinate the furnishing of hardware templates required for the installation of the units.
6. Finish: US 32D stainless steel, satin finish.

J. Flush Bolts

1. Provide flush bolts on the inactive leaf of all pairs of doors, unless otherwise specified.
2. Provide flush bolts at the top and bottom of door.
3. Materials: Provide the following materials:
    a. Flush Bolt Levers: Forged Brass.
    b. Flush Bolt Plate: Forge Brass.
    c. Flush Bolt Guide and Strike: Wrought Brass.
    d. Flush Bolt Rods: 1/2-inch round rods, bronze, 12-inch minimum length.
4. Provide extension flush bolts with 3/4 inch throws and with top bolt not over 6 foot-0 inches above finished floor. Provide bottom flush bolt 12-inches long.
5. Where required by governing authorities provide cast bronze automatic flush bolts bearing the UL label.

K. Astragals

1. Provide metal astragal bar, not less than 1/8-inch by 2-inches, for exposed flathead screw mounting on active leaf of all pairs of doors.
2. Provide astragal of extruded aluminum with clear anodized finish.

L. Magnetic Monitor Switch

1. Provide stainless steel magnetic monitor switch which incorporates a magnet set into the door leaf head and an actuator set into the corresponding position in the frame which will electronically monitor the door leaf position.
2. Provide magnetic monitor switch; flush (full mortized) mounted into frame and door leaf head.
3. Finish: US 4.

M. Weatherstripping And Acoustic Seals

1. Provide perimeter weatherstripping at all exterior doors. Provide acoustic stripping and seals for interior doors where scheduled.
2. Continuity of Stripping: Except as otherwise specified, it is required that the stripping at each opening be continuous and without unnecessary interruptions at door corners and hardware.
3. Replaceable Seal Strips: It is required that the resilient or flexible seal strip of every unit be easily replaceable and readily available from stocks maintained by the manufacturer.

4. Provide bumper-type weatherstripping at jambs and head, including a resilient insert and metal retainer strip, surface-applied of the following metal, finish and resilient bumper material:
   a. Housing: Extruded aluminum with clear anodized finish; 0.062-inch minimum thickness of main walls and flanges.
   b. Dimensions: 1-1/2 inches by 15/16-inches; stop-mounted.
   c. Seals: Closed-cell extruded sponge neoprene.
5. Provide heavy-duty automatic acoustic drop-seal sound-stripping door-bottom unit with threshold of manufacturer's standard design, with operating seal bar of the following material, retained in an extruded metal bar, and capable of operating to close a 1-inch gap (from door bottom to floor or threshold). House mechanism and operating bar in the following metal housing, for mounting on doors as follows:
   a. Housing: Extruded aluminum, 0.062-inch thick, with clear anodized finish on exposed surfaces.
   b. Seal: Closed-cell sponge neoprene.
   c. Mounting: Semi-mortise. Mount on stop-face of doors, except mount on binge-face of swing-in exterior doors.

N. Thresholds
1. Thresholds for all exterior doors shall be supplied by custom entry door system manufacturer. All interior doors shall be provided with thresholds.
2. Metal: Extruded aluminum; custom satin brushed aluminum; US 26 finish.
3. Surface Pattern: Fluted tread, manufacturer's standard.
4. Provide countersunk stainless steel screws and expansion shields.
5. Width: 5-inches wide and of length sufficient to span full width of rough openings; coped and scribed neatly at and around door frames.
6. Construction:
   a. Single-piece, complying with manufacturer's recommendations.
7. Profile: Provide manufacturer's unit which conforms to the minimum size and profile requirements specified.
8. Coordinate thresholds for full compatibility with recessed floor mounted closers.
9. Thickness: 1/2 inch minimum.

O. Offset Thresholds
1. Thresholds for custom entry door system doors shall be supplied by custom entry door system manufacturer. All doors shall be provided with thresholds of the types specified herein.

2. Metal: Extruded aluminum; custom satin brushed aluminum; US 26 finish.
3. Surface Pattern: Fluted tread, manufacturer's standard.
4. Provide countersunk stainless steel screws and expansion shields.
5. Width: 7-3/4 inches and 8-3/4-inches wide and of length sufficient to span full width of rough openings; coped and scribed neatly at and around door frames.
6. Construction:
   a. Single-piece, complying with manufacturer's recommendations.
   b. When threshold abuts a wall at the ends, provide straight ends substituted for mitered returns.
7. Profile: Provide manufacturer's unit which conforms to the minimum size and profile requirement specified.
8. Coordinate thresholds for full compatibility with recessed floor mounted closers and with 1/2-inch thick polyacrylate terrazzo at all locations of step down conditions.
9. Thickness: 1/2-inch minimum.

P. Silencers
1. Provide silencers for all door frames.
2. Provide pneumatic design that once installed, forms an air pocket to reduce noise.
3. Provide minimum of three per strike side of door jambs.

Q. Stops
1. Stops shall be semi-automatic cast bronze extra heavy-duty floor mounted door holder, one per leaf.
2. Activation of holder accomplished by flipping engagement tongue forward. Release by firmly pushing door.

R. Sealants
1. Provide butyl rubber sealant complying with ASTM C920for use with thresholds.
2. Adhesives, sealants, and primers, shall comply with VOC limits established by City standards or other local restrictions, as applicable.

S. Hardware Finishes
1. Provide matching finishes for hardware units at each door or opening, to the greatest extent possible. Reduce difference in color and textures as much as commercially possible where the base metal or metal forming process is different for individual units of finish hardware exposed at the same door or

opening. In general, match all items to the manufacturer's standard finish for the latch set for color and texture.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examination

1. The Contractor, installer and architectural hardware consultant shall examine the substrate to receive finish hardware, and ascertain the conditions under which the work will be performed, and notify Engineer in writing of unsatisfactory conditions. Do not proceed with the finish hardware Work until unsatisfactory conditions have been corrected in a manner acceptable to the Engineer.

B. Preparation

1. Templates: Furnish finish hardware templates to each fabricator of doors, frames and other work to be factory-prepared for the installation of finish hardware. Upon request, check the Shop Drawings of such other work, to confirm that adequate provisions are made for the proper installation of the finish hardware.

3.02 INSTALLATION

A. Mount finish hardware units at heights recommended in "Recommended Locations for Builders' Hardware" by National Builders Hardware Association, except as otherwise specified or required to comply with governing regulations.

B. Install each finish hardware item in compliance with the manufacturer's instructions and recommendations.

C. Set units level, plumb and true to line and locations. Adjust and reinforce the attachment substrate as necessary for proper installation and operation.

D. Drill and countersink units which are not factory-prepared for anchorage fasteners. Space fasteners and anchors in accordance with industry standards.

E. Cut and fit threshold and floor covers to profile of door frames, and recessed floor mounted closers with mitered corners and hair-line joints. Join units with concealed welds or concealed mechanical joints. Cut smooth openings for spindles, bolts and similar items, if any.

F. Screw thresholds to substrate with No. 10 or larger stainless steel screws of the proper type for permanent anchorage.

G. Set thresholds in a bead of butyl rubber sealant to completely fill concealed voids and exclude moisture from every source. Do not plug drainage holes or block weeps. Remove excess sealant before sealant cures to a firm set.

3.03 FIELD TESTING / QUALITY CONTROL

A. Provide a written field report, prepared by installer's architectural hardware consultant, identifying actual condition, location, manufacturer, and product designation for each item of finish hardware actually present on each door at the Site, including whether finish hardware is adjusted and operating properly. Compare actual units present with each item referenced to the approved Shop Drawings and Contract requirements.

B. Installer's architectural finish hardware consultant shall provide opinions to, and assist the Engineer in determining, acceptability of installation as work proceeds. All comments and discussions, conversations and meetings with the Engineer shall be included in written field report for submission to the Engineer for review and approval at completion of finish hardware installation.

C. As part of written field report to be submitted to the Engineer for approval, recommend remedial actions for work not in compliance with the Sections. No payment for remedial action shall be made until remedial recommendations and actions have been approved by the Engineer and incorporated into the Work.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Provide a Final Report on the actual finish hardware present on each door of the work. Compare this field Report to approved Shop Drawings submittal and present to the Engineer with remedial recommendations. No payment for remedial action shall be made until remedial recommendations have been approved by the Engineer and implemented by the Contractor.

B. Adjust and check each operating item of finish hardware and each door to ensure proper operation or function of every unit. Lubricate moving parts with the type lubrication recommended by manufacturer (graphite-type if no other recommended). Replace units which cannot be adjusted and lubricated to operate freely and smoothly as intended for the application.

C. Final Adjustment: Where finish hardware installation is made more than one month prior to Final Acceptance or occupancy of a space or area, return to the Work during the week prior to Final Acceptance or occupancy, and make a final check and adjustment of all finish hardware items in such space or area. Clean and relubricate operating items as necessary to restore proper function and finish of finish hardware and doors. Adjust door control devices to compensate for final operating of heating and ventilating equipment.

D. Provide each manufacturer's authorized technical representative to instruct and train the City's personnel in proper adjustment and maintenance of finish hardware during the final adjustment of finish hardware.

E. Finish hardware which is blemished or defective will be rejected even though it was set in place before defects were discovered. Remove and replace with new finish hardware. Repair all resultant damage to other work.

F. Continued Maintenance Service: Approximately 6 months after the acceptance of finish hardware in each area, the installer, accompanied by the representative of the latch and lock manufacturer, shall return to the project and readjust every item of hardware to restore proper function of doors and finish hardware. Consult with and instruct City's personnel in recommended additions to the maintenance procedure. Clean and lubricate operational items wherever required. Replace finish hardware items which have deteriorated or failed due to faulty design, materials or installation of finish hardware units. Prepare a written report of current and predictable problems (of substantial nature) in the performance of the finish hardware.

SECTION 08 81 03 – GLASS, PLASTIC AND GLAZING
CONTRACT WP-169 CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Furnishing all labor, materials, equipment and appliances required for the complete execution of work as shown on the Contract Drawings and specified herein.

B. Principal items of work include:

1. Insulated glass
2. Glazing clips, tapes, gaskets and compound
3. Setting glass and glazing
4. Laminated Safety Glass

C. The Contractor shall implement practices and procedures to meet the project's sustainability goals as identified in the Contract Documents. The Contractor shall ensure that the sustainability requirements of this Section are implemented to the fullest extent.

D. The following index of this Section is presented for convenience:

Article	Title	Section Page
PART 1	GENERAL	1
1.01	Summary	1

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 07 90 00 -- Joint Protection

1.04 REFERENCES

A. NYCBC -- New York City Building Code

B. CPSC 16 CFR 1201 -- Federal Safety Standard for Architectural Glazing Materials

C. ANSI Z97.1 -- Performance Specifications and Methods of Test For Safety Glazing Material Used in Buildings

D. ASTM C1036 -- Standard Specification for Flat Glass

E. ASTM E119 -- Standard Test Methods for Fire Tests of Building Construction and Materials

1.05 DESCRIPTION

A. Glass Sizes and Types

1. Each light of glass shall bear the manufacturer's label, showing kind, thickness and quality and the label shall not be removed until the work has been inspected and approved by the Engineer.

2. All glass shall be the best quality of its respective kind, free from integral or surface defects and shall not be clouded, cracked or broken.

B. Sustainable Design Requirements

1. Recycled Content of Glass: Postconsumer recycled content plus one-half of pre-consumer recycled content shall not be less than 10 percent.

2. Low Emitting Materials: Sealants and adhesives used on site and within the building’s weatherproofing system shall meet the VOC content limits listed below or in the detail specifications.

a. Architectural Sealants: 250 g/L.

b. Sealant Primers for Nonporous Substrates: 250 g/L.

c. Sealant Primers for Porous Substrates: 775 g/L.

d. Multipurpose Construction Adhesives: 70 g/L

e. Structural Glazing Adhesive: 100 g/L.

C. Fire Rating

1. Where Glass, Plastic and Glazing systems are used within a fire rated room, corridor, egress path, and as indicated in the Contract Drawings, those Glass, Plastic and Glazing systems shall maintain the fire rating of the location in which they are placed.

1.06 QUALITY ASSURANCE

A. In addition to complying with pertinent codes, regulations and safety standards, comply with the recommendations contained in the "Manual of Glazing" of the Flat Glass Marketing Association.

B. Provide at least one person who shall be thoroughly trained and experienced in the skills required, who shall be completely familiar with the referenced standards and the requirements of the Contract Documents, and who shall personally direct all installations performed under this Section.

C. Coordinate with the various glass, door and window manufacturers to ascertain the proper type of glazing compounds to be used so that all design criteria are met and so that the required manufacturers' guarantees are not invalidated.

D. IGCC Certification- Insulating Glass Certification Program: Provide insulating glass units complying with requirements indicated which are permanently marked with certification label.

E. Glass thickness specified shall be considered as minimum values and that thicker glass or wider insulating spaces, or both, may be required by door and window manufacturers in order to produce a product, which meets the thermal requirements specified in other Sections. Secure and coordinate all requirements from each manufacturer prior to ordering or installing such items.

F. All glass shall be factory labeled on each pane and shall contain, as a minimum, grade, type and quality of glass and trademark. Glass without factory labels shall be considered unacceptable. After inspection and approval by Engineer, remove labels from all glass.

G. Check openings to verify that frames are plumb and true, square and secure. Clean surfaces to be sealed; perform work under satisfactory weather conditions; provide shelter and proper temperature.

H. Take field dimensions for cutting glass and fabricating units.

I. All glass sizes shall be determined by measuring the frames to receive the glass at the site and/or from guaranteed dimensions provided by the frame supplier. Glass sizes shall comply with the manufacturer's specified tolerances for each type of glass including cutting tolerance, minimum edge clearance, minimum face clearance, and cover on glass.

1.07 SUBMITTALS

A. Contractor shall submit the following to the Engineer for review and approval, in accordance with the procedures and requirements set forth in Section 01 33 00 – Submittal Procedures.

1. Samples
2. Shop Drawings

B. Samples shall include:

1. Two 12" square pieces of each type of glass specified.
2. One bead, approximately 1/4 inch wide x 3 inches long of sealant, indicating color and set of cured material.

C. Shop Drawings shall include but not be limited to:

1. Complete layout and installation drawings and schedules with clearly marked dimensions.
2. Manufacturer's descriptive data of glass and glazing materials.
3. Recommended installation instructions.
4. Manufacturer's certification that the materials meet specification requirements.

D. Sustainable Design Submittals:

1. Environmental Materials Reporting Form (EMRF) Recycled Content. Provide the following information:
   a. Name of Product and Manufacturer.
   b. Material cost breakdowns. Cost breakdowns must include total material-only cost (excluding installation, labor and equipment).
   c. The percentage (by weight) of post-consumer and pre-consumer recycled content in the submitted product(s), if applicable.
   d. Indicate the location and distance from Project of material manufacturer and point of extraction, harvest, or recovery for each raw material. For assemblies, include the percentage by weight that is considered regional.
2. VOC Reporting Form. Provide the following information:
   a. For all sealants and adhesives used on site and within the building's weatherproofing system provide the VOC content in grams/Liter (g/L) less water and other exempt compounds.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivered materials shall match to approved samples in every respect. Deliver materials in the manufacturer's original unopened labeled containers, clearly marked with their name and brand. Transport large panes of glass in vertical position with spacers to prevent contact between panes and edges.

B. Store glass in a dry, well-ventilated location at a constant temperature, maintained above dew point. Handling shall be kept to a minimum and all glass shall be protected from soiling, condensation or moisture of any kind.

C. Glass delivered to the job site with manufacturer's markings, or when markings are applied at the job, use either neutral or slightly acidic adhesive. In no case shall marking materials or adhesives be alkaline. Any staining of glass by alkaline material will be cause for rejection.

D. The edges of all tempered and insulating glass shall be protected from damage and edges shall not be modified in any way after the glass leaves the factory. Nipping of any glass to reduce size shall not be permitted.

E. All glass shall be delivered with manufacturer's labels showing type, thickness and quality of material (and UL label as required). These labels shall not be removed until the glass is set and final approval has been secured.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Insulating Glass: The Contractor shall obtain from the insulating glass manufacturer and provide to the City a manufacturer’s warranty, in an acceptable and beneficial form, warranting to deliver without charge, a replacement for any unit, which develops material obstruction to vision due to film formation or dust collection on the interior glass surfaces resulting from failure of the hermetic seal other than through glass breakage for a period of 20 years from the date of Substantial Completion.

B. Laminated Glass: The Contractor shall obtain from the laminated glass manufacturer and provide to the City a manufacturer’s warranty, in an acceptable and beneficial form, warranting to deliver without charge, a replacement for any light of laminated glass, which develops edge separation or other defects, which materially obstruct vision through the glass for a period of 5 years from the date of Substantial Completion.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The products accepted as manufactured by:

1. PPG Industries, One PPG Place Pittsburgh, PA.
2. Libby - Owens – Ford, Toledo, OH.
3. Cardinal IG, Eden Prairie, MN.
4. Viracon, Inc., Owatonna, MN.
5. Guardian, Inc., Webster, MA.
6. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Unless otherwise specified, all glass shall conform to FS DD-G-451c. ASTM C1036 All product references are Viracon trade names. All substitutions shall perform equal to or better than products specified.

B. Insulating glass (unit type 1) shall be one and five-eights (1-1/4) inches thick hermetically sealed units consisting of an outer light of 9/16 inch heat strengthened clear laminated panels and an inner light of 1/4 inch thick heat strengthened clear glass with VH11-50 E Coating System (Solarban 70 or equal), each separated by 1/2 inch entrapped, dehydrated air, edges dual sealed and silicone second sealed. Each panel to have 0.060 clear polyisobutylene (PVB) inner layer.

1. Transmittance:
   a. Visible Light: 45%
   b. Solar Energy: 22%
   c. Ultraviolet: <1%
      1) (Ultraviolet defined as 300 to 380 nanometers (nm)
2. Reflectance:
   a. Visible Light-Exterior: 13%
   b. Visible Light-Interior: 13%
   c. Solar Energy: 22%
3. ASHRAE U-Value:
   a. Winter Nighttime: 0.28 Btu (hr. x sq. ft. x °F)
   b. Summer Daytime: 0.26 Btu (hr. x sq. ft. x °F)
4. Shading Coefficient: 0.40
5. Solar Factor (SHGC): 0.34
6. Relative Heat Gain: 85 Btu/hr x sqft

C. Clear Heat-Strengthened Float Glass: Kind HS, Condition A, Type I, Class 1, and Quality q3.

D. Clear Float Glass - Type I, Class 1, and Quality g3.

E. Glazing Materials

1. Use a resilient, non-hardening glazing compound, capable of withstanding the climatic conditions at the Project site, such as silicone or polysulfide sealants.
2. Secure recommendations from window and glass manufacturers as to the proper type of glazing compound, which should be used so as not to delaminate glass, stain materials or otherwise create defects in the work.

a. Make exposed surfaces smooth, even and uniform in appearance. Slope glazing compound to readily shed water.

b. Glazing compound for glazing metal sash, doors, etc., shall meet the requirements of ASTM E119respectively for physical qualities and shall be as manufactured by:

1) H.B. Fred Kuhls, Brooklyn, NY.

2) Tremco Manufacturing Co., Beachwood, OH.

3) Pecora Paint Co., Harleysville, PA.

4) Gibbs and Hohman, Munster, IN.

5) Or approved equal.

c. Preformed vision strips and tape shall be used in conjunction with setting all glass in exterior windows and shall be similar and equal to Tremco vision strips and "Tremco 440" Tape as manufactured by:

1) Tremco Manufacturing Co., Beachwood, OH.

2) Or approved equal.

d. Tapes and vision strips shall be as selected from the manufacturer's standard products.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Perform glazing when ambient temperature is above 40°F.

B. Perform glazing on dry surfaces only.

C. Sheet glass shall be cut and set with waves running horizontally.

D. All measurements and size for the work shall be obtained and verified by the Contractor who shall be responsible for the correct and accurate fitting of all his work.

E. All glass shall be set in such manner as to avoid possibility of breakage.

F. Rabbets shall be thoroughly cleaned and shall have been prime coated before glass is set.

G. Glass shall be well bedded and back glazed and all surplus compound and markings shall be carefully removed from doors, sash and adjoining work, while still fresh. Compound shall be finished in true, even lines, neatly and smooth faced. All glass shall be set in strict accordance with the manufacturer's printed directions.

H. All glass when set and glazed shall be free from rattle and all exterior glazing shall be executed in such a manner that the work will be watertight. Insulating glass shall be set in compliance with the manufacturer's instructions.

I. Glazing molds shall be removed and replaced in their correct locations in such a manner as not to mar molding or the screws securing same.

J. All glazing shall be done at the building after the work into which glass is to be set has been installed. All openings shall be properly marked after being installed, to show that the openings have been glazed.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Before and after installation, all work shall be properly protected against damage.

B. On completion and prior to turning the project over to DEP, all metal work and glass shall be cleaned and left in perfect condition. Glass shall be washed outside and inside.

C. Make required adjustments.

D. Thoroughly clean all glass and mirrors just before final acceptance by DEP, or sooner if authorized by Engineer.

E. Remove excess glazing compound and foreign materials.

F. Replace broken or defective glass and hardened, uneven, defective or otherwise non-complying glazing compound.

END OF SECTION

SECTION 08 91 20 – FIXED LOUVERS
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish all labor, materials, equipment and appliances required for the complete execution of the Work as shown on the Contract Drawings, specified in the Contract, and as specified herein.

B. The extent of louver Work is shown on the Contract Drawings and includes the following:

1. Individual louver openings where indicated.

2. Blank-off metal panels where required.

3. Bird screen or insect screen as required.

C. Remove sections of louver where indicated on the Drawings.

D. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the

applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 07 90 00 - Joint Protection

1.04 REFERENCES

A. AMCA 500 - Air Movement Control Association (AMCA) Louvers, Dampers, and Shutters, Test Method for

B. AA - The Aluminum Association Incorporated, Aluminum Standards and Data

1.05 DESCRIPTION

A. Structural Performance: Design, engineer, fabricate and install metal louvers to withstand the effects of loads and stresses from wind and normal thermal movement without evidencing permanent deformation of louver components including blades, frames and supports, noise or metal fatigue caused by louver blade rattle or flutter; and permanent damage to fasteners and anchors.

1. Wind Load: Uniform pressure (velocity pressure) of 30 lb. per sq. ft. acting inwards or outwards.

2. Normal thermal movement is defined as that resulting from the following maximum change (range) in ambient temperature. Base design calculations on actual surface temperatures of metals due to both solar heat gain and nighttime sky heat loss.

a. Temperature Change (Range): 100 deg. f (55.5 deg. C)

B. Air-Performance, Water-Penetration and Air-Leakage Ratings: Provide louvers complying with performance requirements indicated as demonstrated by testing manufacturer's stock units of height and width indicated according to AMCA 500.

1.06 QUALITY ASSURANCE

A. Codes and Standards: All units shall conform to AA - Aluminum Standards and Data, latest edition.

1.07 SUBMITTALS

A. The following shall be submitted for review and approval by the Engineer.

1. Cut Sheets

2. Samples, including proposed finishes as specified herein

3. Shop Drawings

1.08 DELIVERY, STORAGE, AND HANDLING

A. Brace and support units to prevent deformation during delivery.

B. Factory wrap units with approved materials to protect finish during delivery and storage.

C. Handle units with care to prevent bending or scratching.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The Airolite Co, Schofield, WI

B. Penn Ventilator Co., Inc., Birmingham, AL

C. Airflex Corporation, Farmingdale, NY

D. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Double Drainable Fixed Louver:

1. Individual louver shall be Airflex Industrial Model No. FDD-6-SS or approved equal; fixed 45-degree, 6 inch deep dual drainable storm proof blade of the following characteristics:

a. Frames and blades shall be stainless steel 316 alloy .064" thick.

b. Fasteners: Of same basic metal and alloy as fastened metal, unless otherwise indicated. Do not use metals which are corrosive or incompatible with materials joined.

1) Use types, gages and lengths to suit unit installation conditions.

2) Use Philips flat-head machine screws for exposed fasteners unless otherwise indicated.

c. Anchors and inserts of type, size and material required for type of loading and installation indicated. Use non-ferrous metal or hot-dip galvanized anchors and inserts for exterior installation and elsewhere as required for corrosion resistance.

d. Bituminous Paint: SSPC-Paint 12 (cold-applied asphalt mastic).

2. Manufacturer to submit test data on 4 feet x 4 feet louver units. Test data shall show the following results at 1100 fpm free area velocity.

Minimum Free Area	Maximum Pressure Drop	Maximum Water Penetration
7.32 sq. ft.	0.24 in	0.005 oz.
0.678 m	6.10 mm	1.53 g

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Provide continuous stainless steel angle support. Length of angle shall ensure proper edge distance for fasteners in opening and to frame of louver.

B. Finish

1. Exposed sides of all stainless steel components shall be Airflex Industrial finish A1221 Glass Bead or approved equal to match finish of window wall system, as per the approved submittal of the finish sample.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Anchor louver frames using stainless steel bolts into holes drilled and tapped in sub-frames or with strap anchors to masonry in accordance with the manufacturer's approved directions.

B. Isolate aluminum from contact with masonry or dissimilar metals with heavy coat of bituminous paint or neoprene gaskets.

C. Mount bird screens of all louvers unless indicated otherwise on inside face with clips, machine screw into frames. Screws shall be stainless steel.

D. Verify size, location and placement of continuous louvers and individual louver units prior to fabrication wherever possible. Coordinate field measurement and shop assembly to minimize field adjustment. It is important to recognize that both fabrication and installation be done by the same company in order to achieve the quality required.

E. Locate and place louver unit’s plumb, level and in proper alignment.

F. Use concealed anchorages where possible. Provide brass or lead washers fitted to screws where required to protect metal surfaces and to make a weather-tight connection.

G. Form closely fitted joints with exposed connections accurately located and secured.

H. Provide perimeter reveals and openings of uniform width for sealants and joint fillers as indicated.

I. Repair finishes damaged by cutting, welding, soldering and grinding operations required for fitting and jointing. Restore finishes so there is no evidence of corrective work. Return items which cannot be refinished in field to shop, make required alterations and refinish entire unit or provide new units.

J. Install concealed gaskets, flashings, joint fillers and insulation as louver installation progresses where required to make louver joints weather-tight. Comply with Section 07 90 00 – Joint Protection for sealants applied during installation of louver.

K. Protect louvers and vents from damage of any kind during construction period including use of temporary protective coverings where needed and approved by louver manufacturer. Remove protective covering at time of Substantial Completion.

L. Restore louvers and vents damaged during installation and construction period so that no evidence remains of correction work. If results of restoration are unsuccessful, remove damaged units and replace with new units.

M. Do all cutting and fitting required for the installation in a neat manner.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Upon completion remove any and all protective coatings, and clean off all parts of the work in accordance with Contract Documents.

PART 1 GENERAL

1.01 SUMMARY

A. Painting, as specified herein, shall include, but not be limited to, preparation of surfaces, shop painting of items furnished, and field painting of structures, piping, conduit, ducts and equipment, and marking of piping and electrical conduit.

B. Painting shall be provided as shown on the Contract Drawings, specified herein or in the Contract, or as required for a complete installation.

1.05 DESCRIPTION

A. Safety Requirements

1. All painting materials specified herein, and ingredients of coatings containing substances that are potentially toxic or hazardous shall be shipped with warning labels. These products shall be applied in strict conformance with the safety requirements of the following:

a. Manufacturer
b. National Paint and Coatings Association (NPCA)
c. Society of the Plastics Industry (SPI)
d. Manufacturing Chemist Association (MCA)
e. Society of Protective Coatings (SSPC)
f. United States Government Occupational Safety and Health Administration (OSHA)
g. Health and Safety Requirements of the State of New York (PESH-Public Employees Safety and Health)

h. Health and Safety Requirements of the City of New York (COSH-Citywide Office of Safety and Health)

B. Environmental Requirements

1. Weather:

a. Air and surface Temperatures: Prepare surfaces and apply and cure coatings within air and surface temperature range in accordance with manufacturer's instructions.

b. Surface Temperature: Minimum of 5 degrees F (3 degrees C) above dew point.

c. Relative Humidity: Prepare surfaces and apply and cure coatings within relative humidity range in accordance with manufacturer's instructions.

d. Precipitation: Do not prepare surfaces or apply coatings in rain, snow, fog or mist.

e. Wind: Do not spray coatings if wind velocity is above manufacturer's limit.

2. Ventilation

a. Provide ventilation during coating evaporation stage in confined or enclosed areas in accordance with AWWA D102.

3. Dust and Contaminants:

a. Schedule coating Work to avoid excessive dust and airborne contaminants.

4. Protect Work areas from excessive dust and airborne contaminants during coating application and curing.

1.06 QUALITY ASSURANCE

A. Paint Quality Assurance Records

1. The following information shall be recorded for every paint project and submitted to the Project-Manager:

a. Date

b. Shift

c. Part Temperature

d. Dew Point

e. Paint Batch Number/s

f. Mixing Time for Each Part and the Combined Parts of a Paint System

g. Pot Life

h. Curing Time of Primer and Finish Layers

i. Paint thickness measurements (DFT)

j. Holiday Test Results and Repair Data

k. Peel Test Results and Repair Data

l. Foreman or Supervisor's Signature

B. Test Surfaces

1. The Contractor shall paint certain areas of concrete and other surfaces, where directed, using approved coatings for use by the Engineer for comparisons with coating systems applied during the progress of the Work.

2. Such coated areas shall not be subsequently painted during the entire period of construction or during the period one-year after the date of Final Acceptance.

3. At or about one year after Final Acceptance, the test surfaces shall be inspected by the City for any deterioration such as cracks, blisters, flakes and excessive chalking.

4. The Contractor shall supply all material and labor and shall perform any remedial Work on all such deteriorated surfaces using the coating system represented by the test surface at no additional cost to the City.

C. Painting Requirements

1. General: The Contract does not specify the surface treatment for every individual part of the Work, however this Contract shall be provided with a complete painting job throughout the Work as specified herein. All items customarily or specified to be shop painted shall be primed and finished in the shop. Field painting will not be allowed unless requested in writing to the Engineer, and written consent is given by the Engineer. In general, only areas that are to be field welded are not to be painted until field erected.

2. Manufacturer's Standard Finished Items: The following items shall be furnished with the manufacturer's standard prime and finish coats applied in the shop: pumps, motors, gears, gear housings, air compressors, wall fans, temperature control and instrument panels, process air blowers, engines, filters, strainers, air dryers, meters, gas boosters, gas turbines, generators, panelboards, transformers, boilers, condensing units, water chillers, cooling towers, condensers, heat exchangers, humidifiers, air handling units, sound attenuators, air conditioning and dehumidification units, convector cabinets, unit heaters, enclosures for finned tube radiators, cabinet heaters, boilers, wood seats, lockers, metal toilet partitions, metal urinal screens, aluminum fascia, motor control centers, aluminum light standards, and hoisting equipment. Steel reinforcing bars for concrete shall

be coated in accordance with the Contract. When powder coatings are required by the Contract, the powder coatings shall be in accordance with the requirements of the manufacturer of the item.

3. Painted Items: The following items shall be painted as specified herein: steel water storage tank, structural steel and wrought metals, composite metal floor deck, pipelines, hangers and supports, sluice gates, pumps and pumps parts, valves, valve and sluice gate operators and stands, guard housings, air filter equipment, effluent strainers, heat exchangers, air receivers, tanks, air silencing equipment, storage tanks, gas domes, sediment tanks, steel stair framing, steel lintels, hollow metal doors and frames, gypsum wallboard, interior concrete block, interior concrete walls, columns, beams and ceilings, covering over insulation on piping, electrical conduit systems, small piping and copper tubing, ducts, covering over ducts, and PVC piping, valves and fittings.

4. Unpainted Items: The following items shall not be painted, unless otherwise specified: registers, grilles, dampers and linkage, fire sprinklers, name and identification plates and tags, floor gratings, brass pipe and fittings, brass valves, stainless steel, wood, stop log panels, spray-on fireproofing steel to receive spray-on fireproofing, surfaces to receive field welding, and fraying surfaces of high strength bolted connections.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings for approval by the Engineer. Submittals shall include, but not be limited to:

1. Catalog cuts and reference materials.

2. Color Chart: The Contractor shall submit the manufacturer's standard color chart for color selection for painting of items other than process piping, valves, pipe line equipment, pump casings, blowers and other mechanical equipment and their drive units, all of which shall be in conformance with the "BACKGROUND COLOR" of the General Color Code specified in Section 40 05 97 – Identification for Process Equipment.

3. Paint Samples:

a. Two one-quart samples of each required kind of paint material, or the ingredients thereof which are to be mixed on the job.

b. Samples shall be labeled, and shall include the certificate of the manufacturer stating the actual percentages by weight and volume of all ingredients entering into the mixture.

c. Upon request, further samples shall be provided as the Work progresses.

d. Painting materials shall not be applied without written approval of samples by the Engineer.

4. Painted Surface Samples:
   a. Upon request, duplicate samples of the results obtained by painting and finishing various materials on the Work shall be submitted. Such samples, and the approved paint applied thereto, shall be applied in strict conformance with these Sections.
   b. Finished areas shall be considered adequate for the purpose of determining the quality of the Work. All painting work shall be performed in a quality equal to the approved samples.
   c. Where equipment is customarily shipped with a standard finish, samples of the proposed color and finish shall be submitted for approval prior to shipping.
5. Certification:
   a. Affidavits from the manufacturer certifying that materials furnished conform to the requirements specified.
   b. And that paint products have been checked for compatibility.
6. Immersion Certification:
   a. Affidavits from the manufacturer certifying that coatings in immersion service contain no water soluble solvents or corrosion inhibitive (active) pigments with slight water solubility.
7. List of Paints:
   a. A list of paint products with mil thickness and solids by volume, including all paint applied in the shop and in the field. The list shall be in accordance with the requirements of this Section and the recommendations of the paint manufacturer.
8. Applicator's Quality Assurance:
   a. Submit list of a minimum of 5 completed projects of similar size and complexity to this work. Include for each project:
      1) Project name and location
      2) Name of owner
      3) Name of contractor
      4) Name of engineer
      5) Name of coating manufacturer
      6) Approximate area of coatings applied.
      7) Date of completion.
9. Warranty:
   a. Submit manufacturer's standard warranty.

1.08 DELIVERY, STORAGE, AND HANDLING

A. General: All products and materials shall be delivered, stored, and handled as specified in Contract Documents and as follows:

B. Delivery and Storage: All paint materials delivered and stored at the site shall be from the approved manufacturer only.

C. Packaging and Labeling: Paints, stains, varnish or ingredients of paints to be used on the job shall be properly prepared, packed, and labeled. All materials shall be delivered to the Site in original, unbroken containers bearing the manufacturer's printed labels, which shall specify the following:

1. Project and Contract No.
2. Name of manufacturer
3. Address of manufacturer
4. Generic name of paint or ingredients
5. Brand and trademark
6. Schedule letter as listed herein
7. Percent solids by volume
8. Net quantity
9. Date of manufacturer
10. Date packed

D. Storage: Painting materials shall be stored at the Site in manner and place which shall be in accordance with applicable codes and regulations, and in accordance with manufacturer's instructions. The storage space shall be kept clean at all times. Every precaution shall be exercised to eliminate fire hazards.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer’s standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Standards of Quality: Proprietary protective coatings included herein by brand name or trade mark are given solely as standards of quality and for bidding purposes and do not preclude the use of an approved equivalent.

B. Latest Products: Unless specified otherwise, the proprietary protective coatings of the manufacturer's latest products in regular production on the date of receipt of order shall be provided.

C. Equivalents: Equivalent products shall be of a standard, regularly produced product of a manufacturer. Equivalent products shall be submitted on their applicable published printed literature that states the generic type, instructions for use, solids by volume, application rates, and chemical components of vehicles and solids. Equivalent products shall be accompanied by a list of projects where each of the coatings has been used on new construction and has rendered satisfactory service for at least three years. Should the manufacturer's literature of the product being offered call for higher film thickness, the greater film thickness shall be applied, and the submitted schedule shall so state.

D. Paints shall be as manufactured by the following manufacturers:

1. Tnemec Company, Inc., Kansas City, MO.
2. Sherwin Williams, Cleveland, OH.
3. International Paint, Houston, TX.
4. Carboline Company, St. Louis, MO.
5. PPG Amercoat, Little Rock, AR.
6. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. General:

1. Compatible shop and field coats shall be provided.
2. All coats of paint for any particular surface shall be from the same manufacturer.
3. Paint shall be of approved color as selected from the manufacturer's standard range of colors.
4. The Contractor shall submit proposed modifications to the specified painting systems for the Engineer's approval prior to use.
5. Paints containing lead or manganese driers shall not be submitted.

B. Classification of Paints: Alphabetical designations have been used in the following list to classify/group acceptable paints by the type and quality of materials desired. Equivalent material from the manufacturers named above or from other approved manufacturers may be used in any of these paint groups in accordance with the procedures for substitution. Refer to the “Material Painting Schedule”, attached after the “End of Section” designation, for applicability of these paint groups.

CLASSIFICATION OF PAINTS			
Paint Group	**Product Name and Number**	**Volume Solids %**	**Dry Film Thickness Mils per Coat**
A	**Tnemec:** Series V69 Hi-Build Epoxoline II	69	3.0-5.0
	Carboline: Carboguard 60/61 or Carboguard 635 or Carboguard 890 Series	72 65 75	4.0-8.0 4.0-6.0 4.0-8.0
	Sherwin Williams: Macropoxy 240	72	2.0-4.0
	International Paint: Integrated 345 or Devran 224V	70/77	3.0-4.0 (typically 4.0-6.0)
	PPG: Amerlock 2/400	85	4.0-8.0
B	**Tnemec:** Series V140-44 BR Pota-Pox Plus	69	4.0-6.0
	Carboline: Sanitile 120	38	1.0-2.0
	Sherwin Williams: Dura-Plate 235 (Waste Water)	68	3.0-5.0
	International Paint: Interseal 670 HS or Bar Rust 233HS	82/80	3.0-6.0 (typically 4.0-8.0)
	PPG: Amerlock 2/400	85	4.0-8.0
C	**Tnemec:** Series 1095 Endura-Shield	68	2.0-3.0
	Carboline: Carbothane 134 Series or Carbothane 134WB	70 50	2.0-3.0 2.0-3.0
	Sherwin Williams: Hi Solids Polyurethane 250 or Sherloxane 800	63 90	3.0-5.0 4.0-6.0
	International Paint: Interthane 990V or Devthane 379	71/63	2.0-3.0
	PPG: Pithane Ultra	70	2.0-3.0
D	**Tnemec:** Series V69 Hi-Build Epoxoline II	69	3.0-5.0
	Carboline: Carboguard 61 or Carboguard 691 or Carboguard 635 Series	72 80 65	4.0-8.0 4.0-20.0 4.0-8.0
	Sherwin Williams: Macropoxy 646	72	4.0-6.0
	International Paint: Interseal 670HS or Bar Rust 233H/236	82	3.0-6.0
	PPG: Amerlock 2/400	85	4.0-8.0
E	**Tnemec:** Series 90-97 Tnemec-Zinc	63	2.5-3.5

CLASSIFICATION OF PAINTS			
Paint Group	**Product Name and Number**	**Volume Solids %**	**Dry Film Thickness Mils per Coat**
	Carboline: Carbozinc 859 Series or Carboguard 890 Series or Carboguard 60/61	66 75 72	3.0-10.0 4.0-10.0 4.0-10.0
	Sherwin Williams: Corothane I Galvapac	67	2.5-3.5
	International Paint: Interzinc 52	59	3.0-5.0 (typically 2.0-3.0)
	PPG: Amercoat 68HS	70	2.5-5.0
F	**Tnemec:** Series 54 Envirofill Masonry Filler	68	As Required
	Carboline: Sanitile 100 Block Filler or Carbocrylic 3350	54	As Required
	Sherwin Williams: Heavy Duty Block Filler (dry) Kem Cati –Coat Epoxy Filler/ Sealer	50 72	8-10 10-20
	International Paint: Devran 224 or Intercrete 4820	77/NA	As Required
	PPG: Perma-Crete 4-100XI	55	8.0-11.0
G	**Tnemec:** Series 151 Elasto-Grip	17	1.0-1.5
	Carboline: Galoseal WB	31	0.5-1.0
	Sherwin Williams: Pro-Mar 200 Zero VOC / Primer	26	1.0-2.0
	International Paint: Intercryl 520	44	1.0-2.0 (typically 2.0-3.0)
	PPG: Seal Grip 17-921XI	28	1.6
H	**Tnemec:** Series 1026	43	2.0-3.0
	Carboline: Sanitile 155	38	2.0-3.0

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Surface Preparation: Prior to painting, Surface preparation prior to painting shall be in accordance with the following guidelines and as recommended by the painting material manufacturer.

SURFACE PREPARATION GUIDELINES	
Class of Work	Preparation of Surface Prior to Painting
Structural Steel and Steel Encased in Concrete, Masonry or Fireproofing	All visible oil, grease, dirt, dust, mill scale, rust, paint, oxides, corrosion products and other foreign matter shall be removed by compressed air nozzle blasting, centrifugal wheels or other specified method. Discoloration caused by certain stains shall be limited to no more than 33 percent of each square inch of surface area in accordance with Society of Protective Coatings (SSPC-SP6).

SURFACE PREPARATION GUIDELINES	
Class of Work	Preparation of Surface Prior to Painting
Steel (other than structural, encased or galvanized) and Steel Submerged Under Water	All visible oil, grease, dirt, dust, mill scale, rust, paint, oxides, corrosion products and other foreign matter shall be removed by compressed air nozzle blasting, centrifugal wheels or other specified method. Discoloration caused by certain stains shall be limited to no more than 5 percent of each square inch of surface area in accordance with Society of Protective Coatings (SSPC-SP10).
Galvanized Steel and Other Metals	All welds, beads, blisters or protuberances, other than identification markings shall be smooth, and other imperfections shall be removed. All nonferrous metals and galvanized steel, whether shop primed or field primed, shall be solvent cleaned in accordance with Society of Protective Coatings (SSPC-SP1).
Canvas Pipe Covering	All adhering debris shall be removed and indentations or other unsightly spots shall be smoothed out to give a uniform, even surface. Surfaces shall be brushed clean.
Gypsum Wallboard and Plastered Surfaces	Gypsum wallboard shall be prepared as recommended by the wallboard manufacturer. Plaster surfaces shall be dry. Scratches, cracks, holes and other defects shall be filled flush with adjoining surfaces by approved methods, sandpapered smooth, and brushed clean.
Concrete and Masonry Surfaces	Concrete and masonry shall be dried for a minimum of 28 days and then the dry concrete and masonry shall be brushed and washed to remove all loose dirt, dust, free lime and other deleterious substances by approved methods. Protruding fins and other adhering matter shall be removed or ground until a smooth, even finish is obtained. Concrete surfaces to be painted shall be acid etched or otherwise roughened as recommended by the manufacturer of the coating to be applied, to produce a slightly granular surface required for adherence of coating to the concrete, unless otherwise indicated.
PVC	All adhering debris shall be removed and surface shall be roughened using suitable sandpaper. Surfaces shall be dry and free from dirt, oil, grease etc.

3.02 APPLICATION

A. General: All painting and coatings shall be applied in accordance with the manufacturer's recommendations and approved submittals. A representative of the paint manufacturer shall inspect the surfaces to be painted and shall advise on the proper application. The paint manufacturer representative shall periodically be consulted regarding ambient temperature and humidity conditions.

B. Shop Painting: The following items shall be provided with shop coats of primer and finish coats as herein specified before exposure to the weather:

1. Metals:

a. Structural steel

Note: Consider using hot dip galvanizing at crevices or hard to reach places on structural steel.

b. Miscellaneous steel and wrought iron

c. Ornamental wrought and light iron

d. Iron castings

2. Machinery and Equipment:

a. Mechanical and electrical equipment

3. Pipe:

a. All piping except galvanized iron, stainless steel, aluminum, copper, brass and bronze piping.

C. Field Painting: All painting at the site of the project is hereby designated as field painting for those items that cannot be shop painted or are touched up due to minor damage to the painted surface.

1. Repair and Repainting: Field coatings shall not be applied until all marred surfaces have been repaired or repainted. Shop coated surfaces shall be thoroughly cleaned and retouched prior to the application of successive paint coats in the field.

2. Unpainted Materials: Do not paint or finish copper, bronze, chromium plate, nickel, stainless steel, aluminum (except ducts and conduit adjacent to finish painted surfaces), monel metal, lead, lead coated copper and brass, except as otherwise indicated.

3. Items to Receive Coating: All ferrous metals and insulated surfaces shall be provided with a protective coating. Interior surfaces, exposed masonry walls and concrete walls, floors and ceilings shall be provided with protective coatings as specified.

4. Surface Condition: Only surfaces that are dry and free from dust, grease or other undesirable or interfering substances shall receive coatings. Coatings shall be as specified in the “Material Painting Schedule” , attached after the “End of Section” designation.

5. Application: Finish coats shall be applied after all adjacent work has been completed. Successive coats shall have different shades or tints of color wherever possible. Colors shall be as selected and approved by the Engineer. Prime and successive finish coats shall be cleaned, sand papered, or otherwise treated before the next coat is applied, in accordance

with the recommendations of the coating manufacturer, and as approved by the Engineer. All coats shall be inspected and approved by the Engineer, before application of any succeeding coats. All coats shall be applied to the dry film thickness (DFT) specified. Coatings shall be applied by skilled personnel under adequate illumination. All painted surfaces shall be left in a clean, orderly and acceptable condition.

6. Surface and Atmospheric Conditions: Paints shall not be applied when the surface temperature is less than 40 degrees F, when the relative humidity exceeds 85 percent, or when the surface to be painted is wet or damp, unless more stringent requirements are called for by the paint manufacturer.

D. Field Painting Operations: Surfaces to be given protective coating shall be thoroughly cleaned. Scratches and abrasions on equipment which has been shop coated shall be refinished and all surfaces to be field painted shall be approved by the Engineer before proceeding with painting. Painting shall be performed in a continuous and orderly operation to facilitate adequate inspection, however material subject to weathering or corrosion shall be given prime coats as quickly as practicable.

1. Method of Application: All paint material shall be applied by brush or roller. Spray painting will be permitted only with the specific approval of the Engineer. Surfaces which are so close together as to prevent the insertion of a standard size roller or brush shall be painted thoroughly with the prescribed number of coats by using special narrow rollers or brushes.

2. Adjacent Areas: Areas under and adjacent to painted surfaces shall be fully protected at all times. Dripped or spattered paint shall be promptly removed and any adjacent surfaces that have been damaged or discolored by overspray shall be repaired, refinished, and repainted.

3. Tinting: Successive coats of paint shall be tinted to make the various coats easily distinguishable. Undercoats of paint shall be tinted to the approximate shade of the final coat of paint. Final coats of paint shall not be applied until all other work has been completed, the dirt and rubbish removed and the surfaces suitably prepared. Paint to be applied shall be at room temperature.

4. Conditions for Application: Each coat of paint shall be given sufficient time to cure per the manufacturer's recommendation before application of the succeeding coat. Each succeeding coat shall be applied within the recoat time specified by the manufacturer; otherwise the painted surface shall be prepared per the manufacturer's recommendation before it is recoated. Exterior painting will not be allowed in dust laden air, during damp or threatening weather, or on moist or wet surfaces, or when the surface temperature is below 40 degrees F on a falling thermometer or under 50 degrees for catalyzed epoxy material; it will not be allowed in extreme heat or when metal is hot enough to cause the paint to blister and

produce a porous film. Do not apply interior painting until the building is thoroughly dry. If the temperature in the interior of the building, in the opinion of the Engineer, is too low painting will be stopped until the building is heated. Proper ventilation and sufficient heat shall be maintained to permit the paint to dry. The building shall be maintained to be free from dust.

5. Remedial Work: Any paint found defective shall be removed. Touch-up and remedial painting shall be provided as directed and as required until completion and acceptance of final work. If damage to the painted surface is excessive, as determined by the Engineer, that item shall be rejected and shipped back, at Contractor's expense, to be properly recoated before it can be accepted.

6. Application: Each coat of paint shall be applied as a continuous film of uniform thickness, free of pinholes and blemishes, to the maximum extent practicable. Any thin spots or areas missed in the application shall be repainted and permitted to dry before the next coat is applied. An approved low voltage wet sponge "holiday" detector shall be used as directed by the Engineer. All paint shall be carefully applied to a smooth even coating without runs or sagging. Enamels shall be brushed with a smooth even flow. Each coat of paint shall be dry, not only on the surface, but throughout the thickness of the paint film, before the next coat is applied. Finished surfaces shall be uniform in gloss, finish, and color, and free from flash spots and brush marks. In all cases, the resultant paint film produced shall be satisfactory in all respects to the Engineer.

7. Thinning: If the paint material must be diluted for application by spray gun, the coating shall be built up to the same film thickness achieved with undiluted material (i.e., one gallon of paint as originally furnished must not cover a greater surface area when sprayed than when applied unthinned by brush). Where thinning is necessary, only the products of the manufacturer furnishing the paint shall be used for the particular purpose, and thinning shall be done with the manufacturer’s knowledge, in accordance with his printed instructions.

8. Thickness and Adhesion Testing: Dry film thickness of each coat shall be as specified herein. Dry film thickness will be checked by the Engineer or a representative with a magnetic gauge for ferrous metal in accordance with SSPC 2 or Tooke gauge destructive test for concrete. Film thickness of shop coats or other previously applied coating shall be checked by the Engineer or a representative and recorded before painting in order to determine thickness of field coats. Dry film thicknesses for concrete surfaces shall be determined by measuring with a wet-film gauge and by material consumption. Paint adhesion shall be tested by the peel method in accordance with ASTM D 3359.

9. Inaccessible Items: Exposed members which will be inaccessible after erection shall be painted and cleaned prior to erection.

10. Coverage: All surfaces to be painted shall be completely covered. When color on undercoats shows through the final coat of paint, surfaces shall be covered by additional coats until paint is of uniform color and appearance and coverage is complete.

11. Safe Atmosphere: The Contractor shall provide sufficient temporary ventilation during painting operations in enclosed areas to remove moisture and solvents, and to keep the atmosphere safe from harmful or dangerous fumes and dust levels for personnel.

E. Workmanship: Only skilled painters shall perform the work and specialists shall be employed where required. Finished surface shall not show brush marks or other irregularities. Top and bottom edges of doors shall be painted as required for the adjacent surfaces. Undercoats on hollow metal shall be thoroughly and uniformly sanded with No. 00 sandpaper, or equal abrasive, to remove all surface defects and provide a smooth, even surface.

F. Mixing: All paints and coatings shall be mixed in accordance with the manufacturer's instructions on the printed label. The Contractor shall provide galvanized iron pans of sufficient size to contain all mixing pails and mix all paints and ingredients therein.

G. Rates of Application: Paints shall be applied so as to give coverage per gallon not greater than that recommended by the manufacturer. Quantities of paint used for successive coats on the various parts of the work shall be recorded in a manner satisfactory to the Engineer.

H. Touch-Up of Shop-Primed and Finished Items: Touch-up of any and all damaged portions and imperfections in shop-primed and finished items shall be accomplished using the same paint as used for the shop prime and finish. Surface shall be prepared prior to touch-up by wire brushing and sanding to remove rust, scale and loose paint.

I. Aluminum and Incompatible Surfaces: Where aluminum surfaces come in contact with incompatible metals, lime, mortar, concrete or other masonry materials, one field coat of Group A paint as specified under Article 2.03 "Classification of Paints" in this Section shall be applied to the incompatible surfaces.

J. Concealed Surfaces: All wall surfaces which will be concealed by equipment shall be painted before equipment installation.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. The Contractor shall touch up and restore any finish damaged. Paint or other finishes spilled, splashed or splattered shall be removed from all surfaces using care so as not to mar any surface or item being cleaned.

1. The Contractor shall rectify any failures or breakdowns, loosening of the paint or coatings within a year after acceptance of work, regardless of the paint systems used. This will require removal of the entire coating where failure occurs and repainting with the coating system previously specified. Patching will not be allowed.

SECTION 09 96 35 – CHEMICAL RESISTANT CONCRETE COATING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Chemical resistant concrete coating, as specified herein, shall include, but not be limited to, preparation of surfaces, field coating of containment structures, walls, floors, and concrete pads and pedestals within containment areas.

B. Chemical resistant concrete coating shall be provided as shown on the Contract Drawings, specified herein or in the Contract, or as required for a complete installation.

C. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 03 30 10 - Low Carbon Cast-in-Place Concrete

1.04 REFERENCES

A. SSPC - The Society of Protective Coatings (formerly of Steel Structures Painting Council)

2. ASTM D4541 – Standard Test Method for Pull-Off Strength of Coatings Using Portable Adhesion Testers
3. ASTM D16- Terminology Relating to Paint, Varnish, Lacquer, and related Products

C. AWWA - American Water Works Association

1. AWWA D102 – Coating Steel Water-Storage Tanks.

1.05 DESCRIPTION

1. Not Used

1.06 QUALITY ASSURANCE

A. Coating Quality Assurance Records

1. The following information shall be recorded for every coating project and submitted:
    a. Date
    b. Shift
    c. Part Temperature
    d. Dew Point
    e. Paint Batch Number/s
    f. Mixing Time for Each Part and the Combined Parts of a Paint System
    g. Pot Life
    h. Curing Time of Primer and Finish Layers
    i. Paint thickness measurements (DFT)

j. Holiday Test Results and Repair Data

k. Peel Test Results and Repair Data

l. Foreman or Supervisor's Signature

B. Test Surfaces

1. The Contractor shall coat certain areas of concrete and other surfaces, where directed, using approved coatings for use by the Engineer for comparisons with coating systems applied during the progress of the Work.

2. Such coated areas shall not be subsequently painted during the entire period of construction.

3. The Contractor shall supply all material and labor and shall perform any remedial Work on all such deteriorated surfaces using the coating system represented by the test surface at no additional cost to the City.

C. Painting Requirements

1. General: The Contract does specify the surface treatment for every individual part of the Work.

2. Coated Items: The following items shall be coated as specified herein:

a. Interior containment area as identified herein and on contract documents including sump pits.

b. All surfaces of concrete pads within containment area.

c. All surfaces of concrete pedestals within containment area up to 16-inches above containment elevation.

d. All perimeter walls of containment area include 8-inches above containment elevations at walls extending above containment area.

e. All undersides of overhangs within containment areas.

f. All ceilings within containment elevation.

D. Performance Criteria:

1. General:

a. Standards: Comply with applicable standards, recommendations and stated product material properties, except to the extent more stringent requirements are specified or required by governing authorities having jurisdiction at the Site.

b. VOC Content: Provide concrete topping systems that comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D (EPA Method 24):

1) Epoxy matrix: 0.0 g/L

2) Vinyl ester matrix: 100 g/L

2. The finished concrete topping system shall provide abrasion resistance and splash and spill protection from the chemicals listed below.
   a. Sodium Hypochlorite, 20% concentration.
   b. Sodium Bisulfite, 50% concentration.
3. The exposure to sunlight shall have no effect on coating's chemical resistance.

1.07 SUBMITTALS

A. Contractor shall submit Shop Drawings for approval by the Engineer. Submittals shall include, but not be limited to:
   1. Catalog cuts and reference materials.
   2. Coating System Surface Samples:
      a. Upon request, duplicate samples of the results obtained by painting and finishing various materials on the Work shall be submitted. Such samples, and the approved paint applied thereto, shall be applied in strict conformance with these Sections.
      b. Finished areas shall be considered adequate for the purpose of determining the quality of the Work. All painting work shall be performed in a quality equal to the approved samples.
      c. Where equipment is customarily shipped with a standard finish, samples of the proposed color and finish shall be submitted for approval prior to shipping.
   3. Certification:
      a. Affidavits from the manufacturer certifying that materials furnished conform to the requirements specified.
      b. And that paint products have been checked for compatibility.
   4. Immersion Certification:
      a. Affidavits from the manufacturer certifying that coatings in immersion service contain no water soluble solvents or corrosion inhibitive (active) pigments with slight water solubility.
   5. List of Coating System:
      a. A list of coating products with mil thickness and solids by volume, including all paint applied in the shop and in the field. The list shall be in accordance with the requirements of this Section and the recommendations of the paint manufacturer.
   6. Applicator's Quality Assurance:
      a. Submit list of a minimum of 5 completed projects of similar size and complexity to this work. Include for each project:

1) Project name and location
2) Name of owner
3) Name of contractor
4) Name of engineer
5) Name of coating manufacturer
6) Approximate area of coatings applied.
7) Date of completion.

7. Site Quality Control Report:

a. Submit preliminary report indicating the surface moisture testing results and site preparation for installation and any remedial actions taken.

b. Submit final report indicating the surface adhesion testing and testing procedures and results.

1.08 DELIVERY, STORAGE, AND HANDLING

A. General: All products and materials shall be delivered, stored, and handled as specified in Contract Documents and as follows:

1. Safety Requirements

a. All coating materials specified herein, and ingredients of coatings containing substances that are potentially toxic or hazardous shall be shipped with warning labels. These products shall be applied in strict conformance with the safety requirements of the following:

1) Manufacturer
2) National Paint and Coatings Association (NPCA)
3) Society of the Plastics Industry (SPI)
4) Manufacturing Chemist Association (MCA)
5) Society of Protective Coatings (SSPC)
6) United States Government Occupational Safety and Health Administration (OSHA)
7) Health and Safety Requirements of the State of New York (PESH- Public Employees Safety and Health)
8) Health and Safety Requirements of the City of New York (COSH- Citywide Office of Safety and Health)

B. Delivery and Storage: All coating materials delivered and stored at the site shall be from the approved manufacturer only.

C. Packaging and Labeling: Paints, coatings or ingredients of coating to be used on the job shall be properly prepared, packed, and labeled. All materials shall be

delivered to the Site in original, unbroken containers bearing the manufacturer's printed labels, which shall specify the following:

1. Project and Contract No.
2. Name of manufacturer
3. Address of manufacturer
4. Generic name of paint or ingredients
5. Brand and trademark
6. Schedule letter as listed herein
7. Percent solids by volume
8. Net quantity
9. Date of manufacturer
10. Date packed

D. Storage: Coating materials shall be stored at the Site in manner and place which shall be in accordance with applicable codes and regulations, and in accordance with manufacturer's instructions. The storage space shall be kept clean at all times. Every precaution shall be exercised to eliminate fire hazards.

E. Safety Requirements

1. All coating materials specified herein, and ingredients of coatings containing substances that are potentially toxic or hazardous shall be shipped with warning labels. These products shall be applied in strict conformance with the safety requirements of the following:
    a. Manufacturer
    b. National Paint and Coatings Association (NPCA)
    c. Society of the Plastics Industry (SPI)
    d. Manufacturing Chemist Association (MCA)
    e. Society of Protective Coatings (SSPC)
    f. United States Government Occupational Safety and Health Administration (OSHA)
    g. Health and Safety Requirements of the State of New York (PESH-Public Employees Safety and Health)
    h. Health and Safety Requirements of the City of New York (COSH-Citywide Office of Safety and Health).

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

B. Additionally as part of the post-Substantial Completion Guaranty Period, the Contractor shall touch up and restore any finish damaged. Coating or other finishes spilled, splashed or splattered shall be removed from all surfaces using care so as not to mar any surface or item being cleaned. The Contractor shall rectify any failures or breakdowns, loosening of the paint or coatings within a year after Substantial Completion, regardless of the paint systems used. This will require removal of the entire coating where failure occurs and repainting with the coating system previously specified. Patching will not be allowed.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Chemical Resistant Concrete Coating Products and Manufacturers:

1. Stonchem 856HD by Stonhard, Incorporated, Part of the StonCor Group, Maple Shade, NJ.

2. Key Vinyl Ester STD by Key Resins Incorporated.

3. Or approved equal.

B. Latest Products: Unless specified otherwise, the protective coatings of the manufacturer's latest products in regular production on the date of receipt of order shall be provided.

C. Equivalents: Equivalent products shall be of a standard, regularly produced product of a manufacturer. Equivalent products shall be submitted on their applicable published printed literature that states the generic type, instructions for use, solids by volume, application rates, and chemical components of vehicles and solids. Equivalent products shall be accompanied by a list of projects where each of the coatings has been used on new construction and has rendered satisfactory service for at least three years. Should the manufacturer's literature of the product being offered call for higher film thickness, the greater film thickness shall be applied, and the submitted schedule shall so state.

2.02 MATERIALS / EQUIPMENT

A. Chemical Resistant Concrete Floor Topping Physical Properties: Provide the following trowel-applied vinyl ester composition flooring system capable of, and recommended by the manufacturer for, resisting strong concentrations of chemicals, heavy-duty trucking and heavy traffic.

1. Acid Etch: Provide manufacturer's recommended ten percent muriatic acid etching compound in addition to shot blast scarification, grinding and other required surface preparations.

2. Primer: Two-component, highly cross-linked, penetrating vinyl ester, as recommended by the manufacturer.

3. Woven Fiberglass Roving Reinforcement: Provide a ten-ounce glass cloth reinforced system using materials recommended for the system and chemical resistance specified.

4. Mortar: Two layers of trowel-applied vinyl ester mortar consisting of a three-component, highly cross-linked combination of organic peroxides and catalyst, vinyl ester resin and styrene monomers and selected, graded aggregates blended with inorganic pigments.

5. Saturant: Two-component, as recommended by the manufacturer.

6. Topcoats: Provide optional mineral composite topcoat for increased impermeability and a chemical resistant textured topcoat for slip-resistance.

7. Termination Strips: White metal, tapered bar type as recommended by the manufacturer.

8. Colors: To be selected by Engineer from manufacturer's full selection of standard grey colors.

9. Textures: Nonslip surface.

   a. Tensile Strength, ASTM D 307: 2,700 pounds per square inch, minimum.

   b. Indentation, MILD3134: 0.062-inches, maximum.

   c. Bond Strength, ASTM C 321: 400 pounds per square inch, minimum.

   d. Flame Spread, ASTM D 635: Self-extinguishing.

   e. Thermal Coefficient of Linear Expansion, ASTM C 531: 2 x 10-5-inches per inch per degree C, maximum.

   f. Abrasive Resistance, ASTM D 4060: 0.10 gram maximum weight loss.

   g. Flexural Strength, ASTM C 580: 8,000 pounds per square inch, minimum.

   h. Compressive Strength, ASTM C 579: 11,000 pounds per square inch, minimum.

   i. Surface Hardness - Shore D Durometer, ASTM D 2240: 85 to 90.

   j. Water Absorption, MILD3134: 0.12.

   k. Chemical Resistance, ASTM C 267: Reagent Film Integrity

      1) 20 percent Sodium Hypochlorite Unaffected.

      2) 50 percent Sodium Hydroxide Unaffected.

B. Auxiliary System Components:

1. Underlayment Grout: Heavy-duty, three-component, fast-setting, high temperature resistant, 100 percent solids epoxy grout for filling and leveling deep holes, erosions, modifying pitch in trench drains and similar uses in the Work, and recommended by the concrete toppings manufacturer for compatibility with concrete toppings specified.
2. Epoxy Grout Primer: Compatible primer as recommended by the concrete toppings manufacturer.
3. Epoxy Sealants: Two-component, self-leveling and non-sag, chemical resistant, flexible epoxy/polyamide sealants.
4. Waterproof Membrane: 100 percent solids, liquid-applied membrane providing a positive barrier against water penetration.
5. Protective Joint Sealer: Two-component, traffic bearing, fluoro-elastomeric joint sealer, recommended by the concrete toppings manufacturer for sealing and protecting floor sealant joints.
6. Heavy-Duty Industrial Detergent: Concentrated, biodegradable, industrial cleaner and degreaser.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Surface Preparation: Prior to coating, surface preparation prior to coating shall be in accordance with this section and as recommended by the coating material manufacturer.

B. Concrete and masonry shall be dried for a minimum of 28 days and then the dry concrete and masonry shall be brushed and washed to remove all loose dirt, dust, free lime and other deleterious substances by approved methods. Protruding fins and other adhering matter shall be removed or ground until a smooth, even finish is obtained. Concrete surfaces to be painted shall be acid etched or otherwise roughened as recommended by the manufacturer of the coating to be applied, to produce a slightly granular surface required for adherence of coating to the concrete, unless otherwise indicated.

C. Do not proceed with coating installation until manufacturer's technical representative approves condition of subfloor. Correct all unsatisfactory conditions, as required by manufacturer's technical representative, at no additional cost. Record all such requirements and remedial actions as part of the final Site Quality Control Report.

D. Environmental Requirements

1. Weather:
    a. Air and surface Temperatures: Prepare surfaces and apply and cure coatings within air and surface temperature range in accordance with manufacturer's instructions.
    b. Surface Temperature: Minimum of 5 degrees F (3 degrees C) above dew point.
    c. Relative Humidity: Prepare surfaces and apply and cure coatings within relative humidity range in accordance with manufacturer's instructions.
    d. Precipitation: Do not prepare surfaces or apply coatings in rain, snow, fog or mist.
    e. Wind: Do not spray coatings if wind velocity is above manufacturer's limit.
2. Ventilation
    a. Provide ventilation during coating evaporation stage in confined or enclosed areas in accordance with AWWA D102.
3. Dust and Contaminants:
    a. Schedule coating Work to avoid excessive dust and airborne contaminants.
4. Protect Work areas from excessive dust and airborne contaminants during coating application and curing.

3.02 APPLICATION

A. General: Apply each component of coating system in compliance with manufacturer's directions to produce a uniform monolithic wearing surface of thickness indicated, uninterrupted except at divider strips, saw joints or other types of joints, indicated or required.
    1. Total Chemical Resistant Concrete Coating System thickness: 1/4-inch, minimum.

B. Primer: Mix and apply primer over properly prepared substrate with strict adherence to manufacturer's installation procedures and coverage rates.

C. Basecoat: Mix basecoat material according to manufacturer's recommended procedures. Uniformly spread material over substrate using a notched squeegee as specified by manufacturer.

D. Engineering Fabric: Embed fiberglass fabric into basecoat material with strict adherence to manufacturer's installation procedures.

E. Saturant: Uniformly roll the saturant into the fiberglass fabric as recommended in manufacturer's application procedures.

F. Mortar coat: Mix mortar coat according to manufacturer's recommended procedures. Apply mixed material over surface with strict adherence to manufacturer's installation procedures.

1. Apply mortar coat as specifically recommended by the manufacturer to achieve the physical properties and dimensional tolerances specified.

G. Topcoat: Remove any surface irregularities. Mix and apply mineral composite topcoat with strict adherence to manufacturer's installation procedures.

1. Apply vinyl ester floor topcoat to 15 mil inch dry cured minimum thickness, or greater if specifically recommended to achieve the physical properties, chemical resistances and dimensional tolerances specified.

H. Terminations:

1. Edges shall be chased to “lock” the lining into the concrete.

2. Tank pedestals and pads:

a. Coating shall be installed prior to placement of tanks within containment area at or below 16-inches above the elevation of containment.

b. Coating shall terminate at tank perimeter without sealing perimeter edge, to allow detection of leaks that may occur under the tank.

3. Equipment supports and legs:

a. Coating shall be installed prior to placement of tanks within containment area at or below 16-inches above the elevation of containment.

b. Supports and legs shall be coated with compatible chemical resistant coating.

4. Pipe drains shall be treated by chasing the coating to “lock” in place at point of termination. Pipe drain must be anchored to prevent movement between concrete and trench.

5. Pipe chases shall be treated by having the coating lap and seal onto the perimeter of the pipe chase.

I. Joints and Cracks:

1. Control joints shall be treated by coating manufacturer to assure bridging of potential cracks and to maintain monolithic protection.

2. Cold joints or construction joints shall be treated by coating manufacturer to assure bridging potential cracks and to maintain monolithic protection on horizontal and vertical surfaces as well as horizontal and vertical interfaces.

3. Vertical and horizontal expansion/contraction joints shall be honored by installing backer rod and compatible chemical resistant sealant after coating is installed. Sealant shall be sufficient to handle traffic conditions and chemical exposures in area.

4. Cracks in vertical or horizontal concrete substrates shall be treated by coating manufacturer to assure bridging of cracks and to maintain monolithic protection.

3.03 FIELD TESTING / QUALITY CONTROL

A. General: Before start of installation of chemical resistant concrete coating, perform the following field quality control tests and include procedures and results in final Site Quality Control Report. Incorporate installation or system improvements, as may be recommended based on test results, into the remainder of the Work.

B. Moisture Testing

1. Test the low carbon cast-in-place concrete for moisture, in compliance with ASTM D 4263, in order to determine that the maximum safe moisture-emission level, recommended by the concrete topping system manufacturer's written installation limitations, will not be exceeded, before installation of the concrete topping system.

a. Perform minimum of one test for every 1,000 square feet of substrate area to receive the concrete topping system. Perform tests on areas scheduled to be coated the following day.

b. If moisture tests indicate unacceptable levels of moisture remaining in the substrate, do not install the concrete topping system. Report existing conditions, along with manufacturer's recommendations, to Engineer. Allow additional time for the low carbon cast-in-place concrete to dry and retest.

c. Contractor may, at its option and expense, enclose, dehumidify or provide additional heat, in order to speed the drying process. If, after remediation measures are implemented, retesting the low carbon cast-in-place concrete continues to indicate unacceptable levels of moisture, perform calcium chloride tests in accordance with ASTM F 1869. If readings are below five pounds per 1,000 square feet for 24 hours install the primer. If readings are between five and eight pounds per 1,000 square feet for 24 hours install the moisture barrier coating, if readings are over eight pounds per 1,000 square feet for 24 hours submit the concrete topping system manufacturer's recommended remedial action for Engineer's acceptance.

C. Adhesion Testing:

1. Before application of the coating system, an adhesion test shall be conducted on a properly prepared concrete surface that is acceptable to the material manufacturer and Engineer. The test area shall be at least two square feet or larger to allow a minimum of three tests to be conducted. The test area shall be coated with the specified system and cured as recommended by the material manufacturer. Pull-off strength adhesion tests of coating system shall be conducted by the material manufacturer in

accordance with ASTM D 4541, using an Elcometer tensile adhesion tester. At least three adhesion tests shall be conducted and the results averaged. Adhesion strength shall equal or exceed the minimum adhesion strength recommended by the material manufacturer and shall exceed the tensile strength of the concrete. If the concrete topping system fails the adhesion test, the cause of the failure shall be determined and corrected before re-conducting the test.

D. Allowable Installation Tolerances:

1. Do not install the Work until substrate preparation and tolerances have been accepted by Engineer, concrete topping manufacturer's technical representative and the coating installer and Contractor has verified the substrates are within tolerances and profiles specified and acceptable to produce acceptable Work. Work advanced, for any reason, without such verification shall be stopped, and coating removed and replaced with new material if substrates are determined to be unacceptable for the Work.

2. Substrate Tolerances:

a. Out-of-Plane: 1/8-inch maximum in ten feet and 1/16-inch maximum in any 12-inches measured along the plane.

b. Maximum Offset in Plane Alignment: 1/16-inch.

c. Variation From Slope: 1/8-inch maximum in ten feet.

3. Chemical Resistant Concrete Coating Tolerances:

a. Finished coating system level to 1/8-inch in ten feet with smooth continuous uniformly sloped-to-drain planes.

b. Provide smooth continuous color with no color streaks or inconsistencies with smoothly textured non-slip finish.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. The Contractor shall touch up and restore any finish damaged. Coating or other finishes spilled, splashed or splattered shall be removed from all surfaces using care so as not to mar any surface or item being cleaned.

1. The Contractor shall rectify any failures or breakdowns, loosening of the paint or coatings within a year after Substantial Completion, regardless of the paint systems used. This will require removal of the entire coating where failure occurs and repainting with the coating system previously specified. Patching will not be allowed.

B. Cure coating materials in compliance with manufacturer's directions, taking care to prevent contamination during stages of application and prior to completion of curing process. Close area of application for a minimum of 24 hours.

C. Protect coating materials from damage and wear during construction. Provide temporary covering, comply with manufacturer's recommendations for protective materials and method of application. Contractor is responsible for protection and cleaning of surfaces after final coats.

END OF SECTION

SECTION 10 14 01 – IDENTIFYING DEVICES
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Identifying devices as specified herein shall include standing signs, metal letters and numbers signs and appurtenances.

B. Identifying devices shall be provided as specified in the Contract, in accordance with the NYC Fire Code and NYC Building Code, and as required for a complete installation of the equipment or structure.

C. The Contractor shall implement practices and procedures to meet the project's sustainability goals as identified in the Contract Documents. The Contractor shall ensure that the sustainability requirements of this Section are implemented to the fullest extent.

D. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. Sustainable Design Requirements

1. Adhesives: As recommended by sign manufacturer and with a VOC content of 70 g/L or less for adhesives used inside the weatherproofing system and applied on-site when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

2. Adhesives: Do not use adhesives that contain added urea formaldehyde.

3. Composite Wood and Agrifiber Products: Do not use composite wood and agrifiber products that contain added urea formaldehyde.

1.06 QUALITY ASSURANCE

A. Manufacturer Qualifications:

1. Engage a single fabricator, with undivided responsibility for detailing and performance of the signage structure and wall mounted metal lettering.

2. Engage a firm which can show five years previous successful experience in detailing and fabrication of signage paneling, signage structures, and metal lettering, of scope and type similar to the required work.

3. Materials and fabrication procedures shall be subject to inspection and tests in the mill, shop, and field, conducted by a qualified inspection agency. Such inspections and tests shall not relieve the Contractor of responsibility

for providing materials and fabrication procedures in compliance with specified requirements.

B. Installer Qualifications:

1. Engage a single installer skilled, trained and with documented successful experience in the installation of signage structures and wall mounted metal lettering, and with specific skill and successful experience in the erection of the types of materials required; and who agrees to employ only tradesmen with specific skill and successful experience in this type of Work. Submit names and qualification to Engineer along with the following information on a minimum of three successful projects:

a. Names and telephone numbers of owner, architects or engineers responsible for projects.

b. Approximate contract cost of the ornamental fences and gates.

c. Amount of area installed.

C. Source Quality Control:

1. Obtain all signage structure components and accessories from the same manufacturer.

2. Provide qualified welding processes and welding operators in accordance with AWS D1.1, Section 6 “Qualification”.

3. Provide certification that all welders employed on, or to be employed for, the fabrication of the signage structures and wall mounted metal lettering, have satisfactorily passed AWS qualification tests within the previous twelve months. Contractor shall ensure that all certifications are kept current.

1.07 SUBMITTALS

A. The Contractor shall submit for approval, catalog cuts, shop drawings, and reference materials.

B. Shop Drawings

1. The Contractor shall submit copies of specifications, installation instructions and general recommendations from the identifying device manufacturers, for each type of identifying device product. Manufacturer's data substantiating that the materials comply with the requirements of the Contract Documents shall be included.

2. Drawings showing extent of the Work and all details required for the Work referencing system components provided as samples, and shall include:

a. Complete details for all signs giving sizes and styles of lettering and colors.

b. Complete schedules for all signs, and building name letters giving location, message, letter, size, color, and method of attachment.

c. Details of fabrication and attachment of all items.

d. Complete location plan for all sign types.

C. Samples

1. Submit for approval color and finish samples of each identifying device product, including each accessory and miscellaneous material to be used in the Work.

D. Mockups

1. Mockups of each type of Identifying Device including wall mounded letters, shall be done in shop and await approval before installation.

E. Sustainable Design Submittals

1. Environmental Materials Reporting Form (EMRF) Recycled Content Materials. Provide the following information:

a. Name of Product and Manufacturer.

b. Material cost breakdowns. Cost breakdowns must include total material-only cost (excluding installation, labor and equipment).

c. The percentage (by weight) of post-consumer and pre-consumer recycled content in the submitted product(s), if applicable.

2. Environmental Materials Reporting Form (EMRF) - Composite Wood Products. Include the following information:

a. Confirmation that composite wood and Agri Fiber products contain no added urea formaldehyde.

b. For each laminate adhesive used on site and in the shop, documentation indicating that the adhesive contains no added urea formaldehyde.

3. VOC Reporting Form. Provide the following information:

a. For all adhesives used on site, provide the VOC content in grams/Liter (g/L) less water and other exempt compounds.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery of Materials:

1. Materials shall not be delivered to the project site before the time of installation.

2. Materials shall be delivered in sufficient quantities to allow continuity of the Work.

3. All welding and fastening shall be done in shop prior to delivery to the site to minimize installation time.

B. Storage of Materials:

1. Materials shall be stored in original, undamaged containers with manufacturer's labels and seals intact.
2. All materials shall be stored in a dry, enclosed area, off the ground and away from all possible contact with water, ice or snow.
3. Damage to materials during storage shall be prevented by minimizing the amount of time they are stored at the site before being incorporated into the Work.

C. Handling of Materials:

1. Materials shall be handled in such a manner to avoid damage or breakage.
2. Materials shall not be exposed to detrimental conditions or physical damage. Materials which are so exposed shall be removed from the site and shall not be incorporated into the Work.
3. Packages or containers shall not be opened until all necessary preparatory Work is complete and installation is to begin immediately. Materials shall not be allowed to become wet or soiled or covered with ice or snow.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer’s standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Acceptable manufacturers are listed below. Other manufacturers of equivalent products may be submitted for approval by the Engineer.

1. Standard Signs and Handicap Signs: (exterior)
   a. Nelson-Harking Industries
   b. Or approved equal
2. Standard Signs and Handicap Signs: (interior)
   a. ASI Signage Innovations
   b. Best Signs
   c. Or approved equal
3. Metal Letters and Numbers: (exterior)
   a. Nelson-Harking Industries
   b. American Sign Letters

c. Or approved equal

2.02 MATERIALS / EQUIPMENT

A. General:

1. Accessibility Standard: Comply with applicable provisions in ICC A117.1 for signs.

2. Signs shall be in accordance with the NYC Fire Code, the NYCBC and as directed by the Engineer.

B. Standard Signs and Handicap Signs:

1. All standard signs information shall be as per the Contract Drawings and the In-design File that is to be provided by the Engineer. For signs font, font size, color, logo and graphic refer to the In-Design File.

a. Font: Helvetica Medium.

b. Minimum Font Height: 1-inch, refer to the Contract Drawings.

2. Room name and informational signage:

a. Product Description: Provide unframed signs, surface-etched, 1/32-inch raised tactile lettering and pictograms, sandblasted on an opaque sheet.

b. Materials:

1) Interior Signs: Three-ply, self-extinguishing melamine plastic.

2) Exterior Signs: One-piece fiberglass.

c. Size and Thickness: 0.125-inch thick; eight inches by eight inches with 1/2-inch radiused corners.

3. All wayfinding, directional, identifying signage and handicap signs, shall be a standalone structure. No signage shall be secured to the new fence, gates, or other structures.

4. All sign support structures shall be made of White Powder Coated Steel and bolted to concrete footings.

5. All mounting hardware shall be as provided as shown on the Contract Drawings.

C. Metal Letters and Numbers (Exterior)

1. All metal letters, numbers, and symbols shall be as per contract drawings and made of:

a. Metal: 316 stainless steel

b. Thickness: 1/2 inch, unless otherwise noted in Contract Drawings.

c. Finish: No. 4 Satin

d. Size: 10 inches and 5 inches - refer to the Contract Drawings

e. Font: Shall be as per the design file that will be provided by the Engineer.

2. NYC Logo and Agency Name:

a. Follow NYC Logo Guidelines: nyc_logoguidelines.pdf

1) Logo: Match NYC logo font and style in proportion.

2) Agency Name – Font: Helvetica Neue 55 Roman.

3) Agency Name – Height: 7-1/2 inches.

b. Building Name:

1) Font: Helvetica Neue 85 heavy with -20 track.

2) Height: 12-1/2 inches.

3. All letters shall be manufactured to have Projected Mounting Hardware with ½ inch.

D. Attachments: All attachments and anchors necessary for concealed installments of identifying devices shall be furnished.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Wall Mounted Metal Letters

1. All surfaces shall be cleaned and prepared to receive the metal lettering as per the Contract Documents.

2. All pegs/bolts/nuts/clips, etc., fastening the metal lettering to the wall surface shall be of like materials or separated by neoprene washers.

3. The Contractor shall follow requirements for metal fastening as per Section 05 05 23.02 - Miscellaneous Metal Fastening.

B. Post Mounted Signs

1. All steel posts are to be welded to their baseplates or any other items in shop unless otherwise indicated on the Contract Documents.

2. All welding is to be done in accordance with Section 05 05 23.01 – Welding.

3. All structural steel fabrication shall be done in accordance with Section 05 12 00 -Structural Steel Framing.

4. All concrete and concrete re-enforcement to be used for footings shall be done in accordance with Section 03 21 00 - Reinforcing Steel and Section 03 30 00 - Cast-in-Place Concrete.

C. Welding

1. For all welding in shop or in field the Contractor shall adhere to AWS A5.12, AWS D1.1 and any other applicable reference.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. The Contractor shall verify that areas to receive identifying devices are properly prepared and completed.

3.02 INSTALLATION

1. All materials specified herein shall be installed in compliance with the NYCBC, ANSI A117, OSHA regulations, and the approved manufacturer's printed specifications. Mounting devices, bolts, screws, nuts, and the like shall be in accordance with the Contract Drawings, and all related section listed herein.

B. Identifying devices shall be installed where shown on the Contract Drawings.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjustment: System components which are dislodged, damaged, expanded, broken, penetrated or crushed by subsequent installation operations or damaged by detrimental weather shall be immediately replaced with undamaged material in compliance with the Specifications and properly protected as specified.

B. Protection: Identifying devices shall be protected from all damage and abuse from all other Contractors and installers involved in the Work until Final Acceptance by the City.

C. Cleaning: Upon completion of the project, all protection devices shall be removed and identifying devices shall be touched up as necessary. All exposed surfaces shall be cleaned using a mild solution of detergent and warm water. All surfaces shall be left in a neat and clean condition.

END OF SECTION

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment and incidentals as shown, specified, and required to furnish and install fire extinguishers, complete and operational, with cabinets and all anchor bolts, fasteners, and accessories.

B. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Not Used

1.04 REFERENCES

A. Abbreviations and Acronyms:

1. DC Dry Chemical

2. CO_2 Carbon Dioxide

B. Reference Standards:

1. NFPA 10 Portable Fire Extinguishers.

1.05 DESCRIPTION

A. Not Used

1.06 QUALITY ASSURANCE

A. Not Used

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to, the following:

1. Action Submittals:

a. Shop Drawings:

1) Complete detail and installation drawings for fire extinguisher s and cabinets.

2) Wall mount hardware.

2. Information Submittals:

a. Manufacturer's specification data sheets and verification of UL ratings.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver equipment provided under this Section in accordance with the requirements of the Contract Documents.

B. The Contractor shall store and handle equipment provided under this Section in accordance with the requirements of the Contract Documents.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer’s standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. DC fire extinguishers:

1. Ansul Inc., Marinette, WI.

2. Kidde as manufactured by United Technologies Corp., Mebane, NC.

3. Or approved equal.

B. Cabinets:

1. 'Duo-vertical' panel w/ tempered safety glass style, as manufactured by Potter-Roemer Inc., Union, NJ.

2. 'Duo-vertical' panel w/ tempered safety glass style, as manufactured by Larson's Manufacturing Company, Minneapolis, MN.

3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. DC fire extinguishers shall be 10 lb. capacity, cartridge operated, hand portable, with wall mount, tri-class dry chemical type, with Underwriters' Laboratories rating of 4A:60B:C.

B. CO2 fire extinguishers shall be 10 lb. capacity, portable carbon dioxide type with wall mounts, having Underwriters' Laboratories rating of at a minimum 1A:10B:1C.

C. Provide the manufacturer's standard wall-mounting bracket for each fire extinguisher.

D. Cabinets: Surfaced mounted as indicated on the Contract Drawings. All cabinets shall be #4 finish type 316 stainless steel and ⅛-in. thick, double strength sheet ('DSA') glass. Size cabinets for extinguishers.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Install fire extinguishers in complete accordance with the manufacturer's printed instructions and the approved shop drawings.

B. Fire extinguishers shall be installed where shown on the Contract Drawings, as indicated below and as directed by the Engineer.

1. Provide exterior fire extinguishers with weather cover.

C. Wall mounts for extinguishers shall be securely mounted to masonry with Type 316 stainless steel lag bolts and shields.

D. Fire extinguishers shall be mounted with carrying handle no more than 42-inches above finish floor and fire extinguisher bottom 4-inches or more above finish floor.

E. Fire extinguisher locations, refer to the Contract Drawings and as follows:

1. Provide CO2 fire extinguishers in electrical rooms.
2. Provide dry chemical fire extinguishers at each building exits.
3. Provide dry chemical fire extinguishers in surface mounted cabinet at each exterior chemical fill stations.
4. Provide minimum one dry chemical fire extinguisher at entrance to sodium bisulfite room.
5. Provide minimum one dry chemical fire extinguisher at entrance to sodium bisulfite room.
6. Provide minimum one dry chemical fire extinguisher at entrance to sodium hypochlorite room. Do not install any CO2 fire extinguishers in this room.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used

END OF SECTION

SECTION 21 13 13 – WET PIPE SPRINKLER SYSTEM
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Contractor shall provide all labor, materials, equipment and incidentals as shown, specified, and required to furnish and install automatic wet-pipe sprinkler system complete and operational with accessories.

B. The following index of this Section is presented for convenience:

2. American Society for Testing and Materials, (ASTM).

a. ASTM A 47/A 47M, Specification for Ferritic Malleable Iron Castings, Grade 32510.

b. ASTM A 48/A 48M, Specification for Gray Iron Castings.

c. ASTM A 53/A 53M, Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.

d. ASTM A 126, Specification for Gray Iron Castings for Valves, Flanges and Pipe Fittings.

e. ASTM A 183, Specification for Carbon Steel Track Bolts and Nuts.

f. ASTM A 307, Specification for Carbon Steel Bolts and Studs, 60,000 PSI Tensile Strength.

g. ASTM A 449, Specification for Hex Cap Screws, Bolts and Studs, Steel, Heat Treated, 120/105/90 KSI Minimum Tensile Strength, General Use.

h. ASTM A 795/A 795M, Specification for Black and Hot-Dipped Zinc- Coated (Galvanized) Welded and Seamless Steel Pipe for Fire Protection Use.

i. ASTM B 5, Specification for Electrolytic Tough-Pitch Copper Refinery Shapes.

j. ASTM B 19, Specification for Cartridge Brass Sheet, Strip, Plate, Bar and Disks.

k. ASTM B 584, Specification for Copper Alloys Sand Castings for General Applications.

l. ASTM D 1330, Specification for Rubber Sheet Gaskets.

m. ASTM D 2000, Classification System for Rubber Products in Automotive Applications.

3. American Welding Society, (AWS).

a. AWS D1.1/D1.1M, Structural Welding Code-Steel.

4. Factory Mutual Association, (FM).

5. National Fire Protection Association, (NFPA).

a. NFPA 13, Standard for Installation of Sprinkler Systems.

b. NFPA 24, Installation of Private Fire Service Mains and Their Appurtenances.

c. NFPA 25, Inspection, Testing and Maintenance of Water-Based Fire Protection Systems.

1.05 DESCRIPTION

A. This Section includes requirements for providing wet-pipe sprinklers, piping, valves and accessories for fire service, in accordance with applicable standards and regulations.

1.06 QUALITY ASSURANCE

A. Installer's Qualifications:

1. Engage a single installer regularly engaged in sprinkler piping installation and with experience in the installation of the types of materials required; and who agrees to employ only tradesmen with specific skill and experience in this type of Work. Submit name and qualifications to Engineer.

2. Engage a single installer for the entire sprinkler piping system with undivided responsibility for performance and other requirements.

3. The installer shall be a licensed fire suppression contractor for fire sprinkler and fire alarm systems.

B. Component Supply and Compatibility:

1. Obtain all equipment included in this Section regardless of the component manufacturer from a single wet-pipe sprinkler system manufacturer.

2. The wet-pipe sprinkler system equipment manufacturer to review and approve or to prepare all Shop Drawings and other submittals for all components furnished under this Section.

3. All components shall be specifically constructed for the specified service conditions and shall be integrated into the overall assembly by the wet-pipe sprinkler system equipment manufacturer.

C. Regulatory Requirements: Comply with applicable provisions and recommendations of the following except as otherwise shown or specified.

1. Local and State Building Codes and Ordinances.

2. Permits: Contractor shall obtain and pay for all required permits, fees and inspections.

D. Qualifications for Welding Work:

1. Qualify welding processes and welding operators in accordance with AWS "Structural Welding Code-Steel" D1.1/D1.1M, Section 5, Qualification and NFPA 13. Use only welding fitting for shop welding.

2. Provide certification that all welders employed on, or to be employed for the Work, have satisfactorily passed AWS qualification test within the previous 12 months. Contractor shall ensure that all certifications are kept current.

E. Field Measurements: Take field measurements, where required, prior to preparation of Shop Drawings and fabrication, to ensure proper fitting of the Work.

F. Manufacturers' Qualifications: Firms whose equipment, specialties and accessories are listed by product name and manufacturer in UL Fire Protection Equipment Directory and FM Approval Guide and that conform to other requirements indicated.

G. Listing/Approval Stamp, Label or Other Marking: On equipment, specialties and accessories made to specified standards.

H. Listing and Labeling: Equipment, specialties and accessories that are listed and labeled.

1. The Terms "Listed and Labeled": As defined in "National Electrical Code", Article 100.

2. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" (NRTL), as defined in OSHA Regulation 1910.7.

I. Comply with requirements of applicable authority having jurisdiction for submittals, approvals, materials, hose threads, installation, inspections and testing.

J. Licensed Engineer: Submit design calculations and installation inspection reports. Include seal and signature of Registered Engineer licensed in the State of New York, certifying compliance with these Specifications.

1.07 SUBMITTALS

A. Action Submittals: Submit the following:

1. Shop Drawings:

a. Contractor shall submit for review a reflected ceiling plan or layout of all areas with automatic sprinkler protection showing proposed location of sprinkler heads with respect to lights, diffusers, framing members, etc. After review of the reflected ceiling plan, Contractor

shall prepare 1/4-inch scale working drawings of the installation. Data on these working drawings shall include, but not be limited to, the following:

1) Size of all piping

2) Method of anchoring or hanging pipe-lines

3) Location and type of valves

4) Position, type and temperature ratings of sprinkler heads, zone valves, nozzles and detectors

5) Material and equipment list indicating manufacturers' names and types

6) Structural, mechanical, heating and ventilating, electrical and architectural coordinating information

7) Hydraulic calculations and various other items pertinent to the complete installation of the systems.

8) Working drawings, hydraulic calculations, specifications, etc., shall be submitted to the local authorities having jurisdiction at the Site for checking and approval. Contractor shall submit final approved working drawings, hydraulic calculations, etc, for record purposes prior to starting any Work.

2. Product Data:

a. Manufacturer' literature, specifications, illustrations and Engineering data, including dimensions, size, weights and materials for the following:

1) Pipe and fittings.

2) Unions.

3) Flexible couplings.

4) Valves.

5) Strainers.

6) Fire department connections.

7) Sleeves and escutcheons.

8) Waterflow alarm indicator.

9) Gages.

10) Tamper switches.

11) Sprinkler heads.

12) Sprinkler cabinet.

13) Reduced pressure zone backflow preventer assembly.

14) Hangers and supports.

15) Escutcheons.

16) Pipe and valve labels.

17) Other materials and equipment requested by Engineer.

B. Informational Submittals: Submit the following:

1. Qualification Statements:

a. Installer's qualifications.

C. Closeout Submittals: Submit the following:

1. Operation and Maintenance Manuals:

a. Submit complete installation, operation and maintenance manuals, including test reports, maintenance data and schedules, description of operations and spare parts information, including:

b. Fire Department approved drawings.

c. Furnish Operation and Maintenance Manuals in conformance with the requirements of Section 01 78 25 – Operations and Maintenance Manuals.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Packing, Shipping, Handling and Unloading:

1. Deliver materials to the Site to ensure uninterrupted progress of the Work. Deliver anchor bolts and anchorage devices which are to be embedded in cast-in-place concrete in ample time to prevent delay of that Work.

B. Storage and Protection:

1. Store materials to permit easy access for inspection and identification. Keep all material off the ground, using pallets, platforms, or other supports. Protect steel members and packaged materials from corrosion and deterioration.

2. Store all equipment in covered storage off the ground and prevent condensation and in accordance with the manufacturer's recommendations for long-term storage.

C. Acceptance at Site:

1. All boxes, crates and packages shall be inspected by Contractor upon delivery to the Site. Contractor shall notify Engineer, in writing, if any loss or damage exists to equipment or components. Replace loss and repair damage to new condition in accordance with manufacturer's instructions.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Bronze Body Gate Valves:

1. Milwaukee Valve Company, Inc., Fig. No. 118-FP
2. Nibco Inc., Fig. No. T-104-O
3. Or approved equal.

B. Iron Body Gate Valves:

1. Kennedy Valve Division of McWane Corp., Fig. No. C509
2. Nibco, Inc., Fig. No. F-607-OTS
3. Or approved equal.

C. Iron Body Check Valves:

1. Kennedy Valve Division of McWane Corp., Fig. No. 1126
2. Nibco, Inc., Fig. No. F-908-W
3. Or approved equal.

D. Strainers:

1. Grinnell Products Division of JCI
2. The Viking Corporation.
3. Or approved equal.

E. Automatic Ball Drip:

1. Potter-Roemer Incorporated, Fig. No. 5983
2. The Viking Corporation, Model B-1
3. Or approved equal.

F. Wet Pipe Alarm Valves:

1. Grinnell Products Division of JCI
2. Reliable Automatic Sprinkler Co.
3. The Viking Corporation.
4. Or approved equal.

G. Riser Check Valves:
   1. Grinnell Products Division of JCI
   2. Reliable Automatic Sprinkler Co.
   3. The Viking Corporation.
   4. Or approved equal.

H. Gages:
   1. States Gauge Division Ametek, Incorporated.
   2. Weksler Instruments Division of Ashcroft, Inc.
   3. Or approved equal.

I. Fire Department Connection:
   1. Croker Division, Fire End & Croker Corporation NYC Approved**.**
   2. Potter-Roemer Incorporated, No. 5020 NYC Series.
   3. Or approved equal.

J. Automatic Sprinklers, Standard:
   1. Reliable Automatic Sprinkler Co., Inc.
   2. Tyco Fire Products - JCI
   3. The Viking Corporation.
   4. Or approved equal.

K. Automatic Sprinklers, Quick Response:
   1. Reliable Automatic Sprinkler Co., Inc.
   2. Tyco Fire Products - JCI
   3. The Viking Corporation.
   4. Or approved equal.

L. Sprinkler Cabinets:
   1. Tyco Fire Products - JCI
   2. The Viking Corporation.
   3. Or approved equal.

M. Tamper Switch:
   1. Notifier Division of Honeywell, Int., Model OSY2A
   2. Potter Electric Signal Company, Model OSYSU-2.
   3. Or approved equal.

N. Hangers and Supports:
   1. Anvil International, Inc.
   2. Tolco Division of Nibco, Inc.
   3. Or approved equal.

O. Escutcheons:
   1. Tyco Fire Products - JCI
   2. Or approved equal.

P. Electric Alarm Bell:
   1. Reliable Automatic Sprinkler Company.
   2. The Viking Corporation.
   3. Or approved equal.

Q. Waterflow Alarm Indicators:
   1. Notifier Division of Honeywell, Int., series WFDE
   2. Potter Electric Signal Company, Model VSR-F.
   3. Or approved equal.

R. Threaded Fittings ANSI B2.1:
   1. Anvil International, LLC
   2. Mueller Industries, Inc
   3. Ward Manufacturing, LLC
   4. Or approved equal

S. Grooved:
   1. Anvil International, LLC
   2. Grinnell Products Division of JCI
   3. Victaulic Company of America.
   4. Or approved equal

2.02 MATERIALS / EQUIPMENT

A. Steel Pipe: Interior:
   1. Pipe:
      a. Reference: ASTM A 795/A 795M or ASTM A 53/A 53M.
      b. Weight: Schedule 40.
         1) Cut or roll grooved, threaded or welded pipe - Schedule 40.

2) Grooved Pipe 2-Inch and Larger:

a) Cut or roll grooved - Schedule 40.

b) Roll grooved - Schedule 10.

c. Finish: Black or galvanized.

d. End Connections: Compatible with fittings and accessories.

e. Labeling: Manufacturer shall provide industrial inkjet printed, or other industry standard, labeling with all information required by the NFPA 13 for piping used in automatic sprinkler service.

2. Fittings:

a. Threaded: ANSI B2.1

1) Reference: ANSI B16.3, Class 150 and 300, Factory Mutual approved, Underwriters' Laboratory listed for specific use.

2) Material: Malleable iron.

3) Finish: Black or galvanized.

b. Grooved:

1) Reference: FM approved, UL listed.

2) Material: Malleable iron.

3) Finish: Black or galvanized.

4) Couplings:

a) Type: Grooved mechanical.

b) Material: Malleable iron, ASTM A 47/A 47M.

c) Finish: Black or galvanized.

d) Nuts and Bolts: Carbon steel, ASTM A 449 and ASTM A 183.

e) Gasket: EPDM, ASTM D 2000.

3. Unions: Threaded, malleable iron, FS WWU531, Class 1, Type B. 1-1/2-inch pipe size and smaller only.

4. Flanges:

a. Type: Screwed, 125 lb. or 150 lb., ANSI A21.10 drilling.

b. Material: Steel, ANSI B16.5.

c. Gaskets: Red rubber, ASTM D 1330, Grade 1, 1/8-inch thick.

d. Bolts and Nuts: ASTM A 307, Grade B.

5. Joint Compound: Underwriters' Laboratory listed or Factory Mutual approved.

6. Thread Tape:
   a. Material: Teflon.
   b. Underwriters' Laboratory listed or Factory Mutual approved.
7. Flexible Coupling Assembly:
   a. Manufacturers: Provide products of one of the following:
      1) Anvil International, LLC
      2) Grinnell Products Division of JCI
      3) Victaulic Company of America.
      4) Or approved equal
   b. Reference: Underwriters' Laboratory listed or Factory Mutual approved.
   c. Material: Malleable iron, ASTM A 47/A 47M.
   d. Finish: Red.
   e. Nuts and Bolts: Carbon steel, ASTM A 449 and ASTM A 183.
   f. Gasket: EPDM, ASTM D 2000.
   g. Pipe:
      1) Reference: ASTM A 795/A 795M.
      2) Weight: Schedule 40.
      3) Finish: Black or galvanized.
      4) End Connection: Cut or roll groove.

B. Ductile Iron Pipe: Underground Water Service:
   1. Pipe: Ductile Iron, ANSI A21.51.
   2. Fittings: Ductile Iron, ANSI A21.11.
   3. Joints:
      a. Mechanical Joint:
         1) Glands, Bolts and Nuts: ANSI A21.11.
      b. Push-on Joint:
         1) Gaskets Rubber: ANSI A21.11.
         2) Lubricant: ANSI A21.11.
   4. Lining: Cement Lined, ANSI A21.4.

C. Bronze Body Gate Valves:
   1. Type: Outside screw and yoke, rising stem solid wedge disc.
   2. Materials: Brass and Bronze.

3. Rating: 175 lb. WOG.
4. End Connections: Threaded.
5. Markings: Underwriters' Laboratory listed, Factory Mutual approved, rating and manufacturers markings cast on body.
6. Size: 3/4-inch to 2-inch pipe size.

D. Iron Body Gate Valves:

1. Type: Outside screw and yoke, rising stem, solid wedge.
2. Materials: Iron body with bronze trim.
3. Rating: 175 lb. WOG.
4. End Connections: Flanged, ANSI B16.1, ANSI A21.10 drilling.
5. Markings: Underwriters' Laboratory listed, Factory Mutual approved, rating and manufacturer's markings cast on body.
6. Size: 2-1/2-inch to 8-inch.

E. Iron Body Check Valves:

1. Type: Swing, regrind-renew disc and seat ring, bolted cover.
2. Materials: Iron body, renewable or bronze trim, bronze disc and seat ring.
3. Rating: 175 lb. WOG.
4. End Connections: Flanged, ANSI B16.1, ANSI A21.10 drilling.
5. Markings: Underwriters' Laboratory listed, Factory Mutual approved, rating and manufacturer's markings cast on body.

F. Strainers:

1. Type: Self-cleaning "Y" body with blow-off cock.
2. Materials:
   a. Body: Cast-iron, galvanized.
   b. Screen: Stainless steel with 3/16-inch diameter holes.
   c. Retainer: Steel.
   d. Pipe Plug: Steel.
   e. Rating: 175 lb. WOG.
   f. End Connections: Threaded.

G. Automatic Ball Drip:

1. Type: In-line automatic ball drip.
2. Materials: Rough cast brass.
3. Rating: 175 lb. WOG.

4. End Connections: Threaded.

H. Riser Check Valves:

1. Type: Vertical.
2. Materials:
   a. Gray Iron Castings: ASTM A 48/A 48M, Class 30A.
   b. Cast Bronze: ASTM B 584, Alloy 5A.
   c. Clapper Facing: EPDM rubber, ASTM D 2000.
   d. Clapper Retainer: Stainless steel.
   e. Stainless Steel: AISI 302.
3. Rating: 175 lbs. WOG.
4. End Connections: Flanged ANSI B16.1, ANSI A21.10 drilling.
5. Markings: Underwriters' Laboratory listed, Factory Mutual approved markings, rating, year and manufacturer's markings cast on body.
6. Accessories:
   a. Trim packages shall consist of angle valves, ball valves, orifice restriction, pipe nipples and fittings.
   b. Water pressure gages.
   c. Plugs.

I. Gages:

1. Type: Bourdon type having an enclosed phosphor-bronze tube.
2. Materials:
   a. Moving Parts: Brass or stainless steel.
   b. Case: Brass or stainless steel.
   c. Ring: Brass or stainless steel, threaded.
   d. Hair Spring: Phosphor-bronze.
3. Dial Markings: Subdivisions one percent of maximum scale reading.
   a. Pressure Gage: 0 to 300 psi.
4. Accuracy: One percent of manufacturer's specified pressure over the working range.
5. Face Diameter: 4-1/2-inch.

J. Fire Department Connection:

1. Type: Wall mounted fire department connection, double clapper two-way inlets with plate and plugs.

2. End Connection: As required by local Fire Department.
3. Caps: Cast brass complete with gasket and chain with "S" hooks.
4. Threads: Verify thread types and sizes with local fire department.
5. Material: Cast brass with satin finish chrome plating.
6. Wall Plate: Cast brass round with satin finish chrome plating.
7. Rating: 175 lb. WOG.
8. Markings: Manufacturer's label and **"AUTO-SPKR"** cast on top.
9. Reference: UL listed, FM approved.

K. Automatic Sprinklers, Quick Response:

1. Type:
   a. Upright Spray: Deflector cupped downward at edges.
   b. Pendent Spray: Flat deflector.
2. Materials:
   a. Natural bronze, corrosion resistant upright or pendent as required shall be used in the areas designated corrosive atmosphere and shall be additionally Teflon coated for corrosion resistance.
   b. Natural bronze, upright or pendent as required shall be used in the areas designated non-corrosive.
   c. Frame: Bronze casting ASTM B 584; threads, Teflon taped.
   d. Levers: Bronze casting ASTM B 584, Alloy 5A.
   e. Link: Leaf and ball CDA-411.
   f. Waterway Washer: Copper ASTM B 5.
   g. Deflector: Brass ASTM B 19.
3. Finishes: Chrome plated, natural bronze or Teflon coated.
4. Rating: 175 lb. WOG.
5. Markings:
   a. Upright Use: "SSU" stamped on deflector plate.
   b. Pendent Use: "SSP" stamped on deflector plate.
   c. All sprinklers shall be permanently marked with the manufacturer, the model, year, deflector characteristic, thermal sensitivity and temperature rating.
6. End Connections: Threaded.

L. Sprinkler Cabinets:

1. Type: Sprinkler head cabinet for sprinkler head, sprinkler wrench storage.

2. Material: Enameled steel.

3. Markings: Manufacturer's name and words "AUTOMATIC SPRINKLERS, RESERVE SUPPLY" stenciled on face of cabinet.

4. Contents:

   a. Two sprinkler wrenches.

   b. Spare sprinkler heads of each type and spare heads of each temperature rating used in the building in accordance with NFPA 13.

M. Tamper Switch:

1. Type: Monitor open position of OS & Y sprinkler system control valves.

2. Reference: Underwriters' Laboratory listed and Factory Mutual approved.

3. Tamper proof, NEMA 4X switch case.

4. Two single pole, double throw switches.

5. Operation: The entire assembly shall be tamper proof, adjusted to operate within two revolutions of the valve control, or when stem has moved no more than 1/5 of the distance from its normal position.

N. Hangers and Supports:

1. Type: Clamps, hooks, rods, and hangers used to support a sprinkler piping system from the structure.

2. Materials: Comply with the requirements of, NFPA 13, Underwriters' Laboratory listed and Factory Mutual approved.

O. Escutcheons:

1. Type: Split ring with set screw.

2. Material: Chrome plated cast brass.

P. Pipe Labels: Provide in accordance with Section 40 05 97 – Identification for Process Equipment.

Q. Electric Alarm Bell:

1. Type: Electric alarm bell, weatherproof.

2. Materials:

   a. Gong Shell: Alloy steel, painted.

   b. Plunger: Cadmium finish iron with stainless steel striking tip.

   c. Mounting Plate: Plated steel and drilled to fit standard back boxes.

   d. Back-Box Housing: Weatherproof die-cast aluminum with rubber gasket.

   e. Bell Guard: Cast aluminum, fasten to gong shell.

3. Diameter: Ten-inch.
4. Voltage/Phase/Hertz: 120/1/60.
5. Decibel Rating: 97 decibels at ten feet.

R. Waterflow Alarm Indicators:

1. Type: Flexible vane projecting into the waterway with pneumatic retard.
2. References: Underwriters' Laboratory listed and Factory Mutual approved.
3. Tamper proof, NEMA 4X switch case.
4. Two single pole, double throw switches rated at ten amps, 120/240 VAC.
5. Flow sensitivity adjustment from 0 to 90 seconds.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Contractor shall examine the conditions under which the Work is to be installed and notify the Engineer, in writing, of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. Piping Schedule

1. Use types of pipe and fittings as specified below, unless otherwise specified or shown.
   a. All sprinkler piping shall be galvanized steel or copper for corrosive environment.
   b. All sprinkler piping, 2-inches and larger, Schedule 40 shall be threaded, welded or cut or roll grooved mechanical fittings.
   c. All sprinkler piping, 2-inches and larger, Schedule 10 shall be threaded, welded or roll grooved mechanical fittings.
   d. All sprinkler piping, 1-1/2-inch and smaller, shall be Schedule 40 with threaded or welded fittings.
   e. Potable water supply mains to sprinkler system, aboveground and underground, 3-inches and larger upstream of the backflow preventers shall be ductile iron.

B. General:

1. The installation of the sprinkler system shall conform to the requirements of NFPA 13, Factory Mutual 2-0 and the supplemental Specifications, below.
2. Provide all necessary supports, angle iron stands, miscellaneous steel, inserts, anchor bolts and hangers required for all equipment furnished under this Section. Supports, angle iron stands, etc., shall be in accordance with Section 05 50 00 – Metal Fabrications.
    a. Space supports so that there is at least one hanger for each length of pipe, with one hanger within 30-inches of the end sprinkler head.
    b. Do not hang piping from ductwork or other piping.
3. Install all items as shown, specified, and recommended by the manufacturer.
4. Request instructions from Engineer, in writing, when there is a conflict between the manufacturer's recommendations and the Contract Documents.
5. Present conflicts between piping systems and equipment or structures to the Engineer, in writing, who will determine corrective measures to be taken.
6. Do not modify structures to facilitate installation of piping, unless specifically approved by Engineer.
7. Installation to conform to requirements of all local and state codes.
8. Defective Materials: Examine piping, fittings, valves, sprinkler heads and accessories to be installed and reject those which are defective or in poor condition.

C. Piping:

1. Install straight runs true to line and elevation.
2. Install vertical pipe truly plumb in all directions.
3. Install piping parallel or perpendicular to building walls. Piping at odd angles and 45° runs across corners will not be accepted.
4. Install small diameter piping (1-inch minimum) generally as required to avoid ducts, equipment, beams, etc.
5. Provide drains at low points of all lines and wherever sprinkler piping is trapped.
6. Install underground piping in accordance with NFPA 24, Chapter 10.
7. Install sprinkler heads at centerline of corridors.

D. Joints:

1. General:

a. Make joints in accordance with the pipe manufacturer's recommendations and the supplemental Specifications, below.

b. Cut piping accurately and squarely and install without forcing or springing.

c. Ream out all pipes and tubing to full inside diameter after cutting.

d. Remove all cuttings and foreign matter from the inside of pipes and tubing before installation.

2. Threaded Joints: Use standard, right hand tapered full depth threads on steel piping and apply an approved joint compound to the male threads only, before installation. Leave not more than three pipe threads exposed at each connection.

3. Flanged Joints: Assemble flanged joints with approved full face gaskets and gasket compounds and draw up flange bolts evenly.

4. Welded Joints: ANSI Z49.1 latest revision and requirements of the American Welding Society for pipe welding.

5. Grooved Joints: Grooves for couplings shall be fabricated in accordance with manufacturer's recommendations.

E. Unions:

1. Provide a union downstream of each valve with screwed connections.

2. Provide screwed or flanged unions where shown or where necessary to install piping, so that piping may be readily dismantled in small sections.

F. Valves and Accessories:

1. Provide supports for large valves and other heavy items as shown.

2. Install floor stands as shown and as recommended by the manufacturer.

3. Position valve operators as shown and where required. When the position is not shown, install the valve so that it can be conveniently operated and as approved by the Owner. Avoid placing operators at odd angles to the floors or walls.

4. Any valve placed so that its operating mechanism is more than seven-foot above a floor or stair landing, a 12-inch wide wrought iron, steel or equivalent ladder securely fastened shall be provided for access to the valve.

G. Head Quantity:

1. Actual quantity and locations shall be as required by the local fire protection agency (Fire Marshal's Office). Contractor shall design, furnish and install complete, all piping and sprinkler heads as required to conform to all local, state and federal laws, codes and ordinances having jurisdiction over this Project.

H. Sprinkler Head Guards:

1. Sprinkler heads which are less than 84-inches above finished floor or are so located as to be subject to injury, shall be protected with approved guards.

I. Gages:

1. An approved 3-1/2-inch diameter spring pressure gage shall be installed at each test pipe location.

J. Control Valves:

1. All section control valves shall be installed where required and in accessible locations as required by the local Fire Marshall or Factory Mutual Systems.
2. Each sprinkler zone shall have a control valve.
3. All valves controlling the water supply to the sprinkler system shall be provided with tamper switches. Coordinate wiring and connection to the fire alarm control panel with Division 26, Electrical.

K. Test Pipes:

1. Test pipes shall be provided in accordance with NFPA 13 and same shall discharge into the nearest open Site floor drain or outside of building.

L. Signs:

1. Enameled signs with appropriate nomenclature as approved by the local Fire Marshall shall be installed at each control valve, drain, inspector's test station, alarm bell, etc.

M. Shields:

1. Furnish and install hoods or shields to protect electrical equipment from water. Hoods or shields shall be fabricated from non-combustible materials.

N. Flexible Couplings:

1. Provide flexible couplings comprised of several grooved joints and grooved couplings adjacent to the previous as required on each sprinkler line crossing a building expansion joint. Grooved joint and coupling assembly shall be UL listed or FM approved, for use with Schedule 40 steel pipe with cut groove joint.

3.03 FIELD TESTING / QUALITY CONTROL

A. Field Tests:

1. Fill all systems and fully test all equipment, piping, valves, etc. in operation.
2. Installed systems and components will not be released to Owner, unless all systems have been tested and approved by the Engineer.
3. Flush out all piping systems according to the applicable building codes.
4. Test the systems before any paint is applied.

B. Inspection of Welded Connections:

1. All welds will be subject to visual inspection. Where visually deficient welds are observed, the welds will be tested using non-destructive methods by a certified testing laboratory. If welds are found to be satisfactory, Owner will pay for testing. Where welds are found unacceptable or deficient, Contractor will pay for testing. Contractor will correct improper workmanship, remove and replace, or correct as instructed, all welds found unacceptable or deficient. Contractor will pay for all corrections and subsequent tests required to confirm the integrity of the weld.

C. Acceptance Tests: Testing shall be in conformance with the requirements of the applicable authority having jurisdiction and NFPA 13 Standard, Chapter 16.

1. Piping system shall be hydrostatically tested at 200 psi. Apply the test for a minimum of two consecutive hours with no loss of pressure.

D. Inspection:

1. Examine areas to receive piping, valves and accessories for:

a. Defects that adversely affect execution and quality of the Work.

b. Deviations beyond allowable tolerances piping, valves and accessories.

c. Start the Work only when conditions are satisfactory.

2. The Engineer reserves the right to reject or authorize replacement of piping, valves and accessories found to defective.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjusting:

1. Adjust all controls for proper settings.

2. While system is operable, balance all equipment, valves, etc., to achieve design conditions.

B. Cleaning:

1. Thoroughly clean all piping, fittings, valves, and accessories prior to installation.

2. Remove all dirt, rust, dust, etc. from piping in preparation for painting.

3. Remove and dispose of all debris and waste from the Site resulting from installation.

END OF SECTION

SECTION 22 05 27 – PIPE SLEEVES FOR PLUMBING PIPING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install pipe sleeves, other wall pieces, and escutcheons complete with accessories.

B. The following index of this Section is presented for convenience:

Article	Title	Section Page

1.05 DESCRIPTION

A. Not Used

1.06 QUALITY ASSURANCE

A. Installers' Qualifications:

1. Engage a single installer regularly engaged in pipe sleeves and mechanical seals installation and with experience in the installation of the types of materials required; and who agrees to employ only tradesmen with specific skill and experience in this type of Work. Submit names and qualifications to Engineer.

2. Engage a single installer for the entire pipe sleeves and mechanical seals system with undivided responsibility for performance and other requirements.

B. Component Supply and Compatibility:

1. Obtain all products included in this Section regardless of the component manufacturer from a single pipe sleeves and mechanical seal manufacturers.

2. The pipe sleeves and mechanical seal manufacturers to review and approve or to prepare all Shop Drawings and other submittals for all components furnished under this Section.

3. All components shall be specifically constructed for the specified service conditions and shall be integrated into the overall assembly by the pipe sleeves and mechanical seal manufacturers.

C. Regulatory Requirements: Comply with applicable provisions and recommendations of the following, except as otherwise shown or specified.

1. Local and State Building Codes and Ordinances.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to:

1. Action Submittals: Submit the following

a. Manufacturer's literature, illustrations, specifications, and engineering data.

b. Details of installation.

c. Detailed drawings showing all pipe sleeves and mechanical seals for each piping system. Drawings shall show location, installation and material of all pipe sleeves and mechanical seals.

d. Other technical data related to the specified material and equipment as requested by Engineer.

e. Installer's Qualifications.

f. Deviations from Contract Documents.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Packing, Shipping, Handling and Unloading:

1. Deliver materials to the Site to ensure uninterrupted progress of the Work. Deliver anchor bolts and anchorage devices, which are to be embedded in cast in place concrete, in ample time to prevent delay of the Work.

B. Storage and Protection:

1. Store materials to permit easy access for inspection and identification. Keep all material off the ground, using pallets, platforms, or other supports. Protect steel members and packaged materials from corrosion and deterioration.

C. Acceptance at Site:

1. All boxes, crates and packages shall be inspected by Contractor upon delivery to the Site. Contractor shall notify Engineer, in writing, if any loss or damage exists to equipment or components. Replace lost equipment or components and repair damage to new condition, in accordance with manufacturer's instructions.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Mechanical Seals: Provide products of one of the following:

1. Advance Products & Systems, Inc., Innerlynx.
2. GPT Division of Enpro Industries, Link-Seal.
3. The Metraflex Company, Metraseal.
4. Or equal.

B. Wall, Floor and Ceiling Escutcheon Plates: Provide products of one of the following:

1. McGuire Manufacturing, Inc.
2. Pegasus Manufacturing, Incorporated.
3. Or equal.

C. Exterior Wall or Floor Sleeves (Below-Grade): Provide products of one of the following:

1. GPT Division of Enpro Industries, Century-Line.
2. SIGMA Corporation, Omni-Sleeve.
3. Or equal.

2.02 MATERIALS / EQUIPMENT

A. Pipe Sleeves:

1. Ferrous and Plastic Pipe: Use standard weight galvanized steel pipe, unless otherwise shown on the Contract Drawings.
2. Copper Pipe: Use standard weight galvanized steel pipe with mechanical link seals as spacers, unless otherwise shown on the Contract Drawings.

B. Cast Wall Sleeves:

1. Material: Cast-iron furnished with integral wall collar in accordance with AWWA C110.
2. Dimensions: As required for mechanical joint or calked joint pipe to pass through sleeve. Length as required.

C. Mechanical Seals: Provide link type mechanical seals with adjusting bolts suitable for 20 psi working pressure where shown on the Contract Drawings or required.

1. Materials:
   a. Mechanical seals through non-fire rated walls or floors:
      1) Pressure Plate: Glass reinforced nylon plastic.
      2) Bolt and Nut: 18-8 stainless steel.
      3) Sealing Element: EPDM rubber.
   b. Mechanical seals through fire rated walls or floors; two independent mechanical seal assemblies required for each penetration:
      1) Pressure Plate: Low carbon steel, zinc galvanized plated or stainless steel.
      2) Bolt and Nut: Low carbon steel zinc galvanized.
      3) Sealing Element: Silicone rubber.
      4) Fire rating: Three hour.

D. Wall, Floor and Ceiling Escutcheon Plates:

1. Bare Pipes Passing Through Walls, Floors and Ceilings in any Room: Provide escutcheon plates of cast brass or stamped steel, chrome plated, hinged with setscrews.

2. Insulated Pipes Passing Through Walls, Floors and Ceilings in Finished Rooms: Provide plated escutcheon plates of stamped steel or cast brass, chrome plated, hinged with setscrews.

E. Exterior Walls or Floors Sleeves: Below grade:

1. Type: Thermoplastic sleeve for use in new construction where sleeves are exposed to liquid or on exterior walls or floors exposed to backfill only.

2. Integral reinforcing ribs, anchor and waterstop collar textured surface for adhesion to concrete.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. General:

1. Install all items as shown, specified, and as recommended by the manufacturer.

2. Request instructions from Engineer, in writing, when there is a conflict between the manufacturer's recommendations and the Contract Documents.

3. Present conflicts to Engineer, in writing, who will determine corrective measures to be taken.

4. Do not modify structures to facilitate installation of pipe sleeves, mechanical seals, and accessories, unless specifically approved by Engineer.

5. Installation to conform to requirements of New York City and state codes.

6. Protection: Equipment shall be tightly covered and protected against dirt, water, and chemical or mechanical damage.

B. Pipe Sleeves:

1. Use sleeves wherever pipes pass through walls, partitions, floors and roofs, unless otherwise shown.

2. All sleeves through floor slabs in finished areas shall extend a maximum of 1/4 inch above finished floor.

3. Anchor sleeves to concrete and masonry walls as shown or otherwise accepted.

4. Sleeves through walls shall be flush with wall face.
5. Calk and seal annular space between pipe and sleeve.
6. All pipe joints and annular spaces in exterior walls or walls subjected to hydrostatic pressure shall be completely watertight.
7. All vertical pipes through sleeves shall be installed with a modular seal system capable of maintaining a 2-hour fire rating between the two fire areas.
8. Size Sleeves to provide annular space as recommended by the mechanical seal manufacturer and as follows:

Pipe Size	Sleeve ID Minus Pipe or Insulation OD
Less than 2 in.	1/2 in. to 3/4 in.
2 in. to 4 in.	3/4 in. to 1 1/4 in
6-in. to 12-in.	1-1/4-in. to 2-in.

9. For mechanical link seals, size sleeves to provide space required to suit link type seals provided.
10. Do not install sleeves and pipes through structural members unless specifically required due to coordination or obstructions, each sleeve condition shall be submitted for approval.

3.03 FIELD TESTING / QUALITY CONTROL

A. Inspection:

1. Examine areas to receive pipe sleeves, mechanical seals, escutcheons and accessories for:
   a. Defects that adversely affect execution and quality of the Work.
   b. Deviations beyond allowable tolerances for pipe sleeves, mechanical seals, escutcheons and accessories.
   c. Start the Work only when conditions are satisfactory.
2. The Engineer reserves the right to reject or authorize replacement of pipe sleeves, mechanical seals, escutcheons and accessories found to be defective.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjusting:

1. Adjust all materials for proper settings.

B. Cleaning:

1. Thoroughly clean all pipe sleeves, mechanical seals, escutcheons and accessories prior to installation.
2. Remove all dirt, rust, dust, etc. from all pipe sleeves, mechanical seals and escutcheons in preparation for required painting.
3. Remove and dispose of all debris and waste from the Site resulting from installation.

END OF SECTION

SECTION 22 05 29 – HANGERS AND SUPPORTS FOR PLUMBING PIPING AND EQUIPMENT
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified, and required to furnish, install, and test all hangers and supports complete with accessories for plumbing piping and equipment.

B. The following index of this Section is presented for convenience:

PART 3	EXECUTION	9
3.01	Examination / Preparation	9
3.02	Installation	9
3.03	Field Testing / Quality Control	12
3.04	Startup / Demonstration	12
3.05	Adjusting / Protection / Cleanup	12

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 05 05 23.02 – Miscellaneous Metal Fastenings.

B. Section 05 12 00 – Structural Steel Framing

C. Section 05 50 00 – Metal Fabrications.

D. Section 09 91 00 – Painting.

1.04 REFERENCES

A. Standards referenced in this Section are listed below:

1. American National Standards Institute, (ANSI).
    a. ANSI B1.1, Unified Inch Screw Threads. (ASME B1.1).
2. American Society for Testing and Materials, (ASTM).
    a. ASTM A36/A 36M, Specification for Carbon Structural Steel.
    b. ASTM A47/A 47M, Specification for Ferritic Malleable Iron Castings.
    c. ASTM A307, Specification for Carbon Steel Bolts and Studs, 60,000 PSI Tensile Strength.
    d. ASTM A575, Specification for Steel Bars, Carbon, Merchant Quality, M-Grades.
    e. ASTM A668/A668M, Specification for Steel Forgings, Carbon and Alloy, for General Industrial Use.
3. Federal Specifications, (FS).
    a. FS WW-H-171E, Hangers and Supports, Pipe.
4. Manufacturer's Standardization Society, (MSS).
    a. MSS SP-58, Pipe Hangers and Supports - Materials, Design and Manufacture.
    b. MSS SP-59, Short Radius Welding Fittings.
    c. MSS SP-69, Pipe Hangers and Supports - Selection and Application.
    d. MSS SP-89, Pipe Hangers and Supports - Fabrication and Installation Practices.
    e. MSS SP-90, Guidelines on Terminology for Pipe Hangers and Supports.

1.05 DESCRIPTION

A. This Section includes requirements for providing hangers and supports for plumbing piping in accordance with applicable standards and regulations.

1.06 QUALITY ASSURANCE

A. Qualifications of Manufacturer and Pipe Support Designer:

1. Pipe hangers, supports, and appurtenances shall be standard products of the manufacturer specified herein.
2. Each type of hanger and support shall be the product of a single manufacturer.

3. The pipe support designer, if retained by the Contractor, shall have a minimum of five (5) years of experience in the design of pipe supports and shall show evidence of having completed at least five (5) substantially similar, successful pipe support projects of equal complexity as the systems specified.

   a. The pipe support designer shall be a New York State Registered Professional Engineer.

B. Installer's Qualifications:

1. Engage a single installer regularly engaged in hangers and supports installation and with experience in the installation of the types of materials required; and who agrees to employ only tradesmen with specific skill and experience in this type of Work. Submit name and qualifications to Engineer.

2. Engage a single installer for the entire plumbing pipe and equipment hangers and supports system with undivided responsibility for performance and other requirements.

C. Regulatory Requirements: Comply with applicable provisions and recommendations of the following, except as otherwise shown or specified.

1. All hangers and supports shall conform to the applicable requirements of ASME B31.1, MSS SP-58, SP-59, SP-69, SP-89, and SP-90, except as modified herein, and be of standard manufacture wherever possible, and best suited for the service required.

2. Unless otherwise approved, all hangers, supports and concrete inserts shall be listed with Underwriters' Laboratory, Inc.

3. Local and State Building Codes and Ordinances.

4. Permits: Contractor shall obtain and pay for all required permits, fees and inspections.

D. Supply and Compatibility:

1. Obtain all products included in this Section regardless of the component manufacturer from a single plumbing pipe and equipment hangers and supports manufacturer.

2. The plumbing piping and equipment hangers and supports manufacturer shall review and approve all Shop Drawings and other submittals for all components furnished under this Section.

3. All components shall be specifically constructed for the specified service conditions and shall be integrated into the overall assembly by the plumbing piping and equipment hangers and supports manufacturer.

4. The pipe and fittings shall be designed, fabricated, and installed in accordance with standards referenced herein.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to:

1. Action Submittals: Submit the following:

a. Shop Drawings:

1) Details of installation.

2) Detailed drawings showing all hangers and supports for each piping system. Drawings shall show:

a) Location, installation, material, loads, forces, stresses and deflections of all hangers and supports.

b) Reaction forces imparted to structures to which hangers and supports are attached shall be shown.

c) Contractor shall provide detailed drawings of each pipe support. Each drawing shall contain enough information to verify the pipe support design and to allow the manufacture of the device. At a minimum, the Contractor shall submit:

(1) Scaled details of the device with dimensions.

(2) A table of applied forces and moments.

(3) A complete bill of materials.

(4) An isometric showing the applied forces and moments.

(5) Detailed connections to existing structure.

(6) Shop and field welds.

3) Manufacturer's catalogs and engineering data on all hangers and supports.

4) Load ratings.

5) Materials.

6) Installation details.

b. Submit the name and qualifications of the support and hanger engineer.

c. All drawings and design calculations included in the shop drawings shall be signed and sealed by a New York State Registered Professional Engineer.

d. Pipe support design shall include detailed load and movement calculations:

1) In the design of hangers, supports and anchors, unless otherwise shown or specified, pipe pressures shall be the maximum test pressures specified for pipelines carrying gases and twice the maximum test pressures specified for pipelines carrying liquids.

2) The following loads shall be included in pipe support design and pipe stress analysis:

3) The gravity force, including the weight of the pipeline plus the weight of any appurtenances, contents, insulation, etc.

4) The thermal expansion force developed by the restraint of free end displacement of the piping.

5) Hydrostatic forces developed by internal pressure during operation of the piping system.

6) Loading due to expansion joint reaction forces.

7) Seismic forces, as required by the latest edition of the New York City Building Code.

8) Occasional load calculations and pipe stress analysis shall be provided where required by the Contract Documents, Building Codes, or Standards referenced herein. Occasional loads include:

a) Seismic forces.

b) Pressure waves produced by sudden changes in fluid momentum, commonly referred to as water hammer.

c) Wind, snow or ice loads.

d) Safety valve thrust loads.

e. Calculated forces shall be included in the pertinent shop drawings as called for by the submittal requirements specified herein.

2. Informational Submittals: Submit the following:

a. Qualifications Statements:

1) Installer's Qualifications.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Packing, Shipping, Handling and Unloading:

1. Deliver materials to the Site to ensure uninterrupted progress of the Work. Deliver anchor bolts and anchorage devices, which are to be embedded in cast in place concrete, in ample time to prevent delay of the Work.

B. Storage and Protection:

1. Store materials to permit easy access for inspection and identification. Keep all material off the ground, using pallets, platforms, or other supports. Protect steel members and packaged materials from corrosion and deterioration.

2. Store all equipment in covered storage off the ground and prevent condensation and in accordance with the manufacturer's recommendations for long-term storage.

C. Acceptance at Site:

1. All boxes, crates and packages shall be inspected by Contractor upon delivery to the Site. Contractor shall notify Engineer, in writing, if any loss or damage exists to equipment or components. Replace lost equipment or components and repair damage to new condition, in accordance with manufacturer's instructions.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Standard pipe supports and components shall conform to the requirements of MSS SP-69 and MSS SP-58, as manufactured by:

1. B-Line

2. Carpenter & Patterson

3. Grinnell

4. Or approved equal.

B. Expansion Joints: Provide products of one of the following:

1. Flex-Hose Co., Inc.

2. The Metraflex Company

3. Or approved equal.

C. Alignment Guides: Provide products of one of the following:

1. Flex-Hose Co., Inc.

2. The Metraflex Company
3. Or approved equal.

D. Toggle Bolts: Provide products by one of the following:
1. Cooper B-Line Division of Eaton Corp.
2. Powers Fasteners
3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Components of hangers and supports shall conform to the following:
1. Materials:
a. Bolts: ASTM A307, Grade A, unless otherwise specified below.
b. Forgings: ASTM A668/A 668M.
c. Malleable Iron: ASTM A47/A47M.
d. Rods and Bars: ASTM A575.
e. Threads: Unified Screw Threads, Class 2A and 2B, ANSI B1.1.
f. Structural Steel: ASTM A36/A36M.
2. Finish:
a. Steel or Malleable Iron Items: Hot-dipped galvanized, unless otherwise specified or as shown.
b. Steel or Malleable Iron Materials Used for the Support of Uninsulated Copper Piping: Copper plated.
c. Framing Members and Fittings: Dip painted with corrosion resistive primer as specified in Section 09 91 00 – Painting.
d. All hangers, rods, bolts, nuts, inserts, washers located in the corrosive areas shall be Type 316 stainless steel.

B. Pipe Attachments: The following types of pipe attachments shall be considered acceptable:
1. Adjustable Steel Clevis: FS WW H 171E, Type 1.
2. Steel Double Bolt Pipe Clamp: FS WW H 171E, Type 3.
3. Steel Pipe Clamp: FS WW H 171E, Type 4.
4. Adjustable Swivel Pipe Ring: FS WW H 171E, Type 6.
5. Adjustable Steel Band Hanger: FS WW H 171E, Type 7.
6. Riser Clamp: FS WW H 171E, Type 8.
7. Light-Duty Cleves Hanger: FS WW H 171E, Type 12.

8. Long Clips: FS WW H 171E, Type 26.
9. Offset J Hooks: FS WW H 171E, Type 27.
10. Steel Pipe Covering Protection Saddle: FS WW H 171E, Type 40A.
11. Insulation Protection Shield: FS WW H 171E, Type 41.
12. Pipe Saddle Support: FS WW H 171E, Type 37.
13. Pipe Stanchion Saddle: FS WW H 171E, Type 38.
14. Pipe Saddle Support with Base: FS WW H 171E, Type 36.
15. Adjustable Roller Hanger: FS WW-H-171E, Type 42.

C. Structural Attachments: The following types of structural attachments shall be considered acceptable:

1. Side Beam Clamp: FS WW H 171E, Type 20.
2. Center I Beam Clamp: FS WW H 171E, Type 21.
3. Welded Steel Bracket: FS WW H 171E, Types 32 and 33.
4. Side Beam Bracket: FS WW H 171E, Type 35.
5. Malleable Iron with Galvanized Finish Concrete Insert: FS WW H 171E, Type 18. The use of steel concrete inserts is prohibited and NOT acceptable.

D. Hanger Rod Attachments: Use as required to complete assembly:

1. Forged Steel Clevis: FS WW H 171E, Type 14.
2. Adjustable Turnbuckle: FS WW H 171E, Type 15.
3. Forged Steel Welders Eye Nut: FS WW H 171E, Type 17.

E. Expansion Joints:

1. 2 1/2 inch and Smaller Copper Tubing:
    a. Construction: Free flexing expansion joints with stainless steel corrugated members, NSF 372 certified lead-free for use in domestic water systems.
    b. End Connections: Male and female solder end fittings or screwed ends with adaptors for screwed to sweat ends.
2. 3 inch and Larger:
    a. Construction: Free flexing expansion joints with stainless steel corrugated members, NSF 372 certified lead-free for use in domestic water systems.
    b. End Connections: Welded ends with flanges.

F. Alignment Guides:

1. Type: Semi steel spider with four guiding fingers and guilding cylinder with base.

G. Connection Bolts: Materials shall be as specified in other Sections of these Specifications or as shown. Where materials are not specified or shown, they shall be of Type 304 stainless steel with Monel nuts.

H. Toggle Bolts:

1. Provide zinc plated spring wing toggle bolts of the size required for secure anchorage of individual items, but not less than 1/4-inch diameter, of length required.

I. Contractor shall furnish and install all necessary supports, angle iron stands, miscellaneous steel, inserts, anchor bolts and hangers required for all equipment furnished under this Contract, unless otherwise noted. All supports shall meet the requirements of the applicable Sections of Division 05, Metals.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. All pipe hangers, supports and restraints shall be painted as required in accordance with the requirements of Section 09 91 00 – Painting.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. The Contractor shall coordinate the Work such that all plumbing piping hangers, supports, and restraining systems shall be installed and secured prior to the testing or activation of the process pipeline.

3.02 INSTALLATION

A. General:

1. Install all items as shown, specified, and as recommended by the manufacturer.

2. Request instructions from Engineer, in writing, when there is a conflict between the manufacturer's recommendations and the Contract Documents.

3. Present conflicts to Engineer, in writing, who will determine corrective measures to be taken.

4. Do not modify structures to facilitate installation of pipe hangers, supports and restraints, unless specifically approved by Engineer.

5. Installation to conform to requirements of all local and state codes.

6. Protection: Equipment shall be tightly covered and protected against dirt, water, and chemical or mechanical damage.

B. Hangers, Supports and Restraints for Horizontal Piping:

1. Space supports and hangers for all piping no farther apart than shown below, unless otherwise shown:

a. Copper Tube:

1) All Pipes: 6 feet 0 inch on center.

b. Steel Pipe:

1) Pipes up to 1 inch: 6 feet 0 inch on center.

2) Pipes 1 1/4 inch to 6 inch: 8 feet 0 inch on center.

c. Cast Iron Pipe:

1) Two supports per length, maximum 5 feet-0 inches on center.

d. Plastic Pipe:

1) 3 feet 0 inch on center for all sizes, unless otherwise recommended by manufacturer for 100°F ambient temperature.

2. Additional supports are to be provided at all changes of direction, at all no-hub fittings and couplings for cast iron pipe, and at all valves or other in-line devices installed in piping.

3. Rigid support sway bracing shall be provided at all changes of direction for piping 4" diameter and larger.

4. Mechanical restraints shall be installed at all fittings for changes of direction in drainage piping 4" and larger in accordance with the CISPI installation guidelines.

C. Hanger Rods: Size hanger rods according to the schedule below, unless noted otherwise.

Nominal Pipe Diameter	Rod Diameter
1/2-in. through 2 in.	3/8 in.
2-1/2 in. through 3-1/2 in.	1/2 in.
4-in. through 5-in.	5/8-in.
6-in.	3/4-in.

D. Supports for Vertical Piping:

1. Provide riser clamp placed under hub, fitting or coupling with approved solid bearing on steel sleeve at each floor level.
2. Where riser clamps are used with plastic piping they shall be modified so as not to exert any compressive forces on the pipe.
3. Support spacing shall not exceed code requirements.
4. Piping support intervals shall not exceed those listed in Paragraph 3.4.A., above.
5. Additional supports shall be placed immediately adjacent to any change in piping direction, and on both sides of valves and couplings.
6. Accurately locate inserts for hanger rods in forms before concrete is placed.
7. Use Type 304 stainless steel expansion anchor assemblies of the capsule polyester resin adhesive type and only to support rods, hangers and brackets for piping 1 inch and smaller no other type will be considered and only if the expansion anchors are designed to carry 100 percent of the full load, hanger, and/or bracket and pipe load.

E. Supports for water meters and backflow preventers: Provide pipe saddle supports with base anchored to floor.

F. Structural members shall conform to Section 05 12 00 – Structural Steel Framing.

G. Anchor bolts, expansion anchors and concrete inserts shall conform to Section 05 05 23.02 – Miscellaneous Metal Fastenings. Miscellaneous metal fabrications shall conform to Section 05 50 00 – Metal Fabrications.

H. Allow clearances for expansion and contraction of piping.

I. Anchors shall be designed to prevent any pipe movement at pipe anchorage points. Anchors shall be securely fastened to the construction directly or indirectly through structural framing:

1. Piping 2-1/2-inches and Smaller: Anchor horizontal runs over 50 feet to midpoint to allow expansion toward expansion compensators (anchor intervals shall not exceed 30 feet) or elbows.
2. Piping 3-inches and Larger: Anchor horizontal runs over 100 feet at mid-points to force expansion toward expansion compensators.
3. Provide alignment guides in accordance with expansion compensator manufacturer recommendations.

J. Provide expansion compensators where necessary to absorb expansion and contraction in heating lines and as follows:

1. Thirty feet on center of copper piping.
2. Fifty feet on center of steel piping section spec

K. Locate first set of alignment guides within four pipe diameters of the anchor or expansion compensator, the second set of pipe alignment guides shall be located within fourteen pipe diameters of the first guides.

3.03 FIELD TESTING / QUALITY CONTROL

A. Inspection:

1. Examine areas to receive plumbing piping and equipment hangers and supports and accessories for:

a. Defects that adversely affect execution and quality of the Work.

b. Deviations beyond allowable tolerances for pipe hangers, supports and restraints and accessories.

c. Start the Work only when conditions are satisfactory.

2. The Engineer reserves the right to reject or authorize replacement of pipe hangers, supports and restraints and accessories found to be defective.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjusting:

1. Adjust all materials for proper settings.

B. Cleaning:

1. Thoroughly clean all pipe hangers, supports and restraints and accessories prior to installation.

2. Remove all dirt, rust, dust, etc. from all pipe hangers, supports and restraints in preparation for required painting.

3. Remove and dispose of all debris and waste from the Site resulting from installation.

END OF SECTION

SECTION 22 05 33 – HEAT TRACING FOR PLUMBING PIPES
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install heat tracing for plumbing pipes, complete with accessories.

B. The following index of this Section is presented for convenience:

1.04 REFERENCES

A. The Institute of Electrical and Electronic Engineers (IEEE):

1. Testing, Design, Installation, and Maintenance of Electrical Resistance Trace Heating for Commercial Applications.
2. National Electrical Manufacturer's Association (NEMA).
3. NFPA 70 - National Electric Code.
4. Underwriter's Laboratories.
5. Factory Mutual (FM).

1.05 DESCRIPTION

A. Not Used.

1.06 QUALITY ASSURANCE

1. Installer:
   a. Qualifications to include ten years' experience in design, engineering, manufacture and support of specified system and components.
   b. System installer shall have complete understanding of product and product literature from manufacturer or authorized representative prior to installation.
   c. Electrical Connections shall be performed by a licensed electrician.

B. Product Requirements:

1. The equipment covered by these specifications is intended to be standard equipment of proven performance as manufactured by reputable concerns. Equipment shall be designed, constructed and installed in accordance with the best practices of the trade, and shall operate satisfactorily when installed as shown on the Contract Drawings.

C. Regulatory Requirements and Approvals:

1. The heat tracing system shall be UL Listed/CSA Certified.
2. Electrical Components, Devices, and Accessories: Listed and labelled as defined in NFPA 70 and marked for intended use.

1.07 SUBMITTALS

A. Action Submittals: Submit the following:

1. Shop Drawings:
   a. Bill of Materials
   b. Wiring Schematic of Monitor Panel
   c. Power and End Termination points in relation to the piping layout.
   d. Location of Monitor Panels
   e. Location and placement of RTD sensors

2. Product Data:

a. Manufacturers' catalog literature, specifications, and illustrations with the following information:

1) Thermal Properties.

2) Physical Properties.

b. Data Sheet for each electric heating circuit with the following information:

1) Heater catalog number

2) Heater length.

3) Voltage required.

4) Ampere load.

5) Total output in watts.

6) Output in watts per lineal foot.

B. Informational Submittals: Submit the following:

1. Qualifications Statements:

a. Installer’s qualifications.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Packing, Shipping Handling and Unloading:

1. Deliver materials to the Site to ensure uninterrupted progress of the Work. Deliver anchor bolts and anchorage devices, which are to be embedded in cast in place concrete, in ample time to prevent delay of the Work.

B. Storage and Protection:

1. Store materials to permit easy access for inspection and identification. Keep all material off the ground, using pallets, platforms, or other supports. Protect steel members and packaged materials from corrosion and deterioration.

2. Store all equipment in covered storage off the ground and prevent condensation and in accordance with the manufacturer’s recommendations for long-term storage.

C. Acceptance at Site:

1. All boxes, crates and packages shall be inspected by Contractor upon delivery to the Site. Contractor shall notify Engineer, in writing, if any loss or damage exists to equipment or components. Replace lost equipment or components and repair damage to new condition, in accordance with manufacturer’s instructions.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Heat Trace Cable:

1. Thermon, Inc.
2. nVent Thermal Management, LLC.
3. Chromalox, Inc.
4. Or approved equal

2.02 MATERIALS / EQUIPMENT

A. General:

1. All thermally insulated piping, valves, and related fluid transfer systems supplying tepid water to eyewashes or safety showers, as shown on the Drawings, shall be electrically traced with self-limiting heater cable. The maintenance temperature for these systems shall be 80 degrees Fahrenheit.
    a. The system shall be controlled from a Control/Monitoring panel as specified.
    b. Heat tracing cable shall be installed before insulation is installed and as per manufacturers' instructions.
    c. Furnish and install a complete heat tracing system with all components including temperature sensor, cable, junction box, etc., being the product of one manufacturer or supplier.
    d. All outdoor remote connections and equipment shall be corrosion resistant weatherproof, NEMA 4X.
    e. Submit suppliers' information related to design parameters and heat loss values related to specified maintenance of temperature.
2. The heater cable shall be suitable for cutting to desired length to suit conditions at installation. The cable shall form a continuous heating circuit. Heat trace cable shall not be used as jumper conduit from one piping system to another. Contractor shall use heat trace cable, wire, conduit and junction boxes to achieve the complete circuit.
3. Upon receipt, the contractor shall record an insulation resistance of 20 megohms minimum bus to braid using the procedure outlined in "C" above.

B. Self-Regulating Cable:

1. The heater cable shall be capable of maintaining maximum recommended pipe temperatures, and withstand continuous exposure temperatures as outlined below, without permanent damage to the matrix core.

   a. The maximum maintenance temperature rating of the cable shall be +150 F.

   b. The maximum continuous exposure rating of the cable shall be +185 F.

   c. At a minimum the heat trace cable shall be designed to maintain the solution in the pipe at a temperature at 80 F, unless otherwise specified. The assumed outdoor ambient temperature is -10 F with a 25-mph wind with a 20 percent safety factor. Indoors, assume 50 degrees F with no wind.

2. The heater cable assembly shall consist of two parallel copper bus wires, minimum size 16 AWG, connected through a semi-conductive heating matrix. This heating element shall be covered with a cross-linked polyolefin insulation jacket. This insulation shall be covered by a tinned copper braid and then covered again with a fluoropolymer insulating jacket. The cable heat output capacity shall be designed by the manufacturer's heat loss software and submitted to the engineer.

C. Accessories

1. Splicing connectors, end termination, caution labels, tee connectors, thermostats, control panel (as required) and power termination kits shall be provided to ensure a complete heat trace system in accordance with the manufacturer's recommendations.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Provide insulation on all heat traced pipe in accordance with Section 22 07 19 – Plumbing Piping Insulation.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

1. Heat tracing cables to be Megger tested prior to shipment. Before shipment, cable shall indicate an insulation resistance of 20 megohms minimum bus to braid using a 2500 volt DC megger and withstand for one minute a voltage equal to twice rated plus 1,000 volts applied bus to braid.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. The heating cable system shall be inspected before the system is covered over with insulation to look for damaged heating cable and to ensure the manufacturer's recommended installation instructions have been observed.

3.02 INSTALLATION

A. Cable shall be carefully located so as to preclude subsequent damage coincident with normal operations and maintenance.

B. Fasten cable with manufacturer-supplied tape so as to uniformly position the cable on the pipeline.

C. Accordion cable around valves, etc. to avoid overlaying cable over cable.

D. Special care is required to permit turning, or inserting, spec blinds, re-packing or replacing valves, and adjusting and calibrating process control instruments.

E. The installed heating cable should be covered with thermal insulation and waterproof jacketing as rapidly as possible. Install thermal insulation in accordance with insulation requirements specified herein.

F. The following decal type sign shall be prominently fixed to the exterior of the thermal insulation every 20 feet and readily visible from ground level: ELECTRIC HEAT TRACING: CAUTION.

3.03 FIELD TESTING / QUALITY CONTROL

A. Heat tracing cables to be Megger tested after shipment, after attachment to the pipe, and again after insulation has been properly installed. Testing shall be performed at 2,500 VDC.

1. Testing for dielectric strength shall be performed as follows: power wire is separated from the heater cable and the leads of a 2500 VDC megger is placed on one copper cable conductor of the heat tracing while the other is placed on the electrical ground wire, pipe, or tinned copper braid. A minimum of 20 megohms should be measured. This test indicates that splices are properly made and insulated and that the heater cable insulation is intact and undamaged. This test may be performed at the monitor panel by taking the load side leads off the terminal blocks and measuring between the conductor wires and the ground wire or other electrical ground in the panel.

B. Visual Inspection: All electrical connections should be intact including conduit, junction boxes, temperature sensors and wiring. All pipe insulation and weather proof barriers should be sound and not penetrated by water.

C. Pre-start up Tests**:** The following actions should have been performed prior to start up:

1. Check all electrical connections are made from monitor panel to the heat tracing junction boxes.

2. Check that, at the heat tracing power start point junction boxes, the cable has the proper insulating boot installed. The power wire should be connected to the heater cable.

3. Check that all splices have the proper insulating boots installed.

4. Check that the remote temperature sensor is wired to the heat trace monitor panel properly with twisted shielded 3 conductor wire.
5. Check that the test for dielectric strength with a 2500 VDC megger is completed and recorded.
6. Secure a trained technician to program the unit for operation as part of this contract.
7. Each setting and reading should be recorded and submitted to the Engineer or Owners Representative.

3.04 STARTUP / DEMONSTRATION

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 22 05 29 – Hangers and Supports for Plumbing Piping.

B. Section 22 05 33 – Heat Tracing for Plumbing Pipes.

C. Section 22 10 53 – Installation of Plumbing Piping.

D. Section 22 11 16 – Domestic Water Piping.

1.04 REFERENCES

A. Standards referenced in this Section are:

1. ANSI A117.1, Guidelines for Accessible and Usable Buildings and Facilities.

2. ASTM C449/C449M, Specification for Mineral Fiber Hydraulic-Setting Thermal Insulating and Finish Cement.

3. ASTM D1784, Specification for Rigid Poly (Vinyl Chloride) (PVC) Compounds and Chlorinated Poly (Vinyl Chloride) (CPVC) Compounds.

4. Federal Specification (FS) SS-C-160, Cement, Insulation, Thermal.

1.05 DESCRIPTION

A. Not Used.

1.06 QUALITY ASSURANCE

A. Qualifications:

1. Installer:

a. Engage installer regularly engaged in plumbing piping insulation installation and with experience installing the types of materials required; and employ only tradesmen with specific skill and experience in this type of Work. Submit name and qualifications to Engineer.

b. Engage a single plumbing piping insulation installer for entire piping insulation system, with undivided responsibility for performance and other requirements.

B. Component Supply and Compatibility:

1. Obtain all products included in this Section regardless of component manufacturer, from a single piping insulation Supplier.

2. Plumbing piping insulation Supplier shall review and approve or prepare all Shop Drawings and other submittals for components furnished under this Section.

3. Components shall be suitable for specified service conditions and shall be integrated into overall assembly by plumbing piping insulation Supplier.

C. Regulatory Requirements: Comply with the following.

1. Local and State Building Codes and Ordinances.

2. Americans with Disabilities Act (ADA)

1.07 SUBMITTALS

A. Action Submittals: Submit the following:

1. Product Data:

a. Manufacturer's literature, illustrations, specifications, and engineering data.

b. Other technical data related to specified materials as requested by Engineer.

B. Informational Submittals: Submit the following:

1. Manufacturer's Instructions:

a. Manufacturer's recommended installation instructions.

2. Qualifications Statements:

a. Installer's Qualifications.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Packing, Shipping, Handling, and Unloading:

1. Deliver products to Site to ensure uninterrupted progress of the Work.

2. Inspect all boxes, crates, and packages upon delivery to Site and notify Engineer in writing of loss or damage to products. Promptly remedy loss and damage to new condition per manufacturer's instructions.

3. Conform to Section 01 65 00 – Product Delivery Requirements.

B. Storage and Protection:

1. Keep all products off ground using pallets, platforms, or other supports, in covered storage. Protect materials from damage and deterioration.

2. Prevent condensation in materials and packaging in accordance with manufacturer's recommendations for long-term storage

3. Conform to Section 01 66 00 – Protection of Materials and Equipment.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Fiberglass Insulation:

1. Owens Corning Fiberglass Corporation, Fiberglass SSL II with ASJ Max Fiberglass.

2. Johns Manville Division of Berkshire Hathaway, Micro-Lok HP

3. Or approved equal.

B. Calcium Silicate Insulation at Insulation Protection Shields:

1. Industrial Insulation Group, LLC, IIG.b.
2. Thermo 12 Gold, by Johns-Manville.
3. Or approved equal.

C. PVC Pipe Jacketing and Valve and Fitting Covers:

1. Proto Corporation
2. Speedline Corporation.
3. Zeston by Johns Manville.
4. Or approved equal.

D. Weatherproof SS Jacketing and Valve & Fittings Covers:

1. Great Lakes Textiles Products
2. Insultherm
3. Shur-Fit Products
4. Or approved equal

2.02 MATERIALS / EQUIPMENT

A. Fiberglass Insulation:

1. Type: Heavy-density pre-formed fiberglass sectional pipe insulation with factory-applied indoor foil or polymer jacketing with self sealing lap.
2. Thermal Conductivity: 0.25-0.29 Btu inch per hour per square foot per degree F at 125 degrees F mean temperature. Insulation thicknesses shall be as indicated in manufacturer's installation guidelines, except that in no case shall insulation thicknesses be less than required by ASHRAE 90.1.
3. Fire Hazard Classification:
   a. Flame Spread: 25.
   b. Fuel Contributed: 50.
   c. Smoke Developed: 50.
4. Density: Three pounds per cubic foot (pcf) minimum.
5. Fittings: Molded fiberglass.
6. Jointing Materials: Manufacturer's recommended adhesives and tape.
7. Valve Insulation: Miter cut nesting size covering segments of same thickness as pipeline, for insulation of valves.

B. Calcium Silicate Insulation at Insulation Protection Shields:

1. Type: Asbestos-free calcium silicate pipe insulation.
2. Thermal Conductivity: 0.40 Btu inch per hour per square foot per degree F at 200 degrees F mean temperature.
3. Fire Hazard Classification:
    a. Flame Spread: Zero.
    b. Smoke Developed: Zero.
4. Density: 14 pounds per cubic foot (pcf).
5. Compressive Strength: 140 psi.
6. Cut insulation 0.5-inch longer than insulation shield upon which it rests.

C. PVC Pipe Jacketing and Valve and Fitting Covers:

1. Type: PVC Jacketing (for insulated piping and appurtenances located indoors, unless otherwise shown or indicated):
    a. 25/50 PVC, conforming to ASTM D1784, Class 16354-C and C-585
    b. Thickness: 20 mils.
    c. Color: White.
    d. Finish: Glossy.
    e. Temperature: Suitable for 150 degrees F, minimum.
    f. Provide insulation adhesive of other means of sealing jacketing per manufacturer insulation instructions.

D. Weatherproof Jacket (for insulated piping and appurtenances located outdoors, and where shown or indicated):

1. Type: Smooth-embossed, Type 316 stainless steel jacket.
    a. Thickness: 0.016 inches.
    b. Moisture Barrier: Polycraft.
    c. Fastening: Pre-formed "Z"-lock seam with two-inch butt strap with waterproof sealant.
    d. Bands: 1/2-inch Type 316 stainless steel bands with wing seals.
    e. Fittings: Pre-fabricated Type 316 stainless steel fittings, 0.016-inch thickness.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examine conditions under which materials are to be installed and notify Engineer in writing of conditions detrimental to proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. Piping systems to be insulated and associated insulation thicknesses are specified in the schedule at the end of this Section.

B. Thoroughly clean all piping, insulation, and accessories prior to installation.

C. Remove from piping all dirt, rust, dust, and other materials detrimental to proper installation of insulation.

D. Install items as shown, specified, and as recommended by manufacturer.

E. Request interpretation from Engineer if there is conflict between manufacturer's recommendations and the Contract Documents.

F. Do not modify structures to facilitate installation of piping insulation unless approved by Engineer.

G. Installation of plumbing piping insulation shall conform to Laws and Regulations.

H. Surfaces of piping, valves, and fittings shall be clean and dry before applying insulation.

I. Install piping insulation after associated piping system has been successfully tested.

J. Provide high-density insulation pipe support inserts at each hanger and shield extending halfway up the pipe insulation cover and extending along pipe at least six inches on each side of hanger. Securely fasten shield with pipe straps at each end. Insulate pipe anchors adequately to prevent moisture condensation problems.

K. Protection: Piping insulation materials applied each day shall have vapor barrier applied the same day and exposed ends shall be temporarily protected with moisture barrier and sealed to pipe.

3.03 FIELD TESTING / QUALITY CONTROL

A. Piping Insulation Schedule: Insulate plumbing piping as specified below, unless otherwise specified or shown:

1. All hot, cold, tepid and tempered piping 2.5-inch diameter and smaller: Insulation thickness shall be one-inch minimum.

2. All hot, cold, tepid and tempered piping three-inch diameter and larger: Insulation thickness shall be 1.5-inch minimum.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjusting:

1. Adjust or replace, as required, poorly fitted joints.

END OF SECTION

NO TEXT ON THIS PAGE

SECTION 22 10 53 – INSTALLATION OF PLUMBING PIPING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment and incidentals as shown, specified, and required to furnish and install plumbing piping systems complete with accessories.

B. The following index of this Section is presented for convenience:

1.04 REFERENCES

A. Standards referenced in this Section are listed below:

1. American National Standards Institute, (ANSI).
   a. ANSI B13.1, Code for Pressure Piping.
   b. ANSI B31.1, Power Piping.
2. American Society for Testing and Materials, (ASTM).
3. American Welding Society, (AWS).
   a. AWS D10.9, Welding Procedures and Welders for Piping and Tubing.
4. Institute of Electrical and Electronic Engineers, (IEEE).
5. National Electrical Code, (NEC).
6. National Electrical Manufacturers' Association, (NEMA).
7. National Fire Protection Association, (NFPA).
8. Underwriters' Laboratories, Incorporated, (UL).

1.05 DESCRIPTION

A. The Scope of this Section includes the requirements for the installation of plumbing piping systems, including domestic water piping and sanitary waste and vent piping, except where installation requirements for plumbing piping are shown or specified elsewhere in the Contract Documents.

1.06 QUALITY ASSURANCE

A. Installer's Qualifications:

1. Engage a single installer regularly engaged in plumbing piping installation and with experience in the installation of the types of materials required; and who agrees to employ only tradesmen with specific skill and experience in this type of Work. Submit name and qualifications to Engineer.
2. Engage a single installer for the entire plumbing piping system with undivided responsibility for performance and other requirements.

B. Regulatory Requirements: Comply with applicable provisions and recommendations of the following, except as otherwise shown or specified.

1. Local and State Building Codes and Ordinances.
2. Permits: Contractor shall obtain and pay for all required permits, fees and inspections.

1.07 SUBMITTALS

A. Action Submittals: Submit the following:

1. Shop Drawings:

a. Layout and Installation Drawings:

1) Shall include plans, sections, and details showing location, elevations, and clearly marked dimensions.

2) Piece numbers which are coordinated with the tabulated pipe layout schedule shall be clearly marked.

3) The scale used shall be the greater of the following two (2):

a) The scale used on the Contract Drawings that depict the process pipe for which the submittal pertains, or

b) A minimum scale of ¼-in = 1-ft - 0-in.

4) When special designs or fittings are required, the work shall be shown in large detail and the special or fitting completely described and dimensioned.

5) Include a north arrow.

6) Information on pipe supports, including:

a) Pipe support location.

b) Pipe support type.

c) hanger rod size.

d) Insert type.

e) All loads on the support (in either lbs. or kips.)

7) Locations where pipe and valve identification signs will be placed.

8) Location of pipe couplings, specials, and adapters.

9) Location of expansion joints.

10) Locations of pipe hangers and supports.

11) Extent of pipe insulation and heat tracing.

12) Extent of lining, wrapping, and coatings.

b. A tabulated pipe layout schedule for each plumbing piping system. Submit a separate schedule for each pipe system and/or service. The pipe layout schedule shall include the following information for each pipe section, fitting, and appurtenance that comprises that system:

1) Service.

2) Pipe size.

3) Working pressure.

4) Vacuum pressure (if applicable).

5) Weight (in lbs.)

6) Joint type.

7) Wall thickness.

8) Piece number.

9) Laying length.

c. For each plumbing piping system that contains valves, submit a tabulated valve schedule. Submit a separate schedule for each pipe system and/or service. The valve schedule shall include the following information for each valve:

1) Valve tag number.

2) Valve size.

3) Whether the valve is manual or actuated. If actuated, the type of actuator.

B. Informational Submittals:

1. Qualifications Statements:

a. Installer's qualifications.

1.08 DELIVERY, STORAGE, AND HANDLING

1. Not Used.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. Materials for piping system shall be specified under applicable Sections of Division 22, Plumbing.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. All equipment and accessories shall be painted in accordance with the requirements of Section 09 91 00 – Painting.

B. Identification:

1. Provide in accordance with Section 40 05 97 - Identification for Process Piping and Equipment.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examine areas to receive piping, valves and accessories for:

1. Defects that adversely affect execution and quality of the Work.

2. Deviations beyond allowable tolerances for piping, valves and accessories.

3. Start the Work only when conditions are satisfactory.

B. The Engineer reserves the right to reject or authorize replacement of piping and accessories found to be defective.

3.02 INSTALLATION

A. General:

1. Install all items as shown, specified, and as recommended by the manufacturer.

2. Wherever changes in sizes of piping occur, changes shall be made with reducing fittings. The use of bushings is not permitted unless otherwise shown.

3. All pipes passing through ceilings, floors and walls in finished rooms, and all supplies to fixtures shall have escutcheon plates.

4. Install straight runs true to line and elevation.

5. Install vertical piping tight to walls, columns and truly plumb leaving clearance for vertical supports only.

6. Install piping parallel or perpendicular to building walls. Piping at odd angles and 45 degrees runs across corners will not be accepted unless specifically shown.

7. Install small diameter piping generally as shown on the Drawings when specific locations and elevations are not indicated. Locate such piping as required to avoid ducts, equipment, beams, etc.

8. Remove all cuttings and foreign matter from the inside of pipes and tubing before installation.

9. Provide a union downstream of each valve with screwed connections.

10. Use eccentric reducers where shown and where air or water pockets would otherwise occur in mains because of a reduction in pipe size.

11. Valves and Accessories:

    a. All valves and equipment are to be installed perfectly plumb and level, in horizontal runs of piping (except where specifically indicated for vertical piping installation).

    b. Provide supports for large valves, flow meters and other heavy items as shown or otherwise required.

    c. All required access shall be provided for valves and equipment. Where valves or equipment are installed behind walls, above ceilings, or in otherwise inaccessible locations, 18”x18” access panels are to be provided by the Contractor at locations to be coordinated.

    d. Install floor stands as shown on the Contract Drawings and as recommended by the manufacturer.

    e. Provide lateral restraints for extension bonnets and extension stems as shown and as recommended by the manufacturer.

12. Do not modify structures to facilitate installation of piping, unless specifically approved by Engineer.

13. Installation to conform to requirements of all local and state codes.

14. Unless otherwise required by the tubing manufacturer or AHJ, copper tubing, fittings, couplings, and soldered joints shall be installed according to methods and procedures described in “The Copper Tube Handbook” reference publication by the Copper Development Association.

15. Unless otherwise required by the piping manufacturer or AHJ, Cement-Lined Ductile Iron Pipe, fittings, couplings, joints and appurtenances are to be installed according to methods and procedures described in ANSI/AWWA 600, “Installation of Ductile Iron Mains and Their Appurtenances”, and the AWWA “Manual M41 on Ductile Iron Pipe and Fittings”.

16. All connections between ferrous and non ferrous piping materials shall be made with dielectric couplings.

17. Properly plug or cap the open ends of all piping at the end of each day’s Work or other stopping point through construction. Equipment shall be tightly covered and protected against dirt, water, and chemical or mechanical damage.

18. Provide shutoff valve, located for easy access, to each piece of equipment furnished.

19. Material Schedule shall be as specified under applicable Sections of Division 22, Plumbing.

B. Insulation:

1. Provide insulation, where required, in accordance with Section 22 07 19 – Plumbing Piping Insulation.

a. Insulation shall be installed after the installation and testing of plumbing piping.

2. Hangers and Supports:

a. Install pipelines with supporting devices in accordance with requirements of Section 22 05 29 - Hangers and Supports for Plumbing Piping and Equipment.

b. No piping shall be supported by metal stairs, ladders or walkways.

3.03 FIELD TESTING / QUALITY CONTROL

A. General:

1. Fill all systems and fully test all equipment, valves, piping, etc. in operation.

2. Check for excessive vibration while all systems are operating.

3. Installed systems and components will not be released to DEP unless all systems have been tested and approved by the Engineer.

B. Sanitary Waste and Vent Piping:

1. Water Tests:

a. Perform tests either on the entire system or on successive sections of the system.

b. Tightly close all openings, except the highest opening of the system or section to be tested.

c. Fill the system or section with water to the point of overflow.

d. Test with a head of at least ten feet of water, except for the uppermost ten feet of the system.

e. Allow water to stand in the system for at least 15 minutes before inspecting.

f. Inspect the system or section for leaks, and repair any leaks found.

2. Air Tests:

a. Attach air compressor testing apparatus to any suitable opening after closing all other inlets and outlets. Force dehydrated oil less compressed air, pressure dew point -40ºF, into system until there is a uniform gage pressure without the introduction of additional air. Below is a list of required gage pressures:

1) Drainage and Vent Piping (substitute for water test): Five psi for 15 minutes.

3. Smoke Tests:

a. Finished Plumbing: Final test for gas and water tightness of the completed drainage and vent system:

1) Fill all traps with water.

2) Introduce a pungent thick smoke, produced by one or more smoke machines, into the system.

3) When the smoke appears at stack openings on the roof, close the system.

4) Maintain a pressure in the system equivalent to a 1-inch water column for the period of the inspection.

5) Inspect the system for leaks and repair any leaks found.

3.04 STARTUP / DEMONSTRATION

A. All domestic water piping shall be disinfected before they are placed into service, as specified in Section 33 01 10.60 - Disinfection of Piping, Tanks, Structures, and Equipment.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjusting:

1. While system is operable, balance all equipment, valves, etc. to achieve design conditions.

B. Cleaning:

1. Thoroughly clean all piping, fittings, valves, and accessories prior to installation.

2. Remove all dirt, rust, dust, etc. from piping in preparation for painting.

3. Remove and dispose of all debris and waste from the Site resulting from installation.

END OF SECTION

SECTION 22 11 16 – DOMESTIC WATER PIPING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install domestic water piping, complete with accessories.

B. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. This Section includes requirements for providing domestic water pipe and accessories in accordance with applicable standards and regulations.

1.06 QUALITY ASSURANCE

A. Installer's Qualifications:

1. Engage a single installer regularly engaged in domestic water piping installation and with experience in the installation of the types of materials required; and who agrees to employ only tradesmen with specific skill and experience in this type of Work. Submit name and qualifications to Engineer.
2. Engage a single installer for the entire domestic water piping system with undivided responsibility for performance and other requirements.

B. Regulatory Requirements: Comply with applicable provisions and recommendations of the following, except as otherwise shown or specified.

1. Local and State Building Codes and Ordinances.

C. Component Supply and Compatibility:

1. Obtain all equipment included in this Section regardless of the component manufacturer from a single domestic water piping systems manufacturer.

2. The domestic water piping systems manufacturer to review and approve or to prepare all Shop Drawings and other submittals for all components furnished under this Section.

3. All components shall be specifically constructed for the specified service conditions and shall be integrated into the overall assembly by the domestic water piping systems manufacturer.

1.07 SUBMITTALS

A. Action Submittals: Submit the following:

1. Shop Drawings:

a. Shop drawings for domestic water piping shall comply with the requirements of Section 22 10 53 – Installation of Plumbing Piping.

2. Product Data:

a. Manufacturer's literature, illustrations, specifications and engineering data.

b. Flexible connections.

c. Other technical data related to the specified material and equipment as requested by Engineer.

d. Gasket material.

B. Informational Submittals: Submit the following:

1. Qualifications Statements:

a. Installer’s qualifications.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Packing, Shipping Handling and Unloading:

1. Deliver materials to the Site to ensure uninterrupted progress of the Work. Deliver anchor bolts and anchorage devices, which are to be embedded in cast in place concrete, in ample time to prevent delay of the Work.

B. Storage and Protection:

1. Store materials to permit easy access for inspection and identification. Keep all material off the ground, using pallets, platforms, or other supports. Protect steel members and packaged materials from corrosion and deterioration.

2. Store all equipment in covered storage off the ground and prevent condensation and in accordance with the manufacturer’s recommendations for long-term storage.

C. Acceptance at Site:

1. All boxes, crates and packages shall be inspected by Contractor upon delivery to the Site. Contractor shall notify Engineer, in writing, if any loss

or damage exists to equipment or components. Replace lost equipment or components and repair damage to new condition, in accordance with manufacturer's instructions.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Dielectric Couplings:

1. Hart Industrial Unions, LLC
2. SSP Corporation
3. Watts
4. Or approved equal.

B. Bronze Body Globe Valves:

1. Apollo Valves Division of Conbraco Industries, Inc., 120S-LF Series
2. Milwaukee Valve, Fig. No. UP1502
3. Or approved equal.

C. Strainers:

1. Watts
2. Zurn Industries
3. Or approved equal.

D. Iron Body Gate Valves:

1. Apollo Valves Division of Conbraco Industries, Inc., 611F-LFA Series
2. Watts, Series 408-OSYRW
3. Or approved equal.

E. Iron Body Check Valves:

1. Apollo Valves Division of Conbraco Industries, Inc., Fig. No. 910F-LFA
2. Nibco, Inc. Fig. No. F-910-LF
3. Or approved equal.

F. Tepid Water Mixing Valve

1. Haws Corporation, Model No. TWBS.H
2. Powers, Model No. LFMM431.
3. Leonard Water Temperature Controls, Model No. TM-5125-STSTL-EXP.
4. Or approved equal.

G. Point-of-Use Thermostatic Anti-Scalding Valve:
1. The Bradley Corporation, S59-4016 Series
2. Watts, Series LFMMV.
3. Or approved equal.

H. Hose Bibbs, Pipe Drains:
1. Zurn Industries LLC, Model Z1341XL
2. Acorn Engineering Company, Model 8121-LF
3. Or approved equal.

I. Exposed Wall Hydrant Connection, Non-Freeze Type:
1. Jay R. Smith, Fig 5609 SE.
2. Zurn Industries, Fig. No. Z1321XL
3. Or approved equal.

J. Water Hammer Arresters:
1. Products and Manufacturers: Provide one of the following:
2. Zurn-Wilkins Division of Zurn Industries, 1260XL Series
3. Watts, LF15 Series
4. Or approved equal.

K. Flexible Connections:
1. Flex Hose Co., Inc.
2. The Metraflex Company
3. Or approved equal.

L. Automatic Air Vents:
1. Armstrong Fluid Technologies.
2. Bell and Gossett.
3. Or approved equal.

M. Thermometers:
1. H.O. Trerice Company.
2. Weksler Instruments Division of Ashcroft, Inc.
3. Or approved equal.

N. Pressure Gages:
   1. H.O. Trerice Company.
   2. Weksler Instruments Division of Ashcroft, Inc.
   3. Or approved equal.

O. Backflow Preventers: 1/2-Inch to 2-Inches: (BFP-RPZ):
   1. Watts, Series LF919
   2. Zurn-Wilkins Division of Zurn Industries, Series 975XL2
   3. Or approved equal.

P. Backflow Preventers, Reduced Pressure Detector Assembly (BFP-RPDA):
   1. Zurn Industries, Series 350
   2. Watts, Series 709.
   3. Or approved equal.

Q. Backflow preventers test kit.
   1. Watts, Backflow Preventer Test Kit with carrying case.
   2. Zurn-Wilkins Division of Zurn Industries Test Kit and case.
   3. Or approved equal.

R. Water Meter:
   1. Sensus OMNI R2 Series.
   2. Neptune Water Meter Company, T10.
   3. Or approved equal.

S. Vacuum Breakers: Pressure Type: PVB
   1. Conbraco Industries, Incorporated, Series SVB 4ALF
   2. Watts, Series LF800
   3. Or approved equal.

T. Vacuum Breakers Atmospheric Type: AVB:
   1. Apollo Valves Division of Conbraco Industries, Inc, Series 38LF-100
   2. Watts, Series LF288A.
   3. Or approved equal.

U. Trap Primer Valve:
   1. MIFAB
   2. Watts.
   3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. General Materials Requirements:

1. All piping, couplings and fittings to be used in the potable domestic water distribution system shall be certified NSF 61 Annex G/NSF 372 lead-free.

2. All piping and fittings to be used for domestic water shall comply with the current requirements of the United States Safe Drinking Water Act.

B. Copper Water Tube:

1. Tube:

a. Reference: ANSI H23.1, ASTM B 88.

b. Type: K or L.

c. Temper: Hard drawn or soft annealed.

2. Fittings:

a. Reference: ANSI B16.22.

b. Reference: ANSI B16.26.

c. Reference: ANSI B16.18.

3. Joints:

a. Sweat:

1) Solder Metal: ASTM B 32, Type 95 5TA.

2) Flux: FS O F 506, Type 1.

b. Flanged:

1) Flanges: ANSI B16.24, 150 lb. class.

2) Gaskets: Red rubber, ASTM D 1330, Grade 1, 1/8 inch thick.

3) Nuts and Bolts: ASTM A 307.

4. Unions:

a. Reference: FS WW U 516.

b. Material: Bronze.

c. Rating: 250 lb. W.O.G.

C. Ductile Iron Pipe:

1. Pipe: Ductile iron, ANSI A21.51.

2. Fittings: Ductile iron, ANSI A21.1.

3. Joints:

a. Mechanical Joints:

1) Glands, Bolts and Nuts: ANSI A21.11.

b. Flanged Joints:

1) Reference: ANSI A21.10.

4. Lining: Mortar lined, ANSI A21.4.

D. Dielectric Couplings:

1. Type: Union or flange.

2. Ratings:

a. Unions: 250 psi, ANSI B16.39.

b. Flanges: 175 psi, ANSI B16.42 (Iron), ANSI B16.24 (Bronze).

E. Valves:

1. General Valves Requirements:

a. All valves, strainers and appurtenances to be used in the potable domestic water distribution system shall be certified NSF 61 Annex G/NSF 372 lead-free. Where specified products are third-party certified lead-free, uncertified products shall not be acceptable equals for substitution.

b. All valves, strainers and appurtenances to be used for domestic water shall comply with the current requirements of the United States Safe Drinking Water Act.

2. Bronze Body Globe Valves:

a. Products and Manufacturers: Provide one of the following:

1) Apollo Valves Division of Conbraco Industries, Inc., 120S-LF Series

2) Milwaukee Valve, Fig. No. UP1502

3) Or approved equal.

b. Type: Composition disc, screwed bonnet.

c. Materials: Lead-free Brass and bronze.

d. Rating: 150 lb. SWP.

e. End Connections: Solder joint.

3. Bronze Body Check Valves:

a. Products and Manufacturers: Provide one of the following:

1) Apollo Valves Division of Conbraco Industries, Inc., 161S-LF Series

2) Milwaukee Valve, Fig. No. UP1502

3) Or approved equal.

b. Type: Swing, bronze disc, screw in cap.

c. Materials: Lead-free Brass and bronze.

d. Rating: 200 PSI CWP

e. End Connections: Solder joint.

4. Bronze Body Ball Valves:

a. Type: Non blowout stem, two-piece, quarter turn, full port ball valve.

b. Materials:

1) Body: Lead-free bronze or brass.

2) Ball: Chrome plated brass.

3) Packing and Seats: Teflon.

4) Rating: 200 PSI CWP.

5) End Connections: Soldered End.

5. Strainers:

a. Type: Self-cleaning wye body with blow off cock.

b. Construction:

1) Basket: Perforated stainless steel basket.

2) Perforations: 0.045 inches diameter, minimum.

3) Free Area: Four times, cross sectional area of connecting pipe, minimum.

6. Strainers 2 1/2 inch and smaller:

a. Materials:

1) Body: Cast bronze, ASTM B 62.

b. Pressure Rating: 250 psi steam at 425□F temperature.

c. End Connections: Solder ends or screwed ends with adapters for screw to sweat ends.

d. Blowoff Connection: Unplugged, NPT blowoff connection.

F. Iron Body Gate Valves:

1. Type:

a. Solid wedge, OS&Y, full-port with bolted bonnet.

2. Materials:

a. Body: Cast Iron with epoxy finish

b. Wedge: Lead-free bronze or epoxied cast-iron

c. Bonnet: Cast Iron

3. Rating:200 PSI CWP

4. End Connections: Flanged end connections, ANSI B16.1 drilling.
5. Provide chain wheel operators for all valves above 5 foot-6 inches above finished floor.

G. Iron Body Check Valves:
1. Type: Swing, bolted cover.
2. Materials: Iron body, lead-free bronze trim and disc.
3. Rating: 200 PSI CWP.
4. End Connections: Flanged, ANSI B16.1 drilling.

H. Tepid Water Mixing Valve
1. Type: Thermostatically operated water-blending device.
2. Materials:
   a. Body: Brass.
   b. Vanes: Brass.
3. Thermostatic element to be located in main body of valve.
4. Low outlet temperature type valve shall be adjustable from 60 to 110°F.
5. Test Pressure: 300 psi.
6. Reference: NSF/ANSI 61-G.

I. Point-of-Use Thermostatic Anti-Scalding Valve:
1. Type:Thermostatically operated point-of-use anti-scalding with integral supply checks.
2. End Connection: Soldered-end.
3. Maximum Supply Pressure: 150 PSI
4. Maximum Supply Temperature: 180º F
5. Approvals:ASSE 1070, NSF 61/372

J. Hose Bibbs, Pipe Drains:
1. Valve:
   a. Type: Indoor chrome plated.
   b. Materials: Bronze body, screwed bonnet, renewable composition disc.
   c. End Connections: Hose thread outlet, NPT thread inlet.
   d. Rating: 125 lbs. WOG.
2. Vacuum Breaker:
   a. Type: Non removable, atmospheric.

b. Materials: Brass body, stainless steel trim, silicone rubber diaphragm and disc.

c. End Connections: Hose thread inlet and outlet.

3. Reference: NSF 61/NSF 372, ASSE 1011

K. Wall Hydrants, Exposed Non-Freeze Type:

1. Type: Anti-siphon, non-freeze wall hydrant.

2. Materials:

a. Casing: Bronze.

b. Vacuum Breaker: Integral.

c. Threads: Standard 3/4-inch hose thread outlet.

d. Wall Clamp: Adjustable with set screw.

e. Key: Removable tee handle type.

3. Connections: 3/4-inch sweat end inlet and 3/4-inch hose thread outlet, universal type.

4. Reference: NSF 61/NSF 372.

L. Water Hammer Arresters:

1. Materials:

a. Casing: Copper Tube

b. Piston: Polycarbonate

c. Tailpiece: Low-lead brass

2. Connection: Male NPT thread.

3. Maximum Working Pressure: 250 psig.

4. Sizing and Certification: PDI WH 201.

5. References: ASSE 1010, NSF 61 / NSF372

M. Flexible Connections:

1. Type: Flexible connections for piping 2 1/2 inches and smaller.

2. Construction:

a. Hose: 316 Stainless Steel

b. Braid: 316 Stainless Steel

3. Pressure Ratings: 190 psig working pressure at 250□F temperature.

4. End Connections: Threaded or flanged pipe connection.

5. References: NSF 61/NSF 372

N. Automatic Air Vents:

1. Type: Automatic vent air eliminator with built in air chamber.
2. Construction:
   a. Body: Bronze.
   b. Finish: Chrome plated exterior.
   c. Overflow Connector: Provide connection for 1/4 inch OD copper tubing.
3. Ratings: 75 psig working pressure.
4. References: NSF 61/NSF 372

O. Thermometers:

1. Range: 30°F to 240°F temperature range in maximum of 2°F increments.
2. Type: Adjustable Angle Column Type Thermometer.
   a. Construction:
      1) Scales and Lens: Nine inch high satin finish aluminum scales, black numerals, front reading tubes for non-mercury fluid.
      2) Wells: Insertion well with brass separable sockets.
      3) Neck: 2 1/2 inch extension neck.
      4) Case: Cast aluminum.
      5) Window: Glass or clear acrylic plastic.

P. Pressure Gages:

1. Reference ANSI B40.1 for Grade AA gages.
2. Type: Direct mounted, dial type pressure gage.
3. Construction:
   a. Case: Six inch diameter cast aluminum, flangeless with black finish and bottom 1/4 inch N.P.T.
   b. Ring: Chrome plated close type.
   c. Dial: White face, black numbers and graduations.
   d. Window: Glass or clear acrylic plastic.
   e. Pointer: Micrometer type, black finish, red tip.
   f. Movement: Stainless steel, rotary type, delrin sector and bushings.
   g. Bourdon Tube: Type 316 stainless steel
   h. Socket and Tip: Forged brass, alloy steel and Type 316 stainless steel.
4. Accuracy: One percent minimum.
5. Gage Cocks: Provide brass tee handle isolation cock before each gage.

6. All gauges are to be filled with non-mercury organic fluids.

Q. Backflow Preventers: 1/2-Inch to 2-Inches: (BFP-RPZ):

1. Type: Reduced pressure zone device with two independently acting check valves, together with an automatically operated pressure differential relief valve located between the two check valves.

2. Materials:

   a. Body: Low-lead Bronze.

   b. Valve Discs: BUNA-N rubber.

   c. Diaphragm: Silicone rubber or Buna N rubber.

   d. Springs: Stainless steel.

   e. Screws: Stainless steel.

3. Maximum Working Pressure: 175 PSI WWP

4. End Connections: Screwed.

5. Accessories:

   a. Air gap drain funnel with threaded outlet and vent elbow furnished by manufacturer.

   b. Strainer with blow-off on inlet.

   c. Ball valves on inlet and outlet.

   d. Reduced pressure principle backflow preventer test kit for each unit furnished, provided in molded plastic carrying case with foam inserts.

6. References: ASSE 1013, AWWA C511, NSF 61 and applicable authority having jurisdiction.

R. Backflow Preventers, Reduced Pressure Detector Assembly (BFP-RPDA):

1. Type: Assembly of two single independently acting check valves with tight closing shut off valves at each end and suitable connections for testing the water tightness of each check valve with bypass assembly. Gate valves shall be provided with tamper switches as specified herein.

2. Materials:

   a. Main Valve Body: Cast-iron.

   b. Trim: Bronze.

   c. Bypass Valve Body: Bronze.

   d. By-Pass Meter: Totalizing 1 to 20 gpm, 5/8-inch by 3/4-inch.

   e. Seats: Bronze.

   f. Fasteners: Stainless steel.

g. Main-Line Shut Off Valves: OS & Y with resilient seats and tamper switches, Underwriters' Laboratory listed and Factory Mutual approved.

h. Test cocks: Bronze body ball valves, four required.

3. Maximum Working Pressure: 200 psi.

4. End Connections: Flanged.

5. Accessories:

a. Gate valves on inlet and outlet with Underwriters' Laboratory listed, Factory Mutual approved tamper switches.

b. DCV backflow preventer test kit provided in molded plastic carrying case with foam inserts for each unit furnished to be turned over to DEP.

6. Reference: Underwriters' Laboratory listed and Factory Mutual approved.

7. Fire protection system backflow preventers shall be provided with a bypass assembly consisting of a water meter, approved double check valve backflow prevention assembly with shut-off valves and test cocks.

8. All backflow preventers shall meet with the approval of U.S.C. Cross Connection Control Lab, U.S. Army Corps of Engineers, U.S. Navy, AMPS, Southern Building Code Congress, AWWA, and ASSE.

S. Water Meter:

1. General: Water meter shall be as supplied by local water utility company. Otherwise, provide water meters as specified below.

2. Type: Turbine Type.

3. Materials:

a. Body: Lead-free alloy.

b. Register: Lead-free alloy.

c. Gear Train: Direct Coupled.

4. Size: 2-inch.

5. Maximum Working Pressure: 150 psi.

6. End Connections: Flanged.

7. Reference: NSF 61/NSF 372, Local Water Utility

T. Vacuum Breakers:

1. Pressure Type: PVB:

a. Type: An assembly containing an independently operating internally loaded check valve and an independently operating loaded air inlet valve located on the discharge side of the check valve. The assembly

shall also be equipped with test cocks and shut off valves on the inlet and outlet of the assembly.

b. Materials:

1) Springs: Stainless steel.

2) Bonnet: Glass filled PPO

3) Vent Disc: Silicone rubber.

4) Disc Holder Float: Polypropylene.

5) Check Valve Disc: Silicone rubber.

6) Check Valve Seat: NORYL

7) Body: Lead-free copper alloy

c. Accessories:

1) Ball valves on inlet and outlet on the assembly.

2) Ball valve test cocks on the assembly.

d. Reference: ASSE 1020, NSF 61/NSF 372.

e. Working Pressure: 150 psi.

f. Installation: Vertical, minimum 12 inches above fixture vacuum breaker serves.

2. Atmospheric Type: AVB:

a. Type: An assembly containing an air inlet valve, a check seat and an air inlet port to prevent reverse flow of water and allow air into the water line to break a siphon.

b. Materials:

1) Hood: Polished Chrome Finish

2) Body: Lead-Free Bronze.

3) Vent Disc: Silicone.

4) Disc Holder Float: Polyethylene.

5) Body: Lead-Free Bronze.

c. Reference: ASSE 1001.

d. Working Pressure: 210°F at 125°F.

e. Installation: Vertical, minimum 6 inches above fixture vacuum breaker serves.

U. Trap Primer Valve:

1. Construction:

a. Body: Brass.

b. Seals: O-ring 40°F to 450°F.

c. Inlet and Outlet Size: 1/2-inch.

d. Integral backflow preventer.

e. Provide multiple outlet distribution units, as required.

f. Reference: ASSE 1018, NSF 61/NSF 372

g. Accessories: Floor drain trap primer distribution unit.

V. Material Schedule:

1. Use types of pipe and fittings as specified below, unless otherwise specified or shown.

2. All potable water supply, hot, cold, tepid and tempered water piping 3-inches and smaller, run within the interior of a building, shall be hard drawn copper Type "L" with solder joints and connections.

3. All potable water piping 3-inches and smaller run underground shall be soft-annealed copper Type "K" copper tubing.

4. All underground water piping 4-inches and larger shall be cement-lined ductile iron pipe with mechanical joints.

5. All water piping 4-inches and larger run above ground within the interior of a building, shall be Type "L" hard-drawn copper tubing with soldered joints and fittings.

6. All exposed water piping and valves to plumbing fixtures shall be chrome-plated brass.

7. All valves for copper tubing shall be bronze bodied, unless otherwise specified.

8. All valves for ductile iron piping shall be iron bodied, unless otherwise specified.

9. Use "wrought copper" fittings for copper tubing.

10. Use "butt welded" fittings for welded steel pipe connections.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Piping and accessories shall be painted in accordance with Section 09 91 00 – Painting.

B. Provide insulation, where required, in accordance with Section 22 07 19 – Plumbing Piping Insulation.

C. Provide heat tracing on hot and tepid water piping as required in accordance with Section 22 05 33 – Heat Tracing for Plumbing Pipes.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Install domestic water piping in accordance with the requirements of Section 22 10 53 – Installation of Plumbing Piping.

B. Installation of hangers and supports shall be in accordance with Section 22 05 29 – Hangers and Supports for Plumbing Piping and Equipment.

3.03 FIELD TESTING / QUALITY CONTROL

A. Perform field testing and quality control of domestic water piping in accordance with the requirements of Section 22 10 63 – Testing of Plumbing Piping Systems.

3.04 STARTUP / DEMONSTRATION

A. All domestic water piping shall be disinfected before they are placed into service, as specified in Section 33 01 10.6, Disinfection of Piping, Tanks, Structures, and Equipment .

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used.

END OF SECTION

SECTION 22 13 16 – SANITARY WASTE AND VENT PIPING
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Contractor shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install sanitary waste and vent piping, and appurtenances complete with accessories.

B. The following index of this Section is presented for convenience:

Article	Title	Section Page
PART 1	GENERAL	1
1.01	Summary	1
1.02	Payment	1

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 09 91 00 – Painting.

B. Section 22 05 29 – Hangers and Supports for Plumbing Piping and Equipment.

C. Section 22 10 53 – Installation of Plumbing Piping.

1.04 REFERENCES

A. Standards referenced in this Section are listed below:

1. American Society of Sanitary Engineering, (ASSE).
2. The American Society of Mechanical Engineers (ASME).
   a. ASME A112.14.1, Backwater Valves
   b. ASME B16.29, Standard for Wrought Copper and Wrought Copper Alloy Solder-Joint Drainage Fittings – DWV.
3. American Society for Testing and Materials, (ASTM).
   a. ASTM A74, Specification for Cast-Iron Soil Pipe and Fittings.
   b. ASTM A518/A 518M, Specification for Corrosion Resistant High Silicon Iron Castings.
   c. ASTM A861, Specification for High Silicon Iron Pipe and Fittings.
   d. ASTM A888, Specification for Hubless Cast-Iron Soil Pipe and Fittings for Sanitary and Storm Drain, Waste and Vent Piping Applications.
   e. ASTM C564, Specification for Rubber Gaskets for Cast-Iron Soil Pipe and Fittings.
   f. ASTM D1785, Specification for Poly (Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80 and 120.
   g. ASTM D2665, Specification for Poly (Vinyl Chloride) (PVC) Plastic Drain, Waste and Vent Pipe and Fittings.
4. Cast-Iron Soil Pipe Institute, (CISPI).
   a. CISPI 310 Specification for Couplings for Use in Connection with Hubless Cast-Iron Soil Pipe and Fittings for Sanitary and Storm Drain, Waste and Vent Piping Applications.
   b. CISPI HSN, Specification for Neoprene Rubber Gaskets for Hub and Spigot Cast-Iron Soil Pipe and Fittings.
5. Federal Specifications, (FS).

6. National Sanitation Foundation (NSF).
   a. NSF 14: Plastic Piping System Components and Related Materials

1.05 DESCRIPTION

A. Not Used.

1.06 QUALITY ASSURANCE

A. Installer's Qualifications:

1. Engage a single installer regularly engaged in sanitary piping installation and with experience in the installation of the types of materials required; and who agrees to employ only tradesmen with specific skill and experience in this type of Work. Submit name and qualifications to Engineer.
2. Engage a single installer for the entire sanitary waste and vent piping system with undivided responsibility for performance and other requirements.

B. Regulatory Requirements: Comply with applicable provisions and recommendations of the following, except as otherwise shown or specified.

1. Local and State Building Codes and Ordinances.
2. Permits: Contractor shall obtain and pay for all required permits, fees and inspections.

C. Component Supply and Compatibility:

1. Obtain all equipment included in this Section regardless of the component manufacturer from a single sanitary waste and vent piping systems manufacturer.
2. The waste and vent piping systems manufacturer to review and approve or to prepare all Shop Drawings and other submittals for all components furnished under this Section.
3. All components shall be specifically constructed for the specified service conditions and shall be integrated into the overall assembly by the sanitary waste and vent piping systems manufacturer.

1.07 SUBMITTALS

A. Action Submittals: Submit the following:

1. Shop Drawings:
   a. 1/4 inch scale piping layouts, dimensioned to show length of piping runs, pipe sizes, support spacing and expansion provisions.
   b. Details of installation, including piping supports.
   c. Submit pipe schedule with laminate construction, sizes, thickness, vacuum pressure, weight per foot pressure, spans, joint type and flange data.
2. Product Data:
   a. Manufacturer's literature, illustrations, specifications and engineering data.
   b. Flexible connections.
   c. Other technical data related to the specified material and equipment as requested by the Engineer.
   d. Gasket material.

B. Informational Submittals: Submit the following:

1. Qualifications Statements:

a. Installer's Qualifications

1.08 DELIVERY, STORAGE, AND HANDLING

A. Packing, Shipping, Handling and Unloading:

1. Deliver materials to the Site to ensure uninterrupted progress of the Work. Deliver anchor bolts and anchorage devices, which are to be embedded in cast in place concrete, in ample time to prevent delay of the Work.

B. Storage of Materials:

1. Store materials to permit easy access for inspection and identification. Keep all material off the ground, using pallets, platforms, or other supports. Protect steel members and packaged materials from corrosion and deterioration.

2. Store all equipment in covered storage off the ground and prevent condensation and in accordance with the manufacturer's recommendations for long-term storage.

C. Acceptance at Site:

1. All boxes, crates and packages shall be inspected by Contractor upon delivery to the Site. Contractor shall notify Engineer, in writing, if any loss or damage exists to equipment or components. Replace lost equipment or components and repair damage to new condition, in accordance with manufacturer's instructions.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Cast-Iron Pipe:

1. Charlotte Pipe & Foundry Company

2. Tyler Pipe Company.

3. Or approved equal.

B. Steel Pipe and Fittings:

1. Mueller Industries

2. Wheatland Tube Co.
3. Or approved equal.

C. Floor Drains (FD-1):
1. Jay R. Smith, Fig. 2010-U-NB with A.R.E Coating.
2. Zurn Industries, Fig. Z-415S-P-VP with A.R.E Coating.
3. Or approved equal.

D. Floor Drains (FD-2):
1. Jay R. Smith, Fig. 2340-B-M with A.R.E. coating.
2. Zurn Industries, Fig. Z-521-Y with A.R.E. coating.
3. Or approved equal.

E. Cleanout Deck Plate:
1. Jay R. Smith, Fig. No. 4258C.
2. Zurn Industries, Fig. No. Z-1474.
3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Piping:
1. Cast-Iron Pipe:
a. Hub & Spigot Cast-Iron Soil Pipe and Fittings:
1) Pipe and Fittings: ASTM A 74.
2) Weight: Service Weight.
3) Joints:
b. Compression:
1) Gasket: Neoprene Rubber, ASTM C 564, CISPI HSN.
2) Lubricant: As recommended by pipe manufacturer.
c. Calked:
1) Lead: FS QQ C 40, Type I, Grade AA.
2) Jute Packing: FS HH P 117, Type I.
2. Hubless Cast-Iron Soil Pipe and fittings:
a. Pipe and Fittings: ASTM A 888 & CISPI 301
b. Joints: CISPI 310 & ASTM C 1277
3. Heavy duty hubless couplings: ASTM C1540

a. Gaskets: ASTM C 564

4. Steel Pipe and Fittings:

a. Pipe:

1) ANSI B125.2

2) ASTM/ANSI 1.20.1 (Threads)

3) Weight: Schedule 40

4) Finish: Galvanized.

5) Fittings: ANSI B16.12 recessed drainage pattern galvanized cast-iron, threaded so as to allow 1/8 inch or 1/4 inch per foot grade, as required.

B. Floor Drain (FD-1).

1. Materials:

a. Body: Enameled cast iron.

b. Collar: Cast-iron, reversible, threaded for strainer heads, enamel coated.

c. Strainer Head: Square 8-inch by 8-inch nickel bronze grate with bronze body, heel proof grate, and vandal proof screws.

d. Grate: Ductile iron, 11-1/2-inch diameter.

2. Outlet Connection: Bottom outlet, calk or no-hub, as required

3. Trap primer connection on body with thread to solder adapter, as required.

C. Floor Drain (FD-2)

1. Materials:

a. Body: Enameled cast-iron.

b. Collar: Enameled cast-iron.

c. Top: Enameled cast-iron adjustable.

d. Grate: Ductile iron, 11-1/2-inch diameter.

e. Accessories: Sediment bucket.

f. Rating: Heavy-duty.

2. Outlet Connection: Bottom outlet, calk or no-hub, as required.

3. Trap primer connection on body with thread to solder adapter, as required.

D. Cleanouts:

1. Cleanout Deck Plate (FCO):

a. Materials: Cast-iron body, flanged housing, cast-iron cover with fitting device.

1) Outlet Connection: Calk outlet.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. All piping and accessories shall be painted in accordance with the requirements of Section 09 91 00– Painting.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 INSTALLATION

A. Install domestic water piping in accordance with the requirements of Section 22 10 53 – Installation of Plumbing Piping.

B. Installation of hangers and supports shall be in accordance with Section 22 05 29 – Hangers and Supports for Plumbing Piping and Equipment.

C. Material Schedule:

1. Use types of pipe and fittings as specified below, unless otherwise specified or shown.

2. All exposed gravity sanitary waste and vent piping 1-1/2-inches and larger run within the interior of a building shall be no-hub cast-iron.

3. All gravity sanitary waste and vent piping 1-1/2-inches and larger located in concrete slabs or underground to exterior limits as shown shall be service-weight cast-iron soil pipe with hub-and-spigot fittings.

3.03 FIELD TESTING / QUALITY CONTROL

A. Test sanitary waste and vent piping in accordance with Section 22 10 53 – Installation of Plumbing Piping.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Not Used.

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 09 91 00 - Painting.

1.04 REFERENCES

A. Standards referenced in this Section are:

1. ASME Boiler and Pressure Vessel Code.

2. ASME/ANSI Z21.22, Relief Valves for Hot Water Supply Systems.
3. NSF/ANSI 61, Drinking Water System Components – Health Effects.
4. NSF/ANSI 372, Drinking Water System Components – Lead Content
5. UL 1453, Electric Booster and Commercial Storage Tank Water Heaters.

1.05 DESCRIPTION

A. Not Used.

1.06 QUALITY ASSURANCE

A. All products are to be certified NSF 61 and NSF 372 lead-free, all electrical components are to be UL Listed for specific use, and all systems are to be third-party certified to all applicable equipment standards.

B. Qualifications:

1. Manufacturer: Shall have minimum of five years experience producing equipment substantially similar to that required, and shall be able to document evidence of at least five installations in satisfactory operation for at least five years each.

C. Component Supply and Compatibility:

1. Obtain each type of domestic water heater equipment included in this Section, regardless of component manufacturer, from one domestic water heater equipment manufacturer.
2. Each domestic water heater manufacturer shall review and approve, or shall prepare, all Shop Drawings and other submittals for components furnished under this Section for the particular equipment type.
3. Materials and equipment shall be suitable for the required service conditions and shall be integrated into each assembly by the associated domestic water heater manufacturer.

D. Regulatory Requirements: Comply with Laws and Regulations, including the following.

1. Local and State Building Codes and Ordinances.

1.07 SUBMITTALS

A. Action Submittals: Submit the following:

1. Shop Drawings:
   a. Schedule of domestic water heaters for the Project, indicating for each the installation location, model or type, and other distinguishing information.
   b. Drawings showing fabrication methods, assembly, accessories, and installation details.

c. Detailed drawings of each equipment item's and component's wiring diagrams.

d. Detailed installation drawing of each individual component showing:

1) Mounting requirements.

2) Item locations, such as in a panel, installed on floor, or elsewhere.

3) Piping and wiring connections labeled and coded.

4) Data sheets.

e. Detailed description of each component.

2. Product Data:

a. Manufacturer's literature, illustrations, specifications, weight, dimensions, required clearances, materials of construction, and performance data for all equipment.

B. Informational Submittals: Submit the following:

1. Manufacturer's Instructions:

a. Special shipping, storage and protection, and handling instructions.

b. Installation data for the equipment, including setting drawings, templates, and directions for installing anchorage devices.

2. Source Quality Control Submittals:

a. Submit results of required factory tests and inspections.

3. Qualifications Statements:

a. Manufacturer, when submittal of qualifications is required by Engineer.

C. Closeout Submittals: Submit the following:

1. Operations and Maintenance Data:

a. Submit in accordance with Section 01 78 23, Operations and Maintenance Data.

b. Include maintenance data and schedules, description of operation, wiring diagrams, and list of spare parts recommended for one year of operation with current price list.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Packing, Shipping, Handling, and Unloading:

1. Deliver materials and equipment to Site to ensure uninterrupted progress of the Work. Deliver anchorage materials to be embedded in concrete in ample time to prevent delaying the Work.

2. Comply with Section 01 65 00 - Product Delivery Requirements.

B. Storage and Protection:

1. Store materials and equipment in covered storage off the ground and prevent condensation and in accordance with the manufacturer's recommendations for long-term storage.

2. Comply with Section 01 66 00 - Protection of Materials and Equipment.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Electric Water Heater (EHW-1)

1. A.O. Smith, Model DVE-120.

2. Lochinvar Corporation, Model No. HST 12-119.

3. Or approved equal.

B. Vacuum Breakers:

1. Watts LFN36, Vacuum Relief Valve.

2. Cash Acme, VR-801, Lead-Free

3. Or approved equal.

C. Pre-Pressurized Expansion Tank:

1. Amtrol, Incorporated, Therm-X-Trol, ST Series.

2. Watts Regulator, Model DET.

3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Electric Water Heater (EWH-1)

1. Heater Type: Electric with UL label.

2. Service Conditions:

a. Nominal Capacity: 119 gallons.

b. Minimum Recovery Rate:

1) TI-010 Chlorination Facility 98 gallons per hour at 100 degrees F water temperature rise.

2) TI-010 Dechlorination Facility: 50 gallons per hour at 100 degrees F water temperature rise.

3) TI-011 Disinfection Facility: 98 gallons per hour at 100 degrees F water temperature rise.

c. Working pressure: 150 psig.

3. Heater Style: Standard vertical.

4. Materials:

a. Tank: Welded steel.

b. Tank Lining: Glass-lining, fired to a minimum temperature of 1,400 degrees F.

c. Outer Shell: Steel with baked enamel finish.

d. Insulation: Polyurethane foam.

e. Cathodic Protection Anode: High-density magnesium.

f. Water Connections: Brass.

g. Base and Legs: Steel or cast-iron.

5. Heaters shall not have:

a. Sharp edges.

b. Scratches on enameled surfaces.

c. Loose fasteners.

d. Loose panels.

e. Dents on outer jacket.

6. Electric Heat Source:

a. Heating Element and Operation: Immersion type.

1) TI-010 Chlorination Facility: 24 KW element.

2) TI-010 Dechlorination Facility: 13.5 KW element.

3) TI-011 Disinfection Facility: 24 KW element.

b. Heating Elements: Heavy-duty with incoloy sheaths and ceramic terminal blocks.

c. Power Supply:

1) TI-010 Chlorination Facility: 480-volt, three-phase, 60 Hertz.

2) TI-010 Dechlorination Facility: 208-volt, three-phase, 60 Hertz.

3) TI-011 Disinfection Facility: 208-volt, three-phase, 60 Hertz.

7. Controls:

a. Fused transformer for 120-volt control circuit power.

b. Thermostat: Immersion type. 110 degrees F to 170 degrees F adjustable water temperature range, set at 140ºF.

c. Element operation shall be simultaneously switched through individual magnetic contactors.

d. Manual reset high temperature cut-off. High limit energy cut-off to interrupt electrical current in event water inside heater tank exceeds 200 degrees F.

e. Local power disconnect switch to be provided under Division 26, Electrical.

8. Water Connections: 1-1/4 inch diameter inlet and outlet pipe nipples for connections to water piping system.

9. Drain Valve: Manufacturer's standard drain valve on front at tank bottom or lower side to completely drain tank.

10. Source Quality Control: Perform hydrostatic test on tank at the factory at 300 psi. Duration of test shall be the manufacturer's standard. Criteria for acceptance: Zero leakage.

11. Standards: Comply with UL 1453, NSF 61, NSF 372, and ASHRAE 90.1.

B. Accessories:

1. Temperature and Pressure Relief Valve: Provide one of the following on each storage-type water heater unit furnished:

a. Valve: Temperature and pressure relief valve in accordance with ASME/ANSI Z21.22.

b. Capacity and size of valve to relieve heater capacity at specified temperatures and pressure setting of domestic water heater tank.

c. Settings:

1) Temperature Relief Setting: 210 degrees F.

2) Pressure Relief Setting: 150 psig.

2. Cathodic Protection for Water Heaters with Tanks: Provide rigidly-supported anode rods in heater tank.

3. Vacuum Breakers: Provide one for each storage-type water heater furnished.

4. Pre-Pressurized Expansion Tank: Provide where shown or indicated on the Drawings:
   a. Type: Diaphragm type pre-pressurized expansion tank designed for potable hot water systems.
   b. Service Conditions:
      1) Tank Volume: 4 gallons
      2) Maximum Working Pressure: 125 psig.
      3) Maximum Working Temperature: 200 degrees F.
   c. Construction:
      1) Shell: Welded carbon steel.
      2) Diaphragm: Heavy-duty butyl rubber or comparable material for intended service. Schrader valve tapping.
      3) Heads: Dished.
      4) Polypropylene-lined water reservoir.
   d. Factory Charge: Precharged to 40 psig.
   e. Finish: Factory-applied primer coat, to be compatible with required field painting specified in Section 09 91 00, Painting.
   f. Standards: Equipment shall be listed in NSF/ANSI 61.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Factory-paint ferrous surfaces in accordance with Section 09 91 00 – Painting. Do not paint enameled surfaces, stainless steel, brass, chrome-plated, and other finished surfaces.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. All equipment shall be completely manufactured and pre-assembled in accordance with applicable reference standards indicated in this Section. Perform the following tests and inspections at factory before shipment:
   1. For each assembled unit, test and inspect equipment in accordance with UL requirements.
   2. Test and inspect in accordance with ASME Boiler and Pressure Vessel Code.
   3. Perform hydrostatic testing tanks as required in this Section for individual equipment items.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Examine conditions under which materials and equipment will be installed and notify Engineer in writing of conditions detrimental to proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions are corrected.

3.02 INSTALLATION

A. General:

1. Thoroughly clean materials, equipment, and accessories prior to installation.

2. Install items as in accordance with the Contract Documents, Laws and Regulations, manufacturer's recommendations, and good practice. Obtain interpretation from Engineer if manufacturer's instructions or Laws or Regulations conflict with the Contract Documents.

3. Do not modify structures or facilities to facilitate installation of equipment without approval of Engineer.

4. Provide each domestic water heater with shut off valves for required water supplies.

3.03 FIELD TESTING / QUALITY CONTROL

A. Site Tests:

1. Engineer shall witness field tests.

2. Fill all systems and verify that equipment, valves, and appurtenances operate successfully and in accordance with the Contract Documents.

3. Check for excessive vibration while systems are operating.

4. For materials and equipment that do not successfully pass field tests, make repairs or modifications and retest until acceptable results are achieved.

B. Manufacturer's Services: Provide a qualified, factory trained serviceman to perform the following:

1. Supervise installation of equipment.

2. Instruct Contractor in installing equipment.

3. Inspect and adjust equipment after installation and ensure proper operation.

4. Instruct operations and maintenance personnel in operation and maintenance of the equipment.

5. Manufacturer's technician shall make visits to the Site as follows:

a. First visit shall be for instructing Contractor in proper equipment installation, and assisting in installing equipment. Minimum number of hours on-Site: 2 hours.

b. Second visit shall be for checking completed installation, start-up of system; and performing field quality control testing. Minimum number of hours on-Site: 2 hours.

c. Third visit shall be to instruct operations and maintenance personnel.

1) Furnish services of manufacturer's qualified, factory-trained specialists to instruct DEP's operations and maintenance personnel in recommended operation and maintenance of equipment.

2) Training requirements, duration of instruction, and qualifications shall be in accordance with Section 01 79 23, Instruction of Operations and Maintenance Personnel.

3) Number of hours on-Site shall be in accordance with Section 01 79 23, Instruction of Operations and Maintenance Personnel.

d. Technician shall revisit the Site as often as necessary until installation is acceptable.

6. All costs, including allowable expenses for travel, lodging, meals and incidentals, and cost of travel time, for visits to the Site shall be included in the Contract Price.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjusting:

1. Adjust controls for proper settings.

2. While system is operable, balance all equipment, including valves, appurtenances, and similar equipment, to achieve specified service conditions.

3. Adjust thermostats to desired water outlet temperature.

B. Cleaning:

1. Upon completion of the Work, remove all non-permanent labels, and remove dirt, grease, markings, and other objectionable matter from equipment.

2. In preparation for painting, remove dirt, rust, dust, and objectionable materials from materials and equipment.

END OF SECTION

7.	New York City Building Code.	

1.05 DESCRIPTION

A. This Section includes requirements for providing plumbing fixtures in accordance with applicable standards and regulations. In addition:

1. Plumbing fixtures shall be furnished complete with all accessories, attachments, fastenings, and other appurtenances as specified and/or as may be required for a satisfactory installation.

2. Plumbing fixtures shall be of the water conservation type and shall conform to the requirements of the New York City Building Code.

B. All plumbing fixtures are to be white vitreous china unless otherwise specifically noted. Where enameled iron fixtures are specified, they shall be furnished with acid resisting enamel.

1.06 QUALITY ASSURANCE

A. The Work shall be performed by a New York City licensed plumber.

B. All plumbing fixtures and fittings proposed shall be one of a single manufacturer and of similar character in any room or location; escutcheons, handles, etc., on the different fixtures shall be of the same design.

C. All plumbing fixtures shall be "First Quality" as defined and set forth in Commercial Standard CS77-28 as promulgated by the U.S. Department of Commerce.

D. Plumbing fixtures shall be as efficient as those fixtures that have been tested to perform satisfactorily for at least two (2) years.

E. All wall hung fixtures shall be adequately supported from the floor with fixture support carriers. Floor mounted fixtures shall be installed as per manufacturer instructions.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

a. Provide catalogue cuts of all plumbing fixtures, showing: sizes, rough-in dimensions, utility sizes, faucets, drains, carriers, flush valves, trim and finishes, and any electrical requirements.

b. Complete assembly, layout required clearances, and installation drawings, all with clearly marked dimensions.

c. Provide a list of manufacturer's recommended special tools and spare parts to be supplied.

d. Operation and Maintenance Manuals: Submit operation and maintenance manuals for plumbing fixtures, faucets, drains, mixing valves, flush valves, carriers, assembly of parts list for flush valves, signage, emergency equipment and electric water coolers as required in accordance with the Contract Documents.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. The cleaning, preservation and packing of the plumbing fixture for shipment shall be in accordance with the manufacturer's commercial practice subject to the approval of the Engineer.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. Plumbing fixture shall be handled in such a manner that they may be transported and unloaded without being over-stressed, deformed or otherwise damaged.

2. Plumbing fixture shall be protected from corrosion and deterioration, and plumbing fixtures shall be stored in a dry area.

a. Plumbing fixtures stored outdoors shall be supported above ground surfaces on wood runners and protected with effective and durable waterproof covers approved by the Engineer.

3. Plumbing fixture interiors shall be kept free from dirt and foreign matter.

4. Plumbing fixtures shall be properly protected from damage during construction, and shall be cleaned in accordance with manufacturer's instructions prior to installation.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall provide spare parts and special tools necessary to service, disassemble, repair and adjust the products provided under this Section, and as per the requirements of the Contract Documents.

B. Tools: Provide standard and special tools as well as supplies necessary to service, disassemble, repair, and adjust the products.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer’s standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Service Sinks (Item No. SS-1):

1. Model K-6716-0, as manufactured by Kohler Company, Kohler, WI;

2. Model 7695.008, as manufactured by., American Standard, Piscataway, NJ;

3. Or approved equal.

B. Emergency Eyewash and Showers:

1. Emergency Shower and Eyewash (Corrosion Resistant): EES-1:

a. Model No. 8336, as manufactured by Haws Drinking Co., Lane Sparks, NV,;

b. Model No. SE-690-PVC as manufactured by Speakman Co., New Castle, DE,;

c. Or approved equal.

2. Emergency Shower and Eyewash Station (Freezeproof): EES-2:

a. Model SE-7000 as manufactured by Speakman Co., New Castle, DE,

b. Model 8317 Top Connection as manufactured by Haws Drinking Faucet Co., Lane Sparks, NV;

c. Or approved equal.

3. Emergency Shower and Eyewash Station (Freezeproof): EES-3:

a. Model SE-7001 as manufactured by Speakman Co., New Castle, DE,

b. Model 8317-Bottom Connection as manufactured by Haws Drinking Faucet Co., Lane Sparks, NV;

c. Or approved equal.

4. Flow Switches, Audible and Visible Alarms:

a. Haws Drinking Co., Lane Sparks, NV;

b. Speakman Co., New Castle, DE;

c. Or approved equal.

5. Safety Valve Lockout with Padlock:

a. Akron, Safety Products, Inc., Akron, OH;

b. Brady USA, Inc., Milwaukee, WI;

c. Or approved equal.

6. Freeze Protection Valves:

a. Model SP158A as manufactured by Haws Drinking Faucet Co. Lane Sparks, NV;

b. Speakman Company, New Castle, DE;

c. Or approved equal.

7. Scald Protection Valves:

a. Model SP157A as manufactured by Haws Drinking Faucet Co., Lane Sparks, NV;

b. Speakman Company, New Castle, DE;

c. Or approved equal.

C. Emergency Shower and Eyewash Station Tempering Valves (TWMV-1):

1. Exposed:

a. Haws Corporation, Model No. TWBS.HF

b. Leonard Valve Co, Model TM-800

c. Or approved equal.

D. Hose Reels:

1. Croker-Standard, Fig. No. 7025.

2. Potter Roemer, Incorporated, Fig. No. 2838.

3. Or approved equal.

E. Hose Nozzles:

1. Croker-Standard, Fig. No. 3477.

2. Potter Roemer, Incorporated, Fig. No. 2959.

3. Or approved equal.

F. Hose:

1. Croker-Standard, Fig. No. 7037 with brass coupling for non-collapsible hose.

2. Potter Roemer, Fig. No. 2852 hose with Fig. No. 2862 coupling.

3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Fixtures shall be equipped with appurtenances such as traps, faucets, stop valves, and drain fittings.

1. Each fixture and piece of equipment requiring connections to the drainage system shall be equipped with a trap.

2. Faucets shall have chrome plated flexible tube risers with loose key operated shutoff valves.

3. All exposed traps shall be cast brass swivel chromium plated, grounded joint, and with cleanout.

4. Polished chromium-plated pipe, valves, and fittings shall be provided where exposed to view.

B. Brass expansion or toggle bolts capped with acorn nuts shall be provided for supports.

C. Service Sinks (SS-1):

1. Type: Wall mounted, enameled cast iron sink.

2. Accessories:

a. Faucet with vacuum breaker shall be equal to Kohler Co. brand spill resistant vacuum breaker shall be closed by ambient air pressure when water flow is off.

b. Wall carrier shall be equal to WATTS® brand, 3-bolt floor mounter service sink carrier with epoxy coated steel uprights, welded feet, and cast iron fitting.

c. P-Trap shall be equal to Kohler Co. brand polished chrome P-Trap with adjustable rotation and slit joint inlet with cleanout plug and strainer.

d. Rim guard shall be equal to Kohler Co. brand stainless steel coated wire.

e. Fitting shall be wall mounted, mixing faucet type with integral stop, vacuum breaker, pail hook, and adjustable top brace. Finish shall be polished chrome.

D. Emergency Eyewash and Showers:

1. Emergency Shower and Eyewash: EES-1:

a. Type: Wall Mounted corrosion resistant emergency shower and eyewash station.

b. Materials:

1) Shower:

a) 9-in. diameter cycolac plastic shower head.

b) 1½-in. stay-open stainless steel ball valve.

c) 24-in. rigid pull rod.

2) Eye/Face-Wash:

a) Cycolac bowl.

b) Twin Buna-N covered ABS heads.

c) Stainless steel ball valve, stay open type.

3) Pipe:

a) All PVC parts shall be Schedule 80.

b) Painted green with bright yellow marking.

4) Supply: 1¼-in. PVC.

c. Anchor water supply to construction.

d. Shower and eyewash must conform to ANSI Z358-1-1998 standards.

2. Emergency Shower and Eyewash Station-Freeze-proof–Top Inlet: EES-2:

a. Emergency Shower:

1) Type: Thru-wall freeze-proof emergency shower station with inlet on top.

2) Materials:

a) Shower: Rough chrome plated brass.

b) Valve: Instant-open ball valve with large push-type plate. Valve remains open until manually closed. Extension shaft for valve handle designed to operate through 15-in wall.

c) Supply: 1¼-in. IPS with inlet on top.

d) Stainless steel pipe clamp and wall support with stainless steel rod.

e) Finish: Corrosion resistant coating.

b. Eye Wash:

1) Type: Thru-wall freeze proof emergency eyewash station.

2) Materials:

a) Receptor: Corrosion resistant stainless steel.

b) Heads: Buna-N covered ABS plastic designed to direct steady flow of water to eyes and ocular area of face.

c) Valve: Instant-open ball valve with large push type plate. Extension shaft for valve handle to operate through wall.

d) Wall Mounting: Bracket to be included.

e) Supply: ¾-in. IPS.

f) Waste: 1½-in. IPS tailpiece, spill onto floor, chrome plated.

g) Finish: Corrosion resistant coating.

3. Emergency Shower and Eyewash Station-Freeze-proof-Bottom Outlet EES-3:

a. Emergency Shower:

1) Type: Thru-wall freeze-proof emergency shower station with inlet at bottom.

2) Materials:

a) Shower: Rough chrome plated brass.

b) Valve: Instant-open ball valve with large push-type plate. Valve remains open until manually closed. Extension shaft for valve handle designed to operate through 15-in wall.

c) Supply: 1¼-in. IPS with inlet on bottom.

d) Stainless steel pipe clamp and wall support with stainless steel rod.

e) Finish: Corrosion resistant coating.

b. Eye Wash:

1) Type: Thru-wall freeze proof emergency eyewash station.

2) Materials:

a) Receptor: Corrosion resistant stainless steel.

b) Heads: Buna-N covered ABS plastic designed to direct steady flow of water to eyes and ocular area of face.

c) Valve: Instant-open ball valve with large push type plate. Extension shaft for valve handle to operate through wall.

d) Wall Mounting: Bracket to be included.

e) Supply: ¾-in. IPS.

f) Waste: 1½-in. IPS tailpiece, spill onto floor, chrome plated.

g) Finish: Corrosion resistant coating.

4. Flow Switches, Audible and Visible Alarms:

a. Type:

1) Single pole double throw.

2) NEMA 4X.

3) UL listed paddle type flow switch.

4) Contacts to be rated for 5 amps at 120 vac.

b. Emergency flow switch equipment shall be nominal 120 vac, 1 phase, 60 Hz electrical service, in accordance with Section 26 29 13 - Enclosed Controllers.

c. Flow switches shall only be furnished by emergency shower and eyewash manufacturer for each shower and/or eyewash station to ensure compatibility of flow switch operating in conjunction with shower or eyewash operation or operation of both units. If flow switch is not furnished by shower and eyewash manufacturer the Contractor shall assume complete responsibility for the proper operation of the flow sensing of the eyewash and shower units which shall include all additional conduit, wire and appurtenances, operation of flow switches shall be as stated below.

d. Flow switches shall sense flow for either showers and eyewashes. Flow switches shall be full line size so as not restrict water flow in order to detect flow. Provide a separate flow switch for each shower and each eyewash, if required, at each shower and eyewash station.

e. Alarms shall be activated by flow switch when emergency equipment is in operation. Audible alarm shall be intermittent signal rated at 85 Db at 10 ft. Light shall be red flashing. Alarm voltage shall be 110 vac, 60 Hz.

5. Safety Valve Lockout with Padlock:

a. Heavy duty plastic, dielectric and chemical resistant valve lock.

b. Padlock with unique serial number, hardened steel shackle, two brass keys with matching serial numbers for each padlock.

6. Anti-Freeze and Anti-Scald Valves:

a. Type: Anti-freeze valve provides freeze protection and bleeds valve to flush water through line when internal temperature drops below 35°F and closes when the line temperature reaches 45°F. Anti-scald valve provides scald protection and bleeds valve whenever internal temperature rises above 100°F and closes when line temperature drops to 85°F.

E. Emergency Shower and Eyewash Station Tempering Valves:

1. The Emergency Shower Tempering Valve shall employ two fully independent control mechanisms which split the flow in half, blend each half to the design temperature and then integrate each stream at the outlet. The valve shall control outlet temperature over a wide range of flow and shall be suitable for deluge shower or eyewash applications. The valve shall include three thermometers to measure the temperature of each stream and the merged flow. Temperature adjustment shall be vandal resistant.

2. Each independent control mechanism shall employ a liquid filled thermostatic motor to drive the valve without additional power a stainless steel sliding piston control device with reverse seat closure and both fixed and variable cold water bypass.

3. In the event of interruption of the cold water supply, each control mechanism closes off the hot water port, stopping all flow.

4. In the event of interruption of the hot water supply, each control mechanism shall allow cold flow through both the fixed and variable by pass.

5. In the event that one liquid motor fails, the control mechanism closes off the hot water port with the reverse sat and fully opens the internal variable bypass to allow cold water flow. The other control mechanism will be unaffected by the failure and will maintain design temperature.

6. Maximum Inlet Pressure: 125 psig.

7. Maximum Inlet Temperature: 180ºF.

8. Recommended Inlet Temperature: 140ºF.

9. Connections: 1¼-in. NPT.

10. Capacity: 60 gpm at 30 psig.

11. Temperature Range: 70º to 100ºF.

12. Set Point: 80ºF.

F. Hose Reels:

1. Type: Continuous flow hose reel.

2. Materials:
   a. Rims: Tubular steel, welded.
   b. Spokes: 3/8-inch diameter steel rods.
   c. Frame: Heavy steel bar frame.
   d. Drum: Galvanized steel.
   e. Finish: Baked enamel.
   f. Connections: One-inch inlet and outlet.
   g. Threads: One-inch N.S.T.

G. Hose Nozzles:
1. Materials:
   a. Body: Lexan.
   b. Stem: Brass.
   c. Bumper: Rubber.
2. Threads: One-inch N.S.T.
3. Nozzle: Adjustable fog nozzle, capable of complete shut-off, solid straight stream, or any degree of solid conical fog.

H. Hose:
1. Type: Double braided synthetic hose for use with continuous flow reels to permit flow while hose is coiled on reel. Couplings shall connect to hose nozzle threads and male hose outlet threads on hose reel.
2. Threads: One-inch N.S.T.
3. Hose Size: One-inch.
4. Length: One continuous length as shown with no intermediate couplings.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Inspection:
1. All plumbing fixtures and other related materials shall be inspected for chips, cracks, dents and other flaws. Only items free from defects shall be installed in the work. All fixtures shall be furnished with all necessary

supports, hangers, brackets, etc., for the proper installation of the fixtures. Such supports, etc., shall be in accordance with the manufacturer's recommendations.

2. No fixture will be accepted that shows cracks, blisters, thin spots, or other flaws.

B. Contractor shall install all Work in complete accordance with the manufacturer's instructions and recommendations, and the approved Shop Drawings.

1. Contractor shall not install damaged items until repairs are made in accordance with manufacturer's written instructions and approval by Engineer. Only minor repair work will be permitted in the field. All damaged items requiring remedial work shall be returned to the manufacturer for repair or replacement.

C. Interface with Other Products:

1. Review millwork shop drawings.

2. Confirm the location and size of fixtures and openings before rough-in and installation.

3.02 INSTALLATION

A. Install plumbing fixtures as shown on the Contract Drawings. The Contract Drawings are generally diagrammatic and installation of the plumbing fixtures in the allotted spaces shall be verified.

B. General Installation Requirements:

1. Install fixtures in complete accordance with the manufacturer's printed instructions and the approved shop drawings.

2. Fixtures requiring hot and cold water shall have the cold water faucet on the right hand side of the fixture and the hot water faucet on the left hand side of the fixture. Each fixture shall have shut off valves or stops for hot and cold water.

3. Each fixture shall be separately trapped.

4. Pipe openings shall be closed with caps or plugs during installation. Fixtures shall be tightly covered and protected against dirt, water, chemicals and mechanical injury.

5. Plated or polished fittings, pipes and appliances shall be coated with protective material immediately after installation.

6. Confirm location, size of fixtures and openings before installation.

7. Layout fixtures as indicated on the drawings.

8. Carefully install fixtures in accordance with manufacturer's data with sufficient clearances to coordinate with accessories, specialties and equipment specified in other divisions of these specifications and/or as shown on the drawings.

9. Hangers and carriers shall be installed in accordance with manufacturer's recommendations and in accordance with good practice and workmanship.

10. Upon completion of the work, all labels shall be removed, fixtures and trim shall be cleaned of all dirt, grease and markings and all valves properly adjusted.

11. Clean all exposed metal surfaces from grease, dirt, paint or other foreign material.

12. Fixtures shall be properly protected from damage during construction and shall be cleaned in accordance with manufacturer's instructions.

13. Fixtures, chrome-plated piping, fittings and trim shall be polished before requesting acceptance of the system.

14. All exposed valves and trim shall be chrome plated.

15. The entire plumbing installation shall be in accordance with best standard practice and in conformance with the plumbing ordinances in the Building Code of the City of New York.

C. Fixture Heights:

1. The Contractor shall install fixtures to the heights above finished floor as specified, herein below. Installation of fixtures for use by the physically handicapped shall be in accordance with ANSI/CABO A117.1.

a. Emergency Shower and Eyewash:

1) Emergency shower 84 in. to bottom of shower head.

2) Emergency eyewash 38 in. to receptor rim.

D. Fixture Rough-In :

1. The following table, Table 22 40 00-1, Fixture Rough-In Schedule, indicates the minimum size of run out piping that shall be provided to the fixtures.

TABLE 22 40 00-1
FIXTURE ROUGH-IN SCHEDULE

Fixtures	Hot Water	Cold Water	Waste	Vent
Service Sink	½-in.	½-in.	3-in.	2-in.

3.03 FIELD TESTING / QUALITY CONTROL

A. Contractor shall verify that all work furnished and installed conforms to the requirements the Contract Documents.

3.04 STARTUP / DEMONSTRATION

A. Disinfection:

1. Prior to placing the potable water systems in service, they shall be disinfected in accordance with AWWA Standard C601, Section 33 01 10.60 – Disinfection of Piping, Tanks, Structures, and Equipment, and any additional requirements prescribed by the applicable public health authorities having jurisdiction.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjusting:

1. Upon completion of the installation, the Contractor shall adjust all fixtures for their intended use.

2. The Contractor shall operate each fixture to ensure their performance without splashing, noise or overflow.

B. Cleaning:

1. The Contractor shall thoroughly clean all surfaces of the installed fixtures and polish all chromed surfaces.

2. Clean Work as specified in the Contract Documents.

C. Protection of Finished Work:

1. Protect finished Work as specified in Contract Documents.

2. Fixture Use: Do not permit use of fixtures.

END OF SECTION

SECTION 23 05 93 – TESTING, ADJUSTING, AND BALANCING FOR HVAC
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified, and required to perform testing, adjusting and balancing of all Heating, Ventilation, and Air Conditioning Systems, as specified and/or required for proper operation.

B. The following index of this Section is presented for convenience:

1.05 DESCRIPTION

A. This Section includes requirements for the testing, adjusting, and balancing for HVAC Systems. In addition:

1. HVAC equipment shall be completely installed and in continuous operation as required to accomplish the test, adjust, and balance work specified.
2. Reports shall be certified by the testing engineer that the methods used and the results achieved are as specified.
3. Should corrective measures caused by faulty installation require retesting, adjusting and balancing, such work shall be performed at no additional expense to the City.

1.06 QUALITY ASSURANCE

A. Balancers Qualifications:

1. Balancer shall have certification by NEBB, AABC, or SMACNA, or demonstrate that the standards and experience required for certification are possessed, all to the satisfaction of the Engineer.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited, to:

1. Action Submittals:

a. Contractor shall submit one (1) copy of the standard procedure manual, published by the TAB organization affiliated with the Contractor, to the Engineer for his records.

b. Prior to testing all systems, the Contractor shall submit a test procedure for each and every system to undergo TAB as part of the Work.

c. Report Forms:

1) Submit specimen copies of report forms for Engineer's approval.

2) Forms shall be 8½-in. × 11-in. paper for loose leaf binding, with blanks for listing of the required test ratings and for certification of report.

3) Reports shall be on the organization’s approved forms imprinted with the company's name.

4) Certified report outlining procedure used to balance the system and the types of measuring devices used.

d. Test results shall be submitted on approved forms in a typed format.

e. Submit certified copies of required test reports to the Engineer for approval.

B. Information Submittals:

1. Data Sheets:

a. Submit samples of data sheets on each item of equipment for approval.

b. Submit data sheets on each item of testing equipment required.

c. Include name of device, manufacturer's name, model number, latest date of calibration, and correction factors.

2. Balancer's Qualifications:

a. Submit work experience or resume of proposed biographical data on employee who will directly supervise the TAB Work.

b. Licenses held by the balancer.

c. Submit a record of at least five (5) years' experience in the testing and balancing contracting industry, engaged in HVAC work, including but not limited to:

1) Names of projects.

2) Approximate contract cost of the TAB Work.

3) Amount of area that was tested, adjusted, and balanced for each project.

1.08 DELIVERY, STORAGE, AND HANDLING

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. Not Used

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Not Used

2.02 MATERIALS / EQUIPMENT

A. Instruments:

1. General:

a. Contractor shall provide all necessary instrumentation, tools, ladders, etc. to complete all air and hydronic balancing tests and adjustments.

b. Instrumentation shall be in accordance with NEBB, AABC, or SMACNA requirements and shall be calibrated to the accuracy standards demanded by these organizations.

c. Flow-measuring hoods (manufactured, not fabricated) shall be acceptable for measurement of ceiling diffuser performance only.

d. Contractor shall assume full responsibility for safe keeping of all instrumentation during the course of work.

B. Air balance instruments:

1. Provide all velometers, anemometers, pitot tubes, differential air pressure gages, manometers, hook gages, static pressure probe units, etc. as may be required to perform all air balance tests of HVAC equipment, ducts, registers, grilles, etc.

C. System performance measuring instruments:

1. Provide insertion thermometers, sling psychrometers, tachometers, revolution counters, clamp-on volt-ammeter recorders, and other instruments as required to measure all facets of the complete HVAC system performance.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Not Used

3.02 IMPLEMENTATION

A. General:

1. All TAB of air systems shall be performed in compliance with the standard procedure manual published by the TAB organization affiliated with the Contractor and submitted to the Engineer for approval as specified herein. Contractor shall be solely responsible for the protection and safeguarding of his work and shall provide every protection against accidents, injury, and damage to persons and property.
2. Contractor shall keep dust, dirt, and debris to an absolute minimum and reinstall all removed ceiling components to their original positions at the end of each day.
3. Contractor shall be fully responsible for removal and reinstallation of ceiling system and replacement of any component damaged.
4. Contractor shall install additional access panels at no extra cost to the City, as is required to gain access to equipment concealed above ceilings, behind walls, or any other concealed space.
5. Air systems shall be tested, adjusted, and balanced with clean filters.

B. Inspection:

1. The Contractor shall conform to the requirements of this Contract Equipment Check:
   a. Verify proper overload heater sizes.
   b. Verify function of safety and operating controls.
   c. Verify proper operation of equipment.
   d. Report on inspection, observation and checking procedures.

C. Testing of Piping, Equipment, and Duct:

1. General:
   a. The Contractor shall be bound by this Section to test and adjust all systems and accessories covered under this Contract.
   b. The Contractor shall also comply with the requirements of testing as outlined in the individual sections.
   c. Furthermore, the Contractor shall operate and maintain these systems as per the requirements of the Contract Documents, and shall leave them in good working order.

d. The Contractor shall provide all necessary equipment and labor for this work.

2. Refrigerant piping must be tested before any piping is insulated or concealed.

   a. The entire refrigerant circuit must be thoroughly tested to be sure that it is absolutely tight.

   b. The system shall be tested with oil pumped, dry nitrogen.

   c. The low side of the system shall be tested at 150 psig and the high side at 300 psig.

   d. All pipe joints shall be tapped sharply with a rubber mallet and tested for leaks with a soap solution.

   e. After all leaks have been repaired, the system shall be charged with a small quantity of refrigerant and the entire system shall be checked with a halide leak detector.

   f. Once the system is found tight, it shall be allowed to stand for six (6) hours with the pressure on.

   g. If any pressure drop occurs, except those due to changes in ambient temperature, the entire system shall be retested.

   h. The system shall be evacuated with a vacuum pump until vacuum of 2.5 mm Hg is achieved.

   i. Under no circumstances shall the compressor be used to evacuate the system.

   j. After evacuation, the system shall be allowed to stand for twelve (12) hours.

   k. If no noticeable rise in pressure occurs, the system shall be charged.

3. All ductwork systems including air outlets shall be tested, adjusted and balanced for within limits of the required airflows as indicated on the Contract Drawings.

4. Overall System Test:

   a. After all final tests have been performed on all equipment and on all sub-systems installed under this Contract, including the testing of all controls specified in other Sections, and after the results from all such testing have been accepted, the Contractor shall test the overall system by demonstrating its ability to respond properly to normal changes in controlled parameters, as well as to system upsets.

   b. To facilitate this, the Contractor shall make available a minimum of two (2) personnel, thoroughly familiar with the systems and equipment installed under this Contract, for a minimum of seven (7) days to test the system by changing controlled parameters and

generating system upsets as directed by the Engineer, and demonstrating that the sequential action appropriate to the particular change or upset occurs automatically.

c. Where actual change or upset is not feasible, the Contractor shall simulate the change or the upset.

d. Controlled parameter changes shall include, but not necessarily be limited to, any change in temperature, pressure, flow rate, fluid level, load, etc., which should result in an automatic change in the position of a control valve or control damper, in the output rate of a piece of equipment, in the normal start-up or shutdown of equipment, etc.

e. The change in the state of the controlled device or equipment shall be shown to result in a corrective action on the controlled parameter.

f. Upsets shall include, but not necessarily be limited to, any condition which should cause annunciation of an alarm, safety shutdown of equipment, startup of standby equipment, closing of fusible-link devices, lifting of relief valves, etc.

g. The Contractor shall immediately restore to its original state any safety device, the state of which has been changed by its having been tested.

5. Contractor shall immediately correct any system deficiency that should occur during testing.

6. After the overall system testing has been completed, and after all final adjustments have been made, the Contractor shall operate and maintain all new systems and equipment, site-wide, associated therewith, for a period of thirty consecutive days.

a. During this period all normal maintenance (filter replacements, strainer cleaning, periodic checks of safety devices, datalogging, etc.) shall be performed by the Contractor.

b. If, during this period, any work beyond routine maintenance of equipment and materials installed under this Contract, should be required to maintain proper operation of the overall system, the elapsed time shall be forfeited, and a new thirty-day period shall commence following the completion of the corrective action.

7. The Engineer shall determine which fuel shall be burned in the boilers during these periods. All fuel and utilities required for system operation shall be provided by the City.

D. Balancing and Adjusting:

1. In addition to any other reference to balancing and adjusting specified elsewhere in these Section, the Contractor shall be bound by this portion of

the Section to balance, adjust and leave in good working order all systems and accessories covered under this Contract.

2. The Contractor shall procure the services of an independent balancing and testing agency which specializes in the balancing and testing of heating, ventilating and air conditioning systems to balance, test and adjust all systems installed under this Section.

3. The Contractor shall advise the Engineer at least two weeks in advance of the date scheduled for balancing to commence; at the Engineer's discretion, the balancing shall be conducted in the Engineer's presence.

4. At least three (3) months prior to the commencement of balancing, the Contractor shall forward a detailed explanation of the balancing procedure to the Engineer for review. In general, the method shall conform to those specified by the AABC or SMACNA.

5. All piping systems shall be balanced under this Section to provide the flows indicted on the Contract Drawings.

6. Air systems shall be balanced before all refrigerant systems.

7. Before beginning to balance the air systems the Contractor shall check, in the presence of the Engineer, all filters and coils for cleanliness, dampers (automatic, volume and fire) for correct position, all fans for proper rotation, and temperature controls for minimum completeness to allow for proper balancing.

    a. If any of the above or other conditions are found which would not allow for proper balancing the Contractor shall take the necessary corrective actions, at his own expense, before balancing begins.

8. All heating, ventilating, and air conditioning systems shall be balanced by the Contractor by adjustment of dampers, fan sheaves, apparatus and air outlets to provide the air quantities indicated on the Contract Drawings. If necessary, adjustments of air outlets shall be made to eliminate drafts.

9. Balancing for all air systems shall be accomplished in a manner to first minimize throttling losses, then fan speed shall be adjusted to meet design conditions. All air outlets and fans shall be balanced within 5% of the design capacity.

10. Fan Belt Deflection: No less than ¼-in. or more than a ½-in.

11. Finned Coils: Plate type fins shall be combed out with a fin comb for appropriate fin spacing. Helical fins shall be straightened with blunt bladed instrument.

12. After the systems have been balanced, the Contractor shall submit and certify to the City, a list containing the following minimum information for air outlets and equipment:

    a. Room or facility served.

b. Size, quantity and model of air outlet or equipment.

c. Type of air outlet or equipment.

d. Air flow indicated on Contract Drawings.

e. Air flow measured.

f. Fan cfm indicated on the Contract Drawings.

g. Fan cfm measured.

h. Fan motor running amps.

13. The Contractor shall start heating and/or cooling equipment. Once system design temperature has been reached, and system is in equilibrium, again record the pressures listed above, as well as the temperatures at the inlets and outlets of the condensers, coils, and heat exchangers.

14. The Contractor shall submit all recorded data to Engineer for review.

15. The Contractor shall adjust any or all equipment which, in the City's opinion, is not set within acceptable limits of ±5%.

E. Automatic Control Systems:

1. In cooperation with the control manufacturer's representative and as per the requirements of Section 40 80 82 - PMCS Startup and Field Testing, set and adjust automatically operated devices to achieve required sequence of operations. Refer to Section 23 09 00 – Instrumentation and Control for HVAC for additional information for HVAC sequence of operations.

2. Testing organization shall verify all controls for proper calibration and list those controls requiring adjustment by control system installer.

F. Marking Of Setting:

1. Following approval of TAB Verification Report, the setting of all HVAC adjustment devices including valves, and manual dampers shall be permanently marked by the TAB Specialist so that adjustment can be restored if disturbed at any time.

G. Identification Of Test Ports:

1. The TAB Specialist shall permanently and legibly identify the location points of duct test ports. If the ductwork has exterior insulation, the identification shall be made on the exterior side of the insulation. All penetrations through ductwork and ductwork insulation shall be sealed to prevent air leakage or to maintain integrity of vapor barrier.

1.05 DESCRIPTION

A. This Section includes requirements for providing duct insulation in accordance with applicable standards and regulations. In addition:

1. All fastenings, auxiliary equipment, accessories and appurtenances, necessary and/or required for a complete installation shall be included within the scope of Work.

1.06 QUALITY ASSURANCE

A. Manufacturer Qualifications:

1. Engage a single firm, with undivided responsibility for performance and other requirements and components of the duct insulation installation.

2. Engage a firm which can show successful experience in the manufacture of duct insulation systems of scope and type similar to the required Work.

B. Installer Qualifications:

1. Installer shall have at least five (5) years of experience in the installation of the Work specified. Only tradesmen with specific skills and experience in this type of Work shall be employed.

C. Requirements of Regulatory Agencies: Comply with applicable provisions of regulatory agencies below and others having jurisdiction.

1. Underwriters Laboratories, Incorporated (UL).

2. National Fire Protection Association (NFPA).

3. Local and State Building Codes and Ordinances:

a. New York City Building Code

b. New York State Uniform Fire Prevention and Building Code

c. New York State Energy Conservation Construction Code

D. General: Insulation systems including covering, mastics, adhesives, sealers and facings shall have the following Fire Hazard Classifications in accordance with ASTM E84:

1. Flame spread, 25 maximum.

2. Fuel contributed, 50 maximum.

3. Smoke developed, 50 maximum.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited, to:

1. Action Submittals:

a. Samples: Submit for approval samples of the following:

1) Thermal Insulation - Flexible.

2) Thermal Insulation - Rigid.

3) Acoustical Insulation.

b. Shop Drawings: Submit for approval manufacturer's catalog literature, specifications, and illustrations with the following information:

1) Thermal properties

2) Physical properties

3) Fire hazard ratings

4) Facing information

5) Installation instructions

6) Jointing recommendations for butt joints and longitudinal seams

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Contractor shall provide spare parts and special tools necessary to service and repair duct insulation provided under this Section.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Duct insulation:

1. Owens Corning, Toledo, OH.
2. CertainTeed Corp., Valley Forge, PA.
3. Schuller International, Inc. (Johns-Manville), Littleton, CO.
4. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. General:

1. Supply and return air ducts and plenums shall be insulated with not less than R-6 insulation where located in unconditioned spaces and where located outside the building with not less than R-8 insulation. Where located within a building envelope assembly, the duct or plenum shall be separated from the building exterior or unconditioned or exempt spaces by not less than R-8 insulation.

B. Exposed Ductwork Insulation (Rigid):

1. The following ductwork exposed in room shall be insulated:

a. All outside air intake ducts and plenums from the outside air intake louver, outside air intake shaft, or roof mounted intake up to the point where the duct or plenum is connected to the heating and ventilating units, air conditioning units, or supply fans in heated and air-conditioned spaces.

b. All exhaust and return air ductwork from air-conditioned spaces.

c. All supply and return air ductwork associated with air conditioning units.

d. All heated and air-conditioned ductwork located in unheated spaces.

e. All heated and air-conditioned ductwork located outdoor shall be insulated and covered with weatherproof stainless steel jacket.

f. Where indicated on the Contract Drawings.

2. All exposed ductwork insulation shall be a minimum 1½-in. thick (except 2-in. thick for ducts located outdoor and outside air intake plenums) glass fiber board having a density of not less than 3.0 lbs./ft^3, and a thermal conductivity of not more than 0.23 BTU·in./(h·ft^2·°F) at 75° F mean temperature.

3. The exposed ductwork insulation shall be impaled over pins welded to the duct surface on 12-in. centers.

a. The pins shall be coated with vapor barrier adhesive, and the insulation shall then be secured with caps over the pins.

4. All joints and breaks in the vapor barrier shall be sealed with 3-in. wide strips of the vapor barrier facing.

5. All insulation shall be reinforced with corner bead.

6. The facing shall be finished with a 3-ply application of lagging adhesive, glass fabric reinforcing and a finish coat of mastic.

C. Concealed Ductwork Insulation (Flexible):

1. The following ductwork located above hung ceiling shall be insulated:

a. All supply, exhaust and return ductwork associated with air conditioning units.

b. All outside air intake ducts and plenums from the outside air intake louver, outside air intake shaft or roof mounted intake up to the point where the duct or plenum is connected to the heating and ventilating units and supply fans.

c. Where indicated on the Contract Drawings.

2. All concealed ductwork insulation shall be 1½ in. thick flexible fiberglass, having a thermal conductivity of not more than 0.28 BTU·in./(hr·ft^2·°F) at 75° F mean temperature.

3. The insulation shall have a reinforced foil vapor barrier facing.

4. Insulation shall be secured with 4-in. wide bands of adhesive on 12-in. centers.

5. All joints shall be sealed by adhering a 2-in. sealing lap or 3-in. strips of vapor barrier facing applied with vapor barrier adhesive.

6. On horizontal ducts over 24-in. wide, welded pins and clips shall be used on the underside on 18-in. centers.

D. Acoustical Insulation:

1. Ductwork shall be internally insulated where indicated on the Contract Drawings.

2. Internal Duct Liner - Acoustical Insulation:

a. Type: Fiberglass duct liner board with black surface.

b. Density: Minimum 1½ lbs. per cubic foot.

c. Thickness: 1½ in. minimum.

d. Thermal Conductivity: 0.23 Btu·in./(h·ft^{2}·°F) at 75°F mean temperature.

E. Adhesives and Accessories:

1. Acoustical Lining Insulation Adhesive:

a. Insulation shall be applied in cut-to-size pieces attached to the interior of the duct with a nonflammable, fire-resistant adhesive conforming to ASTM C916, Type I.

b. Exposed edges of the liner at the duct ends and at other joints where the lining will be subject to erosion shall be coated with a heavy brush coat of the nonflammable, fire-resistant adhesive to prevent delamination of glass fibers.

2. Mineral Fiber Insulation Cement:

a. Cement shall be in accordance with ASTM C195.

3. Lagging Adhesive:

a. Lagging adhesives shall be nonflammable and fire-resistant and shall have flame spread and smoke developed ratings of 25/50 when measured in accordance with ASTM E84.

4. Contact Adhesive:

a. Adhesive may be dispersed in a non-halogenated organic solvent with a low flash point (flash pint less than minus 25°F when tested in accordance with ASTM D3278) or, dispersed in a nonflammable organic solvent which shall not have a fire point below 200°F.

b. The adhesive shall be nonflammable and fire resistant.

5. Caulking:

a. Caulking shall be in accordance with ASTM C920.

6. Corner Angles:

a. Nominal 0.016 in. type 316 stainless steel 1-in. × 1-in. with factory applied kraft backing and adhesive.

7. Finishing Cement:

a. Mineral fiber hydraulic-setting thermal insulating cement ASTM C449.

8. Fibrous Glass Cloth and Glass Tape:

a. Fibrous glass cloth and glass tape shall have flame spread and smoke developed ratings of no greater than 25/50 when measured in accordance with ASTM E84.

9. Staples shall be outward clinching Type 316 stainless steel.

10. White Vapor Retarder All Service Jacket (ASJ):

a. Shall be used on hot/cold pipes, ducts, or equipment.

b. Vapor retarder jackets used on insulation exposed in finished areas shall have white finish suitable for painting.

11. Weatherproof Jackets:

a. Type 316 stainless steel jackets shall be smooth sheet, 0.016 in. nominal thickness.

b. Corrugated metal jacket shall not be used outdoors for insulated ducts.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not Used

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Source Quality Control: Perform the following tests and inspections at factory.

1. Flame Spread

2. Smoke Developed

3. Fuel Contributed

B. Manufacturer's Markings:

1. Stamp or label with manufacturer's name and brand every package or standard container of covering, adhesive and coating delivered to the job site for use.

2. Exposed side of insulation shall be legibly labeled by the manufacturer to show thickness, type and manufacturer.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Contractor shall install all Work in complete accordance with the manufacturer's instructions and recommendations, and the approved Shop Drawings.

B. All duct leaks shall be sealed prior to installation of external insulation to prevent billowing and damage to insulation.

C. Contractor shall ensure that all surfaces are clean and dry before applying insulation.

D. Field Measurements: Take field measurements where required prior to installation to ensure proper fitting of Work.

E. Contractor shall ensure that ductwork has been inspected and released for application of insulation.

F. Contractor shall not install damaged insulation until repairs are made in accordance with manufacturer's written instructions and approval by Engineer.

1. Only minor repair work will be permitted in the field.

2. All damaged insulation requiring remedial work shall be returned to the manufacturer for repair or replacement.

3.02 INSTALLATION

A. Install duct insulation in complete accordance with the manufacturer's instructions and the approved shop drawings.

B. Install insulation to make surfaces smooth, even and substantially flush with adjacent duct insulation.

C. Duct sizes indicated on the Contract Drawings are clear inside dimensions. Increase duct sizes to give designated inside dimensions when internal insulation is used.

D. Thickness of rigid insulation shall be greater than the seams or angles of ductwork to which it is applied.

E. Duct insulation shall be continuous through sleeves and prepared openings.

F. Insulation shall terminate at fire dampers and flexible connections.

G. Vapor barrier materials shall be applied to form a complete unbroken vapor seal over insulation.

H. Provide Type 316 stainless steel jacketing and waterproof sealants for insulated ducts exposed to outdoor.

I. Field Painting shall comply with the requirements of Section 09 91 00 - Painting.

J. Identification markers and labels shall be in conformance with the Contract Documents and Section 40 05 97 - Piping and Equipment Identification.

3.03 FIELD TESTING / QUALITY CONTROL

A. Furnish the services of a qualified manufacturer's representative to check and approve all insulation in accordance with the requirements of the Contract documents. In addition:

1. Contractor shall verify that all work furnished and installed conforms to the requirements the Contract Documents.

2. Reports: Submit a report from the manufacturer of each visit to the Site. Reports shall provide complete information on time, schedule, tasks performed, persons contacted, problems corrected, instruction and all other pertinent information.

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Remove all debris, waste materials and loose foreign matter resulting from installation.

END OF SECTION

NO TEXT ON THIS PAGE

SECTION 23 09 00 – INSTRUMENTATION AND CONTROL FOR HVAC
CONTRACT CSO-FC-DF

PART 1 GENERAL

1.01 SUMMARY

A. Contractor shall provide all labor, material, equipment, related services, supervision and incidentals required, including, but not limited to, manufacturing, fabrication, configuration and installation for a complete HVAC Monitoring and Control System (HMCS) including all necessary hardware and all operating and applications software as required for the complete performance of the Work as shown on the Drawings and as specified herein.

1. An overview of the HMCS is summarized below:

a. The TI-010D Dechlorination Facility HMCS shall include an HMCS panel (HMCS-1) located in the Electrical Room. The HMCS panel is provided for global monitoring and control of the HMCS associated with the TI-010D Dechlorination Facility HVAC system. Signaling and alarms shall be provided to the SCADA system for remote monitoring as described under the Sequence of Operations within this specification.

b. The TI-011 Disinfection Facility HMCS shall include an HMCS panel (HMCS-1) located in the Electrical Room. The HMCS panel is provided for global monitoring and control of the HMCS associated with the TI-011 Disinfection Facility HVAC system. Signaling and alarms shall be provided to the SCADA system for remote monitoring as described under the Sequence of Operations within this specification.

c. The HMCS panel shall include among other devices described, direct digital controllers (DDC), panel face mounted operator interface terminal (OIT), uninterruptible power supply (UPS) and panel face mounted alarm horn, indicating lights, and push to test buttons. The OIT shall provide global monitoring and control of the HVAC equipment controlled from the associated panel.

d. HMCS panels shall have provisions for connecting to the HMCS for service and maintenance.

e. Sensors and control devices shall be suitable for the environment they are installed in.

f. Contractor shall be responsible for providing control wiring, conduct, and appurtenances for interconnecting factory controls provided with HVAC equipment including but not limited to remote control devices, thermostats, temperature sensors, controllers, etc.

g. All interfacing with the HMCS shall be through the OIT's graphical interface. Panel face mounted switches, run indicating

pilot lights, and other similar panel face mounted manual controls are not required.

2. Contractor is required to load, configure, develop, test, document and place into satisfactory operation all software associated with the HMCS and all its ancillary devices as described herein, required by other Sections as shown and as necessary to provide a properly operating and integrated system.

3. The system configuration shall be as specified herein and as described in Sequence of Operation. Some variations in the configuration will be considered provided functional constraints as intended for the various components of the system are met. Hardware requirements are specified in this Section. Software requirements for the HMCS and for interfacing with PLC's and other microprocessor-based equipment are specified herein.

4. The Contract Documents illustrate and describe the overall functional and operational requirements. Contractor is responsible for tagging, integrating, and verifying the functionality of all system components.

5. Network level components of the system – workstations, servers, etc. shall communicate using the BACnet protocol, as defined by ASHRAE Standard 135, EIA standard 709.1. No gateways shall be used for communication to controllers furnished under this section.

6. At a minimum, provide controls for the following:
   a. Electric duct heaters.
   b. Ductless split systems.
   c. Exhaust fans.
   d. Supply fans.
   e. Control points for packaged equipment.

7. The Work also includes:
   a. HMCS panels.
   b. Direct digital controllers.
   c. Servers.
   d. Operator interface terminals.
   e. Motorized dampers including linkage kits and other accessories.
   f. Sensors, controllers, thermostats, mounting accessories, junction boxes, face plates, wall plates, covers, mounting hardware as required.
   g. Relays, selector switches, pushbuttons, indicating lights, "ON/OFF/AUTOMATIC" selector switches.
   h. Transformers.

i. Power disconnects switches.

j. Motor starters.

k. Control panels.

l. Other control devices and appurtenances, as required.

m. Power and control wiring and conduit: The conduit and wiring to be provided under this Section shall include the following:

1) All wiring and conduit from each HMCS panel to sensors, controllers, switches, dampers, valves, louvers, HVAC equipment panels, audio visual alarms, etc.

2) All wiring and conduit between HVAC equipment panels and associated field devices.

3) Any other HVAC device requiring control under this Work.

4) All power wiring and conduit to HMCS panels, except where specified to be provided under the Electrical Work.

5) Conduit layouts for these wiring requirements are not shown; Contractor shall determine the requirements based upon the arrangement of the components being furnished.

8. Work Furnished Under the Electrical Work:

a. All 3-phase power wiring and conduit.

b. 120-volt, single phase power wiring and conduit for the following:

1) Power to HMCS panels.

2) Power from HMCS panels to single phase fans and pumps controlled from the HMCS panels.

3) All wiring and conduit between 120V unit heaters and associated 120V thermostats.

c. Starters.

d. Disconnects, except where specified to be furnished under the HVAC Work.

e. “ON/OFF/AUTOMATIC” selector switches, lockout stops, pushbuttons, “START/STOP” switches, and indicating lights, except those located at HMCS panels, which shall be provided under the HVAC Work.

f. Control wiring and conduit and status wiring and conduit from motor control centers to HMCS panels.

g. Control wiring and conduit from gas/leak detection system to HMCS panels.

h. Control wiring and conduit and status wiring and conduit from VFD's to HMCS panels except where VFD's are provided within packaged HVAC equipment.

i. Control wiring and conduit and status wiring and conduit from the Fire Alarm System panels to the HMCS panels.

j. Smoke detectors.

k. Signal wiring and conduit where specified to be provided under the Electrical Work.

B. The following index of this Section is presented for convenience:

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 26 05 20 – Low Voltage Wires, Cables and Accessories.

1.05 DESCRIPTION

A. Definitions:

1. Unless specifically defined within the Contract Documents, the words or acronyms contained within this specification shall be as defined within, or by the references listed within this specification, the Contract Documents, or, if not listed by either, by common industry practice.

2. Definitions:

a. Commercial Area: This is an area that has a clean environment. Examples include administration and office areas.

b. Industrial Non-Process Area: This is an area that generally has a clean environment but could be dusty. Examples include but are not limited to electric rooms, control rooms, and mechanical rooms.

c. Industrial Process Area: This is an area that could have a wet and or corrosive environment and could be electrically classified. Examples include but are not limited to process equipment spaces, chemical rooms, wet wells, drywells, and pump stations.

d. Supplier: The Supplier shall be Contractor and manufacturer jointly, that has undivided responsibility for the Engineering, design, installation and commissioning of a complete and fully functional HMCS with all required appurtenances. An approved representative of the manufacturer is an acceptable substitute to for the manufacture where independent control Contractors are authorized by the manufacturer to provide their products and services.

B. Acronyms:

1. General

a. ASHRAE: American Society Heating, Refrigeration, Air Conditioning Engineers

b. AHU: Air Handling Unit

c. ASC: Application Specific Controllers

d. BACnet: Building Automation Controls Network

e. BMS: Building Management System

f. DDC: Direct Digital Control

g. EIA: Electronic Industries Alliance

h. GUI: Graphical User Interface

i. HVAC: Heating, Ventilation, and Air Conditioning

j. IEEE: Institute Electrical Electronic Engineers

k. MBPS: Mega Bites Per Second

l. MER: Mechanical Equipment Room

m. PID: Proportional, Integral, Derivative

t. XML: eXtensible Markup Language

3. Controllers
   a. ASD: Application Specific Device
   b. AAC: Advanced Application Controller
   c. ASC: Application Specific Controller.
   d. CAC: Custom Application Controller.
   e. DCU: Distributed Control Unit
   f. LCM: Local Control Module
   g. MC: MicroControllers
   h. MPC: Multi-purpose Controller
   i. NSC: Network Server Controller
   j. PEM: Package Equipment Module
   k. PPC: Programmable Process Controller
   l. RC: Room controller
   m. SDCU: Standalone Digital Control Units
   n. SLC: Supervisory Logic Controller
   o. UEC: Unitary Equipment Controller
   p. VAVDDC: Variable Air Volume Direct Digital Controller
4. Tools and Software
   a. AFDD: Automated Fault Detection and Diagnostic
   b. APEO: Automated Predictive Energy Optimization
   c. DR: Demand Response
   d. CCDT: Configuration, Commissioning and Diagnostic Tool

e. BPES: BACnet Portable Engineering Station

f. LPES: LON Portable Engineering Station

g. POT: Portable Operator's Terminal

h. PEMS: Power and Energy Management Software

i. MTBF: Mean Time Between Failure

C. System Description:

1. In accordance with the scope of work, the system shall provide a graphical, web-based, operator interface that allows for instant access to any system through a standard browser. The Contractor shall provide PC-based programming workstations, operator workstations and microcomputer controllers of modular design providing distributed processing capability and allowing future expansion of both input/output points and processing/control functions.

2. For this project, the system shall consist of the following components:

a. Administration and Programming Workstation(s): The Supplier shall include Operation software and architecture as described in Part 2 of the specification. These workstations shall be running the standard workstation software developed and tested by the manufacturer of the network server controllers and the standalone controllers. Workstations shall conform to the B-OWS BACnet device profile.

b. Web-Based Operator Workstations: The Supplier shall furnish licenses for web connection to the HMCS system. Web-based users shall have access to all system points and graphics, shall be able to receive and acknowledge alarms, and shall be able to control setpoints and other parameters. All Engineering work, such as trends, reports, graphics, etc. that are accomplished from the WorkStation shall be available for viewing through the web browser interface without additional changes. The web-based interface shall conform to the B-OWS BACnet device profile. There will be no need for any additional computer-based hardware to support the web-based user interface.

c. Ethernet-based Network Router and/or Network Server Controller(s): The Supplier shall furnish needed quantity of Ethernet-based Network Server Controllers as described in Part 2 of the specification. These controllers will connect directly to the Operator Workstation over Ethernet at a minimum of 100 mbps and provide communication to the Standalone Digital Control Units and/or other Input/Output Modules. Network Server Controllers shall conform to BACnet device profile B-BC. Network controllers that utilize RS232 serial communications or ARCNET to communicate with the workstations will not be

accepted. Network Controllers shall be tested and certified by the BACnet Testing Laboratory (BTL) as BACnet Building Controllers (B-BC).

d. Standalone Digital Control Units (SDCUs): Provide the necessary quantity and types of SDCUs to meet the requirements of the project for mechanical equipment control including air handlers, central plant control, and terminal unit control. Each SDCU will operate completely standalone, containing all of the I/O and programs to control its associated equipment. Each BACnet protocol SDCU shall conform to the BACnet device profile B-AAC. BACnet SDCUs shall be tested and certified by the BACnet Testing Laboratory (BTL) as BACnet Advanced Application Controllers (B-AAC).

3. The Local Area Network (LAN) shall be a 10/100 Mpbs Ethernet network supporting BACnet, Modbus, XML and HTTP for maximum flexibility for integration of building data with enterprise information systems and providing support for multiple Network Server Controllers (NSCs), user workstations and a local host computer system.

4. The Enterprise Ethernet (IEEE 802.3) LAN shall utilize Carrier Sense Multiple/Access/Collision Detect (CSMA/CD), Address Resolution Protocol (ARP) and User Datagram Protocol (UDP) operating at 10 or 100 Mbps.

5. The system shall enable an open architecture that utilizes ANSI / ASHRAE Standard 135, BACnet functionality to assure interoperability between all system components. Native support for ANSI / ASHRAE Standard 135, BACnet protocol are required to assure that the project is fully supported by the HVAC open protocols to reduce future building maintenance, upgrade, and expansion costs.

6. The system shall enable an architecture that utilizes a BACnet IP or BACnet MS/TP selectable 9.6-76.8 KBaud protocol, as a common communication protocol between controllers and integral ANSI / ASHRAE™ Standard 135, BACnet functionality to assure interoperability between all system components. The AAC shall be capable of communicating as a MS/TP device or as a BACnet IP device communicating at 10/100 Mbps on a TCP/IP trunk. The ANSI / ASHRAE™ Standard 135, BACnet protocol is required to assure that the project is fully supported by the leading HVAC open protocol to reduce future building maintenance, upgrade, and expansion costs.

7. The software tools required for network management of ANSI / ASHRAE Standard 135, BACnet protocol shall be provided with the system. Drawings are diagrammatic only. Equipment and labor not specifically referred to herein or on the plans and are required to meet the functional intent, shall be provided without additional cost to the City. BACnet clients shall comply with the BACnet Operator Workstation (B-OWS) device

profile; with the ability to support data read and write functionality. Physical connection of BACnet devices shall support Ethernet IP or MS/TP. Physical connection of LonWorks devices shall support Ethernet IP or FTT-10A.

8. The system shall provide support for Modbus TCP and RTU protocols natively, and not require the use of gateways.

9. Complete temperature control system to be DDC with electronic sensors and electronic/electric actuation of valves and dampers as specified herein. The HMCS is intended to seamlessly connect devices throughout the building regardless of subsystem type.

   a. The supplied system shall incorporate the ability to access all data using HTML5 enabled browsers without requiring proprietary operator interface and configuration programs. The system shall not require JAVA to be enabled in the browser.

   b. Data shall reside on a Supplier-installed server for all database access.

   c. A hierarchical topology is required to assure reasonable system response times and to manage the flow and sharing of data without unduly burdening the customer's internal Intranet network.

10. Provide the Commissioning, configuration and diagnostic tool (CCDT), color display personnel computer, software, and interfaces to provide uploading/downloading of High Point Count Controllers (AAC), Unitary Equipment Controllers (UEC) and VAV controllers (VAVDDC), monitoring all BACnet objects, monitoring overrides of all controllers physical input/output points, and editing of controller resident time schedules.

1.06 QUALITY ASSURANCE

A. General:

1. The HMCS shall be furnished by a single Supplier responsible for the adequacy, performance and configuration of all items.

2. All work described in this section shall be installed, wired, circuit tested and calibrated by factory certified technicians qualified for this work and in the regular employment of the approved manufacturer's local field office.

3. Supervision, hardware and software Engineering, calibration and checkout of the system shall be by the employees of the manufacturer or manufacturers approved technical representative.

4. Provide HMCS components and ancillary equipment, which are UL-916 listed and labeled.

5. All components used in conditioned air streams, spaces or return air plenums shall comply with NFPA 90A Flame/Smoke rating of 25/50.

6. All wiring shall conform to the National Electrical Code.

7. All smoke dampers shall be rated in accordance with UL 555S.
8. Comply with FCC rules, Part 15 regarding Class A radiation for computing devices and low power communication equipment operating in commercial environments.
9. Comply with FCC, Part 68 rules for telephone modems and data sets.

B. Supplier's Qualifications:

1. Shall have a minimum of 5 years of installation experience with the manufacturer and shall provide documentation in the bid and submittal package verifying longevity of the installing company's relationship with the manufacturer.
2. Shall have an in-place support facility within 100 miles of the site with factory certified technicians and Engineers, spare parts inventory and all necessary test and diagnostic equipment for the installed system.
3. Shall have the capability to provide on-site service within a 2-hour period.
4. Shall have 24 hours/day, 7 days/week emergency service available.
5. Shall be a financially sound firm having at least five years continuous experience in designing, implementing, supplying and supporting control systems at similar facilities which are comparable to the HMCS in terms of hardware, software, cost and complexity.
6. Shall have manufactured and supported standard lines of digital processing and control equipment and application software continuously for the last five years.
7. Shall have in existence an experienced Engineering and technical staff capable of designing, implementing, supplying and supporting the HMCS and handling the HMCS submittal and training requirements.
8. Shall provide system hardware components and software packages of fully developed, field proven standardized designs and therefore shall furnish a system which is not a highly unique, custom one-of-a-kind system.
9. Shall have a minimum of five years' experience in software configuration, hardware application, programming, and data highway systems.
10. Shall provide standard course offerings in general control applications and in operation, programming and maintenance of the control system and equipment at a facility specifically utilized for training purposes. The facility shall have been in operation continuously for the last two years.
11. Shall have a demonstrated record of prompt response to field failures.
12. Shall have a documented program of failure analysis.
13. Shall utilize a UL approved panel shop.

C. Component Supply and Compatibility:

1. Obtain all equipment included in this Section regardless of the component manufacturer from a single Supplier.
2. The Supplier shall review and approve or prepare all Shop Drawings and other submittals for all components furnished under this Section.
3. All components shall be specifically constructed for the specified service conditions and shall be integrated into the overall equipment assembly by the Supplier.

1.07 SUBMITTALS

A. Action Submittals: Submit the following:

1. All shop drawings shall be prepared in Visio Professional or AutoCAD software. In addition to the drawings, the Contractor shall furnish a CD containing the identical information. Drawings shall be 11” x 17” size or larger.
2. Shop drawings shall include a riser diagram depicting locations of all controllers and workstations, with associated network wiring. Also included shall be individual schematics of each mechanical system showing all connected points with reference to their associated controller.
3. Submittal data shall contain manufacturer's data on all hardware and software products required by the specification. Valve, damper and air flow station schedules shall indicate size, CV where applicable, configuration, capacity and location of all equipment.
4. Software submittals shall contain narrative descriptions of sequences of operation, program listings, point lists, and a complete description of the graphics, reports, alarms and configuration to be furnished with the workstation software. If color has been used to differentiate information, the information shall be in color.
5. Information common to the entire system shall be provided. This shall include but not be limited to the following.
    a. Product manuals for the key software tasks.
    b. Operating the system.
    c. Administrating the system.
    d. Engineering the operator workstation.
    e. Application programming.
    f. Engineering the network.
    g. Setting up the web server.
    h. Report creation.
    i. Graphics creation.
    j. All other Engineering tasks.

k. System architecture diagram.

l. List of recommended maintenance tasks associated with the system servers, operator workstations, data servers, web servers and web clients.

m. Define the task.

n. Recommend a frequency for the task.

o. Reference the product manual that includes instructions on executing the task.

p. Licenses, guarantees, and warranty documents for equipment and systems.

q. Submit one copy for each building, plus two extra copies.

6. Information common to the systems in a single building shall be provided.

a. System architecture diagram for components within the building annotated with specific location information.

b. As-built drawing for each control panel.

c. As-built wiring design diagram for all components.

d. Installation design details for each I/O device.

e. As-built system flow diagram for each system.

f. Sequence of operations for each system.

g. Binding map for the building.

h. Product data sheet for each component.

i. Installation data sheet for each component.

j. Submit two copies for each building and two extra copies.

7. Software shall be provided:

a. Submit a copy of all software installed on the servers and workstations.

b. Submit all licensing information for all software installed on the servers and workstations.

c. Submit a copy of all software used to execute the project even if the software was not installed on the servers and workstations.

d. Submit all licensing information for all the software used to execute the project.

e. All software revisions shall be as installed at the time of the system acceptance.

f. Firmware Files

g. Submit a copy of all firmware files that were downloaded to or pre-installed on any devices installed as part of this project.

h. This does not apply to firmware that is permanently burned on a chip at the factory and can only be replaced by replacing the chip.

i. Submit a copy of all application files that were created during the execution of the project.

j. Submit a copy of all graphic page files created during the execution of the project.

8. Panel and Cabinet Information:

a. Layout Drawings, including the following:

1) Front views to scale.

2) Dimensional information.

3) Functional name of components mounted in and on panel.

4) Product information on all panel components.

5) Nameplate location and legend including text, letter size and colors to be used.

6) Location of anchoring connections and holes.

7) Location of external wiring connections.

8) Mounting, support and installation details.

b. Wiring diagrams, including the following:

1) Name of panel, console or cabinet.

2) Wiring sizes and types.

3) Terminal strip numbers.

4) Color coding.

5) Functional name and manufacturer's designation for components to which wiring is connected.

c. Electrical control schematics in accordance with NFPA 79 Standards.

9. Conduit Layout Information:

a. Conduit layout drawings showing proposed routing of exposed and concealed conduits.

b. Drawings shall show locations of pull boxes, junction boxes, and all building penetrations.

c. All conduits shall have proper identification as to size and quantity of wire.

B. Informational Submittals: Submit the following:

1. Source Quality Control Submittals:
   a. Submit factory test reports.
2. Site Quality Control Submittals:
   a. Submit field Test Reports.
3. Qualifications Statements:
   a. Supplier's Qualifications Data:
      1) Submit qualifications data as required in Paragraph 1.5.B, above.

C. Closeout Submittals: Submit the following

1. Operations and Maintenance Manuals:
   a. Operation and Maintenance Manuals shall conform to the requirements of this Contract.
   b. The Operation and Maintenance Manuals shall include the following:
      1) Name, address, e-mail address and telephone number of the Supplier's local service representative.
      2) Complete list of supplied system hardware parts with full model numbers referred to system part designations, including spares.
      3) Copy of all approved submittal information and system Shop Drawings.
      4) The following is a list of post construction submittals that shall be updated to reflect any changes during construction and re-submitted as "As-Built".
         a) System architecture drawing.
         b) Layout drawing for each control panel
         c) Wiring diagram for individual components
         d) System flow diagram for each controlled system
         e) Instrumentation list for each controlled system
         f) Sequence of operation
         g) Binding map
         h) A matrix sheet detailing all system addresses and communication settings for the following:

All IP network addresses & settings

All HMCS device addresses & communication settings

5) Safety considerations relating to operation and maintenance procedures.

2. Record Documentation:

a. Contractor and Supplier shall revise all system drawings, submittals and software documentation to reflect as built conditions in accordance with the requirements of the Contract Documents.

b. Half size black line prints of wiring diagrams and any program or configuration printouts applicable to each control panel shall be placed inside a clear plastic envelope and stored in a suitable print pocket or container inside each control panel.

D. Maintenance Material Submittals: Furnish the following:

1. Spare Parts:

a. Spare parts and testing equipment list with recommended quantities to be provided.

E. Software Ownership:

1. The City shall retain licenses to software.

2. The City shall sign a copy of the manufacturer's standard software and firmware licensing agreement as a condition of this Contractor. Such license shall grant use of all programs and application software to the City as defined by the manufacturer's license agreement but shall protect the manufacturer's rights to disclosure of Trade Secrets contained within such software.

3. The licensing agreement shall not preclude the use of the software by individuals under contract to the City for commissioning, servicing or altering the system in the future. Use of the software by individuals under contract to the City shall be restricted to use on the City's computers and only for the purpose of commissioning, servicing, or altering the installed system.

4. All project developed software, files and documentation shall become the property of the City. These include but are not limited to:

a. Server and workstation software

b. Application programming tools

c. Configuration tools

d. Network diagnostic tools

e. Addressing tools

f. Application files

g. Configuration files

h. Graphic files

i. Report files

j. Graphic symbol libraries

k. All documentation

1.08 DELIVERY, STORAGE, AND HANDLING

A. Packing, Shipping, Handling and Unloading:

1. HMCS equipment shall be packaged at the factory prior to shipment to protect each item from damage during shipment and storage. Containers shall be protected against impact, abrasion, corrosion, discoloration and/or other damages.

2. Clearly label contents of each container and provide information on the required storage conditions necessary for the equipment. Keep DEP and ENGINEER informed of equipment delivery.

3. Deliver materials to the Site to ensure uninterrupted progress of the Work.

B. Storage and Protection:

1. Store materials and equipment to permit easy access for inspection and identification. Keep all material off the ground, using pallets, platforms or other supports. Protect metal enclosures and parts and other material from corrosion.

2. Supplier shall notify Contractor, in writing, of the storage requirements and recommendations for the equipment prior to shipment.

3. Protection of materials and equipment shall comply with the requirements of Division 01, General Requirements, and in accordance with manufacturer's instructions and relevant organization standards.

4. Store all material in covered storage and protect from condensation and in accordance with the manufacturer’s recommendations.

5. Store computers and electronic devices in a secure environmentally control warehouse.

C. Acceptance At Site:

1. All boxes and crates and packages shall be inspected by Contractor upon delivery to the Site. Contractor shall notify Engineer, in writing, if any loss or damage exists to the components or equipment. Replace lost equipment or components and repair damage to like new condition in accordance with the manufacturer’s requirements.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. Not Used

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The following manufactures are acceptable provided they meet the requirements of the Contract Documents.

1. Schneider Electric.
2. Siemens.
3. Johnson Controls.
4. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. General Requirements:

1. Design requirements:

a. All HMCS components necessary to meet functional and operational requirements shall be provided to meet the intent of the Work.

b. Components located in Industrial Process and Industrial Non-Process Areas shall be heavy-duty type, designed for continuous service in industrial environments.

c. Components located in electrically classified areas (NFPA Class 1, Division 1 and 2) areas shall be rated for use in those areas. CONTRACTOR shall refer to the Electrical Drawings and the General Code Criteria Chart on the Drawings for areas that are electrically classified.

d. Components located in corrosive or wet electrically unclassified areas shall be provided with NEMA 4X enclosures.

e. Components located in or exposed to corrosive atmospheres shall be constructed of materials suitable for use in areas containing wet hydrogen sulfide, sodium hypochlorite, and sodium hydroxide laden atmosphere. Suitable exposed materials shall be Type 316 stainless steel, epoxy or Teflon coated aluminum or other similar materials approved by the ENGINEER. Steel, galvanized steel, and Type 304 stainless steel are not suitable materials for exposure in corrosive areas.

f. Refer to the General Code Criteria chart on the General drawings for a list of corrosive areas. Any area not listed in the chart shall be treated as a corrosive area.

g. Design all logic and control loops to fail safe.

h. Surge protection shall be provided for all instruments and all other control system components, which could be damaged by electrical surges.

i. Relays with interconnections to field devices shall be wired through terminal blocks. Terminals as part of the relay base are not an acceptable alternate.

j. Panel mounted instruments, switches, and other devices shall be selected and grouped for functionality and arranged to present a pleasing coordinated appearance. Similar type front of panel mounted devices shall be of the same manufacturer and model line.

k. Components furnished, including field and panel instruments, shall be tagged with the item number and nomenclature indicated as shown and/or approved Shop Drawings.

l. Ranges and scales shall be coordinated to suit equipment furnished.

m. Components shall be protected from exposure to freezing temperatures.

n. Fiber optics where applicable, are intended to be used only for Ethernet network level communication and shall not be used for controller to controller or I/O point communications or signals.

2. Power Supplies:

a. Electrically powered monitoring equipment, control equipment and devices shall be suitable for operation on 115 volt ±10 percent, 60 Hz ±2 Hz power. If a different voltage or closer regulation is required, a suitable regulator or transformer shall be provided.

b. Appropriate power supplies shall be provided. Power supplies shall be mounted in panels.

c. Design power supplies for a minimum of 130 percent of the maximum simultaneous current draw.

d. A power on off switch or an air circuit breaker shall be furnished for each item requiring electrical power.

3. Environmental Conditions:

a. The HMCS shall be designed and constructed for continuous operation in the temperature and humidity atmosphere in which the equipment is installed. Provide automatically controlled closed loop ventilation fans or closed loop air conditioners with filtered air louvers if required to maintain temperature inside each enclosure below the maximum operating temperature rating of the components inside the enclosure.

4. Spare Control Points:

   a. Provide sufficient control point capacity within each HMCS panel in order to provide an additional 20 percent of each type of input and output. These inputs/outputs shall be designated as spares.

B. System Architecture:

1. General

   a. The HMCS shall consist of Network Server/Controllers (NSCs), a family of Standalone Digital Control Units (SDCUs). The HMCS shall provide control, alarm detection, scheduling, and reporting and information management for the entire facility.

   b. The system shall be designed with all equipment controllers communicating on 10/100bT Ethernet network, using the BACnet/IP.

2. Modbus RTU/ASCII (and J-bus), Modbus TCP, BACnet MS/TP, BACnet IP, LonTalk FTT-10A, and WebServices shall be native to the NSCs. There shall not be a need to provide multiple NSCs to support all the network protocols, nor should there be a need to supply additional software to allow all three protocols to be natively supported. BACnet MS/TP, Modbus RTU/ASCII and LonTalk FTT-10A sub-networks shall support 3rd party integration as required for communication.

3. A sub-network of SDCUs using the BACnet IP only, shall connect the local, stand-alone controllers with Ethernet-level Network Server Controllers/IP Routers.

4. The TCP/IP layer connects all of the buildings on a single Wide Area Network (WAN) isolated behind the campus firewall. Fixed IP addresses for connections to the campus WAN shall be used for each device that connects to the WAN.

5. The fieldbus layer shall support all of the following types of SDCUs:

   a. BACnet IP SDCU requirements: The system shall consist of one or more BACnet/IP field buses managed by the Network Server Controller. The field bus layer shall consist of up to 50 IP SDCUs in daisy chain topology, or 39 if using RSTP, per layer, with a max of 5 sub networks in daisy chain for a total of 250 SDCUs or 6 sub networks in RSTP for a total of 234 SDCUs.

   b. Modbus SDCU requirements: The system shall consist of one or more Modbus RTU (RS-485 or RS-232) field buses managed by the Network Server Controller. The field bus layer shall consist of up to 31 SDCUs for operation of HVAC equipment. If utilizing Modbus TCP, the field bus layer shall consist of up to 100 SDCUs for operation of HVAC equipment. The NSCs shall be capable of at least two Modbus RTU field buses for a total capability of 62 SDCUs per NSC.

6. The HMCS shall be capable of being segmented, through software, into multiple local area networks (LANs) distributed over a wide area network (WAN). Workstations can manage a single LAN (or building), and/or the entire system with all portions of that LAN maintaining its own, current database.

7. All NSCs, Workstation(s) and Servers shall be capable of residing directly on the DEP's Ethernet TCP/IP LAN/WAN with no required gateways. Furthermore, the NSC's, Workstation(s), and Server(s) shall be capable of using standard, commercially available, off-the-shelf Ethernet infrastructure components such as routers, switches and hubs. With this design the City may utilize the investment of an existing or new enterprise network or structured cabling system. This also allows the option of the maintenance of the LAN/WAN to be performed by the DEP's Information Systems Department as all devices utilize standard TCP/IP components.

8. System Expansion

   a. The HMCS shall be scalable and expandable at all levels of the system using the same software interface, and the same TCP/IP level and fieldbus level controllers. Systems that require replacement of either the workstation software or field controllers in order to expand the system shall not be acceptable.

   b. Web-based operation shall be supported directly by the NSCs and require no additional software.

   c. The system shall be capable of using graphical and/or line application programming language for the Network Server Controllers.

9. All Network Server Controllers shall natively support the BACnet IP, BACnet MS/TP, LonWorks FTT-10, Modbus TCP, Modbus RTU (RS-485 and RS-232), and Modbus ASCII protocols. BACnet MS/TP, Modbus RTU/ASCII and LonTalk FTT-10A sub-networks shall support 3rd party integration as required for communication.

C. Operator Workstation Requirements:

1. General:

   a. The operator workstation portion of the HMCS shall consist of one or more full-powered configuration and programming workstations.

   b. The programming and configuration workstation software shall allow any user with adequate permission to create and/or modify any or all parts of the NSC and/or Enterprise Server database.

   c. All configuration workstations shall be personal computers operating under the Microsoft Windows operating system. The application software shall be capable of communication to all Network Server Controllers and shall feature high-resolution color

graphics, alarming, trend charting. It shall be user configurable for all data collection and data presentation functions.

2. Web-Based Operator PC Requirements:

   a. Any user on the network can access the system, using the following software:

      1) Mozilla Firefox 64 and later

      2) Google Chrome 71 and later

      3) Microsoft Edge (Edge HTML) 17 and later

      4) Safari 11.4 and later

3. General Administration and Programming Workstation Software:

   a. System architecture shall be truly client server in that the Workstation shall operate as the client while the NSCs shall operate as the servers. The client is responsible for the data presentation and validation of inputs while the server is responsible for data gathering and delivery.

   b. The workstation functions shall include monitoring and programming of all DDC controllers. Monitoring consists of alarming, reporting, graphic displays, long term data storage, automatic data collection, and operator-initiated control actions such as schedule and setpoint adjustments.

   c. Programming of SDCUs shall be capable of being done either off-line or on-line from any operator workstation. All information will be available in graphic or text displays stored at the NSC. Graphic displays will feature animation effects to enhance the presentation of the data, to alert operators of problems, and to facilitate location of information throughout the DDC system. All operator functions shall be selectable through a mouse.

4. User Interface:

   a. The software shall be designed so that each user of the software can have a unique username and password. This username/password combination shall be linked to a set of capabilities within the software, set by and editable only by, a system administrator. The sets of capabilities shall range from View only, Acknowledge alarms, Enable/disable and change values, Program, and Administer. The system shall allow the above capabilities to be applied independently to each and every class of object in the system. The system shall allow a minimum of 256 users to be configured per workstation. Additionally, the software shall enable the ability to add/remove users based upon Microsoft Windows Security Domains that enable the customer IT department to assist in user access.

b. Additional requirements include mandatory change of passwords:

1) At first logon with default credentials.

2) Of admin passwords before deploying.

c. No general accounts, one account per user.

d. Capability to integrate and use Windows Active Directory for user log on credentials.

e. Include a timed auto log off feature.

f. Use TLS 1.2 encryption or higher.

g. All devices and software that support HTTP shall allow disabling the HTTP access and require access via HTTPS.

5. Color Graphic Displays

a. The system shall allow for the creation of user defined, color graphic displays for the viewing of mechanical and electrical systems or building schematics. These graphics shall contain point information from the database including any attributes associated with the point (Engineering units, etc.). In addition, operators shall be able to command equipment or change setpoints from a graphic through the use of the mouse.

b. Requirements of the color graphic subsystem include:

1) The system shall support HTML5 enabled graphics.

2) Using the mouse, operators shall be able to adjust setpoints, start or stop equipment, modify PID loop parameters, or change schedules.

3) Status changes or alarm conditions shall be able to be highlighted by objects changing screen location, size, color, text, blinking or changing from one display to another.

4) Ability to link graphic displays through user defined objects, alarm testing, or the result of a mathematical expression. Operators shall be able to change from one graphic to another by selecting an object with a mouse - no menus will be required.

c. Additionally, the Graphics Editor portion of the Engineering Software shall provide the following capabilities:

1) Create and save pages.

2) Group and ungroup symbols.

3) Modify an existing symbol.

4) Modify an existing graphic page.

5) Rotate and mirror a symbol.

6) Place a symbol on a page.

7) Place analog dynamic data in decimal format on a page.

8) Place binary dynamic data using state descriptors on a page.

9) Create motion through the use of animated .gif files or JavaScript.

10) Place test mode indication on a page.

11) Place manual mode indication on a page.

12) Place links using a fixed symbol or flyover on a page.

13) Links to other graphics.

14) Links to web sites.

15) Links to notes.

16) Links to time schedules.

17) Links to any .exe file on the operator workstation.

18) Links to .doc files.

19) Assign a background color.

20) Assign a foreground color.

21) Place alarm indicators on a page.

22) Change symbol/text/value color as a function of an analog variable.

23) Change a symbol/text/value color as a function of a binary state.

24) Change symbol/text/value as a function of a binary state.

All symbols used by Schneider Electric Building Business in the creation of graphic pages shall be saved to a library file for use by the City.

d. Additionally, the Graphics Editor portion of the Engineering Software shall provide the following capabilities:

1) Create and save pages.

2) Group and ungroup symbols.

3) Modify an existing symbol.

4) Modify an existing graphic page.

5) Rotate and mirror a symbol.

6) Place a symbol on a page.

7) Place analog dynamic data in decimal format on a page.

8) Place binary dynamic data using state descriptors on a page.

9) Create motion through the use of animated .gif files or JavaScript.

10) Place test mode indication on a page.

11) Place manual mode indication on a page.

12) Place links using a fixed symbol or flyover on a page.

13) Links to other graphics.

14) Links to web sites.

15) Links to notes.

16) Links to time schedules.

17) Links to any .exe file on the operator workstation.

18) Links to .doc files.

19) Assign a background color.

20) Assign a foreground color.

21) Place alarm indicators on a page.

22) Change symbol/text/value color as a function of an analog variable.

23) Change a symbol/text/value color as a function of a binary state.

24) Change symbol/text/value as a function of a binary state.

25) All symbols used by Schneider Electric Building Business in the creation of graphic pages shall be saved to a library file for use by the City.

6. The software shall allow for the automatic collection of data and reporting from any controller or NSC. The frequency of data collection shall be user configurable.

7. Alarm Management:

   a. The software shall be capable of accepting alarms directly from NSCs or controllers, or generating alarms based on evaluation of data in controllers and comparing to limits or conditional equations configured through the software. Any alarm (regardless of its origination) will be integrated into the overall alarm management system and will appear in all standard alarm reports, be available for operator acknowledgment, and have the option for displaying graphics, or reports.

   b. Alarm management features shall include:

      1) An operator shall have the capability to save and apply alarm favorites.

2) Alarm notifications shall support multiple distribution methods within one notification.

8. Report Generation:

a. The Reports Server shall be able to process large amounts of data and produce meaningful reports to facilitate analysis and optimization of each installation.

b. Reports shall be possible to generate and view from the operator Workstation, and/or Webstation, and/or directly from a reports-only web interface.

c. Reports can be of any length and contain any point attributes from any controller on the network.

d. Image management functionality shall be possible to enable the system administrators to easily upload new logos or images to the system.

9. Scheduling:

a. From the workstation or web station, it shall be possible to configure and download schedules for any of the controllers on the network.

b. Time of day schedules shall be in a calendar style and viewable in both a graphical and tabular view.

c. Schedules shall be programmable for a minimum of one year in advance.

10. Programmer's Environment:

a. Programming in the NSC shall be either in graphical block format or line-programming format or both.

b. Programming of the NSC shall be available offline from system prior to deployment into the field. All Engineering tasks shall be possible, except, of course, the viewing of live tasks or values.

c. The programmer's environment will include access to a superset of the same programming language supported in the SDCUs.

1) It shall be possible to save custom programs as libraries for reuse throughout the system. A wizard tool shall be available for loading programs from a library file in the program editor.

d. It shall be possible to view graphical programming live and real-time from the Workstation.

e. The system shall be capable of creating ‘binding templates’ allowing the user to bind multiple points to multiple objects all at once.

f. Key terms should appear when typing (IntelliType).

g. Applications should be able to be assigned different priorities and cycle times for a prioritized execution of different function.

h. The system shall be able to create objects that allow common objects such as power meters, VFD drives, etc. to be integrated into the system with simple import actions without the need of complicated programming or configuration setups.

11. Saving/Reloading:

a. The workstation software shall have an application to save and restore NSC and field controller memory files.

b. For the NSC, this application shall not be limited to saving and reloading an entire controller – it shall also be able to save/reload individual objects in the controller. This allows off-line debugging of control programs, for example, and then reloading of just the modified information.

12. Audit Trail:

a. The workstation software shall automatically log and timestamp every operation that a user performs at a workstation, from logging on and off a workstation to changing a point value, modifying a program, enabling/disabling an object, viewing a graphic display, running a report, modifying a schedule, etc.

It shall be possible to save custom filtered views of event information that are viewable and configurable in Workstation.

b. It shall be capable to search and view all forced values within the system.

13. Fault Tolerant Enterprise Server Operation (Top level NSC):

a. A single component failure in the system shall not cause the entire system to fail. All system users shall be informed of any detectable component failure via an alarm event. System users shall not be logged off as a result of a system failure or switchover.

14. Web-based Operator Software:

a. General:

1) Day-to-day operation of the system shall be accessible through a standard web browser interface, allowing technicians and operators to view any part of the system from anywhere on the network.

2) The system shall be able to be accessed on site via a mobile device environment with, at a minimum, access to overwrite and view system values.

b. Graphic Displays:

1) The browser-based interface shall share the same graphical displays as the Administration and Programming Workstations, presenting dynamic data on site layouts, floor plans, and equipment graphics. The browser's graphics shall support commands to change setpoints, enable/disable equipment and start/stop equipment.

2) Through the browser-based interface, operators shall be able to navigate through the entire system and change the value or status of any point in any controller. Changes are effective immediately to the controller, with a record of the change stored in the system database.

c. Alarm Management:

1) Systems requiring additional client software to be installed on a PC for viewing the web station from that PC will not be considered.

2) Through the browser interface, a live alarm viewer identical to the alarm viewer on the Administration and Programming workstation shall be presented, if the user's password allows it. Users shall be able to receive alarms, silence alarms, and acknowledge alarms through a browser. If desired, specific operator text shall be able to be added to the alarm record before acknowledgement, attachments shall be viewable, and alarm checklists shall be available.

15. Groups and Schedules:

a. Through the browser interface, operators shall be able to view pre-defined groups of points, with their values updated automatically.

b. Through the browser interface, operators shall be able to change schedules – change start and stop times, add new times to a schedule, and modify calendars.

16. User Accounts and Audit Trail:

a. The same user accounts shall be used for the browser interface and for the operator workstations. Operators shall not be forced to memorize multiple passwords.

b. All commands and user activity through the browser interface shall be recorded in the system's activity log, which can be later searched and retrieved by user, date, or both.

17. Web Services:

a. The installed system shall be able to use web services to "consume" information within the Network Server/Controllers (NSCs) with other products and systems. Inability to perform web services within the NSCs will be unacceptable.

1) Shall be able to “consume” data into the system via SOAP and REST web services.

D. Operator Interface Terminal (OIT):

1. General:

a. OIT shall include the same functionality and capability as defined in Article 2.02.C Operator Workstation.

2. Operator Interface Terminal Panel PC (PPC) shall be integrated touch monitor. The PPC shall be provided with the following features and functions:

a. Screen:

1) 12" inch or larger Color Display.

2) Resolution: 1280 x 800 pixels.

b. Memory: 2 GB

c. Storage: 64 GB.

d. Operating Temperature: 32°F to 104°F.

e. Storage Temperature: -4°F to 140°F.

f. Operating Humidity: 0 to 95% non-condensing

g. Include all programming software needed to configure the PPC as specified herein.

h. Include all drivers as needed to communicate with the control system.

i. Product and Manufacturer:

1) Advantech, TPC-1551WP.

2) Or Equal

E. Network Server Controllers (NSC):

1. Network Server Controllers shall combine both network routing functions, control functions, and server functions into a single unit.

2. The BACnet NSC shall be classified as a “native” BACnet device, supporting the BACnet Network Server Controller (B-BC) profile. Controllers that support a lesser profile such as B-SA are not acceptable. NSCs shall be tested and certified by the BACnet Testing Laboratory (BTL) as BACnet Network Server Controllers (B-BC).

3. Hardware Specifications:

a. Memory:

1) The operating system of the controller, application programs, and all other portions of the configuration database, shall be stored in non-volatile, FLASH memory. Servers/Controllers shall contain enough memory for the current application, plus required history logging, plus a minimum of 20% additional free memory.

b. Each NRC shall provide the following on-board hardware for communication:

1) Two 10/100b Ethernet for communication to Workstations, other NRCs, IP field bus controllers, other SDCUs, and onto the internet.

2) Two RS-485 ports for communication to BACnet MSTP bus or serial Modbus (software configurable)

3) One TP/FT port for communication to LonWorks devices.

4) One device USB port

5) One host USB port

c. Modular Expandability:

1) The system shall employ a modular I/O design to allow expansion. Input and output capacity is to be provided through plug-in modules of various types. It shall be possible to combine I/O modules as desired to meet the I/O requirements for individual control applications.

2) One shall be able to "hot-change" (hot-swap) the I/O modules preserving the system on-line without any intervention on the software; addressing and configuration shall be automatic.

3) If for any reason the backplane of the modular I/O system were to fail, I/O module addresses will be protected.

4. Hardware Override Switches:

a. All digital outputs shall, optionally, include three position manual override switches to allow selection of the ON, OFF, or AUTO output state. These switches shall be built into the unit and shall provide feedback to the controller so that the position of the override switch can be obtained through software. In addition, each analog output shall be equipped with an override potentiometer to allow manual adjustment of the analog output signal over its full range, when the 3 position manual override switch is placed in the ON position.

5. Universal Input Temperatures:

a. All universal inputs directly connected to the NSC via modular expansion shall be capable of using the following thermistors for use in the system without any external converters needed.

1) 10 kohm Type I (Continuum)

2) 10 kohm Type II (I/NET)

3) 10 kohm Type III (Satchwell)

4) 10 kohm Type IV (FD)

5) Linearized 10 kohm Type V (FD w/11k shunt)

6) Linearized 10 kohm (Satchwell)

7) 1.8 kohm (Xenta)

8) 1 kohm (Balco)

9) 20 kohm (Honeywell)

10) 2.2 kohm (Johnson)

b. In addition to the above, the system shall be capable of using the below RTD sensors, however it is not required that all universal inputs be compatible with them.

1) PT100 (Siemens)

2) PT1000 (Sauter)

3) Ni1000 (Danfoss)

6. Local Status Indicator Lamps:

a. The NSC shall provide as a minimum LED indication of CPU status, Ethernet LAN status, and field bus status. For each input or output, provide LED indication of the value of the point (On/Off). The LED indication shall support software configuration to set whether the illumination of the LED corresponds to On or Off or whether the color when illuminated is Red or Green.

7. Real Time Clock (RTC):

a. Each NSC shall include a real time clock, accurate to 10 seconds per day. The RTC shall provide the following: time of day, day, month, year, and day of week. Each NSC will allow for its own UTC offset, depending upon the time zone. When the time zone is set, the NSC will also store the appropriate times for daylight savings time.

b. The RTC date and time shall also be accurate, up to 30 days, when the NSC is powerless.

c. No batteries may be used to for the backup of the RTC.

8. Power Supply:

a. The 24 VDC power supply for the NSCs shall provide 30 watts of available power for the NSC and associated IO modules. The system shall support the use of more than one power supply if heavily power consuming modules are required.

b. The power supply, NSC, and I/O modules shall connect power wise and communication wise via the separate terminal base allowing for ease of replacement and no separate or loose wiring.

9. Automatic Restart After Power Failure:

a. Upon restoration of power after an outage, the NSC shall automatically and without human intervention update all monitored functions, resume operation based on current, synchronize time and status, and implement special start-up strategies as required.

10. Data Retention:

a. During a power failure, the NSC shall retain all programs, configuration data, historical data, and all other data that is configured to be retained. There shall be no time restriction for this retention, and it shall not use batteries to achieve it.

11. Software Specifications:

a. The operating system of the controller, application programs, and all other portions of the configuration database such as graphics, trends, alarms, views, etc., shall be stored in non-volatile, FLASH memory. There will be no restrictions placed on the type of application programs in the system. Each NSC shall be capable of parallel processing, executing all control programs simultaneously. Any program may affect the operation of any other program. Each program shall have the full access of all I/O facilities of the processor. This execution of control function shall not be interrupted due to normal user communications including interrogation, program entry, printout of the program for storage, etc.

b. Each NSC shall have an available capacity of 4 GB of memory. This shall represent 2 GB for application and historical data and 2 GB dedicated for backup storage.

12. User Programming Language:

a. The application software shall be user programmable. This includes all strategies, sequences of operation, control algorithms, parameters, and setpoints. The source program shall be either a script-based structured text or graphical function block based and fully programmable by the user. The language shall be structured to allow for the configuration of control programs, schedules, alarms, reports, telecommunications, local displays, mathematical

calculations, and histories. Users shall be able to place comments anywhere in the body of either script or function block programs.

b. Network Server Controllers that use a "canned" program method will not be accepted.

13. Control Software:

a. The NSC shall have the ability to perform the following pre-tested control algorithms:

1) Proportional, Integral plus Derivative Control (PID)

2) Two Position Control

3) Digital Filter

4) Ratio Calculator

5) Equipment Cycling Protection

14. Mathematical Functions:

a. Each controller shall be capable of performing basic mathematical functions (+, -, *, /), squares, square roots, exponential, logarithms, Boolean logic statements, or combinations of both. The controllers shall be capable of performing complex logical statements including operators such as >, <, =, and, or, exclusive or, etc. These shall be able to be used in the same equations with the mathematical operators and nested up to five parentheses deep.

15. NSCs shall have the ability to perform any or all of the following energy management routines:

a. Time of Day Scheduling

b. Calendar Based Scheduling

c. Holiday Scheduling

d. Temporary Schedule Overrides

e. Optimal Start

f. Optimal Stop

g. Night Setback Control

h. Enthalpy Switchover (Economizer)

i. Peak Demand Limiting

j. Temperature Compensated Duty Cycling

k. CFM Tracking

l. Heating/Cooling Interlock

m. Hot/Cold Deck Reset

n. Hot Water Reset

o. Chilled Water Reset

p. Condenser Water Reset

q. Chiller Sequencing

16. History Logging:

a. Each NSC controller shall be capable of LOCALLY logging any input, output, calculated value or other system variable either over user defined time intervals ranging from 1 second to 1,440 minutes or based upon a user configurable change of value. A minimum of 1,000 logs, with a minimum of 100,000 records, shall be stored. Each log can record either the instantaneous, average, minimum or maximum value of the point. Logged data shall be downloadable to a higher level NSC long term archiving based upon user-defined time intervals, or manual command.

b. For extended trend logging a minimum of 1,500 trends shall be capable, with a minimum number of 600,000 records within.

c. Management of a power meter replacement to ensure meter log data is accurate shall be possible in the NSC.

d. Every hardware input and output point, hosted within the NSC and attached I/O modules, shall be trended automatically without the requirement for manual creation, and each of these logs shall log values based upon a change of value and store at least 500 trend samples before replacing the oldest sample with new data.

e. The presentation of logged data shall be built into the server capabilities of the NSC. Presentation can be in time stamped list formats or in a chart format with fully configurable pen colors, weights, scales and time spans.

f. Tooltips shall be present, magnetic, and visible based on users preference.

g. Comments shall be visible whenever viewing the trend log list.

h. System shall give indication of memory usage and be able to alert the user if too many logs are allocated.

17. Alarm Management:

a. For each system point, alarms can be created based on high/low limits or in comparison to other point values. All alarms will be tested each scan of the NSC and can result in the display of one or more alarm messages or reports.

b. There is no limit to the number of alarms that can be created for any point

c. Alarms can be configured to be generated based upon a single system condition or multiple system conditions.

d. Alarms will be generated based on an evaluation of the alarm conditions and can be presented to the user in a fully configurable order, by priority, by time, by category, etc. These configurable alarm views will be presented to a user upon logging into the system regardless of whether the log in takes place at a WorkStation or a Webstation.

e. The alarm management system shall support the ability to create and select cause and action notes to be selected and associated with an alarm event. Checklists shall also be possible in order to present to an operator a suggested mode of troubleshooting. When acknowledging an alarm, it shall be possible to assign it to a user of the system such that the user is notified of the assignment and is made responsible for the alarm resolution.

f. Alarms shall be capable of being routed to any BACnet workstation that conforms to the B-OWS device profile and uses the BACnet/IP protocol.

18. Embedded Web Server:

a. Each NSC shall have the ability to serve out web pages containing the same information that is available from the WorkStation. The development of the screens to accomplish shall not require any additional Engineering labor over that required to show them at the WorkStation itself.

b. The NSC shall be configurable to logging all Embedded Web Server access attempts

c. The NSC shall have the option to redirect HTTP based Embedded Web Server connections to secure, HTTPS connections.

d. The NSC shall authenticate and authorize all users connecting to the Embedded Web Server

e. The NSC shall provide to ability to configure an automatic logoff for Embedded Web Server users that have not had any activity for an adjustable time period.

F. BACnet/IP Fieldbus Controllers:

1. Controllers – BACnet/IP Protocol

a. All BACnet/IP Fieldbus controllers shall be BACnet Testing Laboratory listed (v12 or later) as specified BACnet Advanced Application Controller (B-AAC)

b. All BACnet/IP Fieldbus controllers shall use the following communication specifications and achieve performance as specified herein:

1) All controllers shall be able to communicate peer-to-peer without the need for a NSC

2) Any BACnet/IP Fieldbus controllers on the Ethernet Data Link/Physical layer shall be able to act as a Master to allow for the exchange and sharing of data variables and messages with any other controller connected on the same communication cabling. Slave controllers are not acceptable.

2. The BACnet/IP Fieldbus controllers shall be equipped with 2x 10/100bT Ethernet communication ports with active switch and will support BACnet/IP communication protocols with the following configurations:
   a. Supporting IPv4 addressing
   b. Supporting Static IP setting, DHCP client and Auto-IP address acquisition
3. Topologies:
   a. BACnet/IP Fieldbus controllers shall support daisy chain.
   b. BACnet/IP Fieldbus Controllers shall support RSTP.
4. Performance:
   a. Each BACnet/IP Fieldbus Controllers shall have a 32-bit microprocessor operating at 500 MHz and support a BACnet protocol stack in accordance with the ANSI/ASHRAE Standard 135 and the BACnet Device Profile supported.
   b. They shall be multi-tasking, real-time digital control processors consisting of communication controllers, controls processing, power supplies with built-in inputs and outputs.
5. Programmability:
   a. The BACnet/IP Fieldbus controllers shall support both script programming language and graphical that will be consistent with the NSC.
   b. The control program will reside within the same enclosure as the input/output circuitry, that reads inputs and controls outputs
   c. All control sequences programmed into the BACnet/IP Fieldbus Controllers shall be stored in non-volatile memory, which is not dependent upon the presence of a battery, to be retained.
   d. BACnet/IP Fieldbus controllers shall communicate with the Network Server Controller (NSC) via a BACnet/IP connection at a baud rate of not less than 100 Mbps
   e. BACnet/IP Fieldbus controllers shall support a dedicated communications port for connecting and supplying power to a matching room temperature and/or humidity sensor and/or CO2 and/or presence detector that does not utilize any of the I/O points of the controller.

f. BACnet/IP Fieldbus controllers (Excluding VAV) shall support an add-on display to supply and provide access in real-time for monitoring inputs and overriding of outputs

g. The override functionality shall be supported by a dedicated processor to assure reliable operation (overriding of output)

h. Each BACnet/IP Fieldbus controller shall have sufficient memory, to support its own operating system and databases, including:

1) Control processes

2) Energy management applications

3) Alarm management

4) Historical/trend data

5) Maintenance support applications

6) Custom processes

7) Manal override monitoring

i. Each BACnet/IP Fieldbus controller shall support local trend data up to 2x the built-in I/O and at a minimum be capable of holding 5 days @ 15 min intervals locally.

a) Built-in I/O: each BACnet/IP Fieldbus controllers shall support:

2) At minimum 8 and up to 20 configurable IO channels to monitor and to control the following types of inputs and outputs without the addition of equipment inside or outside the DDC Controller cabinet.

a) Universal Inputs – the following thermistors for use in the system without any external converters needed.

10 kohm Type I (Continuum)

10 kohm Type II (I/NET)

10 kohm Type III (Satchwell)

10 kohm Type IV (FD)

Linearized 10 kohm Type V (FD w/11k shunt)

Linearized 10 kohm (Satchwell)

1.8 kohm (Xenta)

1 kohm (Balco)

20 kohm (Honeywell)

2.2 kohm (Johnson)

PT100 (Siemens)

PT1000 (Sauter)

Ni1000 (Danfoss)

b) Analog inputs

Current Input - 0-20 mA

Voltage Input 0-10 Vdc

c) Digital inputs from dry contact closure, pulse accumulators, voltage sensing.

d) Digital outputs

e) Analog outputs of 4-20 mA and/or 0-10 Vdc

j. Real Time Clock (RTC):

1) Each BACnet/IP Fieldbus controller shall include a real time clock, accurate to +/-1 minute per month. The RTC shall provide the following: time of day, day, month, year, and day of week.

2) The RTC date and time shall also be accurate, up to 7 days, when the BACnet/IP Fieldbus controller is powerless.

3) No batteries may be used to for the backup of the RTC.

Each BACnet/IP Fieldbus controller shall have a minimum of 10% spare capacity for each point type represented on the controller for future point connection

k. Power Requirements.: 24VDC (21 to 33 VDC) and 24 VAC +/- 20% with local transformer power

6. Commissioning Tool - The BACnet/IP Fieldbus controller shall be supported via a dedicate mobile based commissioning tool for configuration, programming, air balancing and I/O checkout

a. The Commissioning Tool shall be supported across: iOS, Android and Windows 10 platforms

b. The Commissioning Tool shall be available for download on App Store, Google Store and Windows Store

c. Commissioning Tool Interface to BACnet/IP Fieldbus controllers shall be via a Bluetooth adapter interface through the Intelligent Space Sensor or via a Wi-Fi access point on the LAN

d. Functionality

1) Device Configuration – the Commissioning Tool shall be able to set or edit all Network configurations associated with the BACnet/IP Fieldbus controller

2) Programming – The Commissioning Tool shall be able to load offline Engineered applications directly in to the controller directly

3) Air Balancing

a) The Commissioning Tool shall allow the air balancer to manually control the action of the actuator including the following function: open VAV damper, close VAV damper, open all VAV dampers, and close all VAV dampers.

b) The Commissioning Tool shall be able to generate Air Balancing report

4) IO Checkout

a) The Commissioning Tool shall be able to support overriding of the outputs and reading value of inputs live

b) The Commissioning Tool shall be able to support generation of I/O checkout report

5) There shall be no limit to the number of Commissioning Tools that can be used on a network segment, however, one connection per controller is recommended

G. Sensors (Industrial Process Areas):

1. Provide sensors and instrumentation required to provide the Sequence of Operations described under Part 3, constructed and rated for the location in which they are installed.

2. Not all sensors and control devices required to provide the sequence of operations are explicitly described in this Article but shall be provided to meet the functional requirements of the Work.

3. Sensors and control devices specified below shall be used in both electrically classified and electrically non-classified areas. NEMA 4X rated control devices maybe used in non-classified areas provided they have similar rugged industrial construction to those devices specified herein.

4. Provide rugged industrial grade sensors and transmitters from one of the following manufacturers:

a. Dwyer Instruments.

b. Foxboro.

c. Rosemont.

d. Or Equal

5. Temperature Transmitter:

a. Temperature Sensor: Pt1000, 0.00385 DIN.

b. Output Temperature Ranges: User selectable - any range between -30 to 250°F with a minimum span of 40°F.

c. Temperature Limits: Ambient: 0 to 158°F (-18 to 70°C); Process: -30 to 250°F (-34.4 to 121.1°C).

d. Accuracy: Transmitter: ±0.1% F.S.; Probe: ±0.3% F.S.

e. Thermal Drift Effects: ±0.02%/°C max.

f. Response Time: 250 ms.

g. Wetted Materials: 316 Stainless Steel.

h. Process Connection: 1/2" male NPT.

i. Conduit Connection: 1/2" female NPT.

j. Probe Length: 2" to 18" (as required to suit application).

k. Pressure Limits: 2000 psi (137.9 bar).

l. Power Requirements: 10 to 35 VDC.

m. Output Signal: 4-20 mA (two wire loop powered).

n. Display: 2 Lines X 8 Character LCD.

o. Enclosure Rating: Weatherproof and Explosion-proof for Class I, Groups B, C, D; Class II, Groups E, F, G; Class III.

p. Weight: 2 lb 8 oz (1134 g).

q. Agency Approvals: FM, CE.

r. Mounting Bracket: Type 316 SS.

s. Dwyer Series TTE, or approved equal.

6. Humidity Transmitter:

a. Relative Humidity Range: 0 to 100% RH.

b. Temperature Range: -40 to 140°F (-40 to 60°C).

c. Accuracy: ±2% 10-90% RH, ±0.9°F at 72°F (±0.3°C at 25°C).

d. Hysteresis: ±1%.

e. Repeatability: ±0.1% typical.

f. Temperature Limits: -40 to 140°F (-40 to 60°C).

g. Storage Temperature: -40 to 176°F (-40 to 80°C).

h. Compensated Temperature: -40 to 140°F (-40 to 60°C).

i. Power Requirements: For intrinsically safe models HHT-IX, 9.5 to 28 VDC. For explosion-proof models HHT-EX, 16.5 to 28 VDC.

j. Output Signal: 4-20 mA, 2 channels for humidity/temperature models (loop power on RH).

k. Response Time: 15 seconds.

l. Electrical Connections: Screw terminal block.

m. Conduit Connection: 1/2" female NPT.

n. Drift: <1% RH/year.

o. RH Sensor: Capacitance polymer.

p. Temperature Sensor: Solid state band gap.

q. Housing Material: Aluminum.

r. Display: 2 line alpha numeric, 8 characters/line. Temperature display is °F/°C selectable.

s. Display Resolution: RH: 0.1%: Temperature 0.1°F (0.1°C).

t. Weight: 2 lb 8 oz (1134 g).

u. Enclosure Rating: NEMA 4X (IP66). Models HHT-EX: FM Explosion-proof, Class I Div. 1 Group B, C, D, Class II Div. 1 Group E, F, G, Class III Div. 1; Models HHT-IX: FM Intrinsically Safe, Class I Div. 1 Group A, B, C, D, Class II Div. 1 Group E, F, G, Class III Div. 1 T4.

v. Agency Approvals: FM, CE.

w. Mounting Bracket: Type 316 SS.

x. Dwyer Series HHT or approved equal.

7. Differential Pressure Transmitter:

a. Service: Compatible gases, steam, liquids or vapors.

b. Wetted Materials: 316L SS.

c. Accuracy: ±0.075% FS (@ 20°C).

d. Rangeability: 100:1 turn down.

e. Stability: ±0.125% FSO/yr.

f. Temperature Limits: Process: -40 to 248°F (-40 to 120°C); Ambient (without LCD): -40 to 185°F (-40 to 85°C); Ambient (with LCD): -22 to 176°F (-30 to 80°C).

g. Pressure Limits: Max. pressure: Range: -14.5 to 2000 psi; Burst pressure: 10000 psi.

h. Thermal Effect: ±0.125% span/32°C.

i. Power Requirements: 11.9 to 45 VDC.

j. Output Signal: 4 to 20 mA/HART® Communication.

k. Response Time: 0.12 seconds.

l. Damping Time: 0.25-60 seconds.

m. Loop Resistance: Operation: 0 to 1500 Ohm; HART® Communication: 250 to 500 Ohm.

n. Electrical Connection: Two 1/2" female NPT conduit, screw terminal.

o. Process Connection: 1/4" female NPT.

p. Display: Optional 5 digit LCD.

q. Enclosure Rating: NEMA 4X (IP66) and explosion-proof for Class I, Div I, Groups A, B, C and D.

r. Weight: 8.6 lb (3.9 kg).

s. Agency Approvals: CE, FM, ATEX.

t. Mounting Bracket: Type 316 SS.

u. Dwyer Series 3100D or approved equal.

8. Thermal Dispersion Air Flow Switch:

a. Service: Gases or liquids compatible with wetted materials.

b. Accuracy: +/- 10% of setpoint.

c. Repeatability: +/- 1% of setpoint.

d. Power Supply: 85 to 240 Vac or 24 Vdc

e. Wetted Materials: 316 SS.

f. Temperature Limit (Process): -4 to 176°F.

g. Pressure Limit: 4,351 psi.

h. Enclosure Rating: NEMA 4 (IP65).

i. Enclosure Materials: Glass filled nylon. Aluminum die cast optional.

j. Switch Type: 250 Vac SPDT 5 amp.

k. Switch Point Adjustment: Potentiometer.

l. Bargraph:

1) Green LED: Flow rate above setpoint.

2) Yellow LED: Flow is at setpoint.

3) Red LED: Flow is below setpoint.

m. Switch Point Status:

1) Red LED: No flow.

2) Green LED: Flow.

n. Switching Range:

1) Liquid: 0.09 to 9.84 ft/sec.

2) Air: 0.16 to 49 ft/sec.

o. Conduit Connection: 3/4" NPT.

p. Weight: 1.5 Lbs.

q. Omega FSW-6000/7000 Series or approved equal.

H. Sensors (Industrial Non-Process Areas):

1. Provide sensors and instrumentation required to provide the Sequence of Operations described under Part 3, constructed and rated for the location in which they are installed.

2. Not all sensors and control devices required to provide the sequence of operations are explicitly described in this Article but shall be provided to meet the functional requirements of the Work.

3. Sensors shall be similar to those described under Article 2.02.G Sensors (Industrial Process Areas) with the following exceptions:

a. The device shall be rated NEMA 4X if located in an electrically unclassified area.

b. The device can be less accurate and less rugged but must be suitable for an industrial setting.

I. Electrical Power Measurement:

1. Electrical Power Monitors, Single Point (Easy Install):

a. Acceptable Manufacturers:

1) Veris Industries E2xx Series.

2) ACI KW350 Series.

3) Or Equal.

b. General: Consist of three split-core CTs, factory calibrated as a system or ordered separately, hinged at both axes with the electronics embedded inside the master CT. The transducer shall measure true (rms.RMS) power demand real power (kW) consumption (kWh). Conform to ANSI C12.1 or C12.20 metering accuracy standards.

c. Voltage Input: 100-400VAC line to neutral or 100-690VAC line to line, 60 Hz.

d. Maximum Current Input: Up to 2400A.

e. Performance:

1) Accuracy: +/- 1% system from 10% to 100% of the rated current of the CT's or IEC 62053-22 0.5s Class / ANSI C12.00 0.5 Class.

2) Operating Temperature Range: 32-140°F, 122°F for 2400A.

f. Outputs shall be selected to suit application.

g. Ratings:

1) Agency: UL508 or equivalent.

2) Transducer internally isolated to 2000 VAC.

3) Case isolation shall be 600 VAC.

h. Accessories: Communications gateway.

J. Damper Actuators:

1. Type: Electric, Direct Coupled (over the shaft):

a. Proportional and two position as indicated in the Sequence of Operations.

b. Spring return where specified.

c. V-bolt and V-shaped cradle shaft attachment.

d. Electronic overload or digital rotation sensing circuitry to prevent damage to actuator throughout the rotation of actuator.

e. Spring return actuators shall be capable of either clockwise or counterclockwise spring return operation by changing mounting orientation.

f. Proportional actuators shall accept a 0 to 10 VDC or 0 to 20 mADC control input and provide a 2 to 10 VDC or 4 to 20 mADC operating range. Proportional control through a pulse width modulating signal is acceptable. Proportional control through floating (Tri-state) control is not acceptable. Actuators shall be capable of providing 2 to 10 VDC position feedback signals.

g. 24 VAC/VDC actuators shall operate on Class 2 wiring and shall not require more than 10 VA for AC or more than 8 watts for DC applications. Actuators operating on 120 VAC power shall not require more than 10 VA.

h. Modulating actuators shall have an external, built in switch to allow the reversing of direction of rotation.

i. External manual gear release with manual crank to allow manual positioning of shaft.

j. Factory-mounted electrical cable and conduit fitting for connection to junction box.

k. Conforming to UL 873.

l. Actuator shall be provided with sufficient torque to open and close the device. Provide a minimum torque of 133-in-lb.

m. 120VAC or 24VDC.

n. NEMA Type 2 housing.

o. Accessories:

1) Linkage kit.

2) Mounting bracket.

3) Auxiliary switches.

4) NEMA Type 4X enclosure in all corrosive atmospheres or as indicated on the drawings.

p. Manufacturers: Provide products of one of the following:

1) Belimo.

2) Schneider Electric

3) Or equal.

K. Smoke Detectors:

1. Smoke detectors are provided under the Electrical Work.

2. All duct penetrations required for smoke detector mounting shall be provided under the HVAC Work and coordinated with the Electrical Work.

L. Panels and Enclosures

1. General Construction Requirements

a. CONTRACTOR shall provide all electrical components and devices, support hardware, fasteners, and interconnecting wiring required to make the control panels and/or enclosures complete and operational.

b. CONTRACTOR shall locate and install all devices and components so that connections can be easily made and that there is ample room for servicing each item.

c. Components for installation on panel exterior shall be submitted for approval.

d. CONTRACTOR shall adequately support and restrain all devices and components mounted on or within the panel to prevent any movement.

e. All wiring to panel connections from field instruments, devices, and other panels shall be terminated at master numbered terminal strips, unless otherwise specified.

f. CONTRACTOR shall provide copper grounding studs for all panel equipment.

g. CONTRACTOR shall provide the following convenience accessories inside of each control panel:

1) One 120 VAC, 20A duplex, grounding type receptacle.

h. No device shall be mounted less than 36-inches above the operating floor level, unless otherwise specified.

2. Identification:

a. CONTRACTOR shall provide laminated plastic nameplates for identification of panels and components mounted thereon as follows:

1) Nameplates shall be of 3/32-inch thick laminated phenolic type with white matte finish surface and black letter engraving.

2) Panel identification nameplates to have 1/2 inch high letter engravings.

3) Panel mounted component (e.g., control devices, indicating lights, selector switches, etc.) identification nameplates to have 1/4-inch high letter engravings.

4) Nameplates shall be attached to the panel face with two stainless steel self-tapping screws.

5) Nameplate engravings shall include the instrument or equipment tag number and descriptive title.

6) Tag all internally mounted instruments in accordance with the following requirements:

a) The identifying tag number shall be permanently etched or embossed onto a stainless steel tag which shall be fastened to the device housing with stainless steel rivets or self tapping screws of appropriate size.

b) Where neither of the above fastenings can be accomplished, tags shall be permanently attached to the device by a circlet of 1/16-inch diameter stainless steel wire rope.

c) Identification tag shall be installed so that the numbers are easily visible to service personnel.

d) Front of panel mounted instruments shall have the tag attached to rear of device.

7) Tagging of the following items shall be accomplished with the use of adhesive plastic Brady USA, Inc. labels, or equal.

a) Tag all electrical devices (e.g., relays, timers, power supplies) mounted within control panels and enclosures.

b) Numerically tag all terminal blocks.

c) Color code and numerically tag wiring at each end.

3. Panels and Enclosures:

   a. General:

      1) Panels and enclosures shall meet the NEMA requirements for the type specified.

      2) Sizes shown are estimates. CONTRACTOR shall furnish panels and enclosures amply sized to house all equipment, instruments, front panel mounted devices, power supplies, power distribution panels, wiring, and other components installed within.

   b. General Construction Features:

      1) Fabricate enclosures using minimum 14-gauge steel for wall-mounted enclosures. Steel shall be free of pitting and surface blemishes.

      2) CONTRACTOR shall continuously weld all exterior seams and grind smooth. Also, surface grind complete removal of corrosion, burrs, sharp edges and mill scale.

      3) Reinforce sheet steel with steel angles where necessary to adequately support equipment and ensure rigidity and to preclude resonant vibrations.

      4) Panel shall be flat within 1/16-inch over a 24-inch by 24-inch area, or flat within 1/8-inch for a larger surface. Flatness shall be checked by using a 72-inch long straight edge. Out-of-flatness shall be gradual, in one direction only, and shall not consist of obvious depressions or a series of wavy sections.

      5) Panel shall use pan type construction for doors.

      6) Doors shall be mounted with full length heavy-duty piano hinges with stainless steel hinge pins.

      7) CONTRACTOR shall provide oil-resistant gasket completely around each door or opening.

      8) CONTRACTOR shall provide handle operated, oil-tight, key lockable three point stainless steel latching system with rollers on latch-rods for easy door closing.

      9) CONTRACTOR shall use stainless steel fasteners throughout.

      10) CONTRACTOR shall provide steel print pocket with white enamel finish.

      11) CONTRACTOR shall provide enclosure mounting supports as required for wall mounting.

12) CONTRACTOR shall provide all holes and cutouts for installation of conduit and equipment. All conduit and piping openings and all conduits shall be sealed watertight.

13) CONTRACTOR shall completely clean all interior and exterior surfaces so they are free of corrosive residue, oil, grease and dirt. Zinc phosphatize for corrosion protection.

14) One coat of primer shall be applied to all interior and exterior surfaces immediately after corrosion protection has been applied. Exterior surfaces shall then be given sufficient coats of primer surfacer, applied with sanding and cleaning between coats, until a Grade 1 finish can be produced on the finish coat.

15) All interior surfaces shall be painted with two coats of semi-gloss white polyurethane enamel.

16) All exterior surfaces shall be painted with a minimum of three finish coats of polyurethane enamel to ultimately produce a Grade 1 finish (super smooth; completely free of imperfections). Color to be selected by ENGINEER from complete selection of standard and custom color charts furnished by the manufacturer.

17) Primer and finish paint shall be compatible and shall be a low VOC, high solids polyurethane enamel, Hi-Solids Polyurethane B65 W300 Series as manufactured by Sherwin-Williams, Inc. or equal.

18) Provide one extra quart of touch-up paint for each exterior finish color.

c. Control panels located in non-corrosive areas shall be NEMA 12 rated.

d. Control panels located in corrosive areas shall be NEMA 4X rated:

1) Panels shall be Type 316 stainless steel construction with a minimum thickness of 12-gauge for all surfaces (except those areas requiring reinforcement) having a smooth brushed finish.

2) Panel shall be furnished with stainless steel screw clamp assemblies on three sides of each door.

3) Panels shall be furnished with rolled lip around three sides of door and along top of enclosure opening.

4) Panels shall be furnished with hasp and staple for padlocking.

5) Panels shall be provided with a clear plastic, gasketed lockable hinged door to encompass all non-NEMA 4X front

of panel instruments, where NEMA 4X panel instruments are not available.

e. Control Panels located in electrically classified areas shall be NEMA 7:

1) General: Explosion-proof control enclosures shall be used to house devices in hazardous environments. Enclosures shall be suitable for use in NEC Class 1, Groups C&D or Class II, Groups E, F & G applications and comply with UL and CSA standards.

2) Required Features:

a) Light-weight and corrosion resistant copper-free aluminum.

b) Integral, cast-on mounting lugs.

c) Left side door hinges.

d) Viewing windows sized to suit internally mounted components.

e) Stainless steel cover bolts.

f) Cad-plated steel mounting pans.

f. Electrical Systems:

1) Control of Environment:

a) Panels shall be furnished with adequately sized, automatically controlled 120 VAC strip heaters to maintain temperature 10°F above ambient for condensation prevention inside panels.

b) Panels shall be provided with automatically controlled closed loop ventilation fans or closed loop air conditioners with filtered air louvers if required to maintain temperature inside each enclosure below the maximum operating temperature rating of the components inside the enclosure.

2) Internal Power Distribution:

a) Panels shall be provided with an internal 120 VAC power distribution panel with number of circuits and separate circuit breakers sized as required to distribute power to the panel components. Distribution panel shall contain two spare breakers minimum.

3) Wiring:

a) Internal wiring shall be Type MTW stranded copper wire with thermoplastic insulation rated for 600 V at 85°C for single conductors, color coded and labeled with wire identification.

b) For DC panel signal wiring, use No. 18 minimum AWG shielded.

c) For AC power wiring, use No. 12 minimum AWG. For AC signal and control wiring, use No. 16 minimum AWG. For wiring carrying more than 15 Amps, use sizes required by NEC and NFPA 79 Standards.

d) Low voltage signal wiring and shielded wiring shall be separated from power and control wiring by a minimum of 6-inches.

e) Parallel runs of wire shall be grouped or bundled using covered troughs. Maximum bundle size to be 1-inch. Troughs shall have 40 percent spare capacity.

f) Wire troughs along horizontal or vertical routes shall be installed to present a neat appearance. Angled runs are not acceptable.

g) CONTRACTOR shall adequately support and restrain all wiring runs to prevent sagging or other movement.

h) CONTRACTOR shall terminate all field wiring using forked, insulated, crimp-on connectors (soldered type not acceptable) at 600 V rated barrier type terminal strips with screwed connections and permanently affixed numeric identifiers beside each connection. Identifiers to be self-stick plastic tape strips with permanent type, machine printed numbers. For DC field signal wiring, terminal strips shall be capable of handling No. 12 wiring (minimum). Manufacturers: Provide products of one of the following:

   (1) Phoenix Contact.

   (2) Entrelec Swartwout.

   (3) Allen Bradley.

   (4) Or equal.

i) All wiring shall be installed such that if wires are removed from any one device, power will not be disrupted to any other device.

j) For internal component to component wiring only, compression type terminal blocks are acceptable.

k) CONTRACTOR shall provide spare terminals equal in number to 20 percent of the terminals used for each type of wiring (e.g., DC signal and AC power).

l) CONTRACTOR shall provide a separate terminal for grounding each shielded cable.

m) CONTRACTOR shall use separate 5/16 inch diameter copper grounding studs for instrument signal cable shields and AC power.

n) Where wires pass through panel walls, provide suitable bushings to prevent cutting or abrading of insulation.

o) When DC power and/or low voltage AC power is required, provide and install the necessary power supplies and transformers in the panel.

p) CONTRACTOR shall provide circuit breakers to protect each circuit, with no more than six instruments on a single circuit.

q) CONTRACTOR shall provide complete wiring diagram showing "as-built" circuitry. Diagram shall be enclosed in transparent plastic and placed in easily accessible pocket built into panel door.

4) Surge Protection:

a) General: Surge protection shall be provided to protect the electronic instrumentation system from surges propagating along the signal and power supply lines. The protection systems shall be such that the protection level shall not interfere with normal operation but shall be lower than the instrument surge withstand level, and be maintenance free and self-restoring. Instruments shall be housed in suitable metallic cases, properly grounded. Ground wires for all surge protectors shall be connected to a good earth ground and where practical each ground wire run individually and insulated from each other. These protectors shall be mounted within the instrument enclosure or a

separate junction box (compatible with the area designation) coupled to the enclosure.

b) Manufacturers: Provide products of one of the following:

(1) Telecommunication Industries.

(2) Joslyn.

(3) Or equal.

5) Common, push-to-test circuitry shall be provided for each panel to simultaneously test all indicating lights, horn, and strobe on the panel using a single pushbutton.

6) Common, push-to-silence circuitry shall be provided for each panel to silence the alarm horn using a single pushbutton. Alarms strobe and alarm lights shall remain energized until the alarm is cleared from the system.

M. Control Relays

1. Type: General purpose, plug-in type rated for continuous duty.
2. Coil Voltages: 24 VDC and 120 VAC as required.
3. Contacts:
   a. Silver cadmium oxide rated not less than five amperes resistive at 120 VAC or 28 VDC continuous.
   b. For switching low energy circuits (less than 200 mADC) fine silver, gold flashed contacts rated not less than three amperes resistive at 120 VAC or 28 VDC continuous shall be provided.
4. Relays to have clear plastic dust cover.
5. Relays to be UL recognized.
6. Manufacturers: Provide products of one of the following:
   a. IDEC.
   b. Potter & Brumfield.
   c. Allen-Bradley.
   d. Or equal.

N. Selector Switches, Pushbuttons, and Indicating Lights

1. General:
   a. Selector switches, pushbuttons and indicating lights shall be provided by one manufacturer and is of the same series or model type.
   b. Type: Heavy-duty, oil-tight.

c. Provide legend plate for indication of switch, pushbutton or light function (e.g. “OPEN/CLOSED”, “ON/OFF/AUTOMATIC”).

d. Mounting: Flush mounted on control panel front, unless otherwise noted.

e. NEMA rated to match panel in which mounted.

2. Selector Switches:

a. Type: Provide selector switches with number of positions as required to perform intended functions.

b. Contacts:

1) Provide number and arrangement of contacts as required to perform intended functions specified but not less than one single pole, double throw contact.

2) Type: Double break, silver contacts with movable contact blade providing scrubbing action.

3) Rating: Compatible with AC or DC current with devices simultaneously operated by the switch contacts, but not less than ten amperes resistive at 120 VAC or DC continuous.

4) Switch Operator: Standard black knob.

c. Pushbuttons:

1) Type: Provide momentary, dual type pushbuttons as required to perform intended functions specified and shown.

2) Contacts: Comply with the requirements specified for selector switches.

d. Indicating Lights:

1) Type: Compact, integral transformer type.

2) Lamps: Six-volt, long life (20,000 hours minimum).

3) Indicating lights shall be provided with labeled escutcheon plates identifying the light function. (e.g. “RUN”, “STOP”, “ALARM”, “POWER”)

e. Button and Lens Colors:

1) Green for indication of closed, off (ready), stopped.

2) Red for indication of open, on, running.

3) Amber for indication of equipment malfunction, trouble and alarms (e.g. motor overload, etc.).

4) White for indication of electrical control power on.

f. Rotary Cam Switches:

1) Provide rotary cam switches with number of positions and poles as required to perform the required signal switching function specified and shown.

2) Contacts:

a) Gold-flashed contacts housed in mechanical contact blocks with number and arrangement of contacts as required to perform intended functions.

b) Contact Rating: Compatible with AC or DC through-put current of signals and devices simultaneously operated by the switch contacts, but not less than 20 amperes at 600 VAC or 250 VDC continuous.

c) Switch Operator: Standard black knob.

O. Strobe and Horn:

1. General: Strobe light with horn shall be a pulsating, illuminating, multi-tone audible device used to indicate common alarm at HMCS panels.

2. Service:

a. Corrosive and Non-Corrosive Areas: NEMA 4X construction.

b. Electrically Classified Areas: NEMA 7 construction.

3. Required Features:

a. Power Required: 120 VAC, 60 Hz.

b. Strobe Light: Minimum 250 candlepower; 360 degree pattern.

c. Flashing Mechanism: 72 to 75 flashes per minute.

d. Base Materials of Construction: Polycarbonate

e. Color: Amber/Red/Blue.

f. Base Materials of Construction: Aluminum (NEMA 4X Rated)/Cast Aluminum (NEMA 7 Rated).

g. Mounting: Mount on wall above HMCS panel. Provide appropriate mounting bracket and hardware.

h. Decibel Output: 100 at ten feet minimum with manual volume control.

4. Products and Manufacturers: Provide one of the following:

a. NEMA 4X Rated: 400 ST/350; NEMA 7 Rated: 27X ST/31x as manufactured by Federal Signal.

b. Or equal.

P. Conduit, Wire and Accessories:

1. Provide conduit and conduit supports in accordance with Section 26 05 33 – Raceways and Boxes for Electrical Systems and Section 26 05 29 – Hangers and Supports for Electrical Systems.
2. Provide wire in accordance with Section 26 05 20, Low Voltage Wires, Cables and Accessories.
3. Provide conduit, boxes and accessories in accordance with Section 26 05 33 – Raceways and Boxes for Electrical Systems.
4. Provide identification in accordance with Section 26 05 53 – Identification for Electrical Systems.

Q. Labeling:

1. Labeling of all equipment shall be in conformance with requirements specified herein.

R. Miscellaneous:

1. Provide additional controls and appurtenances as required to meet the intent of the HMCS and functional descriptions as specified in Sequence of Operations.
2. Provide all mounting accessories, as required.
3. Tubing, static pressure tips, mounting hardware, fasteners, and appurtenances shall be constructed of Type 316 stainless steel.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Not used.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Factory Test:

1. CONTRACTOR shall submit information on factory testing procedures to verify that testing shall fulfill the requirements as specified herein. Submittal shall be made at least two months in advance of any scheduled testing and shall include dates of scheduled tests.
2. CONTRACTOR shall notify ENGINEER, in writing, at least 4 weeks before expected initiation of tests. City and ENGINEER shall be present at factory during operational test of system equipment, either for individual units or as an integrated system.
3. All input/output devices and components shall be tested to verify operability and basic calibration.
4. All system hardware components equipment shall be tested to verify proper operation of the equipment as stand alone units. Test shall include, but not be limited to, the following:
   a. AC/DC power checks.
   b. Power fail/restart tests.

c. Diagnostics checks.

d. Test demonstrating that all specified equipment functional capabilities are working properly.

5. All system components shall be tested to verify that communication between units is working properly.

6. An integrated system test with all system equipment connected (excluding field sensors and instruments) shall be performed to verify that all equipment is performing properly as an integrated system.

7. CONTRACTOR shall demonstrate all system software utility and security programs incorporated into the system to illustrate the various functions and capabilities specified.

8. CONTRACTOR shall demonstrate the operation and display of all software based on a simulation of five percent of total input/output count, both analog and discrete, as selected by the manufacturer. In addition, City/ENGINEER shall randomly select, at the time of the test, additional inputs and outputs to be simulated in an amount approximately equal to five percent of total input/output count. Demonstration shall show that the monitoring and control application software associated with the input/output points performs the functions intended.

9. System performance shall be tested using a fully integrated system, including all software and hardware if applicable. To achieve this, the entire control system, including all the peripheral devices and all interconnecting cables, shall be assembled on the factory test floor and simulated inputs applied. CONTRACTOR shall carry out a full system test, during which the entire system shall operate continuously without failure in accordance with the requirements of the Contract Documents. CONTRACTOR shall provide a control I/O simulation panel prior to the test with the following applicable devices:

   a. Toggle switches to simulate field or other input contacts.

   b. Indicating lights to simulate outputs from tested panels.

   c. Control relays to simulate motor control center coil inputs.

   d. Time relays to simulate position switches.

   e. Indications (mADC) to indicate every 4 to 20 mADC output from tested panel.

   f. Potentiometers to simulate 4 to 20 mADC inputs to tested panel.

10. Every device shall have nameplate with description and device's tag number. Nameplates shall be removable and interchangeable for multiple use of panel during the test.

11. Demonstration of communication between controllers or to remote I/O's shall be included in the Test Procedure, where applicable.

12. Human Machine Interface (HMI): Prior to the staging and testing of the system, the display environments shall have been configured in accordance with the agreed upon display structure, loaded and data base parameters linked to the specified fields. During this phase of the factory acceptance test, the overall display structure shall be demonstrated, including environment configurations, passwords, security, etc. The display contents shall be reviewed to demonstrate how an operator navigates within the overall display structure. Each graphic display shall be reviewed for correctness in terms of the layout, symbols, color scheme, etc. The operation of standard alarm management displays (Current Alarm Display, Alarm History, etc.) shall also be demonstrated. A demonstration of each type of report specified shall be performed. Printing shall be an integral part of the report demonstration.

13. When the factory tests have been successfully completed, a report shall be submitted to the ENGINEER. The equipment shall not be shipped until Notice of Acceptance of the test is received by CONTRACTOR.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Building openings and penetrations shall be capped to protect the building from outside conditions.

B. INSPECTION

1. Examine conditions under which materials and equipment will be installed and notify ENGINEER in writing of conditions detrimental to proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions are corrected.

2. Take field measurements where required prior to installation to ensure proper fitting of Work.

3.02 INSTALLATION

A. General:

1. Install the equipment in accordance with the Contract Documents and by manufacturer's instructions and recommendations. Obtain written interpretation from ENGINEER in the event of conflict between manufacturer's instructions and recommendations and the Contract Documents.

2. Beginning of the work shall indicate acceptance of the areas and conditions as satisfactory by the Installer.

3. Install in accordance with Laws and Regulations.

4. Do not modify structures to facilitate installation of equipment, unless approved in writing by ENGINEER.

5. Installation to conform to requirements of all local and state codes.

6. All the Work described in this Section shall be installed, wired, circuit tested and calibrated by manufacturers trained and certified electricians, technicians and mechanics qualified for the Work.

7. CONTRACTOR shall be responsible for the proper operation and installation of all control systems herein specified. CONTRACTOR shall be responsible for coordination of all interfaces with other equipment and Contractors to achieve the required control operation.

8. Anchorage shall be provided in accordance with Section 40 05 96, Vibration, Seismic, and Wind Controls.

B. Sensors:

1. Wall sensors shall be installed five feet above finished floor unless otherwise noted.

2. Where sensors are located on exterior walls provide an insulated mounting subbase.

3. Outdoor air sensors will be mounted on the north building face directly in the outside air. Install these sensors such that the effects of heat radiated from the building or sunlight is minimized. Provide sunshield enclosures.

4. Space humidity or temperature sensors will be mounted away from machinery generating heat, direct light and diffuser air streams.

5. Provide all mounting accessories including but not limited to junction boxes, wall boxes, wall plates and mounting hardware as required for a complete installation.

C. Hardware Installation Practices for Wiring

1. All controllers are to be mounted vertically and per the manufacturer's installation documentation.

2. The 120VAC power wiring to each Ethernet or Remote Site controller shall be a dedicated run, with a separate breaker. Each run will include a separate hot, neutral and ground wire. The ground wire will terminate at the breaker panel ground. This circuit will not feed any other circuit or device.

3. A true earth ground shall be available in the building. Do not use a corroded or galvanized pipe, or structural steel.

4. All wiring shall be enclosed in conduit.

5. Conduit in finished areas will be concealed in ceiling cavity spaces, plenums, furred spaces and wall construction.

6. Exposed conduit will run parallel to or at right angles to the building structure.

7. Where sensor wires leave the conduit system, they are to be protected by a plastic insert.

8. Provide fire caulking at all rated penetrations.

D. Installation Practices for Field Devices

1. Well-mounted sensors will include thermal conducting compound within the well to insure good heat transfer to the sensor.
2. Actuators will be firmly mounted to give positive movement and linkage will be adjusted to give smooth continuous movement throughout 100 percent of the stroke.
3. Relay outputs will include transient suppression across all coils. Suppression devices shall limit transients to 150% of the rated coil voltage.
4. Water line mounted sensors shall be removable without shutting down the system in which they are installed.
5. For duct static pressure sensors, the high-pressure port shall be connected to a metal static pressure probe inserted into the duct pointing upstream. The low-pressure port shall be left open to the plenum area at the point that the high-pressure port is tapped into the ductwork.
6. For building static pressure sensors, the high-pressure port shall be inserted into the space via a metal tube. Pipe the low-pressure port to the outside of the building.

E. Enclosures

1. For all I/O requiring field interface devices, these devices where practical will be mounted in a field interface panel (FIP). The CONTRACTOR shall provide an enclosure which protects the device(s) from dust, moisture, conceals integral wiring and moving parts.
2. FIPs shall contain power supplies for sensors, interface relays and contactors, and safety circuits.
3. The FIP enclosure shall meet the requirements specified under Panels and Enclosures.

F. Identification

1. Identify all control wires with labeling tape or sleeves using words, letters, or numbers that can be exactly cross-referenced with as-built drawings.
2. All field enclosures shall be identified as specified under Panels and Enclosures.
3. Junction box covers will be marked to indicate that they are a part of the HMCS system.
4. All I/O field devices (except space sensors located in finished administration areas) that are not mounted within FIP's shall be identified with name plates.
5. All I/O field devices inside FIP's shall be labeled.

G. Software Installation

1. The CONTRACTOR shall provide all labor necessary to install, initialize, start-up and debug all system software as described in this section. This includes any operating system software or other third-party software necessary for successful operation of the system.

H. Sequence of Operations:

1. General:

a. Safety devices shall be hardwired, interlocked to operate in all modes of operation.

b. Safety sequences shall override other automatic control sequences.

c. The following alarm conditions shall de-energize the unit and require manual reset:

1) Low discharge air temperature alarm for 100% outside air units.

d. Fan failure shall be annunciated when the fan is indexed to energize and doesn't achieve run status. This includes but is not limited to interlocked dampers not opening, motor overload, or VFD failure.

e. Reset schedules and set points shown in Sequence of Operations are for initial programming and start-up, during system check out the reset schedules and set points shall be fine-tuned to obtain desired comfort and energy savings results. The ENGINEER reserves the right to make setpoint changes based on installed operating conditions, at no additional cost to the OWNER.

f. Automatic control functions that switch equipment on and off must be programmed with dead bands and/or time delays to prevent short cycling of equipment.

g. All sensors described within the Sequence of Operations or as shown shall give real time output display at the OIT.

h. ON/OFF/AUTO (O-O-A) selector switch shall start the unit when in the "ON" position, stop the unit when in the "OFF" position, and perform a specified operation when in the "AUTOMATIC" position.

i. Status icons on the OIT shall be provided for each piece of equipment controlled from the HMCS panel and include the following where applicable:

1) Run.

2) Stop.

3) Motor overload alarm.

4) Low temperature alarm

5) Dirty filter.

6) Fail (Equipment indexed to run that has not been energized)

7) Variable frequency drive fail.

8) Packaged equipment fail.

9) Motorized damper opened/closed.

j. A horn shall be provided on the HMCS panel. The horn shall be energized whenever the equipment is in alarm for the following:

1) Motor Overload.

2) Low Temperature.

3) Fail.

4) Variable Frequency Drive fail.

k. An "HVAC Common Alarm" contact shall be provided within each HMCS panel. The contact shall close whenever the HMCS panel is in alarm.

l. All HMCS panels shall be provided with the following pilot lights (hardware):

1) Panel Power.

2) Common Alarm.

m. All HMCS panels shall be provided with the following switches (hardware):

1) Push to test circuitry for common alarm horn and light.

2) Push to Silence Circuitry for common alarm horn. Common alarm light and associated alarm icons shall remain annunciated until alarm is cleared.

n. Dampers are two positions, unless otherwise noted by "(modulating)" next to the damper mark number.

o. Motorized dampers shall be provided with sufficient torque to open and close the devices. As a result, more than one actuator may be required even though one actuator is shown. Additional actuators shall be provided at no additional cost to the OWNER.

p. Provide a filter differential pressure sensor/gage for measuring the air flow resistance through filters at all filter sections. The device shall indicate differential pressure at the filter section and provide pressure signal inputs into the HMCS. Dirty filter set point shall be per the filter manufacturer's recommendation.

q. Where 120V dampers are provided, provide a dedicated disconnect switch.

r. Where equipment is provided with modulating return and modulating outside air dampers that operate relative to one another, independent damper actuators shall be provided. Dampers shall be electronically linked. Mechanically linked dampers are not acceptable. Provide a range controller for each damper to compensate for non-linear control characteristics.

s. Refer to Article 2.02.K Smoke Detectors for HVAC equipment that shall be de-energized through hard wire interlocks from the fire alarm system.

2. TI-010 Dechlorination Facility:

a. Chemical Room B01/103 – Supply Air System (SF-1, EDH-1)

1) SF-1 shall be controlled by an ON/OFF switch located at the HMCS panel. SF shall be set to run continuously under normal operation.

2) MD-1 shall be interlocked with SF-1. When SF is set to operate MD shall prove fully open prior to SF energizing.

3) Heating Mode:

a) EDH-1 shall operate during heating mode and be controlled by the DDC system through a discharge air temperature sensor set to maintain a discharge air temperature of 55°F.

b) A low temperature function shall de-energize the supply fan if the discharge air temperature is less than 40°F after a pre-determined amount of time.

4) The following outputs from the HMCS shall be provided for equipment control:

a) Supply fan start/stop (digital)

b) Damper open/close (digital)

c) Heating (analog)

5) The following inputs shall be monitored at the HMCS:

a) Supply fan on/off (digital)

b) Damper open/close (digital)

c) Heating (analog)

d) Discharge air temperature (analog)

e) Heater common alarm (digital)

6) The following shall be annunciated at the HMCS:

a) Supply fan on/off (digital)

b) Damper open/close (digital)

c) Heating (analog)

d) Dirty filter (digital)

e) Discharge air temperature (analog)

f) Unit fail

g) Heater common alarm (digital)

7) The following shall be annunciated through an audible alarm at the HMCS:

a) Unit fail

b) Damper fail

b. Chemical Room B01/103 – Exhaust Air System (EF-1)

1) EF-1 shall be controlled by an ON/OFF/AUTO switch located at the HMCS panel. In AUTO, EF shall be interlocked with SF-1.

2) MD-2 and 3 shall be interlocked with EF-1. When EF is set to operate MDs shall prove fully open prior to EF energizing.

3) The following outputs from the HMCS shall be provided for equipment control:

a) Fan start/stop (digital)

b) Damper open/close (digital)

4) The following inputs shall be monitored at the HMCS:

a) Fan on/off (digital)

b) Damper open/close (digital)

5) The following shall be annunciated at the HMCS:

a) Fan on/off

b) Fan fail

c) Motor overload

d) Damper open/close (digital)

6) The following shall be annunciated through an audible alarm at the HMCS:

a) Fan fail

b) Damper fail

c. Chemical Room B01/103 – Emergency Exhaust Air System (EF-2)

1) EF-2 shall be controlled by an ON/OFF/AUTO switch located at the HMCS panel. In AUTO, EF shall be set to

operate upon receiving an alarm signal of a gas/leak detection from the gas/leak detection system. EF shall turn off when gas/leak alarm is cleared.

2) MD-4, 5 and 6 shall be interlocked with EF-2. When EF-2 is set to operate MDs shall prove fully open prior to EF-2 energizing.

3) The following inputs shall be monitored at the HMCS:

a) Fan on/off (digital)

b) Damper open/close (digital)

4) The following shall be annunciated at the HMCS:

a) Fan on/off

b) Fan fail

c) Motor overload

d) Damper open/close (digital)

5) The following shall be annunciated through an audible alarm at the HMCS:

a) Fan fail.

b) Damper fail

d. Electrical Room 102 – Heat Pump System (AC-1)

1) AC-1 shall be controlled by the manufacturer's temperature controller set to maintain 78°F for cooling and 55°F for heating.

2) Provide control hardware and accessories as required for interfacing with the HMCS panel.

3) The following inputs shall be monitored at the HMCS:

a) AC-1 common alarm (digital)

e. Electrical Room 102 – Emergency Exhaust System (EF-3)

1) EF-3 shall be controlled by an ON/OFF/AUTO switch located at the HMCS panel. In AUTO, EF shall be controlled by a space thermostat set to maintain 90°F within the space.

2) MD-7 and 8 shall be interlocked with EF-3. When EF-3 is set to operate, MDs shall prove fully open prior to EF-3 energizing.

3) The following inputs shall be monitored at the HMCS:

a) Fan on/off (digital)

b) Damper open/close (digital)

4) The following shall be annunciated at the HMCS:
   a) Fan on/off
   b) Fan fail
   c) Motor overload
   d) Damper open/close (digital)
5) The following shall be annunciated through an audible alarm at the HMCS:
   a) Fan fail.
   b) Damper fail

3. TI-011 Disinfection Facility:
   a. Chemical Room B03 – Supply Air System (SF-1, EDH-1)
      1) SF-1 shall be controlled by an ON/OFF switch located at the HMCS panel. SF shall be set to run continuously under normal operation.
      2) MD-1 shall be interlocked with SF-1. When SF is set to operate MD shall prove fully open prior to SF energizing.
      3) Heating Mode:
         a) EDH-1 shall operate during heating mode and be controlled by the DDC system through a discharge air temperature sensor set to maintain a discharge air temperature of 55°F.
         b) A low temperature function shall de-energize the supply fan if the discharge air temperature is less than 40°F after a pre-determined amount of time.
      4) The following outputs from the HMCS shall be provided for equipment control:
         a) Supply fan start/stop (digital)
         b) Damper open/close (digital)
         c) Heating (analog)
      5) The following inputs shall be monitored at the HMCS:
         a) Supply fan on/off (digital)
         b) Damper open/close (digital)
         c) Heating (analog)
         d) Discharge air temperature (analog)
         e) Heater common alarm (digital)

6) The following shall be annunciated at the HMCS:
   a) Supply fan on/off (digital)
   b) Damper open/close (digital)
   c) Heating (analog)
   d) Dirty filter (digital)
   e) Discharge air temperature (analog)
   f) Unit fail
   g) Heater common alarm (digital)

7) The following shall be annunciated through an audible alarm at the HMCS:
   a) Unit fail
   b) Damper fail

b. Chemical Room B03 – Exhaust Air System (EF-1)

1) EF-1 shall be controlled by an ON/OFF/AUTO switch located at the HMCS panel. In AUTO, EF shall be interlocked with SF-1.

2) MD-2 shall be interlocked with EF-1. When EF is set to operate MD shall prove fully open prior to EF energizing.

3) MD-3 shall be interlocked with EF-1 and EF-3 such that when either EF-1 or EF-3 is set to operate MD-3 shall prove fully open prior to EF-1 or 3 energizing.

4) The following outputs from the HMCS shall be provided for equipment control:
   a) Fan start/stop (digital)
   b) Damper open/close (digital)

5) The following inputs shall be monitored at the HMCS:
   a) Fan on/off (digital)
   b) Damper open/close (digital)

6) The following shall be annunciated at the HMCS:
   a) Fan on/off
   b) Fan fail
   c) Motor overload
   d) Damper open/close (digital)

7) The following shall be annunciated through an audible alarm at the HMCS:

a) Fan fail

b) Damper fail

c. Chemical Room B03 – Emergency Exhaust Air System (EF-2)

1) EF-2 shall be controlled by an ON/OFF/AUTO switch located at the HMCS panel. In AUTO, EF shall be set to operate upon receiving an alarm signal of a gas/leak detection from the gas/leak detection system. EF shall turn off when gas/leak alarm is cleared.

2) MD-4 and 5 shall be interlocked with EF-2. When EF-2 is set to operate MDs shall prove fully open prior to EF-2 energizing.

3) The following inputs shall be monitored at the HMCS:

a) Fan on/off (digital)

b) Damper open/close (digital)

4) The following shall be annunciated at the HMCS:

a) Fan on/off

b) Fan fail

c) Motor overload

d) Damper open/close (digital)

5) The following shall be annunciated through an audible alarm at the HMCS:

a) Fan fail.

b) Damper fail

d. Chemical Room B04 – Supply Air System (SF-2, EDH-2)

1) SF-2 shall be controlled by an ON/OFF switch located at the HMCS panel. SF shall be set to run continuously under normal operation.

2) MD-6 shall be interlocked with SF-2. When SF is set to operate MD shall prove fully open prior to SF energizing.

3) Heating Mode:

a) EDH-2 shall operate during heating mode and be controlled by the DDC system through a discharge air temperature sensor set to maintain a discharge air temperature of 55°F.

b) A low temperature function shall de-energize the supply fan if the discharge air temperature is less than 40°F after a pre-determined amount of time.

4) The following outputs from the HMCS shall be provided for equipment control:
   a) Supply fan start/stop (digital)
   b) Damper open/close (digital)
   c) Heating (analog)
5) The following inputs shall be monitored at the HMCS:
   a) Supply fan on/off (digital)
   b) Damper open/close (digital)
   c) Heating (analog)
   d) Discharge air temperature (analog)
   e) Heater common alarm (digital)
6) The following shall be annunciated at the HMCS:
   a) Supply fan on/off (digital)
   b) Damper open/close (digital)
   c) Heating (analog)
   d) Dirty filter (digital)
   e) Discharge air temperature (analog)
   f) Unit fail
   g) Heater common alarm (digital)
7) The following shall be annunciated through an audible alarm at the HMCS:
   a) Unit fail
   b) Damper fail

e. Chemical Room B04 – Exhaust Air System (EF-3)

1) EF-3 shall be controlled by an ON/OFF/AUTO switch located at the HMCS panel. In AUTO, EF shall be interlocked with SF-2.
2) MD-7 shall be interlocked with EF-3. When EF is set to operate MD shall prove fully open prior to EF energizing.
3) MD-3 shall be interlocked with EF-1 and EF-3 such that when either EF-1 or EF-3 is set to operate MD-3 shall prove fully open prior to EF-1 or 3 energizing.
4) The following outputs from the HMCS shall be provided for equipment control:
   a) Fan start/stop (digital)

b) Damper open/close (digital)

5) The following inputs shall be monitored at the HMCS:

a) Fan on/off (digital)

b) Damper open/close (digital)

6) The following shall be annunciated at the HMCS:

a) Fan on/off

b) Fan fail

c) Motor overload

d) Damper open/close (digital)

7) The following shall be annunciated through an audible alarm at the HMCS:

a) Fan fail

b) Damper fail

f. Chemical Room B04 – Emergency Exhaust Air System (EF-4)

1) EF-4 shall be controlled by an ON/OFF/AUTO switch located at the HMCS panel. In AUTO, EF shall be set to operate upon receiving an alarm signal of a gas/leak detection from the gas/leak detection system. EF shall turn off when gas/leak alarm is cleared.

2) MD-8 and 9 shall be interlocked with EF-4. When EF-4 is set to operate MDs shall prove fully open prior to EF-4 energizing.

3) The following inputs shall be monitored at the HMCS:

a) Fan on/off (digital)

b) Damper open/close (digital)

4) The following shall be annunciated at the HMCS:

a) Fan on/off

b) Fan fail

c) Motor overload

d) Damper open/close (digital)

5) The following shall be annunciated through an audible alarm at the HMCS:

a) Fan fail.

b) Damper fail

g. Electrical Room 102 – Heat Pump System (AC-1)

1) AC-1 shall be controlled by the manufacturer's temperature controller set to maintain 78°F for cooling and 55°F for heating.

2) Provide control hardware and accessories as required for interfacing with the HMCS panel.

3) The following inputs shall be monitored at the HMCS:

a) AC-1 common alarm (digital)

h. Electrical Room 102 – Emergency Exhaust System (EF-5)

1) EF-5 shall be controlled by an ON/OFF/AUTO switch located at the HMCS panel. In AUTO, EF shall be controlled by a space thermostat set to maintain 90°F within the space.

2) MD-10 and 11 shall be interlocked with EF-5. When EF-5 is set to operate, MDs shall prove fully open prior to EF-5 energizing.

3) The following inputs shall be monitored at the HMCS:

a) Fan on/off (digital)

b) Damper open/close (digital)

4) The following shall be annunciated at the HMCS:

a) Fan on/off

b) Fan fail

c) Motor overload

d) Damper open/close (digital)

5) The following shall be annunciated through an audible alarm at the HMCS:

a) Fan fail.

b) Damper fail

4. Miscellaneous:

a. EUH:

1) EUH shall be controlled by a space thermostat set to maintain 55°F within the space.

3.03 FIELD TESTING / QUALITY CONTROL

A. Integrated System Field Test:

1. Following checkout of the HMCS, CONTRACTOR, under the supervision of the Supplier shall perform an Integrated System Field Test to verify that all components and programmed software are operating properly as a fully

integrated system, and that the intended monitoring and control functions are fully implemented and operational.

2. The HMCS shall be fully operational and pretested by the CONTRACTOR prior to conducting the Integrated System Field Test.

3. CONTRACTOR shall demonstrate all Sequence of Operations in the presence of the ENGINEER.

4. Deficiencies found during the Integrated System Field Test shall be immediately corrected by CONTRACTOR and the system retested to demonstrate proper operation.

3.04 STARTUP / DEMONSTRATION

A. System Checkout and Start-Up:

1. CONTRACTOR, under the supervision of the Supplier, and other component suppliers, as applicable, shall perform the following:

2. Check and approve the installation of all HMCS components and all cable and wiring connections between the system components prior to placing the system into operation.

B. Conduct a complete system checkout and adjustment, including calibration of all instruments, tuning of control loops, checking operation functions, and testing of final control actions. When there are future operational functions included in the Work, they should be included in the system checkout. All problems encountered shall be promptly corrected to prevent any delays in start-up of the system.

C. CONTRACTOR and the Supplier shall be responsible for initial operation of monitoring and control system and shall make all necessary modifications or replacements to ensure that the operation, monitoring and control of the HVAC systems function in the manner intended by these Specifications.

D. CONTRACTOR shall submit to the ENGINEER certified calibration reports for field instruments and devices and panel mounted devices upon completion of calibration.

E. CONTRACTOR shall submit to the ENGINEER an installation inspection report certifying that all system components have been installed correctly and are operating in the manner intended. The report shall be signed by authorized representatives of CONTRACTOR and the Supplier.

F. Operational Availability Demonstration Test:

1. The Operational Availability Demonstration (OAD) test shall not begin until successful completion of the Integrated System Field test. The period of operation of the OAD test shall be until a time frame has been achieved wherein the system (both hardware and software) availability meets or exceeds 99.9 percent for 7 consecutive days without system failures. If a system failure occurs during this period, the problem shall be corrected and the OAD restarted.

2. During the OAD test, the system shall be available to plant operating personnel. CONTRACTOR and the Supplier shall be readily available to correct any problems with the system during the OAD test. All HMCS system training shall be completed prior to the commencement of the OAD test.

3. The conditions listed below shall constitute system failures which are considered critical to the operability and maintainability of the system. The OAD test shall be terminated if one or more of these conditions occur. Following correction of the problem, a new 7 consecutive day OAD test shall begin.

   a. Failure to repair a hardware or software problem within 48 consecutive hours from the time of notification of a system failure.

   b. Recurrent hardware or software problems (e.g. if the same type of problem occurs three times or more).

   c. Software problem causing a processor to halt execution.

4. The following conditions shall constitute a system failure in determining the system availability based on the equation specified below:

   a. Failure of any operator interface or controller.

   b. Loss of communications between devices on the communications network.

   c. Failure of one or more input/output components.

   d. Failures of any type affecting ten or more input/output points simultaneously.

   e. Failure of any type affecting one or more control loops or sequential control strategies thereby causing a loss of the automatic control of the control variable or control sequence of operation.

   f. Failure of power supply.

   g. Failure of three or more primary sensors/transducers or field instruments simultaneously.

5. The system availability shall be calculated based on the following equation:

$$A = [TTO / (TTO + TTR)] \times 100\%$$

where:

A= System availability in percent.

TTO = Total time in operation.

TTR = Total time to repair.

6. Time to repair shall be the period between the time that CONTRACTOR is notified of a system failure and the time that the system has been restored

to proper operation in terms of hours with an allowance for the following dead times which shall not be counted as part of the time to repair period.

a. Actual travel time for service personnel to get to the Site up to six hours for each incident from the time CONTRACTOR is notified of a system failure.

b. Time for receipt of spare parts to the Site once requested up to 24 hours for each incident. No work shall be done on the system while waiting for delivery of spare parts.

c. Dead time shall not be counted as part of the system available period. The dead time shall be logged and the duration of the OAD test extended for an amount of time equal to the total dead time.

7. Completion of a 7 consecutive day period without any restarts of the OAD test and with system availability in excess of 99.9 percent shall constitute acceptance of the HMCS by the City.

8. All parts and maintenance materials required to repair the system prior to completion of the OAD test shall be supplied by CONTRACTOR, at no additional cost to the City.

9. During the OAD test, a HMCS Malfunction/Repair Reporting Form shall be completed by CONTRACTOR to document system failures. The form shall include at a minimum, date and time of CONTRACTOR notification, arrival and repair dates and times, description of the problem, CONTRACTOR repair actions and ENGINEER approval signature. The HMCS Malfunction/Repair Reporting Form shall be completed by the plant personnel and ENGINEER to document system failures, to record CONTRACTOR notification, arrival and repair times and CONTRACTOR repair actions. Format of the form shall be developed and agreed upon prior to the start of the OAD test.

G. Manufacturer’s Services:

1. CONTRACTOR shall provide the following services in addition to other services specified herein, and required by these Specifications.

a. A factory trained manufacturer's representative shall be provided for minimum of three trips for a minimum of eight hour, on-Site, each day. The first trip shall be to provide installation supervision. Subsequent trips shall be for start-up services and training services. The installation services shall be coordinated between CONTRACTOR and the manufacturer. The startup and field testing services, and the training services shall be coordinated with the City.

b. After installation supervision and field testing services by the manufacturer, CONTRACTOR shall submit to the ENGINEER, a certification letter on the manufacturer's letterhead and signed by

the manufacturer certifying that the equipment was installed in accordance with the manufacturer's recommendations and requirements and shall furnish all field test data, as required.

2. Manufacturer's Training: CONTRACTOR shall retain the services of the System Supplier to provide operation, and maintenance training for the entire HMCS. For equipment items not manufactured by the System Supplier, the System Supplier shall provide for on Site training by an authorized representative of the equipment manufacturer. Training shall be as follows:

   a. The Supplier shall perform standardized, structured training courses on-Site. Training shall be conducted by the Supplier's regular full time training instructors covering both operation and maintenance of the system equipment furnished by the Supplier.

   b. All training shall be scheduled so that it has been completed prior to Start-up and Acceptance by the City.

   c. The City shall determine the exact number of personnel that will attend training.

   d. Provide a training course covering the following topics. Total minimum training days: 1, Total minimum training hours per day: 8.

      1) The structure and the functions of the HMCS components and devices. The course shall familiarize the City's personnel with the procedures for applying the control system. As a minimum, the course shall cover the following topics:

         a) Overview of systems functional capabilities.

         b) Equipment overview including system component functions, operating principals and proper use.

         c) Start up of the system hardware components.

      2) Preventive and troubleshooting maintenance for the system components. The course shall familiarize the City's personnel with diagnostic capabilities of the system, both software and hardware, and also the routine maintenance procedures on the system and the common peripheral devices. As a minimum, the course shall cover the following topics:

         a) System overview description, including the power subsystems and logic components of the processor bus.

b) Description of the maintenance and troubleshooting aids of the system including software diagnostic programs.

c) Description of all bus operations.

d) Description of peripheral and process interface devices.

e) The use of hardware diagnostic routines, test equipment and test procedures as required enabling The City's personnel to detect and isolate system faults to the circuit board or module level and to implement repairs by replacing failed circuit boards or modules.

3) Training in the use and configuration of the specified HMI software. An instructor certified by the software manufacturer to furnish such training shall perform this training. The level of training shall be sufficient to familiarize the City's personnel with the configuration and application of all system programs. All essential system operating procedures shall be described as required to enable the City's personnel to operate the system via the various work stations and local control panels. As a minimum, the course shall cover the following topics:

a) System overview and capabilities.

b) Database configuration.

c) Graphic display configuration, including linking of data to displays.

d) Historical data configuration (collection, manipulation, and display).

e) Real-time and historical trending.

f) Report configuration, generation, printing, and customization.

g) Alarm configuration and management.

h) System security.

i) I/O driver use and configuration.

j) System backup and recovery.

k) System command language.

l) Troubleshooting.

m) System optimization.

n) System startup and shutdown procedures.

o) LAN and WAN communications, as appropriate

3. Provide instruction covering use and operation of the equipment to perform the intended functions.

   a. Provide instruction covering procedures for routine, preventive and troubleshooting maintenance including equipment calibration.

   b. Explain procedures for placing the equipment in and out of operation and explain necessary actions and precautions to be taken regarding the overall HMCS.

4. All costs, including travel, lodging, meals and incidentals, for additional visits shall be at no additional cost to the City.

H. Manufacturer's Services After Construction:

1. Service shall be provided by a factory-trained and certified manufacturer's representative During the One Year Correction Period. The manufacturer shall maintain all equipment furnished under HMCS during the first year of operation.

2. Service provided shall include the following:

   a. Quarterly Service: Service intervals shall be quarterly for a minimum of 1day of 8 hours, on-Site, each day per quarter. The service duration shall be increased, as necessary by supplier, taking into consideration the system service requirements and system size. CONTRACTOR shall indicate the service duration and service scope. Prior to the visits, the Supplier shall contact the City and inquire as to problems encountered with the system. Service visits shall be scheduled at times agreeable to the City at least one week in advance. The quarterly service shall include, but not limited to the following:

      1) Provide manufacturer's recommended maintenance.

      2) Check all controls, components and recalibrate/adjust as necessary.

      3) Perform necessary cleaning and service that is scheduled on a quarterly basis in accordance with the approved Operations and Maintenance Manual. Provide all expendable materials, as necessary.

      4) Review and provide recommendations concerning City's operations.

      5) Replace or repair defective controls and components.

      6) Inspect control panels. Test panel indication lights and replace defective lights.

      7) Provide a detailed field report to the City.

3. Technical Support: Technical support shall be provided between the hours of 8 AM and 4 PM, Monday through Friday when requested by the City. Technical support shall include, but not limited to the following:

   a. Telephone Technical Support.

   b. On-Site Visits.

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjusting:

1. Adjust the HMCS for proper settings and to achieve proper control.

B. Cleaning:

1. Thoroughly clean all equipment and accessories prior to installation and at substantial completion.

2. Remove all dirt, rust, dust, etc. from equipment and accessories.

3. Remove and dispose of all debris and waste from the Site resulting from installation.

C. Protection of Executed Work:

1. Equipment shall be tightly covered and protected against dirt, water, and chemical or mechanical damage.

2. Provide final protection and maintain conditions in a manner acceptable to the manufacturer that shall help ensure that the equipment is without damage at time of Substantial Completion.

END OF SECTION

NO TEXT ON THIS PAGE

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified and required, to furnish, install, and test all metal ductwork, with auxiliary equipment and accessories, complete and operational.

B. The following index of this Section is presented for convenience:

Article	Title	Section Page

C. The following schedule(s), attached after the end of section designation, are a part of this Section:

1. Schedule 23 31 14-1, Schedule of Metal Duct Construction Standards.

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

A. Section 07 92 00 – Joint Sealants.

1.05 DESCRIPTION

A. This Section includes requirements for providing metal ducts and accessories in accordance with applicable standards and regulations. In addition:

1. Metal duct and accessories shall include all painting, coating, lining, gaskets, harnesses, bolts, nuts, and other appurtenances and material required to provide and assemble the lines.

2. Attachments:

a. Exhibit A – TI-10C Duct Cleaning Scope

1.06 QUALITY ASSURANCE

A. Requirements of Regulatory Agencies: Comply with applicable provisions of regulatory agencies below and others authorities having jurisdiction.

1. Underwriters Laboratories, Inc.

2. National Fire Protection Association.

3. National Electrical Code.

4. Local and State Building Codes and Ordinances:

   a. New York City Building Code.

   b. New York State Uniform Fire Prevention and Building Code.

B. Qualifications of Manufacturer:

1. Engage a single firm, with undivided responsibility for performance and other requirements and components of the metallic ductwork.

2. Engage a firm which can show successful experience in the fabrication and erection for metallic ductwork systems of scope and type similar to the required Work.

C. Qualifications of Installer:

1. The Contractor shall have at least five (5) years' experience in the installation of the Work specified herein. The Contractor shall employ only tradespersons with specific skills and experience in this type of Work.

2. The Contractor shall have undivided responsibility as a single firm for performance and other requirements for the installation of the Work specified herein.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

   a. The Contractor shall submit the following Shop Drawings and material specifications for the approval of the Engineer:

      1) ¼-in. scale duct layouts, complete with.

         a) Dimensions.

         b) Details of construction.

         c) Details of installation, hanger details and spacing.

      2) Manufacturer's literature, illustrations, specifications, and Engineering data for the following items, including weights of all component parts:

         a) Registers, grilles, and diffusers.

         b) Fire Dampers (UL Listed), including:

            (1) Closing mechanisms.

            (2) Fusible link operating temperature.

            (3) Installation details.

         c) Access Doors.

d) Duct Access Doors.

e) Flexible connections.

f) Duct sealants.

3) Details of sheet metal safing construction and installation.

4) An air outlet schedule indicating room name and location of each outlet. Cross reference contract designation and manufacturer's model number or name.

5) Details of construction and material to the Engineer for all access doors to ensure the access door material matches the appearance of the finished work.

b. Test Reports: Submit the following test reports for the following:

1) UL Label, Fire Dampers.

2) Volume Damper leakage tests from an AMCA-approved testing laboratory.

2. Information Submittals:

a. Contractor shall submit an affidavit stating that all stainless steel accessories (including, but not limited to: screws, hangers, supports, etc.) for stainless steel ductwork are Type 316 stainless steel.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. All ductwork shall arrive on site fully fabricated, and not in two halves for field fabrication.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall provide spare parts and special tools necessary to service, disassemble, repair and adjust the materials and products provided under this Section, and as per the requirements of the Contract Documents. In addition, furnish the following spare parts:

1. Twelve (12) spare fusible links.

B. Tools: Provide standard and special tools and supplies necessary to service, disassemble, repair and adjust the products.

1.10 WARRANTY

A. Not used.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Ductwork Accessories:

1. Transverse Duct Connections:
   a. Ductmate 35® System as manufactured by Duct Mate Industries Inc., Charleroi, PA.
   b. Or approved equal.
2. Volume Dampers:
   a. Ruskin Co., Grandview, MO.
   b. Or approved equal.
3. Rectangular Fire Dampers:
   a. Ruskin Co., Grandview, MO.
   b. Or approved equal.

B. Registers, Grilles, and Diffusers:

1. Supply Grilles:
   a. A-J Manufacturing Co., Inc., Kansas City, MO.
   b. Or approved equal.
2. Air Turning Devices:
   a. AJ Manufacturing Co., Inc., Kansas City, MO.
   b. Or approved equal.
3. Exhaust and Return Grilles:
   a. A-J Manufacturing Co., Inc., Kansas City, MO.
   b. Or approved equal.
4. Supply Air Drum Louvers:
   a. Krueger-HVAC, Richardson, TX.
   b. Or approved equal.

C. Filter Housing:

1. Product and Manufacturer: Provide one of the following:
   a. Model Surepleat, as manufactured by Flanders Corporation.
   b. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. Metal Ductwork:

1. General:
    a. All work shall be constructed and installed properly in accordance with the recommendations given in the latest edition of SMACNA HVAC Duct Construction Standards and SMACNA Rectangular Industrial Duct Construction Standards.
    b. All ductwork shall be constructed in accordance with Schedule 23 31 14-1, Schedule of Duct Construction Standards, located after the "End of Section" designation.
2. Materials:
    a. The following ductwork shall be constructed of aluminum (with 3003 ductwork H-14 alloy and temper) and all duct accessories (e.g., air outlets, hardware, and fasteners, etc.) shall also be:
        1) Ductwork located in entry hall and electrical room.
3. Stainless Steel Ductwork:
    a. Stainless steel duct sheet thicknesses shall be two (2) gauges heavier than the thickness specified for galvanized steel duct in the SMACNA Duct Construction standards.
4. Connections:
    a. The transverse duct connections shall be bolted, gasketed connections.
5. Duct Elbows:
    a. Duct elbows shall have a minimum centerline radius of 1½ times the width of the duct.

B. Ductwork Accessories:

1. Hangers and Supports:
    a. All ductwork shall be securely hung and anchored to the building structure.
        1) Unless otherwise explicitly shown on the Contract Drawings, hangers and stiffeners for ducts shall conform to all the recommendations and requirements given in the SMACNA HVAC Duct Construction Standards and the SMACNA Seismic Restraint Manual - Guidelines for Mechanical Systems.
        2) Unless otherwise specified herein, hangers and supports shall also conform to all the requirements of Section 40 05 07, Hangers and Supports for Process Piping.
        3) Provide equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.

b. Ducts shall be supported on trapeze hangers with angles or rods – the use of strap hangers, sheet metal duct hangers, and/or straps is prohibited.

c. Hanger rod thickness shall be as follows:

1) For all ducts with half-perimeter up to 72-in.: Hanger rods shall be minimum ⅜-in. thick.

d. For all ducts with half perimeter larger than 72 in.: Hanger rods shall be minimum ½-in. thick. A pair of rods shall be provided at each duct support point.

e. Support shall also be furnished at each fitting.

f. The maximum hanger spacing shall be as follows:

1) For ducts with half perimeter up to 72-in.: 8 ft

2) For ducts with half perimeter larger than 72-in.: 6 ft

g. All hangers, rods, supports, bolts, nuts, washers, inserts, and appurtenances shall be Type 316 stainless steel, except for use on galvanized steel ductwork, when such may be of galvanized steel construction.

h. Seismic Requirements:

1) All piping and ductwork shall be provided with seismic restraints in accordance with the SMACNA Seismic Restraint Manual – Guidelines for Mechanical Systems and in accordance with the New York City Building Code and referenced Uniform Building Code requirements.

2) Piping and ductwork shall be supported to withstand seismic forces anticipated in seismic zones 2A.

2. Sleeves:

a. Where ductwork passes through masonry walls, partitions, or floors, provide sleeves.

b. Material:

1) For stainless steel and aluminum ductwork: Provide sleeves of minimum 16 gauge, Type 316 stainless steel.

2) For galvanized ductwork: Provide sleeves of galvanized steel.

3. Volume Dampers:

a. Volume dampers shall comply with SMACNA Standards.

b. Materials:

1) For stainless steel ductwork: Provide manual volume dampers of Type 316 stainless steel construction.

2) For aluminum: Provide manual volume dampers of and aluminum construction.

c. Blades: Opposed blades, vinyl edge seals.

d. Provide outside handle, quadrant, and approved position indicator and locking device.

e. Performance:

1) Damper Leakage: Not more than 16 cfm/ft^2 at 4-in. W.G.

4. Fire Dampers (Dynamic Type):

a. Provide fusible link fire dampers and access doors where indicated on the Contract Drawings and in accordance with the New York City Building Code. The fire dampers shall conform to all requirements of the latest edition of NFPA 90A and shall have a 1½ hr or 4 hr standard fire protection rating in accordance with the requirements of UL 555. All fusible links shall be UL rated at 165°F.

b. Materials:

1) For stainless steel and aluminum ductwork: Provide fire dampers of Type 316 stainless steel construction, with Type 316 stainless steel blades, interlocking joints, and fusible links.

2) For galvanized ductwork: Provide fire dampers of galvanized steel, with galvanized blades, interlocking joints, and fusible links.

3) Collars, angles, and hardware used for installing stainless steel fire dampers shall be Type 316 stainless steel.

c. Fire dampers shall be of the curtain type with interlocking blades set in a one-piece frame.

d. Fire dampers shall be suitable for installation in the vertical or horizontal position.

e. All fire dampers shall be Dynamic Rated for closure against airflow in the following six installation configurations:

1) Vertical Mount (Horizontal Airflow): Ducted and unducted.

2) Horizontal Mount (Airflow Up): Ducted and unducted.

3) Horizontal Mount (Airflow Down): Ducted and unducted.

f. Each fire damper shall be rated to close against maximum design airflow at its installed location with a 10% safety factor and against 8-in. w.g. maximum pressure across the closed damper.

g. Label:

1) All fire dampers shall have UL Label attached.

2) Label Materials:

a) For stainless steel and aluminum fire dampers: Provide label of Type 316 stainless steel construction.

b) For galvanized steel fire dampers: Provide label of galvanized steel construction.

3) Label shall have a fire rating of, at a minimum:

a) 1½ hrs for fire separations (walls, floors, and partitions) rated at 2 hrs.

b) 3 hrs for fire separations (walls, floors and partitions) rated at 3 hrs and above.

5. Sheet Metal Safing:

a. Provide insulated aluminum sheet metal safing to close off and seal airtight all unused areas behind louvers.

b. Insulation shall be 2-in. thick rigid fiberglass, permanently sandwiched between two 16 ga. minimum metal sheets.

c. Insulation shall be secured to the sheets with adhesive.

d. The sheets, channels, and hardware used for the sheet metal safing shall be Type 316 stainless steel.

e. All edges of the panels shall be provided with a 16 ga. minimum channel secured in place with sheetmetal screws 6-in. on centers.

f. Insulated sandwich panels shall be removable type with maximum space of 18 in., and supported on 3-in. × 3-in. × ¼-in. angle. Provide intermediate supports.

6. Duct Access Doors:

a. Provide gasketed, cam lock cover type access doors in accordance with SMACNA Standards.

b. Construction:

1) Duct access doors shall be rigid and airtight, and provided with neoprene gaskets, hinges, and sash locks.

c. Materials: Each access doors shall be of the same material as the duct or duct accessory to which said access door shall be affixed.

d. Unless otherwise shown on the Contract Drawings or specified herein, access doors shall be of the following sizes:

1) For duct sizes under 14-in.: Provide 12-in. × 6 in. access doors.

2) For ducts sized 14-in.: Provide 12-in. × 12-in. access doors.

3) For duct sizes between 14-in. and 36 in.: Provide 21-in. × 14-in. access doors.

4) For duct sizes between 36-in. and 60-in.: Provide 25-in. × 17- in. access doors.

5) For ducts larger than 60-in.: Provide quantity two (2) 25-in. × 17 in. access doors.

e. Access doors for fire dampers shall be stenciled "FIRE DAMPER ACCESS" with minimum ½-in. high letters.

7. Flexible Connections:

a. Provide flexible connections in accordance with SMACNA HVAC Duct Construction Standards.

1) Flexible connections shall be for a pressure classification of 3 in. w.g.

b. Materials:

1) For galvanized steel ductwork: Provide 16 ga., 3-in. wide galvanized steel strip flexible connections.

2) For stainless steel ductwork: Provide Type 316 stainless steel flexible connections.

3) For aluminum ductwork: Provide 0.080-in. thick, 3-in. wide aluminum strip flexible connections.

8. Vibration Isolation Flexible Connections:

a. Provide flexible connections for preventing the transmission of vibrations through the ductwork at the locations specified herein.

b. Materials: Vibration isolation flexible connections shall be neoprene-impregnated fabric collars with cemented seams fastened with straps and bolts of the same material as the connecting ductwork.

9. Turning Vanes:

a. Provide turning vanes in accordance with SMACNA HVAC Duct Construction Standards.

b. Materials: Provide turning vanes of the same materials as ductwork in which they are installed.

c. Construction: Vanes shall be of double thickness design.

10. Air Volume Extractors:

a. Provide air volume extractors in accordance with SMACNA Standards.

b. Material: Provide air volume extractors of the same material as the ductwork in which they are installed.

c. Construction: Provide gang-operated curved adjustable blades controlled through manual adjusting lever.

11. Hardware:

a. Materials:

1) All fastening devices used for aluminum and stainless steel ductwork and accessories shall be Type 316 stainless steel.

2) All fastening devices used for galvanized and aluminum ductwork and accessories shall be galvanized.

3) All gasketing material shall be butyl.

C. Registers and Grilles:

1. General:

a. Register and grille units shall distribute the volume of air (cfm) specified and/or as shown on the Contract Drawings.

b. Outlets for diffusion, spread, throw, and noise level shall be as required for specified performance.

1) Performance shall be certified according to ASHRAE 70.

2) Inlets and outlets shall be sound rated and certified according to ASHRAE 70.

c. Where the inlet and outlet openings are located less than 7 ft above the floor, they shall be protected by a grille or screen according to NFPA 90A.

d. Materials:

1) For stainless steel ductwork: Register, grille, and diffuser units shall be of Type 316 stainless steel construction.

2) For aluminum: Register, grille, and diffuser units shall be of aluminum construction.

e. Volume Dampers:

1) Diffusers and registers shall be provided with volume damper with accessible operator, unless otherwise indicated; or if standard with the manufacturer, an automatically controlled device will be acceptable.

2) Volume dampers shall be opposed blade type for all diffusers and registers, except linear slot diffusers.

a) Linear slot diffusers shall be provided with round or elliptical balancing dampers.

f. Registers and Grilles:

1) Units shall be four-way directional-control type, except that return and exhaust registers may be fixed horizontal or vertical louver type similar in appearance to the supply register face.

2) Registers shall be provided with sponge-rubber gasket between flanges and wall or ceiling.

3) Grilles shall be as specified for registers, without volume control damper.

2. Supply Registers:

a. Supply registers shall be double deflection type.

b. Supply registers shall be provided complete with:

1) Adjustable vertical face bars

2) Key-operated opposed blade damper.

3. Air Turning Devices:

a. The air turning devices shall be provided complete with:

1) Two (2) sets of individually adjustable blades to equalize flow and control volume at collar takeoffs.

2) Gasketed perimeter.

4. Exhaust and Return Registers:

a. Exhaust and return registers shall be provided complete with:

1) Fixed vertical face bars, set straight.

2) Key-operated opposed blade damper.

5. Exhaust and Return Grilles:

a. Exhaust shall be provided complete with:

1) Fixed vertical face bars, set straight.

6. Supply Air Drum Louvers:

a. Supply air drum louvers shall have a felt seal around the rotating drum to prevent leakage.

b. Supply air drum louvers shall be adjustable to direct the air stream at any angle up to 30° from the louver centerline either by rotating the drum or by adjusting the position of the pivoted vanes.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Stainless Steel Ductwork:

1. All stainless steel ductwork shall be shop fabricated in sections with welded flanged ends.

2. No field welding of stainless steel ductwork shall be permitted.

3. Welding equipment and electrodes shall be of a type specifically suited for welding light gauge Type 316 stainless steel to provide consistently good quality welds.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. Not Used

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Field Measurements:

1. Take field measurements where required prior to installation to ensure proper fitting of Work.

3.02 INSTALLATION

A. Metal Ductwork:

1. All ductwork shall conform accurately to the dimensions shown on the Contract Drawings, with the exception that:

a. Ductwork shall be as shown on the Contract Drawings, subject to such modifications as may be necessary to suit field conditions to clear any obstruction or conflicts with other equipment.

2. All ductwork shall be straight and smooth on the inside with neatly finished joints, and shall not be decreased at any point to avoid obstructions.

3. No piping, conduit, or structural work shall be installed in or through any ductwork.

4. All ductwork shall be run as close as possible to structural members, walls, and ceilings.

5. Where existing walls, floors, or roofs must be penetrated, Contractor shall neatly cut the required openings and patch the existing work to provide a neat and finished appearance.

6. Ductwork shall be installed so as to preclude the possibility of vibration under all operating conditions.

7. Install all ductwork and accessories to provide a system free from buckling, warping, breathing, or vibration.

8. Where required, and as shown on the Contract Drawings, the Contractor shall provide blank off baffles to eliminate drafts caused by nearby obstructions.

B. Ductwork Joints:

1. After the installation is completed, the Contractor shall seal all joints.
2. Tape and seal all joints as per SMACNA Duct Construction Standards.
3. Sealants and tape shall have the following ratings:
   a. Flame Spread Rating, as per ASTM E84: ≤ 25
   b. Smoke Developed Rating: ≤ 50
4. Flanged duct joints shall be 0.25-in Butyl gasketed and bolted together with stainless steel (Type 316) bolts, nuts, washers and lock washers.
5. All metal duct joints shall be airtight with no leakage.

C. Coordinate all air outlets for compatibility with ceiling system.

D. Sleeves:

1. Caulk sleeves airtight with fire resistant sealant between sleeve and ductwork in accordance with Section 07 92 00, Joint Sealants.

E. Floor Openings:

1. Curbs to prevent water leakage shall be provided around all floor openings.
2. Where concrete curbs are not shown on the Contract Drawings:
   a. Provide curbs fabricated of 4-in. × 4-in. × ¼-in. thick angles with welded corners.
   b. The curb shall be set in a mastic compound and securely fastened to the floor to provide a watertight installation.
3. Curbs associated with stainless steel ductwork shall be fabricated of Type 316 stainless steel.

F. Turning Vanes:

1. The turning vanes shall be quiet and free from vibration when the system is in operation.
2. Turning vanes shall be double thickness type.
3. Turning vanes shall be installed in the following locations:
   a. All miter elbows to permit air to make the abrupt turns with a minimum of turbulence.
   b. All collar take-offs to supply registers.
   c. All short radius elbows in accordance with SMACNA standards and Industrial Duct Construction standards.

4. Duct clean out doors shall be provided at each elbow with turning vanes.

G. Volume Dampers:

1. Manual volume dampers larger than 11-in. in any dimension shall be opposed blade type.

2. The damper blades shall be operated by a lockable dial regulator and may be set in any position.

   a. The dial regulators shall be marked so that the "open" and "shut" positions are clearly identified.

   b. The dial regulators on insulated ductwork shall be mounted on an elevated platform which will finish flush with the surface of the insulation.

3. Manual volume dampers shall be located at accessible points and wherever possible some distance from a duct transition or fitting.

4. Care shall be taken during installation to make certain that sheet metal fasteners do not protrude into the duct and interfere with damper operation.

5. Install volume dampers where indicated on the Contract Drawings and as required to facilitate accurate volume control. Volume dampers specified with air devices shall be installed in addition to those shown on the Contract Drawings. In addition, dampers shall be installed in all of the following locations:

   a. Each branch duct take off, and

   b. In both ducts downstream of each trunk duct split.

   c. An additional volume damper shall be installed in duct stub to each air outlet for balancing of air volume.

H. Splitter type dampers are not permitted and shall not be installed.

I. Duct Access Doors:

1. Duct access doors shall be provided in all of the following locations for inspection and maintenance:

   a. Within working distance of (and on the fusible link side of) all fire dampers.

   b. Adjacent to all dampers.

   c. On the linkage side of all automatic dampers.

   d. At all other apparatus requiring service or inspection in the duct system.

2. Whenever space requirements are such that a hinged access door is impractical, a screw fastened lift-out door shall be provided instead.

J. Access Doors:

1. Provide access doors for all concealed valves, controls, test openings, duct access doors, and at all other locations requiring service, inspection, and/or adjustment of a concealed item. Behind finished work such as walls, plaster, and wood paneling, and in suspended ceilings which do not have removable panels. The access doors shall match the appearance of the finished work in which they are installed and shall be of sufficient size to permit service, inspection, and/or adjustment of the concealed item.

K. Test openings:

1. The test openings shall be sealed by a screw cap and gasket, and shall be installed so that the insulation is not disturbed when the cover is removed.

2. The test openings shall be located as follows in all heating, ventilating, air conditioning systems:

a. In the outside air duct adjacent to the unit.

b. In the exhaust air duct adjacent to the unit.

c. In the main supply duct on each unit.

L. Flexible Connections:

1. All expansion joints in ducts at building expansion joints shall be suitably supported at each end by support guides within 12-in. of joint.

2. All ducts at flexible connections with air handling equipment, and fans shall be supported at free end within 12-in. of flexible connection.

3. Provisions shall be made for supporting all ductwork, dampers, and other ductwork accessories, where necessary.

M. Vibration Isolation Flexible Connections:

1. Install vibration isolation flexible connections between the ductwork and all air moving equipment and at the building joints.

a. Provide flexible connections at both the inlet and discharge of air all handling equipment.

2. Vibration isolation flexible connections shall not be painted or used to correct misalignment.

N. Fire Dampers:

1. Fire dampers shall be installed where shown on the Contract Drawings and where required by UL and authorities having jurisdiction, and shall be approved by local building codes and in accordance with the requirements of the NFPA.

a. Two (2) fire dampers, rated at 1½ hours each, with one on each face of the fire separation or fire division, are required for fire separations having a 3-hr fire rating or above as per the New York City Building Code and Uniform Building Code requirements.

2. Fire dampers shall be secured to a Type 316 stainless steel collar with ¼-in. diameter stainless steel nuts and bolts with maximum spacing of 12-in. on center and a minimum of two (2) fastenings per side, beginning 2-in. in from the corners of the collar.

3. The collars shall be at a minimum the same gauge as the ductwork to which the collar is attached or 24 ga. thick (Type 316 stainless steel), whichever thickness is greater.

4. Retaining angles shall be installed on four sides of the collar and on both sides of the protected opening with a minimum of 1-in. overlap on the wall or floor.

   a. The Type 316 stainless steel angles shall be a minimum of 1½-in. × 1½-in. × ⅛-in. and shall be fastened to the collar only – do not fasten angles to the wall or floor.

   b. The retaining angles shall be increased in size to provide the minimum overlap of one inch on the wall or floor.

   c. The angles shall be fastened to the collar with ¼-in. diameter stainless steel nuts and bolts with a maximum spacing of 6-in. on center and a minimum of two (2) fastenings per side, beginning 2-in. from the corners of the collar.

   d. Where gas tight seals are required, the angles shall be fastened to the collar with a continuous weld and a sealant shall be installed between the angle and the wall or floor.

5. Clearance for expansion is required between the collar and the opening on the top and on each vertical side.

   a. The clearance shall be ⅛-in. per linear ft of sleeve, with clearance on the sides distributed equally and all vertical clearance on the top.

6. The ductwork shall be connected to the collar on each side of the wall or floor with a breakaway connection on all four sides of the collar.

   a. The distance from the wall or floor to the breakaway connection shall not exceed 6-in..

7. Provide firestopping at fire separations where fire dampers are installed.

8. Provide an access door in duct at each fire damper located in duct.

O. Prefabricated Roof Curbs:

1. Install before the installation of roofing.

P. Contractor shall furnish and install sleeves for registers, grilles, and dampers mounted in the masonry, concrete plenums or shafts. Sleeves shall be 16 ga. Type 316 stainless steel.

Q. Sheet Metal Safing:

1. Install safing to seal off remaining portions of shafts and louvers which are not covered by the plenums or equipment attached to the shaft or louver.

R. Drip Pans:

1. Route drain pipe of a diameter necessary and required from drip pan to nearest plant drain in accordance with the requirements of Section 40 05 05, Exposed Piping Installation.

2. Drain pipe shall be of copper or brass as per Section 40 05 15, Copper and Brass Process Pipe.

3. Install and restrain drain pipe as per Section 40 05 05, Exposed Piping Installation.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjustment:

1. Set volume control devices for approximate positions in preparation for final testing and balancing.

2. Install fusible links in fire dampers and verify that dampers are in open position.

3. Start fan system and check for excessive leaks and vibration and correct.

B. Balancing:

1. Systems shall be completely tested, adjusted and balanced by a qualified engineer. A complete balancing procedure shall be submitted for approval. All equipment and connections required to balance the systems shall be provided.

2. All duct systems shall be balanced as specified in Section 23 05 93, Testing, Adjusting, and Balancing for HVAC.

C. Cleaning:

1. Remove all loose materials and obstructions from interior of ducts.

2. Remove debris and waste materials resulting from installation.

D. Existing Ductwork:

a. General:

1) Contractor shall provide cleaning services to ductwork associated with the following equipment:

a) HV-7 located in TI-10C. Refer to Exhibit A at the end of this specification for additional information regarding extent of ductwork to be cleaned.

b. The Contractor shall engage a suitable duct cleaning Contractor to provide cleaning services for the ductwork associated with ductwork systems serving the chemical room for the existing FB CSO Facility. Services shall include the following:

1) Employ a NADCA certified duct cleaning agency that will provide cleaning services following NADCA's ACR Standard for Assessment, Cleaning & Restoration of HVAC Systems. Agency shall be regularly engaged in industrial type duct cleaning operations and be experienced with cleaning industrial process piping, exhaust systems, mist and dust collectors, grease exhaust, paint spray booths, and other industrial duct systems.

2) Provide all equipment and chemicals required for the duct cleaning program.

3) Furnish trained personnel to supervise and perform the duct cleaning program.

c. Performance:

1) Engineering Controls:

a) As required by NADCA.

b) Level 1 containment.

d. Inspection:

1) Provide certified inspection service such as Air Systems Cleaning Specialist (ASCS), Certified Ventilation Inspector (CVI) or equal to verify and document the preliminary state of HVAC system cleanliness and determine the exact scope of work, engineering controls required, safety measures required, tools and equipment required.

e. Cleanliness Verification:

1) NADCA Method 2 for Cleanliness verification and documentation shall be performed to verify compliance with the standard.

E. Painting:

1. Surface Preparation and Shop Painting:

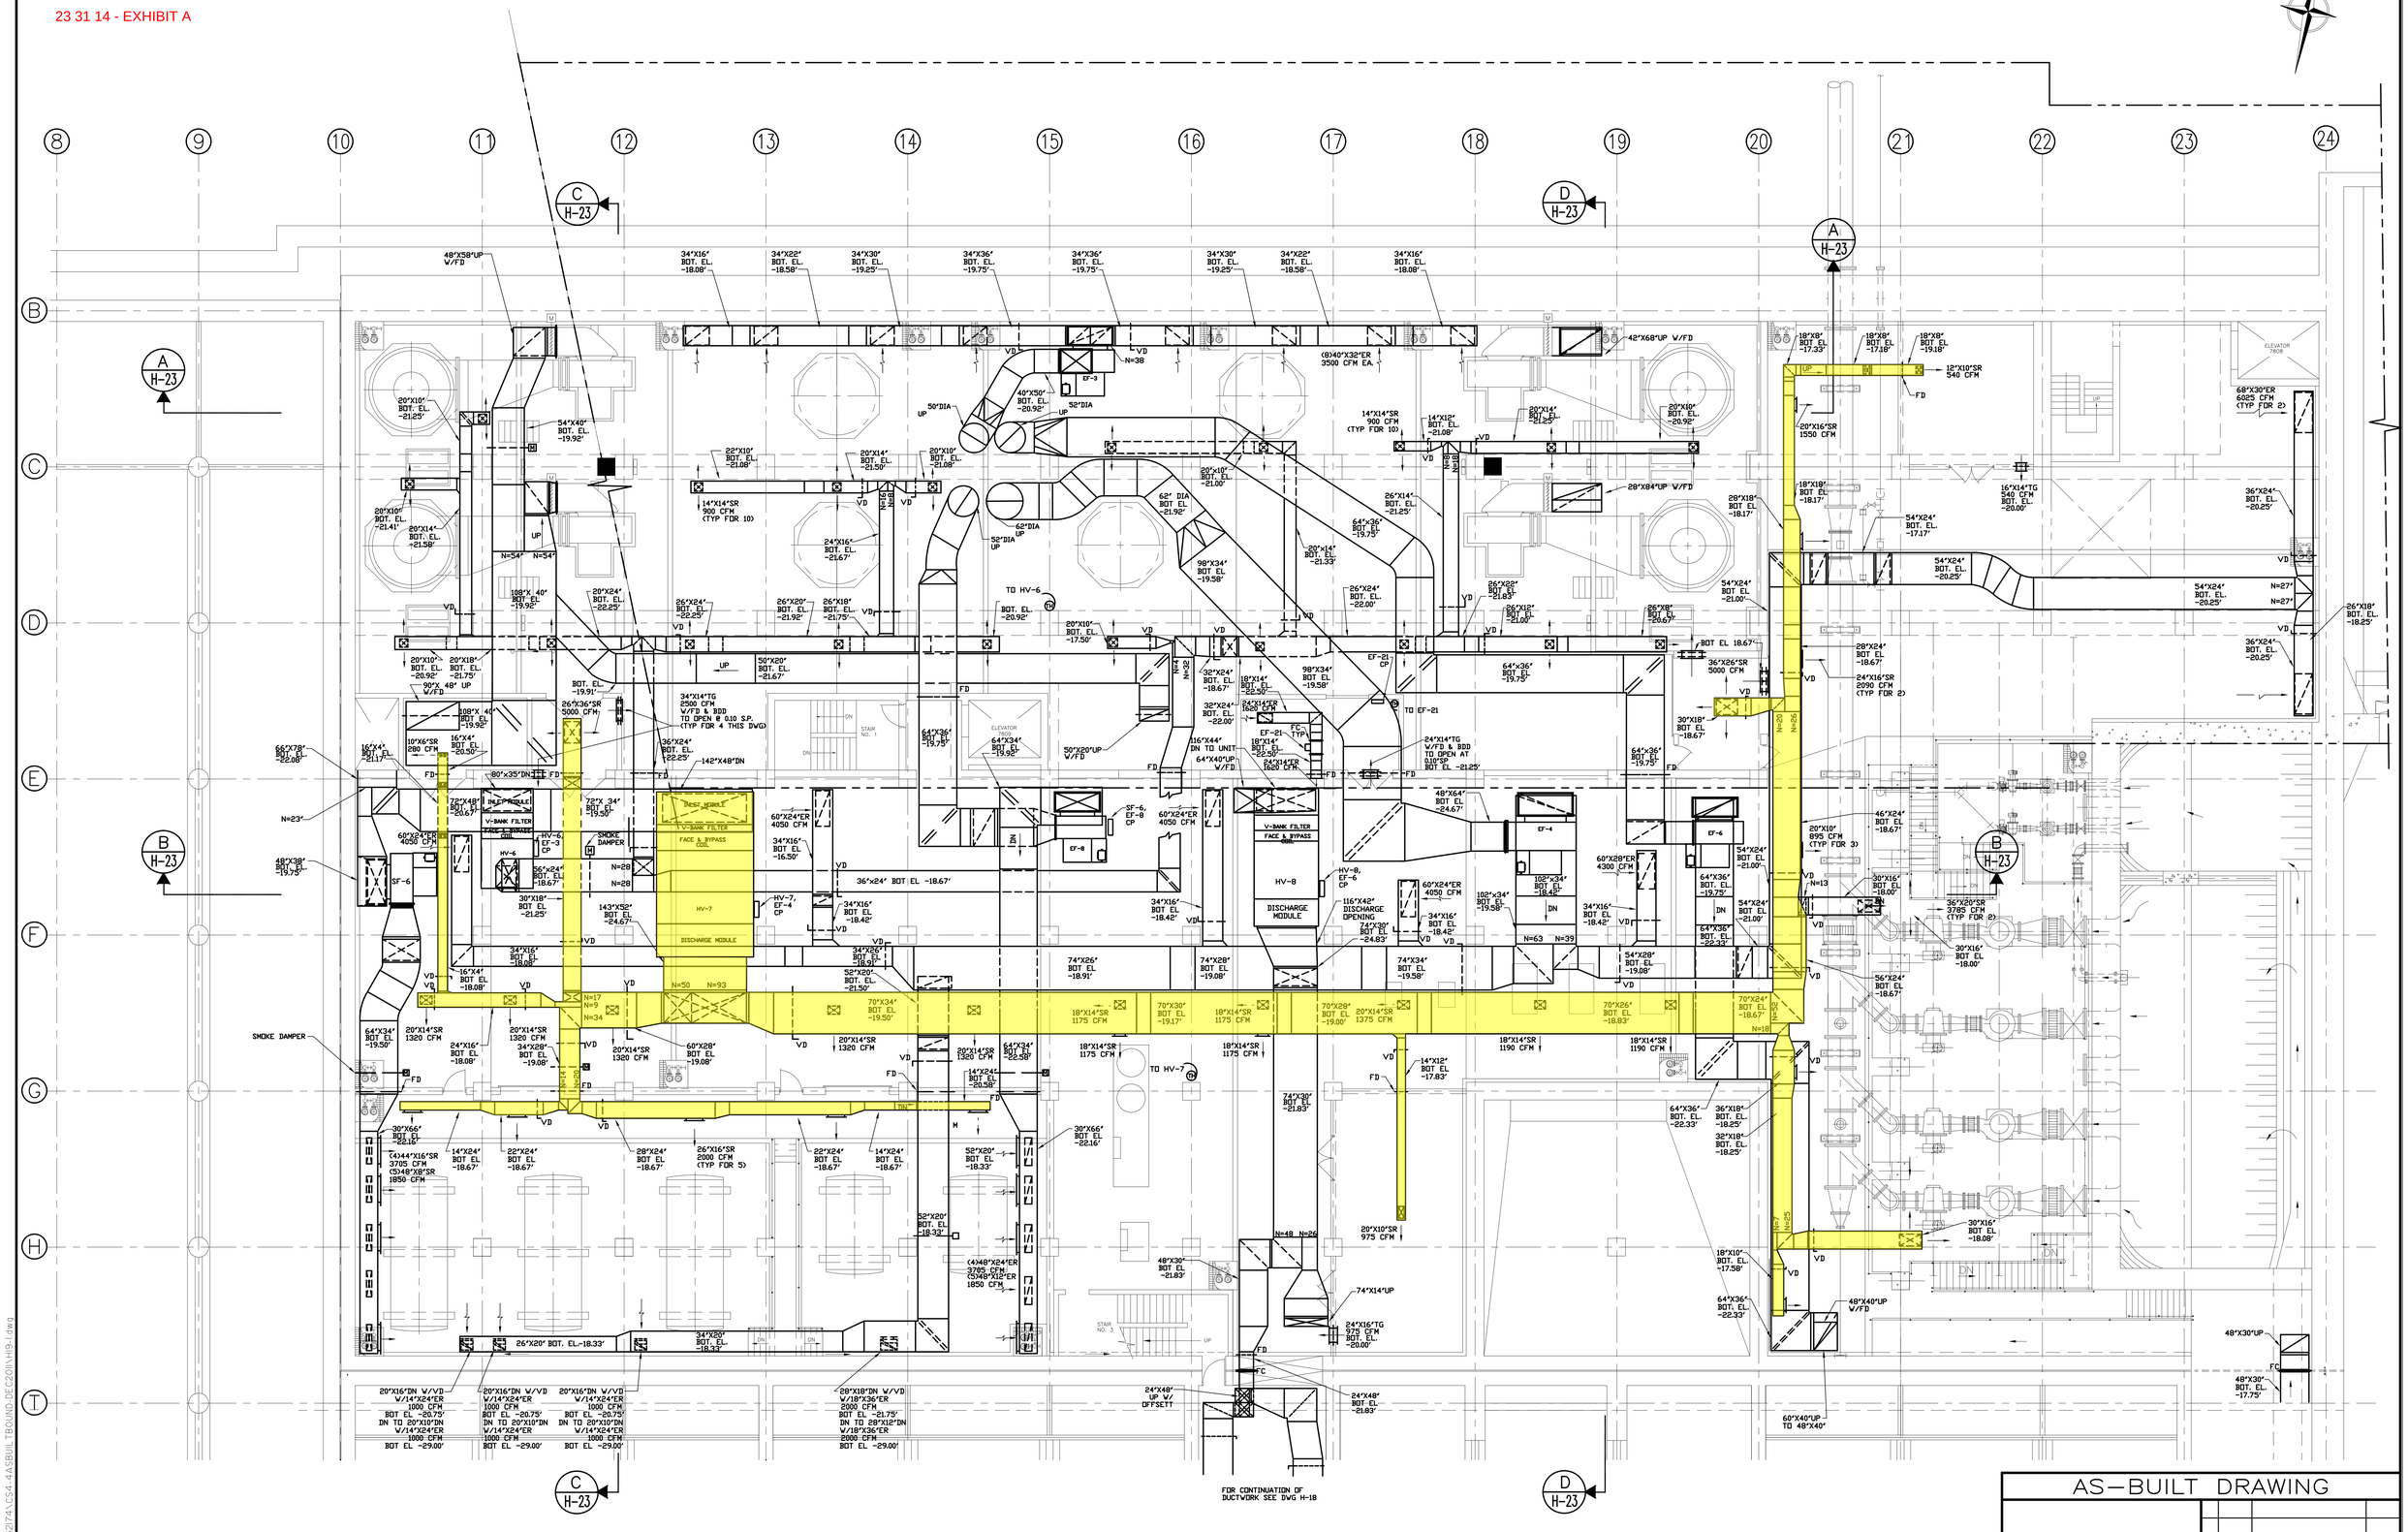
a. Clean and prime coat ferrous metal surfaces of equipment in the factory/shop in accordance with the requirements of Section 09 91 00, Painting.

b. Coat polished and non-ferrous metal surfaces with corrosion prevention compound which shall be maintained during storage and until equipment begins operations.

2. Field Painting:

a. Painting required for exterior surfaces of ductwork and insulation, and finish painting of items only primed at the factory, are specified in Section 09 91 00, Painting.

END OF SECTION



SCHEDULE 23 31 14-1
SCHEDULE OF METAL DUCT CONSTRUCTION STANDARDS [1,2]

Service:	**Pressure Classification: (in. W.G.)**	**Construction Standards:**
All ductwork on fan discharge side	+3	SMACNA HVAC Duct Construction Standards
All ductwork on suction side	-3	
Transfer air duct not connected to fan	±2	

Notes:

1. All accessories (including, but not limited to: turning vanes, air turning devices, manual volume dampers, motor operated control dampers, fire dampers, access doors, supports, angles, clamps, hangers, and hardware) shall be suitable for the pressure classification given above.

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified and required, to furnish, install, and test all non-metallic ductwork, with auxiliary equipment and accessories, complete and operational.

B. The following index of this Section is presented for convenience.

C. The following schedule(s), attached after the end of section designation, are a part of this Section:

1. Schedule 23 31 17-1, Schedule of Non-Metal Duct Construction Standards.

1.02 PAYMENT

A. No separate payment shall be made for performing any Work required under this Section. All costs for Work required by this Section shall be included in the applicable lump sum, unit price(s) or allowance(s) as set forth in Section 01 27 00 – Measurement and Payment.

1.03 RELATED SECTIONS

1.05 DESCRIPTION

A. This Section includes requirements for providing non-metal ducts and accessories in accordance with applicable standards and regulations. In addition:

1. Non-metal duct and accessories shall include all painting, coating, lining, gaskets, harnesses, bolts, nuts, and other appurtenances and material required to provide and assemble the lines.

B. Non-metal ductwork shall be FRP construction.

1.06 QUALITY ASSURANCE

A. Requirements of Regulatory Agencies: Comply with applicable provisions of regulatory agencies below and others having jurisdiction.

1. Underwriters Laboratories, Inc.
2. National Fire Protection Association.
3. National Electrical Code.
4. Local and State Building Codes and Ordinances.
    a. Building code of the City of New York.
    b. New York State Uniform Fire Prevention and Building Code.

B. Qualifications of Manufacturer:

1. Engage a single firm, with undivided responsibility for performance and other requirements and components of the non-metallic ductwork.
2. Engage a firm which can show successful experience in the fabrication and erection for non-metallic ductwork systems of scope and type similar to the required Work.

C. Installer Qualifications:

1. The Contractor shall have at least five (5) years' experience in the installation of the Work specified herein. The Contractor shall employ only tradesperson with specific skills and experience in this type of Work.

2. The Contractor shall have undivided responsibility as a single firm for performance and other requirements for the installation of the Work specified herein.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

a. The Contractor shall submit the following Shop Drawings and material specifications for the approval of the Engineer:

1) ¼-in. scale duct layouts, complete with:

a) Dimensions.

b) Details of construction.

c) Details of installation, hanger details and spacing.

2) Manufacturer's literature, illustrations, specifications and Engineering data for the following items, including weights of component parts:

a) Registers, grilles, and diffusers.

b) Fire Dampers (UL Listed), including:

(1) Closing mechanisms.

(2) Fusible link operating temperature.

(3) Installation details.

c) Access Doors.

d) Duct Access Doors.

e) Flexible connections.

f) Duct sealants.

3) An air outlet schedule indicating room name and location of each outlet. Cross reference contract designation and manufacturer's model number or name.

4) Specifications for FRP resins and reinforcing material used.

5) Contractor shall submit FRP ductwork wall thickness calculations for review. Calculations shall include the following:

a) Wall thickness determination shall be based on the structural fiberglass reinforced wall only.

b) Wall thickness shall have a safety factor of 10:1 for pressure and 5:1 for vacuum service.

c) Wall thickness shall be suitable for use up to 120°F in pressure service and vacuum service.

d) Wall thickness shall be based on a 0.50-in. maximum deflection between supports and for any side of duct under worst case operating conditions.

e) Where ductwork is located outdoors, wall thickness shall be based on the following occurring simultaneously:

f) Wind Load: 25 lbs/ft^2.

g) Rectangular duct may be reinforced with fiberglass angles, channels, tees or tubes as required to meet required pressure/vacuum service.

h) All calculations shall be signed and sealed by a Professional Engineer (P.E.) licensed in the State of New York.

6) Specifications for fire-retardant epoxy FRP ductwork coating and reinforcing material used.

7) The manufacturer shall submit test data indicating that the fire retardant system does not exceed listed ratings and has been tested by Factory Mutual Research Corporation.

8) Specification of FRP ductwork laminate construction including schedule of duct sizes indicating weight per foot, wall thickness and all other data required for indicating conformance to FRP round duct schedule. Submit procedures for hand layup of duct joints.

9) FRP rectangular duct schedule with sizes, thickness, vacuum pressure, weight per foot pressure, spans, joint type, and flange data.

10) Submit standard and custom color selection chart. Color will be selected by the Engineer from the submitted charts.

a) Contractor shall submit a sample FRP panel not less than 2 ft^2 that shall be painted and allowed to dry for not less than 48 hrs and then be checked for paint adhesion by the paint system manufacturer and submitted to the Engineer for approval.

b. Test Reports: Submit test reports for the following:

1) UL Label, Fire Dampers.

2) Individual and separate volume damper leakage tests from an AMCA approved testing laboratory for all types and sizes of dampers furnished under this Section.

2. Information Submittals:

   a. A letter stating that the proposed resins proposed in the fabrication of the FRP ductwork will give satisfactory performance under the specified service conditions or a corrosion resistance chart indicating same.

   b. Contractor shall submit an affidavit certifying that all FRP equipment shall be fabricated, cured and assembled as described in this Section.

   c. Contractor shall submit an affidavit stating that all stainless steel accessories (including, but not limited to: screws, hangers, supports, etc.) for stainless steel ductwork are Type 316 stainless steel.

   d. Manufacturer's certified literature indicating compliance with proposed pressure and vacuum classification and wheel loading classification indicated below.

   e. Tabulation in check list forms to indicate compliance with ASTM D 2563 Table I, Level II visual acceptance levels.

   f. Notification of failure of Barcol hardness and/or acetone tests, and manufacturers course of action (i.e., retest or reject the materials represented by the test).

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents.

   1. A thorough inspection of each piece of ductwork will be conducted upon arrival at construction site to inspect for damage incurred in transit. Any damage shall be immediately repaired by respective equipment fabricators personnel (not a sales representative)

   2. All ductwork shall arrive on site fully fabricated, not in two halves for field fabricated.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall provide spare parts and special tools necessary to service, disassemble, repair and adjust the materials and products provided under this Section, and as per the requirements of the Contract Documents. In addition:

   1. One (1) set of special tools required to maintain and repair the system.

   2. All materials in kit form to make or repair joints. Kits shall be in a number sufficient to repair 10% of the joints.

3. Names and addresses of all manufacturers of: Fiberglass reinforcements, resins, hardeners and components used to repair and maintain FRP duct system.

B. Tools: Provide standard and special tools and supplies necessary to service, disassemble, repair and adjust the products.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. FRP Ductwork:

1. Product and Manufacturer: Provide one of the following:

a. Perry Fiberglass Products, Inc, Westlake, OH.

b. Kenway; Augusta, ME.

c. Or approved equal.

2. Resins:

a. Derakane 510A, as manufactured by Dow Chemical Company, Midland, MI.

b. Dion 9300 FR, as manufactured by Reichhold Chemicals Company, Newark, NJ.

c. Hetron FR 992, as manufactured by Ashland Chemical Company, Covington, KY.

3. Synthetic Surfacing Veil:

a. Veil-Nexus 1012 (apertured), as manufactured by Precision Fabrics Group, Inc., Greensboro, NC.

b. Or approved equal.

4. Two component catalytic epoxy intumescent fire-retardant coating:

a. No. 46081 Thermal Insulating (Intumescent) Epoxy Paint, as manufactured by Flame Control Coatings of Canada, Ajax, ON.

b. Or approved equal.

B. Filter Housing:

1. Product and Manufacturer: Provide one of the following:

a. Model Surepleat, as manufactured by Flanders Corporation.

b. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. FRP Ductwork:

1. General:

a. All work shall be constructed and installed properly in accordance with the recommendations given in the latest edition of SMACNA HVAC Duct Construction Standards.

b. Provide FRP ductwork where shown on the Contract Drawings.

c. All accessories, hardware, and fasteners associated with the FRP ductwork shall be Type 316 stainless steel unless otherwise noted.

2. Painting:

a. Surface Preparation and Shop Painting:

1) Clean and prime coat surfaces of non-metal ductwork in the factory/shop in accordance with the requirements of Section 09 91 00, Painting.

2) Coat polished and non-ferrous metal surfaces with corrosion prevention compound which shall be maintained during storage and until equipment begins operations.

b. Painting for Exterior Ductwork/Piping:

1) FRP ductwork/piping installed exterior to the building (exposed to the weather) shall be provided with a topcoat of pigmented paraffinated gel coat with ultraviolet inhibitors designed for direct exposure to the sun and weather elements.

3. Access doors for fire dampers shall be stenciled "FIRE DAMPER ACCESS" with minimum ½-in. high letters.

a. The FRP duct system shall be specifically designed, constructed, and installed for all ductwork related to chemical room exhaust and ventilation systems, and other areas where shown on the Contract Drawings.

4. Design Conditions: FRP Ductwork shall comply with the following conditions, at a minimum:

a. Air Temperature: -10°F to 120°F.

b. Corrosion resistance to hydrogen sulfide, chlorine, mercaptans and other gases commonly encountered in wastewater treatment plants.

c. Service Conditions: Manufacturer shall design ductwork so that it shall be free from buckling, pulsing, warpage, and sagging, and that it shall have the following pressure ratings:

1) Vacuum Service: ≥ -12 in. W.G.

2) Pressure Service: ≤ 12 in. W.G.

5. FRP Ductwork Construction:

a. General:

1) FRP ductwork shall be of filament wound or hand lay-up construction.

2) FRP ductwork shall be of flame retardant material inside and outside in accordance with NFPA-91.

3) Duct shall meet the applicable requirements of ASTM D 2310, Type 1, Grade 1 or 2, with Class "E" liner, 20 mills minimum thickness, and be manufactured in accordance with ASTM D 2996.

4) Flanges and bolt drilling circles and diameters shall conform to NBS PS 15-69 except that flanges shall be a minimum of 0.75-in. thick.

5) Ductwork shall be fabricated of vinylester resin as specified below.

6) All interior and exterior surfaces shall contain 0.010-inches (10 mil) C-Glass veil saturated with 90% resin by weight.

7) Square or rectangular FRP ductwork shall be constructed of the same materials and conform to the same standards as specified above for round FRP ductwork.

b. Laminates:

1) Laminates shall consist of a 10 to 20 mil chemical resistant liner with a synthetic surfacing veil embedded in a resin rich surface.

2) The corrosion barrier shall be a minimum of 100 mils and include no less than two (2) layers of 1½ oz mat with 25% glass and 75% resin content.

3) The structural layer shall be of sufficient thickness to meet the minimum thickness requirements specified.

4) The exterior surface layer shall be resin rich apertured nexus veil not less than 20 mils thick.

5) Outside finish shall have a paraffinated pigmented gel coat finish with an ultra violet inhibitor.

6) The composition specified for the inner surface and interior layer is intended to achieve optimum chemical resistance.

c. Resins:

1) Resins used in the laminate shall be premium corrosion resistant and fire retardant brominated bispenol-A vinylester resins.

d. All cut edges shall be sealed with a resin coating of the same resin as used in the fabrication.

1) The resin shall contain paraffin.

e. Two component catalytic epoxy intumescent fire-retardant coating:

1) All FRP ductwork installed within the interior of any building shall be additionally protected with a two component catalytic epoxy intumescent fire-retardant coating in accordance with the requirements of Mil-C-46081A.

2) The fire-retardant coating shall have the following ratings:

a) Flame Spread Rating, as per ASTM E84: ≤ 25

b) Smoke Developed Rating: ≤50

6. Connections:

a. All connections to expansion joints, butterfly dampers, tanks, or other equipment shall be flanged.

b. Gaskets shall be EPDM or Butyl and bolts, nuts and washers shall be Type 316 stainless steel.

c. Flanges shall be hand laid up to PS 15-69 thickness, except that minimum thickness shall be ¾-in.

d. The flange shall be hand laid-up anchored to a waxed table to achieve the flatness tolerance outlined within this Section.

e. The face shall be textured for use with full face gaskets, ⅛-in. minimum thickness.

f. Pipe flange drilling shall be NBS PS 15-69.

g. All FRP duct and pipe flange bolt holes shall be back spot faced for a washer seat.

h. All flange bolts shall be torqued to values as recommended by manufacturer.

7. FRP Ductwork Fittings:

a. General:

1) All FRP fittings (such as elbows, laterals, tees, and reducers) shall:

a) Be of the same FRP resin as the adjacent FRP duct section.

b) Be equal or superior in strength to the adjacent FRP duct section

c) Have the same internal diameter as the adjacent FRP duct section.

b. Construction:

1) Round duct joints shall be butt wrapped or bell and spigot joints as shown on the Contract Drawings or as required.

c. Standard Elbows:

1) Standard elbow centerline radius shall be equal to 1½ times the diameter.

2) Standard elbows up to 24-in. diameter shall be smooth radius molded elbows.

3) Standard elbows 30-in. diameter and greater may be mitered sections, as follows:

a) 0° to 44° elbows shall contain one (1) mitered joint and two (2) sections.

b) 45° to 80° elbows shall have a minimum of two (2) mitered joints and three (3) sections.

c) Elbows greater than 80° shall have a minimum of four (4) mitered joints and five (5) sections.

d. Square Elbows:

1) All square elbows shall have FRP or Type 316 stainless steel double thickness turning vanes with streamlined leading edges.

B. FRP Ductwork Accessories:

1. Hangers and Supports:

a. All ductwork shall be securely hung and anchored to the building structure.

1) Unless otherwise explicitly shown on the Contract Drawings, hangers and stiffeners for ducts shall conform to all the recommendations and requirements given in the SMACNA HVAC Duct Construction Standards and the SMACNA Seismic Restraint Manual. - Guidelines for Mechanical Systems.

2) Unless otherwise specified herein, hangers and supports shall also conform to all the requirements of Section 40 05 07, Hangers and Supports for Process Piping.

3) Provide equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.

b. Ducts shall be supported on trapeze hangers with angles or rods – the use of strap hangers and/or straps is prohibited.

1) There shall be not less than a 1/4-inch buildup of FRP over the duct at each support.

2) Each support shall be furnished with a 1/8-inch thick teflon sheet to shield the duct from the support.

c. Hanger rod thickness shall be as follows:

1) For all ducts with half perimeter up to 72 in.: Hanger rods shall be minimum ⅜-in. thick.

2) For all ducts with half perimeter larger than 72 in.: Hanger rods shall be minimum ½-in. thick.

d. A pair of rods shall be provided at each duct support point.

e. Support shall be furnished at each fitting.

f. The maximum hanger spacing shall be as follows:

1) For ducts with half perimeter up to 72 in.: 8 ft

2) For ducts with half perimeter larger than 72 in.: 6 ft.

g. All hangers, rods, supports, bolts, nuts, washers, inserts, and appurtenances shall be Type 316 stainless steel.

h. Seismic Requirements:

1) All piping and ductwork shall be provided with seismic restraints in accordance with the SMACNA Seismic Restraint Manual - Guidelines for Mechanical Systems and in accordance with the New York City Building Code and referenced Uniform Building Code requirements.

2) Piping and ductwork shall be supported to withstand seismic forces anticipated in seismic zones 2A.

2. Flexible Connections:

a. General:

1) Provide flexible connectors in the following locations:

a) For every 100 linear ft of duct run at a minimum.

b) Wherever ductwork crosses an expansion joint.

c) As shown on the Contract Drawings.

2) Provide flexible connections complete with anchors and guides.

3) Flexible connections shall be W-design.

b. Materials: Provide either:

1) EPDM

2) Butyl

c. Construction:

1) EPDM or Butyl shall be $^{3}/_{16}$-in. thick, reinforced with a strong synthetic asbestos-free fabric suitable for corrosive service.

d. Corners on rectangular expansion joints shall be molded and free of patches or splices.

e. Service Conditions:

1) The flexible connections shall be suitable for outdoor service and temperature ranges from -65°F up to 300°F, and pressure to 5 psig.

2) Expansion service flexible connections shall be designed to allow 1-in. of contraction and 3.8-in. of expansion.

3) Working length or flange to flange length shall be a minimum of 12-in.

f. Ends Connections:

1) Flanged conforming to NBS PS 15-69.

2) Specially fabricated split ⅜-in. thick Type 316 stainless steel retaining back-up bars shall be supplied to prevent damage to the EPDM rubber flanges when Type 316 stainless steel bolts are tightened.

3. Rectangular FRP Dampers:

a. General:

1) Provide manually operated, opposed-blade, rectangular FRP dampers where shown on the Contract Drawings.

2) Dampers shall be fabricated from materials similar to those specified for the FRP ductwork. Type 316 stainless steel may be used as a substitute to FRP material for rectangular FRP dampers.

b. Service Conditions:

1) Maximum Velocity Through Damper: 4000 fpm.

2) Pressure Rating: 15 in. W.G.

3) Maximum Allowable Leakage: 7.5 cfm/ft^{2}at 15-in. W.G. pressure.

c. Materials:

1) Bearings: Teflon.

2) Blade: FRP, airfoil shape, 4-in. wide blades.

3) Frame: FRP channel.

4) Shafts: ¾–in. Type 316 stainless steel, full length of damper size as shown on the Drawings.

5) Finish: FRP.

6) Handle (manual damper): Type 316 stainless steel.

7) Pins: Type 316 stainless steel.

8) Bushings: Teflon.

9) Hardware: Type 316 stainless steel.

10) Angles: FRP.

11) Ends: Flanged with bolt holes drilled. Flange thickness shall not vary more than $^1/_{16}$-in.

12) Blade, Shaft and Jamb Seals: EPDM suitable for use in a hydrogen sulfide atmosphere.

d. Dimensions: As shown on the Contract Drawings.

4. Round FRP Dampers:

a. General:

1) Provide manually operated, butterfly, round FRP dampers where shown on the Drawings.

2) Dampers shall be fabricated from materials similar to those specified for the FRP ductwork. Type 316 stainless steel may be used as a substitute to FRP material for round FRP dampers.

b. Rating Conditions:

1) Maximum Velocity Through Damper: 6000 fpm.

2) Pressure Rating: 30 in. W.G.

3) Maximum Allowable Leakage: 5.25 cfm/ft^2 at 30-in. W.G. pressure.

c. Materials:

1) Bearings: Teflon.

2) Blade: FRP, reinforced.

3) Frame: FRP channel.

4) Shaft: Type 316 stainless steel rods, full length of damper size as shown on the Drawings.

5) Blade and Shaft Seals: EPDM suitable for use in a hydrogen sulfide atmosphere.

6) Finish: FRP.

7) Handle (manual damper): Type 316 stainless steel.

8) Pins: Type 316 stainless steel.

9) Bushings: Teflon.

10) Hardware: Type 316 stainless steel.

11) Angles: FRP.

12) Ends: Flanged with bolt holes drilled. Flange thickness shall not vary more than $^{1}/_{16}$-in..

13) Blade Stops: FRP angles with full circumference elastomer seals suitable for use in a hydrogen sulfide atmosphere.

d. Dimensions: As shown on the Contract Drawings.

5. Access Doors:

a. Type: Gasketed cam lock cover type doors in accordance with SMACNA Standards.

b. Construction:

1) Duct access doors shall be rigid and airtight, and provided with neoprene gaskets, hinges and sash locks.

c. Materials: FRP.

d. Unless otherwise specified, access doors shall be:

1) For duct sizes under 14-in.: Provide 12-in. × 6-in. access doors.

2) For ducts sized 14-in.: Provide 12-in. × 12-in.access doors..

3) For duct sizes between 14-in. and 36-in.: Provide 21-in. × 14-in.access doors.

4) For duct sizes between 36-in. and 60-in.: Provide 25-in. × 17-in.access doors.

5) For ducts larger than 60-in.: Provide quantity two (2) 25-in. × 17-in. access doors..

6. Vibration Isolation Flexible Connections:

a. Provide flexible connections for preventing the transmission of vibrations through the ductwork at the locations specified herein.

b. Materials: Vibration isolation flexible connections shall be shall be neoprene-impregnated fabric collars with cemented seams fastened with Type 316 stainless steel straps and bolts.

7. FRP Transition Pieces:

a. General:

1) Provide transition pieces as shown on the Contract Drawings.

b. Construction:

1) ¼-in. minimum thickness FRP sheets and thickness not to be less than thickness of adjacent FRP ducting.

2) All exposed hardware shall be Type 316 stainless steel with stainless steel screws, nuts, bolts and washers as required.

3) Flanges shall be designed as required to connect to adjacent fan and/or duct work.

c. Pressure Classification: Manufacturer shall design transition pieces so that they shall be free from buckling, pulsing, warpage, and sagging, and that it shall have the following pressure ratings:

1) Vacuum Service: ≥ -12 in. W.G.

2) Pressure Service: ≤ 12 in. W.G.

8. Sleeves:

a. Sleeves: Where ductwork passes through masonry walls, partitions or floors provide sleeves.

b. Materials: Provide sleeves of minimum 16 ga., Type 316 stainless steel.

9. Other Ductwork Accessories:

a. For ductwork accessories not specified in this Section (including but not limited to: fire dampers, bird screens, etc.), yet required for a fully functional FRP duct system and/or as shown on the Contract Drawings, provide ductwork accessories as per all the requirements of Section 23 31 14, Metal Ducts and Ductwork Accessories.

1) Provide these ductwork accessories in Type 316 stainless steel construction, as specified in Section 23 31 14, Metal Ducts and Ductwork Accessories.

2) Submit data on these ductwork accessories as per all the submittal requirements specified in Section 23 31 14, Metal Ducts and Ductwork Accessories. Include this submittal data with the other submittals for this Section.

10. Registers, Grilled, and Diffusers:

a. For registers, grilles, and diffusers required for a fully functional FRP duct system and/or as shown on the Contract Drawings, provide these products as per all the requirements of Section 23 31 14, Metal Ducts and Ductwork Accessories.

1) Provide these ductwork products in Type 316 stainless steel construction, as specified in Section 23 31 14, Metal Ducts and Ductwork Accessories.

2) Submit data on these ductwork products as per all the submittal requirements specified in Section 23 31 14, Metal Ducts and Ductwork Accessories. Include this submittal data with the other submittals for this Section.

11. Filter Housings:

a. Details of Construction:

1) Materials:

a) Type 316 stainless steel construction for stainless steel and FRP ductwork.

2) Double wall construction with 1-in thick insulation and predrilled standing flanges.

3) Side, top or bottom access doors as dictated by access requirements shown on Drawings.

4) Access doors shall be swing open type and include neoprene gasket to ensure door-to-filter seal.

5) Access doors shall be equipped with adjustable and replaceable positive sealing UV-resistant star-style knobs and replaceable door hinges.

6) Filter holding frame shall include centering dimples, multiple fastener lances, and polyurethane filter sealing gasket.

7) Provide pressure taps and fittings for installation of differential pressure sensor reading.

8) Provide 2-inch deep throwaway pleated panel filters.

a) Filter media shall be a cotton and synthetic fiber blend lofted to a uniform depth and formed into a uniform radial pleat.

b) A welded wire grid, spot-welded and treated for corrosion resistance shall be bonded to the downstream side of the media to maintain radial pleats and prevent media oscillation.

c) A biodegradable enclosing frame of virgin-origin Kraft board, produced under an initiative for sustainable forest management, shall provide a rigid and durable enclosure. The frame shall be bonded to the media on all sides to prevent air bypass. Integral diagonal support members on the air entering and air exiting side shall be bonded to the apex of each pleat to maintain uniform pleat spacing in varying airflows.

d) Filter efficiency shall be determined in accordance with ASHRAE Standard 52.2 with a minimum MERV 8 rating.

e) Filter shall be UL 900 Class 2 rated.

f) Initial resistance to airflow shall not exceed 0.41-inch W.G. for a 2-inch deep or 0.35-inch W.G. for a 4-inch deep filter at a velocity of 500 fpm.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Factory Painting:

1. All exterior surfaces of FRP ductwork located outdoors shall be factory painted as specified herein.

B. Factory application of two component catalytic epoxy intumescent fire-retardant coating:

1. Surface Preparation: All mold release agents and other foreign matter shall be completely removed. All glossy surfaces shall be brush-blasted or sanded and cleaned.

2. Laminate must be fully cured before application of fire-retardant coating.

3. Apply first coating minimum 8-10 mil (wet) over duct.

4. Immediately apply one layer of C-Veil onto wet coating. Brush or roll C-Veil to remove any creases and to completely wet C-Veil.

5. Apply second layer of intumescent coating at 8-10 mil (wet) minimum thickness. Dry thickness of two coats plus C-Veil shall be not less than 10 mils.

6. Apply additional coats as required to ensure that C-Veil is completely immersed in the epoxy coating and completely wetted and that the total dry thickness will be greater than 10 mils. There shall be no exposed or dry C-Veil.

C. Ductwork markings:

1. Each standard and random length of pipe used for ductwork shall be clearly marked with the following information:

a. Pipe Size (nominal diameter, in.).

b. Pipe Class (Pressure class, or schedule).

c. Production Code.

d. Material Designation.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. FRP ductwork and accessories shall be fabricated in a heated and well ventilated structure protected from weather and temperature extremes (minimum 50°F). Entire fabrication, curing and assembly process of any piece of FRP equipment shall be indoors.

B. The Manufacturer shall test resin cure for all FRP ductwork by Barcol hardness and acetone tests:

1. Hardness shall be within 90% of resin manufacturer's specification.

2. Barcol test shall be required for inside and outside surfaces of all fiberglass fabrications in accordance with ASTM D2583.

C. Failure of Shop Tests:

1. If the Barcol hardness and acetone test results do not meet the requirements specified, the Barcol hardness and acetone tests shall be deemed a failure.

2. In the event of failure, the manufacturer may take only one (1) of the following two course of action:

a. Retest the materials represented by the tests one (1) time.

1) The manufacturer shall bear all costs of repeating the Barcol hardness and acetone tests and no additional costs shall be passed on to the Contractor.

2) The Contractor shall submit to the Engineer in writing of any failures of the Barcol hardness and/or acetone tests, and the manufacturers course of action (i.e., retest or reject the materials represented by the test).

3) In retesting, all the product requirements of this Section shall be met, and the test methods specified in this Section shall be followed.

4) If upon retest, failure again occurs, then the quantity of product represented by the tests shall be rejected.

b. Reject the quantity of product represented by the tests.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Field Measurements:

1. Take field measurements where required prior to installation to ensure proper fitting of Work.

3.02 INSTALLATION

A. Non-Metal ductwork:

1. General:

a. All ducts shall be installed in accordance with manufacturer's recommendations.

b. All ductwork shall conform accurately to the dimensions shown on the Contract Drawings, with the exception that:

1) Ductwork shall be as shown on the Contract Drawings, subject to such modifications as may be necessary to suit field conditions to clear any obstruction or conflicts with other equipment.

c. All ductwork shall be straight and smooth on the inside with neatly finished joints, and shall not be decreased at any point to avoid obstructions.

d. No piping, conduit, or structural work shall be installed in or through any ductwork.

e. All ductwork shall be run as close as possible to structural members, walls, and ceilings.

f. Where existing walls, floors or roofs must be penetrated, Contractor shall neatly cut the required openings and patch the existing work to provide a neat and finished appearance.

g. Ductwork shall be installed so as to preclude the possibility of vibration under all operating conditions.

h. Install all ductwork and accessories to provide a system free from buckling, warping, breathing, or vibration.

2. Tolerances:

a. Out-of-roundness of duct shall be limited to ±⅛-in. or ±1% of duct inside diameter, whichever is greater, for duct sizes 8-in. diameter and greater.

b. Length of all flange pipe sections shall not vary more than ±⅛-in. at 70°F.

c. All unflanged duct shall be square on the ends in relation to the pipe axis and ±⅛-in. up to and including 24-in. diameter and $\pm^{3}/_{16}$-in. for all diameters greater than 24-in.

d. Fittings: The tolerance on angles of all fittings shall be ±1°, up to and including 24-in. diameter and ±½° for 30-in. diameter and above.

e. Flanges:

1) Flange faces shall be perpendicular to the axis of the duct within ½ degree.

2) Flange faces shall be flat to within ± $^{1}/_{32}$-in., up to and including 18-in. diameter and flat within ±$^{1}/_{16}$-in. for 20-in. diameter and larger.

3) Provide custom filler pieces as required to mate flanges squarely.

B. Ductwork Joints:

1. After the installation is completed, the Contractor shall seal all joints air tight.

2. Sealants and tape shall have the following ratings:

a. Flame Spread Rating, as per ASTM E84: ≤ 25

b. Smoke Developed Rating: ≤ 50

3. Bell and Spigot Joints:

a. Bell and spigot joints shall be sealed with a standard butt joint overlay as per PS 15-69.

b. All interior surfaces of joint to be coated with a paraffinated resin-rich gel coat.

c. Total width of overlay for butt-wrap joints shall be:

1) For FRP ductwork diameters from 8 in. up to and including 30-in.: ≥ 6-in..

2) For FRP ductwork diameters 36-in. and larger: ≥ 10-in..

4. All non-metal duct joints shall be airtight with no leakage.

5. Deflection:

a. Maximum allowable deflection for any size ductwork shall be ½-in. between supports and for any side of duct under worse case operating conditions.

C. Sleeves:

1. Install round duct sleeves and mechanical link seals for round ductwork as required.

D. Turning Vanes:

1. The turning vanes shall be quiet and free from vibration when the system is in operation.

2. Turning vanes shall be double thickness type.

3. Turning vanes shall be installed in the following locations:

a. All miter elbows to permit air to make the abrupt turns with a minimum of turbulence.

b. All short radius elbows in accordance with SMACNA standards and Industrial Duct Construction standards.

4. Duct clean out doors shall be provided at each elbow with turning vanes.

E. Volume Dampers:

1. Manual volume dampers larger than 11-in. in any dimension shall be opposed blade type.

2. The damper blades shall be operated by a lockable dial regulator and may be set in any position.

a. The dial regulators shall be marked so that the "open" and "shut" positions are clearly identified.

b. The dial regulators on insulated ductwork shall be mounted on an elevated platform which will finish flush with the surface of the insulation.

3. Manual volume dampers shall be located at accessible points and wherever possible some distance from a duct transition or fitting.

4. Care shall be taken during installation to make certain that sheet metal fasteners do not protrude into the duct and interfere with damper operation.

5. Install volume dampers where indicated on the Drawings and as required to facilitate accurate volume control. Volume dampers specified with air devices shall be installed in addition to those shown on the Drawings. In addition, dampers shall be installed in all of the following locations:

a. Each branch duct take off, and

b. In both ducts downstream of each trunk duct split.

6. Splitter type dampers shall not be installed.

F. Duct Access Doors:

1. Duct access doors shall be provided in all of the following locations for inspection and maintenance.

a. Within working distance of (and on the fusible link side of) all fire dampers.

b. Adjacent to all dampers.

c. On the linkage side of all automatic dampers.

d. At all other apparatus requiring service or inspection in the duct system.

2. Whenever space requirements are such that a hinged access door is impractical, a screw fastened lift-out door shall be provided instead.

G. Test openings:

1. The test openings shall be sealed by a screw cap and gasket.
2. The test openings shall be located as follows:
   a. In the exhaust air duct adjacent to the unit (fan, scrubber).
   b. In suction side of each unit (fan, scrubber).
   c. Where indicated on Drawings.

H. Flexible Connections:

1. All expansion joints in ducts at building expansion joints shall be suitably supported at each end by support guides within 12-in. of joint.
2. All ducts at flexible connections with air handling equipment, and fans shall be supported at free end within 12-in. of flexible connection.
3. Provisions shall be made for supporting all ductwork, dampers, and other ductwork accessories, where necessary.

I. Vibration Isolation Flexible Connections:

1. Install vibration isolation flexible connections between the ductwork and all air moving equipment and at the building joints.
   a. Provide flexible connections at both the inlet and discharge of air handling equipment.
2. Vibration isolation flexible connections shall not be painted or used to correct misalignment.

J. Fire Dampers:

1. Fire dampers shall be installed where shown on the Contract Drawings and where required by UL and authorities having jurisdiction, and shall be approved by local building codes and in accordance with the requirements of the NFPA.
   a. Two (2) fire dampers, rated at 1½ hours each, with one on each face of the fire separation or fire division, are required for fire separations having a 3-hr fire rating or above as per the New York City Building Code and Uniform Building Code requirements.
2. Fire dampers shall be secured to a Type 316 stainless steel collar with ¼-in. diameter stainless steel nuts and bolts with maximum spacing of 12-in. on center and a minimum of two (2) fastenings per side beginning 2-in. in from the corners of the collar.
3. The collars shall be at a minimum the same gauge as the ductwork to which the collar is attached; or 24 ga. thick (Type 316 stainless steel), whichever thickness is greater.

4. Retaining angles shall be installed on four sides of the collar and on both sides of the protected opening with a minimum of 1-in. overlap on the wall or floor.
    a. The Type 316 stainless steel angles shall be a minimum of 1½-in. × 1½-in. × ⅛-in. and shall be fastened to the collar only – do not fasten angles to the wall or floor.
    b. The retaining angles shall be increased in size to provide the minimum overlap of one inch on the wall or floor.
    c. The angles shall be fastened to the collar with ¼-in. diameter stainless steel nuts and bolts with a maximum spacing of 6-in. on center and a minimum of two (2) fastenings per side, beginning 2-in. from the corners of the collar.
    d. Where gas tight seals are required, the angles shall be fastened to the collar with a continuous weld and a sealant shall be installed between the angle and the wall or floor.
5. Clearance for expansion is required between the collar and the opening on the top and on each vertical side.
    a. The clearance shall be ⅛-in. per linear foot of sleeve, with clearance on the sides distributed equally and all vertical clearance on the top.
6. The ductwork shall be connected to the collar sides of the collar.
    a. The distance from the wall or floor to the breakaway connection shall not exceed 6-in.
7. Provide firestopping at fire separations where fire dampers are installed.
8. Provide an access door in duct at each fire damper located in duct.

K. Contractor shall furnish and install sleeves for registers, grilles, and dampers mounted in the masonry, concrete plenums or shafts. Sleeves shall be 16 ga. Type 316 stainless steel.

3.03 FIELD TESTING / QUALITY CONTROL

A. Not Used

3.04 STARTUP / DEMONSTRATION

A. Not Used

3.05 ADJUSTING / PROTECTION / CLEANUP

A. Adjustment:
1. Set volume control devices for approximate positions in preparation for final testing and balancing.
2. Install fusible links in fire dampers and verify that dampers are in open position.

3. Start fan system and check for excessive leaks and vibration and correct.

B. Balancing:

1. Systems shall be completely tested, adjusted and balanced by a qualified engineer. A complete balancing procedure shall be submitted for approval. All equipment and connections required to balance the systems shall be provided.

2. All duct systems shall be balanced in accordance with Section 23 05 93, Testing, Adjusting, and Balancing for HVAC.

C. Cleaning:

1. Prior to final inspection, all surfaces shall be made clean by brushing, wiping, or with a compressed-air blast to remove all loose foreign materials.

2. Remove all loose materials and obstructions from interior of ducts.

3. Remove debris and waste materials resulting from installation.

D. Painting:

1. Field Painting:

a. Painting required for surfaces not otherwise specified, and finish painting of items only primed at the factory, are specified in Section 09 91 00, Painting.

END OF SECTION

SCHEDULE 23 31 17-1
SCHEDULE OF NON-METAL DUCT CONSTRUCTION STANDARDS[1,2]

Service:	**Pressure Classification: (in. W.G.)**	**Construction Standards:**
All ductwork on fan discharge side	3	SMACNA HVAC Duct Construction Standards
All ductwork on suction side	3	
Transfer air duct not connected to fan	3	

Notes:

1. All accessories (including, but not limited to: turning vanes, air turning devices, manual volume dampers, motor operated control dampers, fire dampers, access doors, supports, angles, clamps, hangers, and hardware) shall be suitable for the pressure classification given above.
2. Schedule: All ductwork in the Chemical Rooms shall be FRP construction.

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all labor, materials, equipment, incidentals, and appurtenances as shown, specified and required to furnish, install, and test all HVAC fans, complete and operational.

B. The following index of this Section is presented for convenience:

Article	Title	Section Page
PART 1	GENERAL	1
1.01	Summary	1

1.04 REFERENCES

A. Abbreviations and Acronyms:

1.	FRP	Fiber Reinforced Plastic

B. Reference Standards:

1.	AISI C1045	Medium Carbon Steel
2.	AMCA 210	Laboratory Methods of Testing Fans for Ratings
3.	AMCA 301	Methods for Calculating Fan Sounds Ratings from Laboratory Test Data.
4.	ANSI S2.19, G6.3	Mechanical Vibration - Balance Quality Requirements Of Rigid Rotors

5. SMACNA Seismic Restraint Manual: Guidelines for Mechanical Systems

1.05 DESCRIPTION

A. This Section includes requirements for providing HVAC fans and accessories in accordance with applicable standards and regulations. In addition:

1. HVAC fans shall be furnished complete with all accessories, special tools, spare parts, base attachments, mountings, anchor bolts and other appurtenances as specified and/or required for proper installation.

1.06 QUALITY ASSURANCE

A. Requirements of Regulatory Agencies: Comply with the applicable provisions of the standards organizations and regulatory agencies, below:

1. Underwriters Laboratories, Inc.
2. National Fire Protection Association.
3. National Electrical Code.
4. Local and State Building Codes and ordinances
   a. Building Code of the City of New York.
   b. New York State Uniform Fire Prevention and Building Code.

B. Qualifications of Manufacturer:

1. All components of the HVAC fans shall be provided by the Contractor through a single HVAC fan vendor.
   a. The Contractor (through the HVAC fan vendor) shall have the sole responsibility of matching all components and providing equipment which functions together as a system.

2. The HVAC Fans shall be standard equipment of the manufacturer.

3. The HVAC fans shall be designed, constructed, and installed in accordance with the best practices of the trade, and shall operate satisfactorily when installed as shown on the Contract Drawings.

4. All fans shall be selected from performance curves and not from rating tables.

   a. Performance data for all fans shall be based on tests conducted in accordance with AMCA 210 and shall be licensed to bear the AMCA certified rating seal for both sound and air performance.

5. Provide units listed by the Underwriters Laboratories, Inc.

1.07 SUBMITTALS

A. Submittals shall comply with the requirements of the Contract Documents. In addition, submittals shall include, but not be limited to:

1. Action Submittals:

   a. Equipment specifications and data sheets identifying all materials used and methods of fabrication.

   b. Complete assembly, layout, installation, and foundation drawings with clearly marked dimensions.

   c. Fan performance curve indicating the operating point.

   d. Details of corrosion resistance coating.

   e. Weights of assembled units.

   f. Motor nameplate data as specified in Section 26 05 91, Low-Voltage Electric Motors.

   g. Detailed specifications and data sheets for all accessories such as roof curbs, dampers, damper operators, disconnect switches, vibration isolators, etc.

   h. Example equipment nameplate data sheet.

   i. Schematic diagrams for electric and control systems showing wiring for individual equipment items and interconnecting wiring diagrams.

   j. Shop and field testing procedures.

   k. Deviations from the Contract Documents.

   l. Wiring diagrams with numbered terminal blocks for all external connections.

   m. Description of control system.

   n. Motor Tests and Data: For each motor submit a certified motor test data sheet or a certified motor data sheet from an electrically

duplicate motor, in accordance with Section 26 05 91, Low-Voltage Electric Motors.

o. List of recommended lubricants.

p. Operation and maintenance manuals.

q. Fan manufacturer shall provide sound power ratings in the eight octave bands.

1) Sound power levels shall be based on AMCA Standard 301.

2) Sound power ratings shall be in decibels, referenced to 10^{-12} W.

2. Information Submittals:

a. Spare Parts List

b. Special Tools List

c. Reports of Certified Shop Tests

d. AMCA Approval for Fan Ratings

e. List of Lubricants:

1) The manufacturer shall submit a list with a minimum of four (4) manufacturers' standard lubricants which may be used interchangeably for each type of lubricant required.

a) The Contractor shall utilize this list in preparing his comprehensive lubrication survey as described in the Contract Documents.

1.08 DELIVERY, STORAGE, AND HANDLING

A. The Contractor shall deliver materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. The cleaning, preservation, and packing of the HVAC fans for shipment shall be in accordance with the manufacturer's commercial practice.

B. The Contractor shall store and handle materials provided under this Section in accordance with the requirements of the Contract Documents. In addition:

1. The HVAC fans shall be handled in such a manner that they may be transported and unloaded without being over-stressed, deformed, or otherwise damaged.

2. The HVAC fans shall be protected from corrosion and deterioration and shall be stored in a dry area.

a. Materials stored outdoors shall be supported above ground surfaces on wood runners and protected with effective and durable waterproof covers approved by the Engineer.

3. Interiors shall be kept free from dirt and foreign matter.

1.09 SPARE PARTS, SPECIAL TOOLS, AND SUPPLIES

A. The Contractor shall provide spare parts and special tools necessary to service, disassemble, repair, and adjust the equipment provided under this Section, as per the requirements of the Contract Documents and/or as recommended by the manufacturer. In addition:

1. Provide the following spare parts for up to every four (4) of the same size, model, and type of HVAC fan furnished under this Section:

a. One (1) blower with wheel

b. One (1) set bearing and seal

c. One (1) set sheave

d. One (1) shaft

e. Two (2) sets of belts for each belt driven fan

2. Provide electric motor spare parts in accordance with Section 26 05 91, Low Voltage Electric Motors.

B. Tools: Provide standard and special tools and supplies necessary to service, disassemble, repair, and adjust the equipment.

1.10 WARRANTY

A. The Contractor shall obtain from the manufacturer and provide to DEP the manufacturer's standard warranty, in an acceptable form, warranting against defects in design, materials, abnormal aging, and workmanship.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Wall Mounted Propeller Fans:

1. Model SER-09SH as manufactured by Hartzell, Piqua, OH;

2. Aerovent, Minneapolis, MN;

3. Or approved equal.

B. Fiberglass Up Blast Roof Mounted Centrifugal Fan:

1. Model Series 88 as manufactured by Hartzell, Piqua, OH;

2. Aerovent, Minneapolis, MN;

3. Or approved equal.

C. Fiberglass Duct Vane Axial Fans:

1. Model 35V as manufactured by Hartzell, Piqua, OH;

2. Aerovent, Minneapolis, MN;

3. Or approved equal.

2.02 MATERIALS / EQUIPMENT

A. General:

1. Fans shall be as shown on the Contract Drawings.

   a. The capacity of all HVAC fans shall be as shown on the Contract Drawings.

   b. Where shown on the Contract Drawings, explosion proof motors and AMCA Type "A" spark resistant construction HVAC fans shall be provided.

2. Each fan shall bear a permanently affixed manufacturer's nameplate containing the model number and individual serial number for future identification.

3. Motors:

   a. Motors shall comply with the requirements of Section 26 05 91, Low Voltage Electric Motors.

   b. Unless otherwise indicated, motors shall be of the totally enclosed premium efficiency fan cooled type.

   c. Motors shall not be selected for operation in the service factor range/zone. The maximum brake horsepower required at any point on the performance curve shall not exceed the rated horsepower of the motor.

4. Electrical Service:

   a. Motors ≤ ⅓ hp : 115V, single phase, 60 Hz.

   b. Motors ≥ ½ hp : 460V, 3-phase, 60 Hz

5. Two speed motors: Shall be two winding type.

6. Disconnect Switches: All fans and damper operators shall each be provided with individual externally mounted disconnect switches.

7. Enclosures:

   a. All enclosures shall be NEMA 4X, and of stainless-steel construction, unless otherwise shown on the Contract Drawings.

8. Bearings:

   a. All fan bearings shall be selected for a minimum L-50 life of 100,000 hrs at maximum operating speed.

9. Shafts:

   a. All shafts shall be sized so the first critical speed is at least 20% over the maximum operating speed.

   b. Close tolerance shall be maintained along the length of the shaft.

10. Drive Type:

a. The fans shall be either direct connected or V-belt drive as indicated on the HVAC Fan Schedule shown on the Contract Drawings.

b. V-belt Drives:

1) V-belt Drives shall have the following rated capacities:

a) For motors ≤ 10 hp: 120% of rated capacity.

b) For motors > 10 hp, 150% of rated capacity.

2) All V-belt drives shall be provided with adjustable sheaves.

3) Belt Guards:

a) Exposed V-belt drives shall have removable belt guards with openings to allow for tachometer readings at both drive and fan shafts.

b) Guards shall be so constructed as to allow visual inspection of the belts without removing the guard.

c) All belt guards shall be OSHA-approved.

d) Exterior, exposed belt guards shall be weatherproof.

11. Seismic Restraints:

a. All fans shall be secured or anchored to withstand seismic forces anticipated in seismic zone 2A.

b. Equipment shall be provided with seismic restraints in accordance with SMACNA Seismic Restraint Manual: Guidelines for Mechanical Systems, as published by, and in accordance with the latest edition of the City of New York Building Code and referenced Uniform Building Code requirements.

12. Vibration isolators:

a. Isolators shall have a minimum efficiency of 90%.

b. Installation, type, number, and size of vibration isolators shall be in conformance with the manufacturer's recommendations for the frequencies involved.

B. Wall Mounted Propeller Fans:

1. General:

a. Propellers shall be airfoil design, statically and dynamically balanced.

2. Materials and Construction:

a. Fan shall be constructed of aluminum.

b. Propellers shall be of cast aluminum alloy.

c. Propellers shall be equipped with malleable iron split-taper bushing for alignment and locking of propeller to the shaft.

1) Bushing held in place by compression and keyed to the shaft to prevent slipping or loosening.

d. Propeller shall be mounted in a high efficiency air seal fan orifice with smaller diameter of the ring overlapping the propeller tips.

e. Fan bearing shall be heavy-duty, self-aligning ball type and relubricable selected for continuous service.

f. Mounting hardware shall be steel.

g. The Contractor to provide additional stiffeners, angles and supports as required to mount the fans.

3. Drive:

a. Safety Guard shall have removable sections to provide for easy access to motor.

b. Belt shall be oil, heat and static resistant, sized for continuous duty.

4. Coating:

a. All external and internal metal surfaces of fans, guards, (except propellers and motors) shall be factory primed and factory painted in accordance with Section 09 91 00, Painting.

b. All structural steel used for mounting fans shall be corrosion resistant coated.

5. Accessories:

a. Fan boot.

b. Motorized damper.

C. Fiberglass Reinforced Up-Blast Centrifugal Fans:

1. General:

a. Roof exhaust fans shall be up-blast centrifugal belt driven type.

2. Housing:

a. All fiberglass reinforced plastic surfaces shall be constructed of Derakane 510-A epoxy vinyl ester resin.

b. All structural parts in the air stream shall be fiberglass and resin or epoxy coated Type 316 stainless steel.

c. Dome motor cover, curb cap, and venturi inlet and outlet shall be formed from solid fiberglass and resin.

d. All internal hardware (air stream) shall be encapsulated Type 316 stainless steel.

e. All external hardware (out of airstream) shall be Type 316 stainless steel.

f. All air stream surfaces shall be provided with a synthetic veil and electrostatically conductive surface coating.

3. Fan Wheel:

a. Backward curved airfoil blades with tapered inlet side.

b. Manufactured as a single piece, removed from the pattern whole using solid fiberglass die formed and coated with a corrosion resistant vinyl ester resin, Ashland Derakane 510-A or equivalent.

c. Totally encapsulated aluminum core insert for secure attachment to the shaft.

d. Provided with a synthetic veil and electrostatically conductive surface coating.

4. Shaft (Belt Drive Only):

a. Type 316 stainless steel, turned, ground, and polished.

b. Machined and keyed at both ends with a fiberglass sleeve in the air stream.

c. Fan wheel shall be held tightly against the shaft shoulder by a Type 316 stainless steel bolt in the end of the shaft.

d. Type 316 stainless steel set screws shall be used to hold the key in place.

5. Shaft Seal (Belt Drive Only):

a. Fiberglass and neoprene shaft seal shall be located where the shaft leaves the housing.

6. Bearings (Belt Drive Only):

a. Heavy duty, self-aligning type with extended lube tubes for continuous service.

7. Motor Base (Belt Drive Only):

a. Motor mounting plates shall be steel encapsulated with resin, mat, and cloth and mounted onto the housing.

b. Fully adjustable platform style.

8. Accessories:

a. Manufacturer’s roof curb.

D. Fiberglass Duct Vane Axial Fans:

1. Housing:

a. All fiberglass reinforced plastic surfaces shall be constructed of Derakane 510-B.

b. All structural parts in the air stream shall be fiberglass and resin or epoxy coated Type 316 stainless steel.

c. All internal hardware (air stream) shall be encapsulated Type 316 stainless steel.

d. All external hardware (out of airstream) shall be Type 316 stainless steel.

e. All air stream surfaces shall be provided with a synthetic veil and electrostatically conductive surface coating.

2. Propeller:

a. Six airfoil blades.

b. Manufactured as a single piece, removed from the pattern whole using solid fiberglass die formed and coated with a corrosion resistant vinyl ester resin, Ashland Derakane 510-A or equivalent.

c. Totally encapsulated aluminum core insert for secure attachment to the shaft.

d. Provided with a synthetic veil and electrostatically conductive surface coating.

3. Shaft (Belt Drive Only):

a. Type 316 stainless steel, turned, ground, and polished.

b. Machined and keyed at both ends with a fiberglass sleeve in the air stream.

c. Propeller shall be held tightly against the shaft shoulder by a Type 316 stainless steel bolt in the end of the shaft.

d. Type 316 stainless steel set screws shall be used to hold the key in place.

4. Shaft Seal (Belt Drive Only):

a. Fiberglass and teflon shaft seal shall be located where the shaft leaves the bearing cover.

5. Bearings (Belt Drive Only):

a. Heavy duty, self-aligning type with extended lube tubes for continuous service.

6. Motor Base (Belt Drive Only):

a. Motor mounting plates shall be steel encapsulated with resin, mat, and cloth and mounted onto the housing exterior.

b. Fully adjustable platform style.

7. Accessories:

a. Provide guide vane section.

E. Hangers and Supports:

1. Provide equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.
2. Equipment shall be supported from the building structure.
3. Unless otherwise specified herein, hangers and supports shall also conform to all the requirements of Section 40 05 07, Hangers and Supports for Process Piping.

2.03 FABRICATION / ASSEMBLING / FINISHES

A. Anchorage Devices:

1. Provide anchorage devices in accordance with Section 05 05 23, Metal Fastenings.
2. Contractor shall furnish anchor bolts and nuts of Type 316 stainless steel, of ample size and strength for the purpose intended, sized by the equipment manufacturer.
3. All hardware for mounting of motor drives and control panels shall be Type 316 stainless steel.

B. Identification:

1. Provide in accordance with Section 40 05 97, Identification for Process Equipment.
2. Each unit of equipment shall be identified with the equipment item numbers shown on the Contract Drawings.
3. A corrosion resistant tag and nameplate, securely affixed in a conspicuous place on each unit shall give the equipment item number, manufacturer's name or trademark and such other information as the manufacturer may consider necessary, or as specified, to complete identification.

C. Dampers:

1. All dampers for roof mounted fans shall be mounted in the mounting pedestal with removable access panel for inspection and servicing of damper and operator.
2. Mounting pedestal shall provide solid ventilator support and a weather tight seal.

D. Balancing:

1. All fans shall be statically and dynamically balanced at the speed at which the unit is scheduled to operate. Fans with corrosion resistant coatings shall be balanced after being coated.

E. Coatings:

1. Clean and prime coat ferrous metal surfaces of equipment in the shop in accordance with the requirements of Section 09 91 00, Painting.

2. If no other coating is otherwise specified for a type of fan on the HVAC Fan Schedule shown on the Contract Drawings, fans shall be provided (inside and outside) with baked on phenolic corrosion resistant coating including all accessories but not limited to the housing, wheels, curbs, liners, dampers, damper access sections. Coating shall be applied in the shop using the manufacturer's approved system.

3. Motors shall be painted in accordance with either Section 26 05 91, Low Voltage Electric.

4. Coat machined, polished, and non-ferrous metal surfaces and similar un-painted surfaces with corrosion prevention compound which shall be maintained during storage and until equipment begins operation.

2.04 SOURCE QUALITY CONTROL / SHOP TESTS

A. All HVAC Fans shall be as efficient as those HVAC Fans that have been tested to perform satisfactorily for at least two (2) years.

B. Shop Tests:

1. All shop tests shall be witnessed by a licensed Professional Engineer.

2. The licensed Professional Engineer shall sign and seal all shop test reports.

a. The state of the Professional Engineer's registration, the Professional Engineer's license number, and the Professional Engineer's name on the seal shall be clearly legible.

PART 3 EXECUTION

3.01 EXAMINATION / PREPARATION

A. Inspection:

1. The inspection shall include welding, dimensions, bearings and overall workmanship.

2. The Contractor shall not install damaged items until repairs are made in accordance with manufacturer's written instructions and approval by Engineer.

a. Only minor repair work will be permitted in the field.

b. All damaged items requiring remedial work shall be returned to the manufacturer for repair or replacement.

3.02 INSTALLATION

A. Install HVAC fans in complete accordance with the manufacturer's printed installation instructions and the approved shop drawings. In addition:

1. Units shall be electrically grounded in the field by installing contractor.

3.03 FIELD TESTING / QUALITY CONTROL

A. Furnish the services of a qualified manufacturer's representative to check and approve all installations before operation as well as conduct field testing, in accordance with the requirements of the Contract documents. In addition:

1. The Contractor shall verify that all work furnished and installed conforms to the requirements the Contract Documents.

2. Reports: Submit a report from the manufacturer of each visit to the site. Reports shall provide complete information on time, schedule, tasks performed, persons contacted, problems corrected, test results, training, instruction and all other pertinent information.

3. Motor tests shall be performed in accordance with Section 26 05 91, Low-Voltage Electrical Motors.

4. Perform field tests in accordance with Section 23 05 93, Testing, Adjusting, and Balancing for HVAC.

3.04 STARTUP / DEMONSTRATION

A. Furnish the service of a qualified manufacturer representative to assist and train the plant operations and maintenance staff in the care, operation, and maintenance of the HVAC fans in accordance with the requirements of the Contract Documents. In addition:

1. The Contractor shall make all adjustments required to place Work in proper operating condition.

2. The Contractor shall include instruction on care and maintenance of the HVAC fans in the training of plant personnel.

3. In the event of trouble with the equipment, the manufacturer's representative shall revisit the site as often as required until all troubles are corrected and the installation is entirely satisfactory.
